  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: To use data label feature, we need to inject **DataLabel** using **Chart.Inject(DataLabel)** method.

Position

Using [position](#) property, you can place the label either on **Top**, **Middle**, **Bottom** or **Outer** (outer is applicable for column and bar type series).

INDEX.TS

```
import { Chart, ColumnSeries, Category, DataLabel } from '@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, DataLabel);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category'
    },
    primaryYAxis:
    {
        labelFormat: '{value}°C'
    },
    series: [
        {
            type: 'Column',
            dataSource: columnData, xName: 'country', yName: 'gold',
            marker: {
                //Data label position as middle
                dataLabel: { visible: true, position: 'Middle' }
            }
        }
    ],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: The position **Outer** is applicable for column and bar type series.

Data Label Template

Label content can be formatted by using the template option. Inside the template, you can add the placeholder text `${point.x}` and `${point.y}` to display corresponding data points x & y value. Using [template](#) property, you can set data label template in chart.

INDEX.TS

```
import { Chart, ColumnSeries, Category, DataLabel } from '@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, DataLabel);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category'
    },
    series: [
        {
            type: 'Column',
            dataSource: columnData, xName: 'country', yName: 'gold',
            marker: {
                dataLabel: { visible: true, template: '<div
style="background:#f5f5f5; border: 1px solid black; padding: 3px 3px 3px
3px"><div>${point.x}</div><div>${point.y}</div></div>' }
            }
        }
    ],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>

Value	Format	Resultant Value	Description
1000	n1	1000.0	The number is rounded to 1 decimal place.
1000	n2	1000.00	The number is rounded to 2 decimal places.
1000	n3	1000.000	The number is rounded to 3 decimal place.
0.01	p1	1.0%	The number is converted to percentage with 1 decimal place.
0.01	p2	1.00%	The number is converted to percentage with 2 decimal place.
0.01	p3	1.000%	The number is converted to percentage with 3 decimal place.
1000	c1	\$1000.0	The currency symbol is appended to number and number is rounded to 1 decimal place.
1000	c2	\$1000.00	The currency symbol is appended to number and number is rounded to 2 decimal place.

Margin

margin for data label can be applied to using **left**, **right**, **bottom** and **top** properties.

INDEX.TS

```

import { Chart, ColumnSeries, Category, DataLabel } from '@syncfusion/ej2-
charts';
import { columnData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, DataLabel);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category'
    },
    series: [
        {
            type: 'Column',
            dataSource: columnData, xName: 'country', yName: 'gold',
            marker: {

```

```

        dataLabel: { visible: true,
                      border:{width: 1, color : 'red'},
                      margin:{
                        left:5,
                        right:5,
                        top:5,
                        bottom:5
                      }
                    }
      ],
    }, '#element');

```

INDEX.HTML

Customization

stroke and border of data label can be customized using fill and border properties. Rounded corners can be customized using rx and ry properties.

INDEX.TS

```

import { Chart, ColumnSeries, Category, DataLabel } from '@syncfusion/ej2-
charts';
import { columnData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, DataLabel);
let chart: Chart = new Chart({

```

```

    primaryXAxis: {
        valueType: 'Category'
    },
    series: [
        {
            type: 'Column',
            dataSource: columnData, xName: 'country', yName: 'gold',
            marker: {
                dataLabel: { visible: true,
                    border:{width: 2, color : 'red'},
                    rx:10, ry: 10
                }
            }
        }
    ],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: rx and ry properties requires border values not to be null.

Customizing Specific Point

You can also customize the specific marker and label using [pointRender](#) and [textRender](#) event. [pointRender](#) event allows you to change the shape, color and border for a point, whereas the [textRender](#) event allows you to change the text for the point.

INDEX.TS

```
import { Chart, LineSeries, DataLabel, IPointRenderEventArgs,
ITextRenderEventArgs } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
Chart.Inject(LineSeries, DataLabel);
let chart: Chart = new Chart({
  series: [
    {
      type: 'Line',
      dataSource: numData, xName: 'x', yName: 'y',
      marker: {
        visible: true,
        height: 10, width: 10,
        dataLabel: { visible: true }
      }
    }
  ],
  // pointRender event for chart
  pointRender: (args: IPointRenderEventArgs) => {
    if (args.point.index === 3) {
      args.fill = 'red'
    }
  },
  textRender: (args: ITextRenderEventArgs) => {
    if (args.point.index === 3) {
      args.text = 'Maximum Temperature';
      args.color = 'red';
    }
    else {
      args.cancel = true;
    }
  }
}, '#element');
```

```

Show percentage based on each series points

You can calculate the percentage value based on the sum for each series using the `seriesRender` and `textRender` events in the chart. In `seriesRender` calculate the sum of each series y values and In `textRender` calculate percentage value based on the sum value and modify the text.

INDEX.TS

```

import { Chart, ColumnSeries, Category, Legend, DataLabel, Tooltip,
ISeriesRenderEventArgs,
ITextRenderEventArgs } from '@syncfusion/ej2-charts';

Chart annotations in EJ2 JavaScript Chart control

Annotations are used to mark the specific area of interest in the chart area with texts, shapes or images.

<!-- markdownlint-disable MD033 -->

You can add annotations to the chart by using the `<code>annotations</code> option. By using the content option of annotation object, you can specify either the id of the element or directly specify the element in the content that needs to be displayed in the chart area.`

INDEX.TS

```
import { Chart, ColumnSeries, Category, ChartAnnotation } from
 '@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, ChartAnnotation);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
```

```

    },
    annotations:[{
        content: '70 Gold Medals',
        coordinateUnits: 'Point',
        x: 'France',
        y: 50
    }],
    series:[{
        dataSource: columnData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
    <div id="element1"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: To use annotations feature, we need to inject `ChartAnnotation` using `Chart.Inject(ChartAnnotation)` method.

Region

Annotations can be placed either with respect to `Series` or `Chart`. by default, it will placed with respect to `Chart`.

INDEX.TS

```
import { Chart, ColumnSeries, Category, ChartAnnotation } from
 '@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, ChartAnnotation);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
  },
  annotations:[{
    content: '<div>Highest Medal Count</div>',
    region: 'Series',
    coordinateUnits: 'Point',
    x: 'France',
    y: 50
  }],
  series:[{
    dataSource: columnData,
    xName: 'country', yName: 'gold',
    type: 'Column'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
    <div id="element1"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Co-ordinate Units

Specified the coordinates units of the annotation either **Pixel** or **Point**.

INDEX.TS

```
import { Chart, ColumnSeries, Category, ChartAnnotation } from
 '@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, ChartAnnotation);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
    },
    annotations:[{
        content: '<div style="border: 1px solid black; padding: 5px 5px 5px
5px, background:#f5f5f5">Annotation in Pixel</div>',
        coordinateUnits: 'Pixel',
        x: 150,
        y: 50
    }],
    series:[{
        dataSource: columnData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>
```

Alignment

Annotation provides **verticalAlignment** and **horizontalAlignment**. The **verticalAlignment** can be customized via **Top**, **Bottom** or **Middle** and the **horizontalAlignment** can be customized via **Near**, **Far** or **Center**.

INDEX.TS

```
import { Chart, ColumnSeries, Category, ChartAnnotation } from
 '@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, ChartAnnotation);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
  },
  annotations:[{
    content: '<div style="border: 1px solid black; padding: 5px 5px 5px
5px, background:#f5f5f5">Highest Medal Count</div>',
    x: 'France',
    y: 50,
    verticalAlignment:'Top',
    horizontalAlignment:'Near'
  }],
  series:[{
    dataSource: columnData,
    xName: 'country', yName: 'gold',
    type: 'Column'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Adding y-axis sub title through on annotation

By setting text div in the **content** option of annotation object you can add sub title to chart y-axis. Specified the **coordinate** value as **pixel** and customize x and y location of the text.

INDEX.TS

```

import { Chart, ColumnSeries, Category, ChartAnnotation } from
'@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, ChartAnnotation);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
  },
  primaryYAxis: {
    title: '(m2/min)'
  },
  annotations: [{
    content: '<div id="text" style="transform: rotate(-90deg);">Speed
Rate</div>',
    x: 6,
    y: 180,
    coordinateUnits: 'Pixel',
    Region: 'Chart'
  }],
  series: [{
    dataSource: columnData,
    xName: 'country', yName: 'gold',
    type: 'Column'
  }],
}, '#element');

```

INDEX.HTML

Legend in EJ2 JavaScript Chart control

<!-- markdownlint-disable MD036 -->

Legend provides information about the series rendered in the chart.

Position and Alignment

By using the [position](#) property, you can position the legend at left, right, top or bottom of the chart. The legend is positioned at the bottom of the chart, by default.

INDEX.TS

```

import { Chart, ColumnSeries, Category, Legend } from '@syncfusion/ej2-
charts';
Chart.Inject(ColumnSeries, Category, Legend);
let chartData: any[] = [
  { country: "USA", gold: 50, silver: 70, bronze: 45 },
  { country: "China", gold: 40, silver: 60, bronze: 55 },
  { country: "Japan", gold: 70, silver: 60, bronze: 50 },
  { country: "Australia", gold: 60, silver: 56, bronze: 40 },
  { country: "France", gold: 50, silver: 45, bronze: 35 },
  { country: "Germany", gold: 40, silver: 30, bronze: 22 },
  { country: "Italy", gold: 40, silver: 35, bronze: 37 },
  { country: "Sweden", gold: 30, silver: 25, bronze: 27 }
];
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    title: 'Countries'
  },
  primaryYAxis: {
    minimum: 0, maximum: 80,
    interval: 20, title: 'Medals'
  },
  series:[{
    dataSource: chartData,

```

```

        xName: 'country', yName: 'gold',
        name: 'Gold', type: 'Column'
    }, {
        dataSource: chartData,
        xName: 'country', yName: 'silver',
        name: 'Silver', type: 'Column'
    }, {
        dataSource: chartData,
        xName: 'country', yName: 'bronze',
        name: 'Bronze', type: 'Column'
    }],
    title: 'Olympic Medals',
    legendSettings: {
        visible: true,
        //Legend position as top
        position: 'Top'
    }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

Legend Size

By default, legend takes 20% - 25% of the chart's height horizontally, when it is placed on top or bottom position and 20% - 25% of the width vertically, while placing on left or right position of the chart. You can change this default legend size by using the [width](#) and [height](#) property of the [legendSettings](#).

INDEX.TS

```

Legend Title

You can set title for legend using `title` property in `legendSettings`. You can also customize the `fontStyle`, `size`, `fontWeight`,

color, textAlignment, fontFamily, opacity and textOverflow of legend title. titlePosition is used to set the legend position in Top, Left and Right position. maximumTitleWidth is used to set the width of the legend title. By default, it will be 100px.

INDEX.TS

```
import { Chart, ColumnSeries, Category, Legend } from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, Category, Legend);
let chartData: any[] = [
    { country: "USA", gold: 50, silver: 70, bronze: 45 },
    { country: "China", gold: 40, silver: 60, bronze: 55 },
    { country: "Japan", gold: 70, silver: 60, bronze: 50 },
    { country: "Australia", gold: 60, silver: 56, bronze: 40 },
    { country: "France", gold: 50, silver: 45, bronze: 35 },
    { country: "Germany", gold: 40, silver: 30, bronze: 22 },
    { country: "Italy", gold: 40, silver: 35, bronze: 37 },
    { country: "Sweden", gold: 30, silver: 25, bronze: 27 }
];
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
    },
    primaryYAxis: {
        minimum: 0, maximum: 80,
        interval: 20, title: 'Medals'
    },
    series:[{
        dataSource: chartData,
        xName: 'country', yName: 'gold',
        name: 'Gold', type: 'Column',
        //Legend icon type for chart
        legendShape: 'Circle'
    }, {
        dataSource: chartData,
        xName: 'country', yName: 'silver',
        name: 'Silver', type: 'Column',
        legendShape: 'SeriesType'
    }, {
        dataSource: chartData,
        xName: 'country', yName: 'bronze',
        name: 'Bronze', type: 'Column',
        legendShape: 'Rectangle'
    }],
    title: 'Olympic Medals',
    legendSettings: { visible: true, title: 'Countries' }
}, '#element');
```

INDEX.HTML

Tooltip in EJ2 JavaScript Chart control

<!-- markdownlint-disable MD036 -->

Chart will display details about the points through tooltip, when the mouse is moved over the point.

Default tooltip

By default, tooltip is not visible. You can enable the tooltip by setting [enable](#) property to **true** and by injecting `Tooltip` module using `Chart.Inject(Tooltip)`.

INDEX.TS

```
import { Chart, StepLineSeries, DateTime, Tooltip } from '@syncfusion/ej2-charts';
import { chartData } from './datasource.ts';
Chart.Inject(StepLineSeries, DateTime, Tooltip);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'DateTime'
    },
    series: [
        {
            type: 'StepLine',
            dataSource: chartData, xName: 'x', yName: 'y',
            width: 2, name: 'China',
            marker: {
                visible: true, width: 10, height: 10
            },
        },
    ],
    title: 'Unemployment Rates 1975-2010',
    //Default tooltip for chart
    tooltip: {enable: true}
}, '#element');
```

INDEX.HTML

<!-- markdownlint-disable MD013 -->

Fixed tooltip

By default, tooltip track the mouse movement, but you can set a fixed position for the tooltip by using the [location](#) property.

INDEX.TS

```

import { Chart, StepLineSeries, DateTime, Tooltip } from '@syncfusion/ej2-
charts';
import { chartData } from './datasource.ts';
Chart.Inject(StepLineSeries, DateTime, Tooltip);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'DateTime'
  },
  primaryYAxis: {
    minimum: 0,
    maximum: 20,
    interval: 4
  },
  series: [
    {
      type: 'StepLine',
      dataSource: chartData, xName: 'x', yName: 'y',
      width: 2, name: 'China',
      marker: {
        visible: true, width: 10, height: 10
      },
    },
  ],
  title: 'Unemployment Rates 1975-2010',
  //Default tooltip for chart
  tooltip: { enable: true, location: { x: 120, y: 20 } }

```

```
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Format the tooltip

```
<!-- markdownlint-disable MD013 -->
```

By default, tooltip shows information of x and y value in points. In addition to that, you can show more information in tooltip. For example the format `${series.name} ${point.x}` shows series name and point x value.

INDEX.TS

```
import { Chart, SplineSeries, DateTime, Tooltip } from '@syncfusion/ej2-
charts';
import { chartData } from './datasource.ts';
Chart.Inject(SplineSeries, DateTime, Tooltip);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'DateTime',
  },
  series: [
    {
      type: 'Spline',
      dataSource: chartData, xName: 'x', yName: 'y',
      width: 2, name: 'China',
      marker: {
```

```

        visible: true, width: 10, height: 10
    },
    },
    ],
    title: 'Unemployment Rates 1975-2010',
    tooltip: {
        enable: true,
        //tooltip format for chart
        header: 'Unemployment',
        format: '<b>${point.x} : ${point.y}</b>'
    }
}, '#element');

```

INDEX.HTML

Zooming in EJ2 JavaScript Chart control

Enable zooming

Chart can be zoomed in three ways.

- Selection - By setting [enableSelectionZooming](#) property to true in `zoomSettings`, you can zoom the chart by using the rubber band selection.
- Mousewheel - By setting [enableMouseWheelZooming](#) property to true in `zoomSettings`, you can zoomin and zoomout the chart by scrolling the mouse wheel.

- Pinch - By setting [enablePinchZooming](#) property to true in `zoomSettings`, you can zoom the chart through pinch gesture in touch enabled devices.

Pinch zooming is supported only in browsers that support multi-touch gestures. Currently IE11, Chrome and Opera browsers support multi-touch in desktop devices.

INDEX.TS

```
import { Chart, AreaSeries, Legend, Zoom, DateTime } from '@syncfusion/ej2-charts';
import { series1 } from './datasource.ts';
Chart.Inject(AreaSeries, DateTime, Legend, Zoom);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'DateTime',
    },
    series: [
        {
            type: 'Area',
            dataSource: series1,
            name: 'Product X',
            xName: 'x',
            yName: 'y',
            border: { width: 0.5, color: '#00bdae' },
            animation: { enable: false }
        },
    ],
    //Zooming for chart
    zoomSettings: {
        enableMouseWheelZooming: true,
        enablePinchZooming: true,
        enableSelectionZooming: true
    },
    title: 'Sales History of Product X',
    legendSettings: { visible: false },
}, '#element');
```

INDEX.HTML

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

After zooming the chart, a zooming toolbar will appear with **zoom**, **zoomin**, **zoomout**, **pan** and **reset** buttons. Selecting the Pan option will allow to pan the chart and selecting the Reset option will reset the zoomed chart.

Modes

The [mode](#) property in zoomSettings specifies whether the chart is allowed to scale along the horizontal axis or vertical axis. The default value of the mode is XY (both axis).

There are three types of mode.

- X- Allows us to zoom the chart horizontally.
- Y - Allows us to zoom the chart vertically.
- XY – Allows us to zoom the chart both vertically and horizontally.

```

Enable scrollbar

Using the [enableScrollbar](#) property, you can add a scrollbar to a zoomed chart. This scrollbar allows you to zoom or pan the chart. The appearance of the scrollbar can be customized using properties in [scrollbarSettings](#). For example, you can use [trackColor](#) and [trackRadius](#) properties to customize the track of the scrollbar, and [scrollbarRadius](#) and [scrollbarColor](#) properties to customize the scroller. The ability to zoom through the scrollbar can be enabled or disabled using the [enableZoom](#) property in [scrollbarSettings](#). Additionally, you can change the color of the grip and height of the scrollbar using the [gripColor](#) and [height](#) properties.

INDEX.TS

```

import { Chart, AreaSeries, Legend, Zoom, DateTime, ScrollBar } from
'@syncfusion/ej2-charts';
import { series1 } from './datasource.ts';
Chart.Inject(AreaSeries, DateTime, Legend, Zoom, ScrollBar);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'DateTime',
        zoomFactor: 0.2,

Note: To use zooming feature, we need to inject `Zoom` module `Chart.Inject(Zoom)` method.

<!-- markdownlint-disable MD036 -->

Data editing in EJ2 JavaScript Chart control

Enable Data Editing

We can use the data editing through inject the `DataEditing` module in the chart. It provides drag and drop support to the rendered points. Now, we can change the location or value of the point based on its `y` value. To enable the data editing, set the `enable` property to true in the drag settings of the series. Also, we can set color using `fill` property and set the data editing minimum and maximum range using `minY` and `maxY` properties.

INDEX.TS

```

import { Chart, ColumnSeries, DateTime, Legend, LineSeries, Tooltip,
DataEditing } from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, DateTime, Legend, LineSeries, Tooltip,
DataEditing);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'DateTime',
        labelFormat: 'y',
        intervalType: 'Years',

```

Cross hair and track ball in EJ2 JavaScript Chart control

Crosshair has a vertical and horizontal line to view the value of the axis at mouse or touch position.

Crosshair lines can be enabled by using [enable](#) property in the `crosshair`. Likewise tooltip label for an axis can be enabled by using [enable](#) property of `crosshairTooltip` in the corresponding axis.

INDEX.TS

```
import { Chart, LineSeries, Crosshair, DateTime, Legend } from
 '@syncfusion/ej2-charts';
import { series1 } from './datasource.ts';
Chart.Inject(LineSeries, DateTime, Crosshair, Legend);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'DateTime',
    },
    series: [
        {
            type: 'Line', width: 2, name: 'Temperature',
            dataSource: series1, xName: 'x', yName: 'y'
        }
    ],
    //crosshair for chart
    crosshair: { enable: true },
    legendSettings: { visible: true },
    title: 'Weather Condition'
}, '#element');
```

  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: To use crosshair feature, we need to inject **Crosshair** module **Chart.Inject(Crosshair)** method.

Trackball

Trackball is used to track a data point closest to the mouse or touch position. Trackball marker indicates the closest point and trackball tooltip displays the information about the point. To use trackball feature, we need to inject **Crosshair** module and **Tooltip** module using

Chart.Inject(Crosshair, Tooltip).

Trackball can be enabled by setting the [enable](#) property of the crosshair to true and

[shared](#) property in **tooltip** to true in chart.

INDEX.TS

```

import { Tooltip, Crosshair, DateTime } from '@syncfusion/ej2-charts';
import { Chart, LineSeries, Legend } from '@syncfusion/ej2-charts';
import { trackData } from './datasource.ts';
Chart.Inject(LineSeries, DateTime, Tooltip, Crosshair, Legend);

```

```

let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'DateTime',
  },

Synchronized Charts in EJ2 JavaScript Chart control

Tooltip synchronization

The tooltip can be synchronized across multiple charts using the [showTooltip](#) and [hideTooltip](#) methods. When we hover over a data point in one chart, we call the [showTooltip](#) method for the other charts to display related information in other connected charts simultaneously.

In the [showTooltip](#) method, specify the following parameters programmatically to enable tooltip for a particular chart:

- **x** - Data point x-value or x-coordinate value.
- **y** - Data point y-value or y-coordinate value.

INDEX.TS

Zooming synchronization

You can maintain constant zoom levels across multiple charts using the [zoomComplete](#) event. In the [zoomComplete](#) event, obtain the [zoomFactor](#) and [zoomPosition](#) values of the particular chart, and then apply those values to the other charts.

Selection in EJ2 JavaScript Chart control

Chart provides selection support for the series and its data points on mouse click.

When Mouse is clicked on the data points, the corresponding series legend also will be selected.

We have different types of selection mode for selecting a data.

- None
- Point
- Series
- Cluster
- DragXY
- DragX
- DragY

Point

You can select a point, by setting `selectionMode` to point.

INDEX.TS

```
import { Chart, ColumnSeries, Category, Legend, Selection } from
 '@syncfusion/ej2-charts';
import { selectionData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, Legend, Selection);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
  },
  series:[{
    dataSource: selectionData,
    xName: 'country', yName: 'gold',
    name: 'Gold', type: 'Column'
  }, {
    dataSource: selectionData,
    xName: 'country', yName: 'silver',
    name: 'Silver', type: 'Column'
  }, {
    dataSource: selectionData,
    xName: 'country', yName: 'bronze',
    name: 'Bronze', type: 'Column'
  }],
  // selection mode as point
  selectionMode: 'Point',
  title: 'Olympic Medals'
}, '#element');
```

Rectangular selection

DragXY, DragX and DragY

To fetch a collection of data under a particular region, you have to set `selectionMode` as `DragXY`.

- DragXY - Allow us to select data with respect to both horizontal and vertical axis.
- DragX - Allow us to select data with respect to horizontal axis.
- DragY - Allow us to select data with respect to vertical axis.

The selected data's are returned as an array collection in the

[dragComplete](#) event.

INDEX.TS

Selection type

You can select multiple points or series, by enabling the [isMultiSelect](#) property.

INDEX.TS

```

import { Chart, ColumnSeries, Category, Legend, Selection } from
'@syncfusion/ej2-charts';
import { selectionData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, Legend, Selection);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
    },
    series:[{
        dataSource: selectionData ,
        xName: 'country', yName: 'gold',
        name: 'Gold', type: 'Column'
    }, {
        dataSource: selectionData ,
        xName: 'country', yName: 'silver',
        name: 'Silver', type: 'Column'
    }, {
        dataSource: selectionData ,
        xName: 'country', yName: 'bronze',
        name: 'Bronze', type: 'Column'
    }],
});

```

```

selectionMode: 'Series',
// multipselect forselection
isMultiSelect: true,
title: 'Olympic Medals'
}, '#element');

```

Chart print in EJ2 JavaScript Chart control

Print

The rendered chart can be printed directly from the browser by calling the public method print. ID of the chart div element must be passed as argument to that method.

INDEX.TS

```
import { Chart, ColumnSeries, Category, Legend } from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, Category, Legend);
import { Button } from '@syncfusion/ej2-buttons';
import { EmitType } from '@syncfusion/ej2-base';
let chart: Chart = new Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        title: 'Manager',
        valueType: 'Category',
        majorGridLines: { width: 0 }
    },
    //Initializing Primary Y Axis
    primaryYAxis: {
        title: 'Sales',
        minimum: 0,
        maximum: 20000,
        majorGridLines: { width: 0 }
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Column',
            dataSource: [{ x: 'John', y: 10000 }, { x: 'Jake', y: 12000 }, { x: 'Peter', y: 18000 }, { x: 'James', y: 11000 }, { x: 'Mary', y: 9700 }],
            xName: 'x', width: 2,
            yName: 'y'
        }
    ],
    //Initializing Chart title
    title: 'Sales Comparision',
}, '#element');
document.getElementById('print').onclick = () => {
    chart.print();
};
```

Export

The rendered chart can be exported to JPEG, PNG, SVG, PDF, XLSX, or CSV format using the export method in chart. The input parameters for this method are type for format and fileName for result.

The optional parameters for this method are,

- orientation - either portrait or landscape mode during PDF export,
- controls - pass collections of controls for multiple export,
- width - width of chart export, and
- height - height of chart export.

INDEX.TS

```

import { Chart, ColumnSeries, Category, Legend, Export } from
'@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, Category, Legend, Export);
import { EmitType } from '@syncfusion/ej2-base';
let chart: Chart = new Chart({

Multiple chart export

You can export the multiple charts in single page by passing the multiple chart objects in the export method of chart. To export multiple charts in a single page, follow the given steps:

Initially, render more than one chart to export, and then add button to export the multiple charts. In button click, call the export method in charts, and then pass the multiple chart objects in the export method.

INDEX.TS

```

Data point customization

The color of individual data point or data points within a range can be customized using the options below.

Point color mapping

You can bind the color for the points from [dataSource](#) for the series using [pointColorMapping](#) property.

INDEX.TS

```

import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
  primaryXAxis: { valueType: 'Category', majorGridLines: { width: 0 } },
  primaryYAxis: {
    lineStyle: { width: 0 },
    majorTickLines: { width: 0 },
    minorTickLines: { width: 0 },
    labelFormat: '{value}°C',
  },
  chartArea: {
    border: {
      width: 0
    }
  },
  series: [

```

```

    {
      pointColorMapping: "color",
      dataSource: [
        { x: 'Jan', y: 6.96, color: "red" },
        { x: 'Feb', y: 8.9, color: "blue" },
        { x: 'Mar', y: 12, color: "orange" },
        { x: 'Apr', y: 17.5, color: "aqua" },
        { x: 'May', y: 22.1, color: "grey" }
      ], xName: 'x', yName: 'y', type: 'Column',
      animation: { enable: false },
      cornerRadius: {
        topLeft: 10, topRight: 10
      },

Chart area customization

```
<!-- markdownlint-disable MD036 -->
```

Customize the chart background

Using [background](#) and [border](#) properties, you can change the background color and border of the chart.

INDEX.TS

```
import { Chart, ColumnSeries, Category, ISeriesRenderEventArgs } from
 '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, Category);
let chartData: any[] = [
  { country: "USA", gold: 50 },
  { country: "China", gold: 40 },
  { country: "Japan", gold: 70 },
  { country: "Australia", gold: 60 },
  { country: "France", gold: 50 },
  { country: "Germany", gold: 40 },
  { country: "Italy", gold: 40 },
  { country: "Sweden", gold: 30 }
];
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    title: 'Countries'
  },
  primaryYAxis: {
    minimum: 0, maximum: 80,
    interval: 20, title: 'Medals'
  },
  series: [{
    dataSource: chartData,
    xName: 'country', yName: 'gold',
    name: 'Gold', type: 'Column',
    border: { width: 2, color: 'grey' }
  }],
  title: 'Olympic Medals',
  //Customizing Chart background
  background: 'skyblue',
  //Customize the chart border and opacity
  border: { color: "#FF0000", width: 2 },
}, '#element');
```

Render methods in EJ2 JavaScript Chart control

Chart uses following two rendering methods.

- SVG
- Canvas

SVG

SVG is used to render Chart by default for all browsers except IE8 and old versions.

Canvas

You can switch between SVG and Canvas rendering by using the `enableCanvas` option. The canvas mode rendering is used in the following scenarios,

- Plotting large number of data points.
- Performing high frequency live updates.

Limitations

- Animation is not supported.

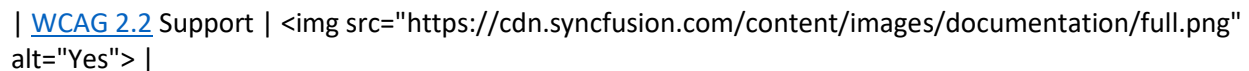

Accessibility in EJ2 JavaScript Chart control

The Chart control followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Chart control is outlined below.

| Accessibility Criteria | Compatibility |

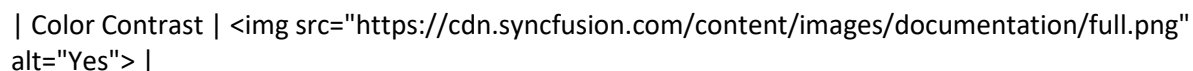

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes"> |

| [Section 508](#) Support |  alt="Yes"> |

| Screen Reader Support |  alt="Yes"> |

| Right-To-Left Support |  alt="Yes"> |

| Color Contrast |  alt="Yes"> |

| Mobile Device Support |  alt="Yes"> |

| Keyboard Navigation Support |  alt="Yes"> |

| [Accessibility Checker](#) Validation |  alt="Yes"> |

| [Axe-core](#) Accessibility Validation |  alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

```
margin: 0.5em 0;  
}
```

```
</style>
```

```
<div> - All  
features of the control meet the requirement.</div>
```

```
<div> - Some features of the control do not meet the requirement.</div>
```

```
<div> - The control does not meet the requirement.</div>
```

WAI-ARIA attributes

The Chart control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Chart control:

- `img` (role)
- `button` (role)
- `region` (role)
- `aria-label` (attribute)
- `aria-hidden` (attribute)
- `aria-pressed` (attribute)

Keyboard interaction

The Chart control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Chart control.

| **Press** | **To do this** |

| --- | --- |

| **Alt + J** | Moves the focus to the chart element. |

| **Tab** | Moves the focus to the next element in the chart. |

| **Shift + Tab** | Moves the focus to the previous element in the chart. |

| **Down Arrow** | Moves the focus to the data point left side from the selected point. |

| **Up Arrow** | Moves the focus to the data point right side from the selected point. |

| **Left Arrow** | Moves the focus to the next series in the chart. |

| **Right Arrow** | Moves the focus to the previous series in the chart. |

| **ESC** | Cancel the tooltip for the data point. |

| **Enter/Space** | Selects the data point in the series. |

| **Down/Left Arrow** | Moves the focus to the legend left side from the selected legend. |

| **Up/Right Arrow** | Moves the focus to the legend right side from the selected legend. |

| Enter/Space | Toggles the visibility of the corresponding series. |

| Ctrl + + | Zoom in the chart. |

| Ctrl + - | Zoom out the chart. |

| Down/Up Arrow | Pan the chart vertically. |

| Left/Right Arrow | Pan the chart horizontally. |

| R | Reset the zoomed chart. |

| Ctrl + P | Prints the Chart. |

Ensuring accessibility

The Chart control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Chart control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Chart control with accessibility tools.

Internationalization in EJ2 JavaScript Chart control

Chart provide supports for internationalization for below chart elements.

- Datalabel.
- Axis label.
- Tooltip.

For more information about number and date formatter you can refer [internationalization](#).

<!-- markdownlint-disable MD036 -->

Globalization

Globalization is the process of designing and developing an component that works in different cultures/locales. Internationalization library is used to globalize number, date, time values in Chart component using `labelFormat` property in axis.

Numeric Format

In the below example axis, point and tooltip labels are globalized to EUR.

INDEX.TS

```
import { Chart, ColumnSeries, DataLabel, Tooltip } from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, DataLabel, Tooltip);
import { loadCldr, L10n, setCulture, setCurrencyCode }
from '@syncfusion/ej2-base';
setCulture('de');
setCurrencyCode('EUR');
let chartData: any[] = [
    { x: 1900, y: 4, y1: 2.6 }, { x: 1920, y: 3.0, y1: 2.8 },
```

```

    { x: 1940, y: 3.8, y1: 2.6}, { x: 1960, y: 3.4, y1: 3 },
    { x: 1980, y: 3.2, y1: 3.6 }, { x: 2000, y: 3.9, y1: 3 }
  ]
let chart: Chart = new Chart({
  primaryXAxis: {
    title: 'Year',
    edgeLabelPlacement: 'Shift'
  },
  primaryYAxis: {
    title: 'Sales Amount in Millions',
    //Label format as currency
    labelFormat: 'c'
  },
  series:[{
    dataSource: chartData,
    xName: 'x', yName: 'y',
    name: 'Product X', type: 'Column',
    marker: { dataLabel: { visible: true }}
  },{
    dataSource: chartData,
    xName: 'x', yName: 'y1',
    name: 'Product Y', type: 'Column',
    marker: { dataLabel: { visible: true }}
  }],
  title: 'Average Sales Comparison',
  tooltip: { enable: true, format: '${series.name} <br>${point.x} :
  ${point.y}' }
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

  ele.style.visibility = "visible";
}
  </script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Localization in EJ2 JavaScript Chart control

Localization library allows to localize the default text content of Chart. In Chart component, it has the static text on some features(like zooming toolbars) and this can be changed to any other culture(Arabic, Deutsch, French, etc) by defining the locale value and translation object.

<!-- markdownlint-disable MD033 -->

Locale key words	Text to display
Zoom	Zoom
ZoomIn	ZoomIn
ZoomOut	ZoomOut
Reset	Reset
Pan	Pan
ResetZoom	Reset Zoom

To load translation object in an application use load function of L10n class.

For more information about localization, refer this [localization](#).

INDEX.TS

```
import { Chart, ColumnSeries, DataLabel, Zoom } from '@syncfusion/ej2-
charts';
Chart.Inject(ColumnSeries, DataLabel, Zoom);

## marker		
visibility of marker	Property:visible\$("#chart").ejChart({ series: [{ marker: { visible: true } }]});	Property:visiblelet chart: Chart = new Chart({ series: [{ marker: { visible: false } }]});chart.appendTo('#chart');
Fill for marker	Property:fill\$("#chart").ejChart({ series: [{ marker: { fill : 'red' } }]});	Property:visiblelet chart: Chart = new Chart({ series: [{ marker: { fill : 'red' } }]});chart.appendTo('#chart');

Opacity for marker	Property:opacity \$("#chart").ejChart({ series: [{ marker: { opacity : 0.5 } }]});	Property:opacity let chart: Chart = new Chart({ series: [{ marker: { opacity : 0.5 } }]});chart.appendTo('#chart');
Shape of marker	Property:shape \$("#chart").ejChart({ series: [{ marker: { shape : 'Circle' } }]});	Property:shape let chart: Chart = new Chart({ series: [{ marker: { shape : 'Triangle' } }]});chart.appendTo('#chart');
ImageUrl of marker	Property:imageUrl \$("#chart").ejChart({ series: [{ marker: { imageUrl : '' } }]});	Property:imageUrl let chart: Chart = new Chart({ series: [{ marker: { imageUrl : '' } }]});chart.appendTo('#chart');
Border of marker	Property:border \$("#chart").ejChart({ series: [{ marker: { border : { width: 2, color: 'red' } } }]});	Property:shape let chart: Chart = new Chart({ series: [{ marker: { border : { width: 2, color: 'red' } } }]});chart.appendTo('#chart');
Height of marker	Property:size.height \$("#chart").ejChart({ series: [{ marker: { size: { height: 30 } } }]});	Property:height let chart: Chart = new Chart({ series: [{ marker: { height: 25 } }]});chart.appendTo('#chart');
Width of marker	Property:size.width \$("#chart").ejChart({ series: [{ marker: { size: { width: 30 } } }]});	Property:width let chart: Chart = new Chart({ series: [{ marker: { width: 25 } }]});chart.appendTo('#chart');
Width of marker	Property:size.width \$("#chart").ejChart({ series: [{ marker: { size: { width: 30 } } }]});	Property:width let chart: Chart = new Chart({ series: [{ marker: { width: 25 } }]});chart.appendTo('#chart');
DataLabelSettings of marker	Property:marker.dataLabel \$("#chart").ejChart({ series: [{ marker: { dataLabel: { } } }]});	Property:marker.dataLabel let chart: Chart = new Chart({ series: [{ marker: { dataLabel: { } } }]});

		<code>});});chart.appendTo('#chart');</code>
Visibility of dataLabel	<code>Property:dataLabel.visible\$("#chart").ejChart({ series: [{ marker: {dataLabel: { visible: true } } }]});</code>	<code>Property:dataLabel.visiblelet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { visible: true } } }]});chart.appendTo('#chart');</code>
Text mapping name of dataLabel	<code>Property:dataLabel.textMappingName\$("#chart").ejChart({ series: [{ marker: {dataLabel: { textMappingName: '' } } }]});</code>	<code>Property:dataLabel.namelet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { name: '' } } }]});chart.appendTo('#chart');</code>
Fill color of data label	<code>Property:dataLabel.fill\$("#chart").ejChart({ series: [{ marker: {dataLabel: { fill: 'pink' } } }]});</code>	<code>Property:dataLabel.filllet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { fill: 'pink' } } }]});chart.appendTo('#chart');</code>
Opacity of data label	<code>Property:dataLabel.opacity\$("#chart").ejChart({ series: [{ marker: {dataLabel: { opacity: 0.6 } } }]});</code>	<code>Property:dataLabel.filllet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { opacity: 0.4 } } }]});chart.appendTo('#chart');</code>
Text position of data label	<code>Property:dataLabel.textPosition\$("#chart").ejChart({ series: [{ marker: {dataLabel: { textPosition: 'middle' } } }]});</code>	<code>Property:dataLabel.positionlet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { position: 'Top' } } }]});chart.appendTo('#chart');</code>
Alignment of data label	<code>Property:dataLabel.verticalAlignment\$("#chart").ejChart({ series: [{ marker: {dataLabel: { verticalAlignment: 'near' } } }]});</code>	<code>Property:dataLabel.alignmentlet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { alignment: 'Near' } } }]});chart.appendTo('#chart');</code>
Border of data label	<code>Property:dataLabel.border\$("#chart").ejChart({ series: [{ marker: {dataLabel: { border: { color: 'blue', width: 2, opacity: 0.4 } } }]});</code>	<code>Property:dataLabel.alignmentlet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { border: { color: 'blue', width: 2 } } }]});</code>

		<code>});});chart.appendTo('#chart');</code>
Offset for data label	<code>Property:dataLabel.offset\$("#chart").ejChart({ series: [{ marker: {dataLabel: { offset: { x: 5, y: 6 } } } }];});</code>	Not Applicable
Margin of data label	<code>Property:dataLabel.border\$("#chart").ejChart({ series: [{ marker: {dataLabel: { margin: { top: 10, bottom: 10, left: 10, right: 10 } } } }];});</code>	<code>Property:dataLabel.marginlet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { margin: { top: 10, bottom: 10, left: 10, right: 10 } } } }];});chart.appendTo('#chart');</code>
Font of data label	<code>Property:dataLabel.border\$("#chart").ejChart({ series: [{ marker: {dataLabel: { font: { fontFamily: 'SegoeUI', fontStyle: 'italic', fontWeight: '600', opacity: 0.5, size: 12, color: 'red' } } } }];});</code>	<code>Property:dataLabel.marginlet chart: Chart = new Chart({ series: [{ marker: {dataLabel: { font: { fontFamily: 'SegoeUI', fontStyle: 'italic', fontWeight: '600', opacity: 0.5, size: 12, color: 'red' } } } }];});chart.appendTo('#chart');</code>
HTML template in dataLabel	<code>Property:dataLabel.template\$("#chart").ejChart({ series: [{ marker: {dataLabel: { template: 'Chart' } } } }];});</code>	<code>Property:dataLabel.templatelet chart: Chart = new Chart({ series: [{ marker: {dataLabel: { template: 'Chart' } } } }];});chart.appendTo('#chart');</code>
Rounded corner radius X	Not Applicable	<code>Property:dataLabel.rxlet chart: Chart = new Chart({ series: [{ marker: {dataLabel: { rx: 10 } } } }];});chart.appendTo('#chart');</code>
Rounded corner radius Y	Not Applicable	<code>Property:dataLabel.rylet chart: Chart = new Chart({ series: [{ marker: {dataLabel: { ry: 10 } } } }];});chart.appendTo('#chart');</code>

Maximum Label width for data label	Property: <code>dataLabel.maximumLabelWidth\$("#chart").ejChart({ series: [{ marker: { dataLabel: { maximumLabelWidth: 20 } } }]});</code>	Not Applicable
Enable wrapping of text for data label	Property: <code>dataLabel.enableWrap\$("#chart").ejChart({ series: [{ marker: { dataLabel: { enableWrap: true } } }]});</code>	Not Applicable
To show contrast color for data label	Property: <code>dataLabel.showContrastColor\$("#chart").ejChart({ series: [{ marker: { dataLabel: { showContrastColor: true } } }]});</code>	Not Applicable
To show edge label for data label	Property: <code>dataLabel.showEdgeLabels\$("#chart").ejChart({ series: [{ marker: { dataLabel: { showEdgeLabels: true } } }]});</code>	Not Applicable
## TrendLines		
Behavior	API in Essential JS 1	API in Essential JS 2
Trendlines settings	Property: <code>series.trendLines\$("#chart").ejChart({ series: [{ trendLines: [] }]});</code>	Property: <code>series.trendLines</code> let chart: Chart = new Chart({ series: [{ trendLines: [] }] }); chart.appendTo('#chart');
Visibility of trendline	Property: <code>trendLines.visibility\$("#chart").ejChart({ series: [{ trendLines: [visibility: true] }]});</code>	Not applicable
Type of trendline	Property: <code>trendLines.type\$("#chart").ejChart({ series: [{ trendLines: [type: 'linear'] }]});</code>	Property: <code>trendLines.type</code> let chart: Chart = new Chart({ series: [{ trendLines: [type: 'Polynomial'] }] }); chart.appendTo('#chart');
Name of trendline	Property: <code>trendLines.name\$("#chart").ejChart({ series: [{ trendLines: [name: 'trendLine'] }]});</code>	Property: <code>trendLines.name</code> let chart: Chart = new Chart({ series: [{ trendLines: [name: 'trendLine'] }] }); chart.appendTo('#chart');
Period of trendline	Property: <code>trendLines.period\$("#chart").ejChart({ series: [{ trendLines: [period: 45] }]});</code>	Property: <code>trendLines.period</code> let chart: Chart = new Chart({ series: [{ trendLines: [period: 45] }] }); chart.appendTo('#chart');
Polynomial order for	Property: <code>trendLines.polynomialOrder\$("#chart").ejChart({ series: [{ trendLines: [polynomialOrder: 3] }]});</code>	Property: <code>trendLines.polynomialOrder</code> let chart: Chart = new Chart({ series: [{ trendLines: [

Polynomial type trendLines		polynomialOrder: 3]]]]);chart.appendTo('#chart');
Backward forecast for trendLines	Property:trendLines.backwardforecast\$("#chart").ejChart({ series: [{ trendLines: [backwardforecast: 3]}]]);	Property:trendLines.backwardforecastlet chart: Chart = new Chart({ series: [{ trendLines: [backwardforecast: 3]}]]);chart.appendTo('#chart');
Forward forecast for trendLines	Property:trendLines.forwardForecast\$("#chart").ejChart({ series: [{ trendLines: [forwardForecast: 3]}]]);	Property:trendLines.forwardForecastlet chart: Chart = new Chart({ series: [{ trendLines: [forwardForecast: 3]}]]);chart.appendTo('#chart');
Fill for trendLines	Property:trendLines.fill\$("#chart").ejChart({ series: [{ trendLines: [fill: 'EEEEFFCC']}]]);	Property:trendLines.filllet chart: Chart = new Chart({ series: [{ trendLines: [fill: 'EEEEFFCC']}]]);chart.appendTo('#chart');
Width for trendLines	Property:trendLines.width\$("#chart").ejChart({ series: [{ trendLines: [width: 2]}]]);	Property:trendLines.widthlet chart: Chart = new Chart({ series: [{ trendLines: [width: 2]}]]);chart.appendTo('#chart');
Intercept value for trendLines	Property:trendLines.intercept\$("#chart").ejChart({ series: [{ trendLines: [intercept: 2]}]]);	Property:trendLines.interceptlet chart: Chart = new Chart({ series: [{ trendLines: [intercept: 2]}]]);chart.appendTo('#chart');
Legend shape for trendLines	Not Applicable	Property:trendLines.legendShapelet chart: Chart = new Chart({ series: [{ trendLines: [legendShape: 'Rectangle']}]]);chart.appendTo('#chart');
Animation settings for trendLines	Not Applicable	Property:trendLines.animationlet chart: Chart = new Chart({ series: [{ trendLines: [animation: { enable: true }]}]]);chart.appendTo('#chart');
Marker settings	Not Applicable	Property:trendLines.markerlet chart: Chart = new Chart({ series: [{

End value for stripline	Property:stripLines.end\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ end: 10 }] } });	Property:stripLines.endlet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ end: 5 }] } });chart.appendTo('#chart');
Startfrom Axis for stripline	Property:stripLines.startFromAxis\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ startFromAxis: true }] } });	Property:stripLines.startFromAxislet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ startFromAxis: true }] } });chart.appendTo('#chart');
Text in stripline	Property:stripLines.text\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ text: 'StripLine; }] } });	Property:stripLines.textlet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ text: 'stripline' }] } });chart.appendTo('#chart');
Text alignment in stripline	Property:stripLines.textAlignment\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ textAlignment: 'Far; }] } });	Property:stripLines.horizontalAlignmentlet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ horizontalAlignment: 'Far' }] } });chart.appendTo('#chart');
Vertical Text alignment in stripline	Not Applicable	Property:stripLines.verticalAlignmentlet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ verticalAlignment: 'Far' }] } });chart.appendTo('#chart');
Size of stripline	Property:stripLines.width\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ width: 10; }] } });	Property:stripLines.sizelet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ size: 10 }] } });chart.appendTo('#chart');
ZIndex of stripline	Property:stripLines.zIndex\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ zIndex: 'Behind' }] } });	Property:stripLines.sizelet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ zIndex: 'Behind' }] } });chart.appendTo('#chart');
Font style of stripline	Property:stripLines.fontStyle\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ fontStyle: {} }] } });	Property:stripLines.textStylelet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ textStyle: {} }] } });chart.appendTo('#chart');
## Multilevel Labels		
Behaviour	API in Essential JS 1	API in Essential JS 2

Default behaviour for multilevel Labels	Property:primaryXAxis.multilevelLabels\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ visible: true }] } });	Property:primaryXAxis.multilevelLabels1let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ }] } });chart.appendTo('#chart');
Default behaviour for multilevel Labels	Property:primaryXAxis.multilevelLabels\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ visible: true }] } });	Property:primaryXAxis.multilevelLabels1let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ }] } });chart.appendTo('#chart');
Text alignment for multilevel Labels	Property:multiLevelLabels.textAlignment\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ textAlignment: 'Near' }] } });	Property:multilevelLabels.alignment1let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ alignment: 'Near' }] } });chart.appendTo('#chart');
Text overflow for multilevel Labels	Property:multiLevelLabels.textOverFlow\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ textOverFlow: 'Trim' }] } });	Property:multiLevelLabels.overFlow1let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ overFlow: 'Trim' }] } });chart.appendTo('#chart');
Border for multilevel Labels	Property:multiLevelLabels.border\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ border: { width: 2, color: 'red', type: 'brace' } }] } });	Property:multiLevelLabels.border1let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ border: { width: 2, color: 'red', type: 'brace' } }] } });chart.appendTo('#chart');
Start value for label	Property:multiLevelLabels.start\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ start: 45 }] } });	Property:multiLevelLabels.categories.start1let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ categories: [{ start: 45}] }] } });chart.appendTo('#chart');
End value for label	Property:multiLevelLabels.start\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ end: 45 }] } });	Property:multiLevelLabels.categories.end1let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ categories: [{ end: 45}] }] } });chart.appendTo('#chart');
Text for label	Property:multiLevelLabels.text\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ text: 'Start' }] } });	Property:multiLevelLabels.categories.text1let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ categories: [{ text: 'text' }] }] } });

		} }}}});chart.appendTo('#chart');
maximum text width for label	Property:multiLevelLabels.maximumTextWidth\$("<#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ maximumTextWidth: 10 }]}}});	Property:multiLevelLabels.categories.maximumTextWidth let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ categories: [{ maximumTextWidth: 20 }] }]}});chart.appendTo('#chart');
level of labels	Property:multiLevelLabels.level\$("<#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ level: 2 }]}}});	Not applicable. Categories are used

Methods

Behaviour	API in Essential JS 1	API in Essential JS 2
animation for series	Property:chart.animate\$("<#chart").ejChart({ animate: () { } });	Not applicable
Redraw for chart	Property:chart.redraw\$("<#chart").ejChart({ redraw: () { } });	Property:chart.refresh() let chart: Chart = new Chart({});chart.appendTo('#chart');chart.width = '400';chart.refresh();
Export	Property:chart.export\$("<#chart").ejChart({ export: () { } });	Property:chart.export() let chart: Chart = new Chart({});chart.export('JPEG', 'chart');chart.appendTo('#chart');
Print	Property:chart.print\$("<#chart").ejChart({ print: () { } });	Property:chart.print() let chart: Chart = new Chart({});chart.print('chart');chart.appendTo('#chart');
AddSeries	Not Applicable	Property:chart.addSeries() let chart: Chart = new Chart({});chart.appendTo('#chart');chart.addSeries();
RemoveSeries	Not Applicable	Property:chart.removeSeries() let chart: Chart = new Chart({});chart.appendTo('#chart');chart.removeSeries();

Events

Behaviour	API in Essential JS 1	API in Essential JS 2
Fires on annotation click	Property:annotationClick\$("<#chart").ejChart({ annotationClick: () { } });	Not applicable
Fires after animation	Property:animationComplete\$("<#chart").ejChart({ animationComplete: () { } });	Property:animationComplete() let chart: Chart = new Chart({

		animationComplete: () => { });chart.appendTo('#chart');
Fires on axis label click	Property:axisLabelClick\$("#chart").ejChart({ axisLabelClick: () { }});	Not applicable
Fires before axis label render	Property:axisLabelRendering\$("#chart").ejChart({ axisLabelRendering: () { }});	Property:axisLabelRender() let chart: Chart = new Chart({ axisLabelRender: () => { });chart.appendTo('#chart');
Fires on axis label mouseMove	Property:axisLabelMouseMove\$("#chart").ejChart({ axisLabelMouseMove: () { }});	Not applicable
Fires on axis label initialize	Property:axisLabelInitialize\$("#chart").ejChart({ axisLabelInitialize: () { }});	Not applicable
Fires before axis range calculation	Property:axesRangeCalculate\$("#chart").ejChart({ axesRangeCalculate: () { }});	Property:axisRangeCalculated() let chart: Chart = new Chart({ axisRangeCalculated: () => { });chart.appendTo('#chart');
Fires on axis title rendering	Property:axisTitleRendering\$("#chart").ejChart({ axisTitleRendering: () { }});	Not applicable
Fires on after chart resize	Property:afterResize\$("#chart").ejChart({ afterResize: () { }});	Not applicable
Fires on before chart resize	Property:beforeResize\$("#chart").ejChart({ beforeResize: () { }});	Property:resized let chart: Chart = new Chart({ resized: () => { });chart.appendTo('#chart');
Fires on chart click	Property:chartClick\$("#chart").ejChart({ chartClick: () { }});	Property:chartMouseClicked let chart: Chart = new Chart({ chartMouseClicked: () => { });chart.appendTo('#chart');

Fires on chart mouse move	Property:chartMouseMove\$("#chart").ejChart({ chartMouseMove: () { } });	Property:chartMouseMovelet chart: Chart = new Chart({ chartMouseMove: () => { }});chart.appendTo('#chart');
Fires on chart mouse leave	Property:chartMouseLeave\$("#chart").ejChart({ chartMouseLeave: () { } });	Property:chartMouseLeavelet chart: Chart = new Chart({ chartMouseLeave: () => { }});chart.appendTo('#chart');
Fires on before chart double click	Property:chartDoubleClick\$("#chart").ejChart({ chartDoubleClick: () { } });	Not applicable
Fires on chart mouse up	Not Applicable	Property:chartmouseUplet chart: Chart = new Chart({ chartmouseUp: () => { }});chart.appendTo('#chart');
Fires on chart mouse down	Not Applicable	Property:chartmouseDownlet chart: Chart = new Chart({ chartmouseDown: () => { }});chart.appendTo('#chart');
Fires during the calculation of chart area bounds. You can use this event to customize the bounds of chart area	Property:chartAreaBoundsCalculate\$("#chart").ejChart({ chartAreaBoundsCalculate: () { } });	Not applicable
Fires when the dragging is started	Property:dragStart\$("#chart").ejChart({ dragStart: () { } });	Not applicable

Fires while dragging	Property:dragging\$("#chart").ejChart({ dragging: () { }});	Not applicable
Fires when the dragging is completed	Property:dragEnd\$("#chart").ejChart({ dragEnd: () { }});	Property:dragCompletelet chart: Chart = new Chart({ dragComplete: () => { }});chart.appendTo('#char t');
Fires when chart is destroyed completely.	Property:destroy\$("#chart").ejChart({ destroy: () { }});	Not applicable
Fires after chart is created.	Property:create\$("#chart").ejChart({ create: () { }});	Property:loadedlet chart: Chart = new Chart({ loaded: () => { }});chart.appendTo('#char t');
Fires before rendering the data labels.	Property:displayTextRendering\$("#chart").ejChart ({ displayTextRendering: () { }});	Property:textRenderlet chart: Chart = new Chart({ textRender: () => { }});chart.appendTo('#char t');
Fires, when error bar is rendering.	Property:errorBarRendering\$("#chart").ejChart({ errorBarRendering: () { }});	Not applicable
Fires during the calculation of legend bounds.	Property:legendBoundsCalculate\$("#chart").ejChar t({ legendBoundsCalculate: () { }});	Not applicable
Fires on clicking the legend item.	Property:legendItemClick\$("#chart").ejChart({ legendItemClick: () { }});	Not applicable
Fires when moving mouse over legend item	Property:legendItemMouseMove\$("#chart").ejCha rt({ legendItemMouseMove: () { }});	Not applicable

Fires before rendering the legend item.	Property:legendItemRendering\$("#chart").ejChart({ legendItemRendering: () { }});	Property:legendRenderlet chart: Chart = new Chart({ legendRender: () => { }});chart.appendTo('#char t');
Fires before loading the chart.	Property:load\$("#chart").ejChart({ load: () { }});	Property:loadlet chart: Chart = new Chart({ load: () => { }});chart.appendTo('#char t');
Fires, when multi level labels are rendering.	Property:multiLevelLabelRendering\$("#chart").ejChart({ multiLevelLabelRendering: () { }});	Property:axisMultiLabelRender let chart: Chart = new Chart({ axisMultiLabelRender : () => { }});chart.appendTo('#char t');
Fires on clicking a point in chart.	Property:pointRegionClick\$("#chart").ejChart({ pointRegionClick: () { }});	Property:pointClick let chart: Chart = new Chart({ pointClick : () => { }});chart.appendTo('#char t');
Fires when mouse is moved over a point.	Property:pointRegionMouseMove\$("#chart").ejChart({ pointRegionMouseMove: () { }});	Property:pointMove let chart: Chart = new Chart({ pointMove : () => { }});chart.appendTo('#char t');
Fires before rendering chart.	Property:preRender\$("#chart").ejChart({ preRender: () { }});	Not applicable
Fires when point render.	Not Applicable	Property:pointRender let chart: Chart = new Chart({ pointRender : () => { }});chart.appendTo('#char t');
Fires after selected the data in chart.	Property:rangeSelected\$("#chart").ejChart({ rangeSelected: () { }});	Not applicable
Fires after selecting a series.	Property:seriesRegionClick\$("#chart").ejChart({ seriesRegionClick: () { }});	Not applicable

Fires before rendering a series.	Property:seriesRendering\$("#chart").ejChart({ seriesRendering: () { } });	Property:seriesRender let chart: Chart = new Chart({ seriesRender : () => { } });chart.appendTo('#chart');
Fires before rendering the marker symbols.	Property:symbolRendering\$("#chart").ejChart({ symbolRendering: () { } });	Not applicable
Fires before rendering the trendline	Property:trendlineRendering\$("#chart").ejChart({ trendlineRendering: () { } });	Not applicable
Fires before rendering the Chart title.	Property:titleRendering\$("#chart").ejChart({ titleRendering: () { } });	Not applicable
Fires before rendering the Chart sub title.	Property:subTitleRendering\$("#chart").ejChart({ subTitleRendering: () { } });	Not applicable
Fires before rendering the tooltip.	Property:toolTipInitialize\$("#chart").ejChart({ toolTipInitialize: () { } });	Property:tooltipRender let chart: Chart = new Chart({ tooltipRender : () => { } });chart.appendTo('#chart');
Fires before rendering crosshair tooltip in axis	Property:trackAxisToolTip\$("#chart").ejChart({ trackAxisToolTip: () { } });	Not applicable
Fires before rendering trackball tooltip.	Property:trackToolTip\$("#chart").ejChart({ trackToolTip: () { } });	Not applicable

Event triggered when scroll starts.	Property:scrollStart\$("#chart").ejChart({ scrollStart: () { } });	Property:scrollStart let chart: Chart = new Chart({ scrollStart: () => { } }); chart.appendTo('#chart');
Event triggered when scroll ends.	Property:scrollEnd\$("#chart").ejChart({ scrollEnd: () { } });	Property:scrollEnd let chart: Chart = new Chart({ scrollEnd: () => { } }); chart.appendTo('#chart');
Event triggered when scroll changes.	Property:scrollChange\$("#chart").ejChart({ scrollChange: () { } });	Property:scrollChange let chart: Chart = new Chart({ scrollChange: () => { } }); chart.appendTo('#chart');
Fires while performing rectangle zooming in chart.	Property:zoomComplete\$("#chart").ejChart({ zoomComplete: () { } });	Property:zoomComplete let chart: Chart = new Chart({ zoomComplete: () => { } }); chart.appendTo('#chart'); ## Chart properties
Behaviour	API in Essential JS 1	API in Essential JS 2
selected data index	Property:selectedDataPointIndexes\$("#chart").ejChart({ selectedDataPointIndexes: [{ seriesIndex: 0, pointIndex: 1 }] });	Property:selectedDataIndexes let chart: Chart = new Chart({ selectedDataIndexes: [{ series: 0, point: 1 }] }); chart.appendTo('#chart');
sideBySideSeries Placement for column based series	Property:sideBySideSeriesPlacement\$("#chart").ejChart({ sideBySideSeriesPlacement });	Property:sideBySidePlacement let chart: Chart = new Chart({ sideBySidePlacement: true }); chart.appendTo('#chart');
ZoomSettings	Property:zooming\$("#chart").ejChart({ zooming: { enable: true, enableDeferredZoom: true, enablePinch: true, enableMouseWheel: true, enableScrollBar: true, toolbarItems: [], type: 'X' } });	Property:zoomSettings let chart: Chart = new Chart({ zoomSettings: { enable: true, enablePinchZooming: true, enableDeferredZooming: true, enableMouseWheelZooming: true, enableSelectionZooming: true, enableScrollBar: true } }); chart.appendTo('#chart');
Background color of the chart	Property:background\$("#container").ejChart({ background: 'transparent' });	Property:background let chart: Chart = new Chart({ background: '#EEFFCC' }); chart.appendTo('#chart');

URL of the image to be used as chart background.	Property:backGroundImageUrl \$("#container").ejChart({ backGroundImageUrl : '../images/chart/wheat.png'}) ;	Not Applicable
Customizing border of the chart	Property:border \$("#container").ejChart({ border: { width: 2, color: '#CCEEFF', opacity: 0.5}});	Property:borderlet chart: Chart = new Chart({ border: { width: 2, color: '#CCEEFF'}});chart.appendTo('#char t');
This provides options for customizing export settings	Property:exportSettings\$("#containe r").ejChart({ exportSettings: { filename : "chart", angle: '45' }});	Property:export()let chart: Chart = new Chart({ border: { width: 2, color: '#CCEEFF'}});chart.appendTo('#char t');chart.export(type, fileName);
ChartArea customization	Property:chartArea\$("#container") .ejChart({ chartArea: { background: 'transparent', border: { opacity: 0.3, color: 'red', width: 2}}});	Property:chartArealet chart: Chart = new Chart({ chartArea: { background: 'transparent', border: { width: 2, color: '#CCEEFF' }});chart.appendTo('#chart');chart .export(type, fileName);

Rows

bottomLeft radius for rectangle series	Property:cornerRadius.bottomLeft\$("#chart").ejChart({ series: [{ bottomLeft: 0 }]});	Property:cornerRadius.bottomLeftlet chart: Chart = new Chart({ series: [{ bottomLeft: 0 }]});chart.appendTo('#chart');
DashArray property	Property:dashArray\$("#chart").ejChart({ series: [{ dashArray: '10, 5' }]});	Property:dashArraylet chart: Chart = new Chart({ series: [{ dashArray: '10, 5' }]});chart.appendTo('#chart');
DataSource for series	Property:dataSource\$("#chart").ejChart({ series: [{ dataSource: [] }]});	Property:dashArraylet chart: Chart = new Chart({ series: [{ dataSource: [] }]});chart.appendTo('#chart');
Draw type for Polar series	Property:drawType\$("#chart").ejChart({ series: [{ drawType: 'Line' }]});	Property:drawTypelet chart: Chart = new Chart({ series: [{ drawType: 'Line' }]});chart.appendTo('#chart');

EmptyPointSettings for series	Property:emptyPointSettings.visible\$("#chart").ejChart({ series: [{ emptyPointSettings: { visible: false } }]});	Not Applicable
Empty Point Display mode	Property:emptyPointSettings.displayMode\$("#chart").ejChart({ series: [{ displayMode: 'gap' }]});	Property:emptyPointSettings.displayModelet chart: Chart = new Chart({ series: [{ displayMode: 'Average' }]});chart.appendTo('#chart');
Empty Point color	Property:emptyPointSettings.color\$("#chart").ejChart({ series: [{ color: 'red' }]});	Property:emptyPointSettings.filllet chart: Chart = new Chart({ series: [{ fill: 'red' }]});chart.appendTo('#chart');
Empty Point Border	Property:emptyPointSettings.border\$("#chart").ejChart({ series: [{ emptyPointSettings: { color: 'red', width: 2 } }]});	Property:filllet chart: Chart = new Chart({ series: [{ emptyPointSettings: { color: 'red', width: 2 } }]});chart.appendTo('#chart');
Enable animation for series	Property:enableAnimation\$("#chart").ejChart({ series: [{ enableAnimation: true }]});	Property:animation.enablelet chart: Chart = new Chart({ series: [animation: { enable: false }]});chart.appendTo('#chart');
Animation duration for series	Property:animationDuration\$("#chart").ejChart({ series: [{ animationDuration: 1000 }]});	Property:animation.durationlet chart: Chart = new Chart({ series: [animation: { duration: 1000 }]});chart.appendTo('#chart');
Animation delay for series	Not Applicable	Property:animation.durationlet chart: Chart = new Chart({ series: [animation: { delay: 100 }]});chart.appendTo('#chart');
Drag settings for series	Property:dragSettings\$("#chart").ejChart({ series: [{ dragSettings: { mode: 'X' } }]});	Not Applicable
Errorbar settings for series	Property:errorBarSettings\$("#chart").ejChart({ series: [{ errorBarSettings: { } }]});	Property:errorBarSettingslet chart: Chart = new Chart({ series: [{ errorBarSettings: { } }]});

Closed series	Property:isClosed\$("#chart").ejChart({ series: [{ isClosed: true }]});	Property:isClosedlet chart: Chart = new Chart({ series: [{ isClosed: true }]});
Stacking Property for series	Property:isStacking\$("#chart").ejChart({ series: [{ isStacking: true }]});	Not Applicable
Line cap for series	Property:lineCap\$("#chart").ejChart({ series: [{ lineCap: 'butt' }]});	Not Applicable
Line join for series	Property:lineCap\$("#chart").ejChart({ series: [{ lineJoin: 'round' }]});	Not Applicable
Opacity for series	Property:opacity\$("#chart").ejChart({ series: [{ opacity: 0.7 }]});	Property:errorBarSettingslet chart: Chart = new Chart({ series: [{ opacity: 0.7 }]});
Outlier settings of series	Property:outLierSettings\$("#chart").ejChart({ series: [{ outLierSettings: { shape: 'rectangle' , size: { height: 30, width: 20} }]});	Not Applicable
Palette	Property:palette\$("#chart").ejChart({ series: [{ palette: "ColorFieldName" }]});	Property:pointColorMappinglet chart: Chart = new Chart({ series: [{ pointColorMapping: 'color' }]});chart.appendTo('#cha rt');
Positive fill for waterfall series	Property:positiveFill\$("#chart").ejChart({ series: [{ positiveFill: "red" }]});	Property:pointColorMappinglet chart: Chart = new Chart({ series: [{ pointColorMapping: 'color' }]});chart.appendTo('#cha rt');
Show average value in box and whisker series	Property:showMedian\$("#chart").ejChart({ series: [{ showMedian: true }]});	Property:pointColorMappinglet chart: Chart = new Chart({ series: [{ showMean: false }]});chart.appendTo('#cha rt');
To group the series of stacking collection.	Property:stackingGroup\$("#chart").ejChart({ series: [{ stackingGroup: 'group' }]});	Property:stackingGrouplet chart: Chart = new Chart({ series: [{ stackingGroup: 'group' }]});chart.appendTo('#cha rt');
Specifies the type of the series to	Property:type\$("#chart").ejChart({ series: [{ type: 'Line' }]});	Property:typetlet chart: Chart = new Chart({ series: [{ type: 'Line' }

render in chart.		<code>});});chart.appendTo('#chart');</code>
Defines the visibility of the series.	Property:visibility <code>\$("#chart").ejChart({ series: [{ visibility: true }];});</code>	Property:visible <code>let chart: Chart = new Chart({ series: [{ visible: true }];});chart.appendTo('#chart');</code>
Enables or disables the visibility of legend item.	Property:visibleOnLegend <code>\$("#chart").ejChart({ series: [{ visibleOnLegend : true }];});</code>	Property:toggleVisibility <code>let chart: Chart = new Chart({ legendSettings: [{ toggleVisibility: true }];});chart.appendTo('#chart');</code>
Specifies the different types of spline curve.	Property:splineType <code>\$("#chart").ejChart({ series: [{ splineType : 'Natural' }];});</code>	Property:splineType <code>let chart: Chart = new Chart({ legendSettings: [{ splineType: 'Natural' }];});chart.appendTo('#chart');</code>
Specifies the name of the x-axis that has to be associated with this series. Add an axis instance with this name to axes collection.	Property:xAxisName <code>\$("#chart").ejChart({ series: [{ xAxisName : 'secondaryXAxis' }];});</code>	Property:xAxisName <code>let chart: Chart = new Chart({ series: [{ xAxisName: 'secondaryXAxis' }];});chart.appendTo('#chart');</code>
Name of the property in the datasource that contains x value for the series.	Property:xName <code>\$("#chart").ejChart({ series: [{ xName : 'x' }];});</code>	Property:xName <code>let chart: Chart = new Chart({ series: [{ xName: 'x' }];});chart.appendTo('#chart');</code>
Specifies the name of the y-axis that has to be associated with this series. Add an axis instance with this	Property:yAxisName <code>\$("#chart").ejChart({ series: [{ yAxisName : 'secondaryYAxis' }];});</code>	Property:yAxisName <code>let chart: Chart = new Chart({ series: [{ yAxisName: 'secondaryYAxis' }];});chart.appendTo('#chart');</code>

name to axes collection.		
Name of the property in the datasource that contains y value for the series.	Property:yName \$("#chart").ejChart({ series: [{ yName : 'y' }]});	Property:yName let chart: Chart = new Chart({ series: [{ yName: 'y' }]});chart.appendTo('#chart');
Name of the property in the datasource that contains high value for the series.	Property:high \$("#chart").ejChart({ series: [{ high : 'y' }]});	Property:high let chart: Chart = new Chart({ series: [{ high: 'y' }]});chart.appendTo('#chart');
Name of the property in the datasource that contains low value for the series.	Property:low \$("#chart").ejChart({ series: [{ low : 'y' }]});	Property:low let chart: Chart = new Chart({ series: [{ low: 'y' }]});chart.appendTo('#chart');
Name of the property in the datasource that contains close value for the series.	Property:close \$("#chart").ejChart({ series: [{ close : 'y' }]});	Property:close let chart: Chart = new Chart({ series: [{ close: 'y' }]});chart.appendTo('#chart');
Name of the property in the datasource that contains open value for the series.	Property:open \$("#chart").ejChart({ series: [{ open : 'y' }]});	Property:open let chart: Chart = new Chart({ series: [{ open: 'y' }]});chart.appendTo('#chart');
Option to add trendlines to chart.	Property:trendLines \$("#chart").ejChart({ series: [{ trendLines : [{}]}]});	Property:trendLines let chart: Chart = new Chart({ series: [{ trendLines : [{}]}]});chart.appendTo('#chart');

Options for customizing the appearance of the series or data point while highlighting.	Property:highlightSettings\$("#chart").ejChart({ series: [{ highlightSettings : {} }]});	Not applicable.
Options for customizing the appearance of the series/data point on selection.	Property:selectionSettings\$("#chart").ejChart({ series: [{ selectionSettings : {} }]});	Not applicable.

marker

<!-- markdownlint-disable MD033 -->

visibility of marker	Property:visible\$("#chart").ejChart({ series: [{ marker: { visible: true } }]});	Property:visiblelet chart: Chart = new Chart({ series: [{ marker: { visible: false } }]});chart.appendTo('#chart');

How To

Live chart in EJ2 JavaScript Chart control

You can update a chart with live data by using the set interval.

To update live data in a chart, follow the given steps:

Step 1:

Initialize the chart with series.

```
`javascript
import { Chart } from '@syncfusion/ej2-charts';
// initialize Chart component
let chart: Chart = new Chart(
//Initializing Chart Series
series:[
type: 'Line',
]
);
// render initialized Chart
chart.appendTo('#container');
```

Step 2:

Update the data to series, and refresh the chart at specified interval by using the set interval.

To refresh the chart, invoke the `refresh` method.

INDEX.TS

```
import { Chart, LineSeries, getElement } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries);
let series1: Object[] = [];
let value: number = 10;
let i: number;
let intervalId: number;
for (i = 0; i < 50; i++) { // Data update
    if (Math.random() > .5) {
        value += Math.random() * 2.0;
    }
    series1[i] = { x: i, y: value };
}
let chart: Chart = new Chart({
    series: [
        {
            type: 'Line',
            dataSource: series1,
            xName: 'x',
            yName: 'y', animation: { enable: false }
        },
    ],
    width: '650px',
    height: '350px'
}, '#element');
let setTimeoutValue: number = 100;
intervalId = setInterval(
    (): void => {
        if (getElement('container') === null) {
            clearInterval(intervalId);
        } else {
            if (Math.random() > .5) {
                value += Math.random() * 2.0;
            }
            series1.push({ x: i, y: value });
            i++;
            series1.shift(); // Used to remove the first element
            chart.series[0].dataSource = series1;
            chart.refresh();
        }
    }, setTimeoutValue);
```

```

Prevent data label in EJ2 JavaScript Chart control

To prevent the chart data label when the data value is 0, follow the given steps:

Step 1:

Get the point value and check whether the `args.point.y` value is zero or not by using the [textRender](#) event. If the value is zero, then set the `args.cancel` to true.

The output will appear as follows,

INDEX.TS

```

import { Chart, LineSeries, DateTime, ITextRenderEventArgs, DataLabel } from
'@syncfusion/ej2-charts';
Chart.Inject(LineSeries, DateTime, DataLabel);
let chart: Chart = new Chart({
    //Initializing Primary X Axis
    primaryXAxis: {

```

```

        valueType: 'DateTime',
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Line',
            dataSource: [
                { x: new Date(2005, 0, 1), y: 21 }, { x: new Date(2006,
0, 1), y: 24 },
                { x: new Date(2007, 0, 1), y: 0 }, { x: new Date(2008,
0, 1), y: 38 },
                { x: new Date(2009, 0, 1), y: 54 }, { x: new Date(2010,
0, 1), y: 57 },
            ],
            xName: 'x', width: 2, marker: {
                dataLabel : { visible: true },
                visible: true,
                width: 10,
                height: 10
            },
            yName: 'y', name: 'Germany',
        }
    ],
    //Initializing Chart title
    title: 'Inflation - Consumer Price',
    textRender: (args: ITextRenderEventArgs) => {
        args.cancel = args.point.y === 0;
    }
    width: '650px',
    height: '350px'
}, '#element');

```

Tool tip format in EJ2 JavaScript Chart control

Using [tooltipRender](#) event, you can able to format the datetime value instead of rendered value.

To format the datetime value, please follow the steps below

Step 1:

By using [tooltipRender](#) event we can able to get the current point x value. Using this value to format the tooltip by using `formatDate` method.

The output will appear as follows,

INDEX.TS

```

import { Chart, LineSeries, DateTime, ITooltipRenderEventArgs, DataLabel,
Tooltip } from '@syncfusion/ej2-charts';
import { Internationalization } from '@syncfusion/ej2-base';
Chart.Inject(LineSeries, DateTime, DataLabel, Tooltip);
let chart: Chart = new Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        valueType: 'DateTime',
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Line',
            dataSource: [
                { x: new Date(2005, 0, 1), y: 21 }, { x: new Date(2006,
0, 1), y: 24 },
                { x: new Date(2007, 0, 1), y: 30 }, { x: new Date(2008,
0, 1), y: 38 },
            ]
        }
    ]
});

```

```

        { x: new Date(2009, 0, 1), y: 54 }, { x: new Date(2010,
0, 1), y: 57 },
    ],
    xName: 'x', width: 2, marker: {
        dataLabel : { visible: true },
        visible: true,
        width: 10,
        height: 10
    },
    yName: 'y', name: 'Germany',
    }
],
//Initializing Chart title
title: 'Inflation - Consumer Price',
tooltip: {enable: true},
tooltipRender:(args: ITooltipRenderEventArgs) => { // To format
the current point x value
    let intl: Internationalization = new Internationalization();
    let formattedString: string = intl.formatDate(new
Date(args.point.x), { skeleton: 'yMd' });
    args.text = formattedString;
};
width: '650px',
height: '350px'
}, '#element');

```

```

Add series in EJ2 JavaScript Chart control

You can add or remove the chart series dynamically by using the `addSeries` or `removeSeries` method.

To add or remove the series dynamically, follow the given steps:

Step 1:

To add a new series to chart dynamically, pass the series value to the `addSeries` method.

To remove the new series from chart dynamically, pass the series index to the `removeSeries` method.

INDEX.TS

```

import { Chart, ColumnSeries, Category, Legend } from '@syncfusion/ej2-
charts';
Chart.Inject(ColumnSeries, Category, Legend);
import { Button } from '@syncfusion/ej2-buttons';
import { EmitType } from '@syncfusion/ej2-base';
let chart: Chart = new Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        title: 'Manager',
        valueType: 'Category',
    },

Points customization in EJ2 JavaScript Chart control

You can customize the series points with patterns by using the `pointColorMapping` property.

To customize the series point colors, follow the given steps:

Step 1:

Define the patterns and map the pattern URL to the series point using `pointColorMapping` property in series.

INDEX.TS

```
import { Chart, ColumnSeries, Category, DataLabel, Tooltip } from
 '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, DataLabel, Category, Tooltip);
import { EmitType } from '@syncfusion/ej2-base';

let chart: Chart = new Chart({
  //Initializing Primary X Axis
  primaryXAxis: {
    valueType: 'Category',
  },
  //Initializing Primary Y Axis
  primaryYAxis: {
    minimum: 0, maximum: 250, interval: 50
  },
  //Initializing Chart Series
  series: [
    {
      type: 'Column', xName: 'x', width: 2, yName: 'y',
      pointColorMapping: 'color',
      dataSource: [
        { x: 'BGD', y: 106, text: 'Bangaladesh', color:
'url(#chess)' },
        { x: 'BTN', y: 103, text: 'Bhutn', color:
'url(#cross)' },
        { x: 'NPL', y: 198, text: 'Nepal', color:
'url(#circle)' },
        { x: 'THA', y: 189, text: 'Thiland', color:
'url(#rectangle)' },
        { x: 'MYS', y: 230, text: 'Malaysia', color:
'url(#line)' }
      ], name: 'Tiger',
      cornerRadius: {
        bottomLeft: 10, bottomRight: 10, topLeft: 10, topRight:
10
      }
    }
  ],
  legendSettings: { visible: false },
  //Initializing Chart title
  title: 'Tiger Population - 2016',
  width: '650px',
  height: '300px'
}, '#element');
```

Stacking total in EJ2 JavaScript Chart control

By using the [annotation](#), you can show any element in desired view.

To show the total value in data points, follow the given steps:

Step 1:

Define annotation for each x point in chart, now change the annotation value in chart by using the [annotationRender](#) event. In this event, assign the stacked value of the last series to the annotation to show the total value of the

stacking series.

INDEX.TS

```

import { ChartAnnotation, Chart, StackingColumnSeries, Category, DataLabel,
Tooltip, ILoadedEventArgs, IAnnotationRenderEventArgs, Points } from
'@syncfusion/ej2-charts';
Chart.Inject(StackingColumnSeries, ChartAnnotation, DataLabel, Category,
Tooltip);
import { EmitType } from '@syncfusion/ej2-base';
let i: number = 0;
let chart: Chart = new Chart({
    //Initializing Primary X and Y Axis
    primaryXAxis: {
        valueType: 'Category', interval: 1
    },
    // Initialize the chart series
    series: [

Tool tip table in EJ2 JavaScript Chart control

You can show the tooltip as table by using template property in tooltip.

Follow the given steps to show the table tooltip,

Step 1:

Initialize the tooltip template div as shown in the following html page,

```
<div id='templateWrap'>
```

Female

<code>\$(x):</code>	<code>\$(y)</code>
---------------------	--------------------

</div>

,

Step 2:

To show that tooltip template, set the element id to the `template` property in tooltip.

INDEX.TS

```
import {
  Chart, LineSeries, Legend, Category, Tooltip
} from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, Category, Legend, Tooltip);
import { Browser } from '@syncfusion/ej2-base';
let chart: Chart = new Chart({
  title: 'Population of India ( 2010 - 2016 )',
  // Initialize the chart axes
  primaryXAxis: {
    minimum: 2010, maximum: 2016,
    edgeLabelPlacement: 'Shift',
  },
  primaryYAxis: {
    minimum: 900, maximum: 1300,
    labelFormat: '{value}M',
  },
  // Initialize the chart series
  series: [
    {
      name: 'Female',
      dataSource: [
        { x: 2010, y: 990 }, { x: 2011, y: 1010 },
        { x: 2012, y: 1030 }, { x: 2013, y: 1070 },
        { x: 2014, y: 1105 }, { x: 2015, y: 1138 },
        { x: 2016, y: 1155 }
      ], xName: 'x', yName: 'y',
      marker: {
        visible: true,
        shape: 'Rectangle',
        width: 2
      }
    }
  ],
  tooltip: {
    enable: true,
    template: '#Female-Material'
  },
  width: '650px',
  height: '350px'
});
chart.appendTo('#element');
```

Footer in EJ2 JavaScript Chart control

By using **annotation**, you can place any html elements to chart in a desired view.

To create footer and watermark for chart, follow the given steps:

Step 1:

Initialize the custom elements by using the **annotation** property.

By using the **content** option of the annotation object, you can specify the id of the element that needs to be displayed in the chart area as follow,

INDEX.TS

```

import { Chart, SplineSeries, ChartAnnotation, Category, Legend } from
'@syncfusion/ej2-charts';
Chart.Inject(SplineSeries, Category, Legend, ChartAnnotation);

```

```

let chart: Chart = new Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        valueType: 'Category',
        interval: 1, majorGridLines: { width: 0 },
        labelIntersectAction: 'Rotate90'
    },
    //Initializing Annotations
    annotations: [{ // watermark for chart
        content: '<div id="chart_cloud" style="font-size:450%; opacity:
0.3;" >syncfusion</div>',
        x: 'Wed', y: 20, coordinateUnits: 'Point', horizontalAlignment:
'Center'
    }, { //footer for chart
        content: '<div id="chart" > <a href="https://www.syncfusion.com"
target="_blank">www.syncfusion.com</a></div>',
        x: 400, y: 340, coordinateUnits: 'Pixel', horizontalAlignment:
'Center'
    }
    ],
    //Initializing Primary Y Axis
    primaryYAxis:
    {
        minimum: 0,
        maximum: 40,
        interval: 10,
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Spline',
            dataSource: [
                { x: 'Sun', y: 15 }, { x: 'Mon', y: 5 }, { x: 'Tue', y:
32 },
                { x: 'Wed', y: 15 }, { x: 'Thu', y: 29 }, { x: 'Fri', y:
24 },
                { x: 'Sat', y: 18 },
            ],
            xName: 'x', width: 2, marker: {
                visible: true
            },
            yName: 'y', name: 'Max Temp',
        }
    ],

Threshold in EJ2 JavaScript Chart control

You can mark a threshold in chart by using the **stripline**.

To mark a threshold in chart, follow the given steps:

Step 1:

By using the start and end properties of **striplines** object in vertical axis, you can mark the threshold for y values of the series.

INDEX.TS

```

import { Chart, LineSeries, Category, Legend, Tooltip, ILoadedEventArgs,
StripLine, ChartTheme } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, Category, Legend, Tooltip, StripLine);
let chart: Chart = new Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        valueType: 'Category',

```

```

    },
    //Initializing Primary Y Axis
    primaryYAxis:
    {
        minimum: 10, maximum: 40, interval: 5,
        lineStyle: { color: '#808080' }, labelFormat: '{value} °C',
        rangePadding: 'None',
        //Initializing Striplines
        stripLines: [
            {
                start: 30, end: 30.1, color: '#ff512f', visible: true,
                textStyle: { size: '18px', color: '#ffffff', fontWeight:

Grid data chart in EJ2 JavaScript Chart control

You can visualize the data that returned by grid in chart.

To visualize the data in chart, follow the given steps:

Step 1:

Initialize the grid with datasource.

Step 2:

By using the grid's `actionComplete` event and `getCurrentViewRecords` method, you can get the current page records.

By using the grid's `databound` event, you can update the current page records into the chart's datasource and visualize the grid data in chart.

INDEX.TS

```

import { Grid, Selection, Page, ActionEventArgs } from '@syncfusion/ej2-
grids';
import { Query, DataManager } from '@syncfusion/ej2-data';
import { orderData } from '../datasource.ts';
import { Chart, LineSeries, DateTime } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, DateTime);

```

```

Grid.Inject(Selection, Page);
let chart: Chart;
let data: Object = new DataManager(orderData as JSON[]).executeLocal(new
Query().take(100));
let grid: Grid = new Grid(
    {
        dataSource: data,
        allowPaging: true,
        pageSettings: { pageSize: 10 },
        columns: [
            { field: 'OrderDate', headerText: 'Order Date', width: 130,
format: 'yMd', textAlign: 'Right' },
            { field: 'Freight', width: 120, format: 'C2', textAlign: 'Right' }
        ]
    },
    dataBound: () => {
        chart = new Chart({
            //Initializing Primary X Axis
            primaryXAxis: {
                valueType: 'DateTime',
                intervalType: 'Days'
            },
            series: [
                {
                    type: 'Line',
                    dataSource: grid.getCurrentViewRecords(),
                    xName: 'OrderDate', marker: {
                        visible: true
                    },
                    yName: 'Freight', name: 'Germany'
                }
            ]
        });
        chart.appendTo('#Chart');
    },

Percentage tool tip in EJ2 JavaScript Chart control

By using the [tooltipRender](#) event, you can show the percentage value for each point of pie series in tooltip.

To show the percentage value in pie tooltip, follow the given steps:

Step 1:

By using the [tooltipRender](#) event, you can get the `args.point.y` and `args.series.sumOfPoints` values. You can use these values to calculate the percentage value for each point of pie series. To display the percentage value in tooltip, use the `args.content` property.

INDEX.TS

```

import {
  AccumulationTheme, AccumulationChart, AccumulationLegend, PieSeries,
  AccumulationTooltip, IAccTooltipRenderEventArgs,
  AccumulationDataLabel
} from '@syncfusion/ej2-charts';
AccumulationChart.Inject(AccumulationLegend, PieSeries, AccumulationTooltip,
  AccumulationDataLabel);
let pie: AccumulationChart = new AccumulationChart({
  // Initialize the chart series
  series: [

Data label template in EJ2 JavaScript Chart control

You can bind text and interior information for a point from dataSource other than x and y value. To change color for the background in the datalabel template, you can use `${point.text}`.

To use point.text, you have to bind the property from dataSource to name in the datalabel options.

Follow the given steps to show the table tooltip,

Step 1:

Initialize the datalabel template div as shown in the following html page,

```

<script id="index" type="text/x-template">
<div id='templateWrap' style="background-color: ${point.text}; border-radius:
3px;"><span>${point.y}</span></div>
</script>

```

Step 2:

To show that datalabel template, set the element id to the `template` property in datalabel.

INDEX.TS

```

import {
    Chart, LineSeries, Legend, Category, Tooltip, DataLabel
} from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, Category, Legend, Tooltip, DataLabel);
import { Browser } from '@syncfusion/ej2-base';
let datalabelData: Object[] = [

Hide tool tip in EJ2 JavaScript Chart control

By using the [tooltipRender](#) event, you can cancel the tooltip for unselected series in the chart.

To hide the tooltip value in unselected series, follow the given steps:

Step 1:

By using the [tooltipRender](#) event, you can get the series elements in the arguments. By using this argument we can compare whether `seriesElementclasslist` is deselected container or not. If it is true then we cancel the tooltip by setting the value for `args.cancel` as `true`.

INDEX.TS

```
import { Chart, LineSeries, DateTime, ITooltipRenderEventArgs, DataLabel,
Series, Selection, Tooltip } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, DateTime, DataLabel, Selection, Tooltip);
let chart: Chart = new Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        valueType: 'DateTime',
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Line',
            dataSource: [
                { x: new Date(2005, 0, 1), y: 21 }, { x: new Date(2006,
0, 1), y: 24 },
                { x: new Date(2007, 0, 1), y: 36 }, { x: new Date(2008,
0, 1), y: 38 },
                { x: new Date(2009, 0, 1), y: 54 }, { x: new Date(2010,
0, 1), y: 57 },
            ],

Dotted line in EJ2 JavaScript Chart control

By using **annotation**, you can add dotted lines in the chart.

To add dotted lines in the chart, follow the given steps:

Step 1:

Initialize the custom elements by using the **annotation** property.

By setting **coordinateUnits** value as **point** in annotation object you can placed dotted lines in the chart based on point x and y values.

INDEX.TS

```

import { Chart, LineSeries, Category, ChartAnnotation } from
 '@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(LineSeries, Category, ChartAnnotation);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
    },
    primaryYAxis: {
        title: 'Medals'
    },
    annotations:[{
        content: '<div id ="test" style="border-top:3px dashed grey;border-
top-width: 2px; width: 10000px"></div>',
        x: 'France',
        y: 50,
        coordinateUnits: 'Point',

Grid data pie in EJ2 JavaScript Chart control

You can visualize the filtered data that returned by grid in pie chart.

To visualize the data in pie chart, follow the given steps:

Step 1:

Initialize the grid with datasource.

Step 2:

By using the grid's `actionComplete` event and `getCurrentViewRecords` method, you can get the current page records. By setting `allowFiltering` value as `true`, you can filter the data. By using the grid's `databound` event, you can update the current page filtered records into the chart's datasource and display the grid filtered data in chart.

INDEX.TS

```

import { Grid, Filter, Page, Selection, ActionEventArgs } from
'@syncfusion/ej2-grids';
import { orderData } from './datasource.ts';
import { AccumulationChart, ColumnSeries, DateTime, Category,
AccumulationDataLabel } from '@syncfusion/ej2-charts';
AccumulationChart.Inject(ColumnSeries, DateTime, Category,
AccumulationDataLabel);
Grid.Inject(Filter, Page, Selection);
let chart: AccumulationChart;
let filtertype: { [key: string]: Object }[] = [
    { id: 'Menu', type: 'Menu' },
    { id: 'CheckBox', type: 'CheckBox' },
    { id: 'Excel', type: 'Excel' }
];
let grid: Grid = new Grid(
{
    dataSource: orderData,

```

```

        allowPaging: true,
        allowFiltering: true,
        filterSettings: { type: 'Menu' },
        columns: [
            { field: 'OrderID', headerText: 'Order ID', width: 120,

Down sampling in EJ2 JavaScript Chart control

Downsampling is the process of reducing the data rate. We have given a 2000 data points for chart. After applying downsampling algorithm, chart data points has been reduced and rendered with 400 data points.

Downsampling data using the "Largest-Triangle-Three-Buckets algorithm"[LTTB](#) which describes the point in the bucket that forms the largest triangle using the area of the triangles. This helps to reducing the number of points.

In Downsampling when we perform zooming, particular level of zoomed chart we can see the chart clearly with original data, so we can use original data for that level of zooming. This can be achieved by [zoomComplete](#) event. Refer the below sample for downsampling with zooming feature.

INDEX.TS

```

import { Chart, LineSeries, Tooltip, getElement, Zoom,
Series, IZoomCompleteEventArgs } from '@syncfusion/ej2-charts';
import { downdata } from './datasource.ts';
Chart.Inject(LineSeries, Tooltip, Zoom);
/**
 * Sample for Downsampling
 */
let interval: number;
let chart: Chart = new Chart({
  primaryXAxis: { title: 'Time (s)', majorGridLines: { width: 0 } },
  primaryYAxis: { title: 'Velocity (m/s)', majorGridLines: { width: 0 } },
  minimum: -15, maximum: 15, interval: 5 },
  series: [
    {
      type: 'Line', xName: 'x', yName: 'y', dataSource: downdata,
      animation: { enable: false }, width: 2
    }
  ],
  chartArea: {
    border: {
      width: 0
    }
  }
},

```

```

Initial scrollbar in EJ2 JavaScript Chart control

By setting `zoomFactor` in `primaryXAxis` and `isZoomed` value as `true` in `load` event and `enableScrollbar` value as `true` in `zoomSettings`, you can make the scrollbar visible in initial rendering of chart.

INDEX.TS

```

import { Chart, LineSeries, DateTime, Legend, Tooltip, ILoadedEventArgs,
ChartTheme, Zoom, ScrollBar } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, DateTime, Legend, Tooltip, Zoom, ScrollBar);
let chart: Chart = new Chart({
    primaryXAxis: {
        zoomFactor: 0.3,
        valueType: 'DateTime',
        labelFormat: 'Y',
        intervalType: 'Years',
        edgeLabelPlacement: 'Shift'
    },
    primaryYAxis: {
        labelFormat: '{value}%',
        rangePadding: 'None',
        minimum: 0,
        maximum: 100,
        interval: 20,
    },
    series: [
        {

Legend in table in EJ2 JavaScript Chart control

The **annotation** property is used to add legend in table and the **multiLevelLabels** property is used to customize the axis label in table format.

To add legend in table with x-axis labels, follow the given steps:

Step 1:

Initialize the custom elements using the **annotation** property.

Create table and rectangle shapes in the html page and set this to the **content** property of annotation.

By setting **coordinateUnits** value to **pixel** in annotation object, you can place the legend in chart based on pixel values.

INDEX.TS

```

Syn pan in EJ2 JavaScript Chart control

Using the [chartMouseMove](#) event, you can achieve the synchronized panning between multiple charts.

To make a synchronized panning chart, follow the given steps:

Step 1:

Initially create two charts, and enable `zoomSettings` for both charts.

To use the [chartMouseMove](#) event, assign the first chart's `zoomFactor` and `zoomPosition` values to the second chart. Now, pan the first zoomed chart, and then the second chart will be panned automatically based on `zoomFactor` and `zoomPosition`.

The following code sample demonstrates the output.

INDEX.TS

```

import { ChartTheme, Chart, LineSeries, DateTime, Legend, DataLabel,
IMouseEventArgs, Zoom } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, DateTime, Legend, DataLabel, Zoom);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'DateTime',
        labelFormat: 'y/M/d',
        edgeLabelPlacement: 'Shift',
    },
    primaryYAxis: {
        minimum: -20,
        maximum: 30,
        interval: 10,
        edgeLabelPlacement: 'Shift',
        labelFormat: '{value}°C',
    },
    width: '450px',

Axis hide in EJ2 JavaScript Chart control

By using the [chartMouseClicked](#) event, you can hide the axis line through legend.

To hide the axis line through legend click, follow the given steps:

Step 1:

Create a chart with multiple axes.

By using the [chartMouseClicked](#) event, you can get the legend's target ids. Using this event, you can also get the `yAxisName` of each axis, based on which you can hide the axis line when clicking the legend.

The following code sample demonstrates the output.

INDEX.TS

```

import {
  Chart, ColumnSeries, IAxisLabelRenderEventArgs, DataLabel,
  ILoadedEventArgs, Tooltip, Legend, IMouseEventArgs
} from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, DataLabel, Tooltip, Legend);
let chart: Chart = new Chart({

```

```

Exact date in EJ2 JavaScript Chart control

By using button click you can show exact time or month after scrolling. Here we have changed **zooFactor** and **zoomPosition** based on time or month requirement. After scrolling you want show full month or full day data then you will customize the zoomFactor and zoomPosition of the chart and show exact time or month.

Dialog chart in EJ2 JavaScript Chart control

Using the `content` property of the dialog component, you can show the chart in dialog pop-up.

To show the chart in dialog component, follow the given steps:

Step 1:

Initialize the dialog and button components, and then create a basic chart and set the visibility of dialog to `false` when initialize.

By setting the chart `id` in the `content` property of dialog component, you can show chart when clicking the button component.

Series visible in EJ2 JavaScript Chart control

By using the `chartMouseClick` event, you can show the series based on respective legend click. In this event, you can get the legend target id, using which you can get the current series index. Based on the index, you can set value of `visible` to `true` or `false`.

Dynamic chart in EJ2 JavaScript Chart control

By using html button, you can add the chart dynamically when click the button.

To add the chart dynamically through button click, follow the given steps:

Step 1:

Initially create the html button.

Then create chart inside of button `onClick` function. Now click the button charts will render based on click count.

The following code sample demonstrates the output.

INDEX.TS

```
import { Chart, LineSeries, DateTime, Legend, Tooltip, ILoadedEventArgs,
ChartTheme } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, DateTime, Legend, Tooltip);
let count: number = 0;
document.getElementById('btn').onclick=()=> {
    //Create div element dynamically and append to DOM
    var chartEle = document.createElement('div');
    chartEle.id = 'chartContainer' + count;
    document.getElementsByTagName('body')[0].appendChild(chartEle);
    //Created chart here
    var chart = new Chart({
        series: [{
            type: 'Line', xName: 'x', width: 2, marker: { visible: true
},
            yName: 'y', name: 'Germany',
            dataSource: [{ x: 1, y: 21 }, { x: 2, y: 24 }, { x: 3, y: 36
},
                        { x: 4, y: 38 }, { x: 5, y: 54 }, { x: 6, y: 57 }, { x:
7, y: 70 }],
            title: 'Inflation - Consumer Price', tooltip: { enable: true },
height: '400', width: '800'
        });
    chart.appendTo('#' + chartEle.id);
    count++;
}
```

CheckBox

Label and size in EJ2 JavaScript Check box control

This section explains the different sizes and labels.

Label

The CheckBox caption can be defined by using the [label](#) property. This reduces the manual addition of label for CheckBox. You can customize the label position before or after the CheckBox through the [labelPosition](#) property.

INDEX.TS

```
import { CheckBox } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Label position - Left.
let checkbox: CheckBox = new CheckBox({ label: 'Left Side Label',
labelPosition: 'Before' });
checkbox.appendTo('#checkbox1');
//Label position - Right.
checkbox = new CheckBox({ label: 'Right Side Label', checked: true });
checkbox.appendTo('#checkbox2');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 CheckBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="styles.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
```

```
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <ul>
            <li><input type="checkbox" id="checkbox1"></li>
            <li><input type="checkbox" id="checkbox2"></li>
        </ul>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    width: 30%;
    position: absolute;
    top: 45%;
    left: 45%;
}
.e-checkbox-wrapper {
    margin-top: 18px;
}
li {
    list-style: none;
}
```

Size

The different CheckBox sizes available are default and small. To reduce the size of default CheckBox to small, set the [cssClass](#) property to `e-small`.

INDEX.TS

```
import { CheckBox } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Small CheckBox.
let checkbox: CheckBox = new CheckBox({ label: 'Small', cssClass: 'e-small'
});
checkbox.appendTo('#checkbox1');
//Default CheckBox.
checkbox = new CheckBox({ label: 'Default' });
```

```
checkbox.appendTo('#checkbox2');
```

INDEX.HTML

Accessibility in EJ2 JavaScript Check box control

The Check box component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Check box component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Check box component followed the [WAI-ARIA](https://www.w3.org/WAI/ARIA/apg/patterns/Check box/) patterns to meet the accessibility. The following ARIA attributes are used in the Check box component:

| Attributes | Purpose |

| --- | --- |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

Keyboard interaction

The Check box component followed the [keyboard interaction](https://www.w3.org/WAI/ARIA/apg/patterns/Check box/#keyboardinteraction) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Check box component.

| Press | To do this |

| --- | --- |

| **Space** | When the Check box has focus, pressing the Space key changes the state of the Check box. |

Ensuring accessibility

The Check box component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Check box component is shown in the following sample. Open the [sample](https://ej2.syncfusion.com/accessibility/Check box.html) in a new window to evaluate the accessibility of the Check box component with accessibility tools.

How To

Customized checkbox in EJ2 JavaScript Check box control

Customize CheckBox Appearance

You can customize the appearance of the CheckBox component using the CSS rules. Define own CSS rules according to your requirement and assign the class name to the [cssClass](#) property.

The background and border color of the CheckBox is customized through the custom classes to create primary, success, warning, and danger info type of checkbox.

INDEX.TS

```
import { CheckBox, Button } from '@syncfusion/ej2-buttons';
```

```
// To customize CheckBox appearance
// Refer the 'e-primary' class details in 'style.css'.
let checkbox: CheckBox = new CheckBox({ label: 'Primary', cssClass: 'e-
primary', checked: true });
checkbox.appendTo('#checkbox1');
// Refer the 'e-success' class details in 'style.css'.
checkbox = new CheckBox({ label: 'Success', cssClass: 'e-success', checked:
true });
checkbox.appendTo('#checkbox2');
// Refer the 'e-info' class details in 'style.css'.
checkbox = new CheckBox({ label: 'Info', cssClass: 'e-info', checked: true
});
checkbox.appendTo('#checkbox3');
// Refer the 'e-warning' class details in 'style.css'.
checkbox = new CheckBox({ label: 'Warning', cssClass: 'e-warning', checked:
true });
checkbox.appendTo('#checkbox4');
// Refer the 'e-danger' class details in 'style.css'.
checkbox = new CheckBox({ label: 'Danger', cssClass: 'e-danger', checked:
true });
checkbox.appendTo('#checkbox5');
```

INDEX.HTML

```

csslint allow: adjoining-classes */
    background-color: #ef6c00;
}
.e-checkbox-wrapper.e-warning:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
    background-color: #cc5c00;
}
```

```
.e-checkbox-wrapper.e-danger .e-frame.e-check,
.e-checkbox-wrapper.e-danger .e-checkbox:focus + .e-frame.e-check { /*
csslint allow: adjoining-classes */
  background-color: #d84315;
}
.e-checkbox-wrapper.e-danger:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
  background-color: #ba3912;
}
```

Custom Frame

CheckBox frame can be customized as per the requirement by adding CSS rules.

In the following example, to-do list is displayed with round checkbox by changing **border-radius** as **100%** by adding **e-custom** class.

INDEX.TS

```
import { CheckBox, Button } from '@syncfusion/ej2-buttons';
// To customize CheckBox frame appearance
let checkbox: CheckBox = new CheckBox({ label: 'Buy Groceries', cssClass:
'e-custom' ,checked: true });
checkbox.appendTo('#checkbox1');
checkbox = new CheckBox({ label: 'Pay Rent', cssClass: 'e-custom' });
checkbox.appendTo('#checkbox2');
checkbox = new CheckBox({ label: 'Make Dinner', cssClass: 'e-custom' });
checkbox.appendTo('#checkbox3');
checkbox = new CheckBox({ label: 'Finish To-do List Article', cssClass: 'e-
custom' });
checkbox.appendTo('#checkbox4');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 CheckBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

    border-color: grey;
    color: grey;
}
.e-checkicon.e-checkbox-wrapper .e-checkbox:focus + .e-frame.e-check {
    background-color: white;
    border-color: grey;
    box-shadow: none;
}
```

```
    color: grey;
}
```

Custom Check Icon

CheckBox check icon can be customized as per the requirement by adding CSS rules.

In the following example, the check icon can be customized by changing check icon content, background and border color in focus and hovered states by adding `e-checkicon` class.

INDEX.TS

```
import { CheckBox, Button } from '@syncfusion/ej2-buttons';
// To customize CheckBox frame appearance
let checkbox: CheckBox = new CheckBox({ label: 'Buy Groceries', cssClass:
'e-checkicon', checked: true });
checkbox.appendTo('#checkbox1');
checkbox = new CheckBox({ label: 'Pay Rent', cssClass: 'e-checkicon' });
checkbox.appendTo('#checkbox2');
checkbox = new CheckBox({ label: 'Make Dinner', cssClass: 'e-checkicon' });
checkbox.appendTo('#checkbox3');
checkbox = new CheckBox({ label: 'Finish To-do List Article', cssClass: 'e-
checkicon' });
checkbox.appendTo('#checkbox4');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

Name and value in form submit in EJ2 JavaScript Check box control

The [name](#) attribute of the CheckBox is used to group Checkboxes. When the Checkboxes are grouped in form, the checked items [value](#) attribute will post to the server on form submit that can be retrieved through the name. The disabled and unchecked CheckBox value will not be sent to the server on form submit.

In the following code snippet, Cricket and Hockey are in the checked state, Tennis is in [disabled](#) state and Basketball is in unchecked state. Now, the value that is in checked state only be sent on form submit.

INDEX.TS

```
import { CheckBox, Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Name and Value attribute in form submit.
let checkbox: CheckBox = new CheckBox({ name: 'Sport', value: 'Cricket',
label: 'Cricket', checked: true });
checkbox.appendTo('#checkbox1');
checkbox = new CheckBox({ name: 'Sport', value: 'Hockey', label: 'Hockey',
checked: true });
checkbox.appendTo('#checkbox2');
checkbox = new CheckBox({ name: 'Sport', value: 'Tennis', label: 'Tennis',
disabled: true });
checkbox.appendTo('#checkbox3');
checkbox = new CheckBox({ name: 'Sport', value: 'Basketball', label:
'Basketball' });
checkbox.appendTo('#checkbox4');
let button: Button = new Button({ isPrimary: true });
button.appendTo('#btnElement');
```

INDEX.HTML

```

}

```

Right to left in EJ2 JavaScript Check box control

CheckBox component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in CheckBox component.

INDEX.TS

```

import { CheckBox } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize CheckBox component.
let checkbox: CheckBox = new CheckBox({ label: 'Default', enableRtl: true
});
// Render initialized CheckBox.
checkbox.appendTo('#element');

```

}
```

Ej1 api migration in EJ2 JavaScript Check box control

This article describes the API migration process of Checkbox component from Essential JS 1 to Essential JS 2.

Properties

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Checkbox Label | **Property:** *text*

 \$("#checkbox").ejCheckBox({
text: "Checkbox"
}); | **Property:** *label*

 var checkbox= new ej.buttons.CheckBox({
label: "Checkbox"
});
checkbox.appendTo("#checkbox"); |

| Checked state | **Property:** *checked*

 \$("#checkbox").ejCheckBox({
checked: true
}); | **Property:** *checked*

 var checkbox= new ej.buttons.CheckBox({
checked: true
});
checkbox.appendTo("#checkbox"); |

| Indeterminate state | **Property:** *enableTriState and checkState*

 \$("#checkbox").ejCheckBox({
enableTriState: true,
checkState: "indeterminate"
}); | **Property:** *indeterminate*

 var checkbox= new ej.buttons.CheckBox({
indeterminate: true
});
checkbox.appendTo("#checkbox"); |

| Adding custom class | **Property:** *cssClass*

 \$("#checkbox").ejCheckBox({
cssClass: "custom-class"
}); | **Property:** *cssClass*

 var checkbox= new ej.buttons.CheckBox({
cssClass: "custom-class"
});
checkbox.appendTo("#checkbox"); |

| Disabled state | **Property:** *enabled*

 \$("#checkbox").ejCheckBox({
enabled: false
}); | **Property:** *disabled*

 var checkbox= new ej.buttons.CheckBox({
disabled: true
});
checkbox.appendTo("#checkbox"); |

| State persistence | **Property:** *enablePersistence*

 \$("#checkbox").ejCheckBox({
enablePersistence: true
}); | **Property:** *enablePersistence*

 var checkbox= new ej.buttons.CheckBox({
enablePersistence: true
});
checkbox.appendTo("#checkbox"); |

| RTL | **Property:** *enableRTL*

 \$("#checkbox").ejCheckBox({
enableRTL: true,
 text: "Checkbox"
}); | **Property:** *enableRtl*

 var checkbox= new ej.buttons.CheckBox({
enableRtl: true,
 label: "Checkbox"
});
checkbox.appendTo("#checkbox"); |

| HTML Attributes | **Property:** *htmlAttributes*

 \$("#checkbox").ejCheckBox({
htmlAttributes : { required:"required" },
 text: "Checkbox"
}); | Not applicable |

| Id property | **Property:** *id*

 \$("#checkbox").ejCheckBox({
id: "sync"
}); | Not applicable |

| Prefix value of Id | **Property:** *idPrefix*

 \$("#checkbox").ejCheckBox({
idPrefix: "ej"
}); | Not applicable |

| Name attribute | **Property:** *name*

 \$("#checkbox").ejCheckBox({
name: "sports"
}); | **Property:** *name*

 var checkbox= new ej.buttons.CheckBox({
name: "sports"
});
checkbox.appendTo("#checkbox"); |

| Value attribute | **Property:** *value*

 \$("#checkbox").ejCheckBox({
value: "football",
name: "sports"
}); | **Property:** *value*

 var checkbox= new ej.buttons.CheckBox({
value: "football",
name: "sports"
});
checkbox.appendTo("#checkbox"); |

| Show rounded corner | **Property:** *showRoundedCorner*

 \$("#checkbox").ejCheckBox({
showRoundedCorner: true
}); | Not applicable |

| Size | **Property:** *size*

 \$("#checkbox").ejCheckBox({
size: "small"
 }); | **Property:** *cssClass*

 var checkbox= new ej.buttons.CheckBox({
cssClass: "e-small"
});
checkbox.appendTo("#checkbox"); |

| Label position | Not applicable | **Property:** *labelPosition*

 var checkbox= new ej.buttons.CheckBox({
label: "Checkbox",
labelPosition: "Before"
});
checkbox.appendTo("#checkbox"); |

| Validation rules | **Property:** *validationRules*

 \$("#checkbox").ejCheckBox({
validationRules:{ required:true }
 }); | Not applicable |

| Validation message | **Property:** *validationMessage*

 \$("#checkbox").ejCheckBox({
validationRules:{ required:true },
validationMessage: { required: "Required CheckBox value" }
 }); | Not applicable |

Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Destroy | **Method:** *destroy*

 \$("#checkbox").ejCheckBox({
text: "Checkbox"
 });
 var checkbox = \$("#checkbox").data("ejCheckBox");
checkbox.destroy(); | **Method:** *destroy*

 var checkbox= new ej.buttons.CheckBox({
label: "Checkbox"
});
checkbox.appendTo("#checkbox");
checkbox.destroy(); |

| Disable the Checkbox | **Method:** *disable*

 \$("#checkbox").ejCheckBox({
text: "Checkbox"
 });
 var checkbox = \$("#checkbox").data("ejCheckBox");
checkbox.disable(); | Not applicable |

| Enable the Checkbox | **Method:** *enable*

 \$("#checkbox").ejCheckBox({
text: "Checkbox"
 });
 var checkbox = \$("#checkbox").data("ejCheckBox");
checkbox.enable(); | Not applicable |

| Check state of the Checkbox | **Method:** *isChecked*

 \$("#checkbox").ejCheckBox({
text: "Checkbox"
 });
 var checkbox = \$("#checkbox").data("ejCheckBox");
checkbox.isChecked(); | Not applicable |

Events

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| BeforeChange Event | **Events:** *beforeChange*

 \$("#checkbox").ejCheckBox({
beforeChange: function (args) { / code block */ }
 }); | Not applicable |

| Change Event | **Events:** *change*

 \$("#checkbox").ejCheckBox({
change: function change(args) { / code block / }
 }); | **Events:** *change*

 var checkbox= new ej.buttons.CheckBox({
change: function change(args) { / code block / }
 });
checkbox.appendTo("#checkbox"); |

| Create Event | **Events:** *create*

 \$("#checkbox").ejCheckBox({
create: function(args) { / code block / }
 }); | **Events:** *created*

 var checkbox= new ej.buttons.CheckBox({
created: function created() { / code block / }
 });
checkbox.appendTo("#checkbox"); |

| Destroy Event | **Events:** *destroy*

 \$("#checkbox").ejCheckBox({
destroy: function (args) { / code block */ }
 }); | Not applicable |

Chips

Getting started in EJ2 JavaScript Chips control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

control Initialization

The Essential JS 2 JavaScript controls can be initialized by using either of the following ways.

- Using local script and style references in a HTML page.
- Using CDN link for script and style reference.

Using local script and style references in a HTML page

Step 1: Create an app folder `myapp` for Essential JS 2 JavaScript controls.

Step 2: You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

Syntax:

Script: **(installed location)**\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web (Essential JS 2)\JavaScript\{PACKAGENAME}\dist\global\{PACKAGE_NAME}.min.js

Styles: **(installed location)**\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web (Essential JS 2)\JavaScript\{PACKAGENAME}\styles\material.css

Example:

Script: C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\16.3.0.17\Web (Essential JS 2)\JavaScript\ej2-buttons\dist\global\ej2-buttons.min.js

Styles: C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\16.3.0.17\Web (Essential JS 2)\JavaScript\ej2-buttons\styles\material.css

The below located script and style file contains all Syncfusion JavaScript (ES5) UI control resources in a single file.

Scripts: **(installed location)**\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASE_VERSION}\Web (Essential JS 2)\JavaScript\ej2\dist\ej2.min.js

Styles: **(installed location)**\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASE_VERSION}\Web (Essential JS 2)\JavaScript\ej2\material.css

Step 3: Create a folder `myapp/resources` and copy/paste the global scripts and styles from the above installed location to `myapp/resources` location.

Step 4: Create a HTML page (index.html) in `myapp` location and add the Essentials JS 2 script and style references.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/buttons/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Button's global and dependent script -->
<script src="resources/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/ej2-buttons.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

Step 5: Now, add the `<div>` element and initiate the **Essential JS 2 Chip** control in the `index.html` by using following code

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/buttons/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Button's global and dependent script -->
<script src="resources/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/ej2-buttons.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the div element -->
<div id="chip"></div>
`
```

```
<script>
// initialize and Render chip control
new ej.buttons.ChipList({ chips: ["Janet Leverling"]}, '#chip');
</script>
</body>
</html>
`
```

Step 6: Now, run the `index.html` in web browser, it will render the **Essential JS 2 Chip** control.

Using CDN link for script and style reference

Step 1: Create an app folder `myapp` for the Essential JS 2 JavaScript controls.

Step 2: The Essential JS 2 control's global scripts and styles are already hosted in the below CDN link formats.

Syntax:

Script: `https://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `https://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <https://cdn.syncfusion.com/ej2/ej2-buttons/dist/global/ej2-buttons.min.js>

Styles: <https://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css>

Step 3: Create a HTML page (`index.html`) in `myapp` location and add the CDN link references. Now, add the `Chip` element and initiate the **Essential JS 2 Chip** control in the `index.html` by using following code.

INDEX.HTML

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
  <head>

    <title>Essential JS 2</title>
    <!-- Essential JS 2 material theme -->
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet" type="text/css"/>
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet" type="text/css"/>
    <!-- Essential JS 2 Base's global script (Dependency Script) -->
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/dist/global/ej2-base.min.js" type="text/javascript"></script>
    <!-- Essential JS 2 Button's global script -->
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/dist/global/ej2-buttons.min.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
```

```
</head>
  <body>
    <!-- Add the <div> element -->
    <div id="chip">Janet Leverling</div>
    <script>
      // initialize and Render chip control
      new ej.buttons.ChipList({ chips: ["Janet Leverling"]}, '#chip');
    </script>
  </body>
</html>
```

Step 4: Now, run the `index.html` in web browser, it will render the **Essential JS 2 Chip** control.

Types in EJ2 JavaScript Chips control

The ChipList control has the following types.

- Input Chip
- Choice Chip
- Filter Chip
- Action Chip

Input Chip

Input Chip holds information in compact form. It converts user input into chips.

INDEX.TS

```
import { ChipList } from '@syncfusion/ej2-buttons';
new ChipList({chips: ['Andrew', 'Janet', 'Laura', 'Margaret']}, '#chip');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Chip</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="styles.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="chip"></div>
  </div>
```

```
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
  visibility: hidden;
  display: inline-block;
  position: relative;
  left: 50%;
  top: 100px;
  transform: translateX(-50%);
}
#loader {
  color: #008cff;
  height: 40px;
  width: 30%;
  position: absolute;
  font-family: 'Helvetica Neue', 'calibiri';
  font-size: 16px;
  top: 45%;
  left: 45%;
}
```

Choice Chip

Choice Chip allows you to select a single chip from the set of ChipList/ChipCollection. It can be enabled by setting the `selection` property to `Single`.

INDEX.TS

```
import { ChipList } from '@syncfusion/ej2-buttons';
new ChipList({chips: ['Small', 'Medium', 'Large', 'Extra Large'], selection:
"Single"}, '#chip');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

    position: absolute;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 16px;
    top: 45%;
    left: 45%;
}

```

Filter Chip

Filter Chip allows you to select a multiple chip from the set of ChipList/ChipCollection. It can be enabled by setting the `selection` property to `Multiple`.

INDEX.TS

```

import { ChipList } from '@syncfusion/ej2-buttons';
new ChipList({chips: ['Chai', 'Chang', 'Aniseed Syrup', 'Ikura'], selection:
"Multiple"}, '#chip');

```

Customization in EJ2 JavaScript Chips control

This section explains the customization of styles, leading icons, avatar, and trailing icons in Chip control.

Styles

The Chip control has the following predefined styles that can be defined using the `cssClass` property.

Class	Description
-----	-----
e-primary	Represents a primary chip.
e-success	Represents a positive chip.
e-info	Represents an informative chip.
e-warning	Represents a chip with caution.
e-danger	Represents a negative chip.

INDEX.TS

```

import { ChipList } from '@syncfusion/ej2-buttons';
new ChipList({chips: [{
    text: "Apple",
    cssClass: "e-primary"
},
{
    text: "Microsoft",
    cssClass: "e-info"
},
{
    text: "Google",
    cssClass: "e-success"
},
{
    text: "Tesla",
    cssClass: "e-warning"
},
{
    text: "Intel",
    cssClass: "e-danger"
}
]
})

```

```
] }, '#chip');
```

INDEX.HTML

```

}
```

Leading Icon

You can add and customize the leading icon of chip using the `leadingIconCss` property.

INDEX.TS

```
import { ChipList } from '@syncfusion/ej2-buttons';
new ChipList({chips: [{
  "text": "Anne",
  "leadingIconCss": "andrew"
},
{
  "text": "Janet",
  "leadingIconCss": "janet"
},
{
  "text": "Laura",
  "leadingIconCss": "laura"
},
{
  "text": "Margaret",
  "leadingIconCss": "margaret"
}
]}, '#chip');
```

```

Style in EJ2 JavaScript Chips control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the chip text

Use the following CSS to customize the chip text properties.

,

```
.e-chip .e-chip-text {
font-size: 20px;
color: black;
```

```
font-weight: normal;  
}
```

,

Customizing the chip icon

Use the following CSS to customize the chip icon properties.

,

```
.e-chip .e-icon {  
background-image: url('https://ej2.syncfusion.com/demos/src/chips/images/laura.png');  
opacity: 0.8;  
}
```

,

Customizing the chip delete button

Use the following CSS to customize the chip delete button.

,

```
.e-chip-list .e-chip .e-chip-delete.e-dlt-btn {  
color: #e3165b;  
font-size: 12px;  
}
```

,

Customizing the chip outline

Use the following CSS to customize the chip outline.

,

```
.e-chip-list .e-chip.e-outline {  
border-color: #e3165b;  
border-width: 3px;  
}
```

,

Customizing the chip on selection

Use the following CSS to customize the chip on selection.

,

/ To customize single chip on selection /

```
.e-chip-list.e-selection .e-chip.e-active {  
background-color: #ffca1c;  
color: #e3165b;
```

```

}
/ To customize multiple chip on selection /
.e-chip-list .e-chip.e-active {
background-color: #e3165b;
color: white;
}
,

```

Customizing the chip avatar text

Use the following CSS to customize the chip avatar text properties.

```

,
.e-chip-list .e-chip .e-chip-avatar {
background-color: #d51a1a;
color: #fafafa;
}
,

```

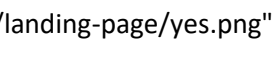

Accessibility in EJ2 JavaScript Chips component

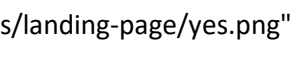

The Chips component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

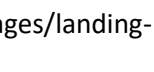

The accessibility compliance for the Chips component is outlined below.

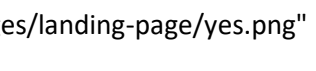

| Accessibility Criteria | Compatibility |

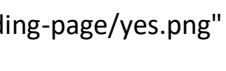

| -- | -- |

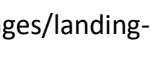

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Chips component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Chips component:

| Attributes | Purpose |

| --- | --- |

| **role=checkbox** | Indicates the ChipList component wrapper element as **checkbox**. |

| **role=option** | Used to convey a significant and contextual message to the user(ChipList). |

| **role=button** | Used to convey a significant and contextual message to the user(Single Chip). |

| **aria-label** | Provides an accessible name for the Chip. |

| **aria-selected** | Indicates the element is selected. |

| **aria-disabled** | Indicates element is perceivable but disabled. |

| **aria-multiselectable** | Indicates multiple items to be selected. |

Keyboard interaction

The Chips component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Chips component.

| Keyboard shortcuts | Actions |

| ----- | ----- |

| **Enter / Space** | Selects the targeted chip from the ChipList/ChipCollection. |

| **Delete / Backspace** | Deletes the targeted chip from the ChipList/ChipCollection. |

Ensuring accessibility

The Chips component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Chips component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Chips component with accessibility tools.

Circular Gauge

Gauge dimensions in EJ2 JavaScript Circular gauge control

Size for Container

Circular gauge can render to its container size. You can set the size via inline or CSS as demonstrated below.

```
<div id='container'>  
<div id='element' style="width:650px; height:350px;"></div>  
</div>
```

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';  
let gauge: CircularGauge = new CircularGauge({}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
  <title>EJ2 Animation</title>  
  <meta charset="utf-8">  
  <meta name="viewport" content="width=device-width, initial-scale=1.0">  
  <meta name="description" content="Typescript UI Controls">  
  <meta name="author" content="Syncfusion">  
  <link href="index.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
popups/styles/material.css" rel="stylesheet">  
  
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"  
  type="text/javascript"></script>  
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type  
  ="text/javascript"></script>  
</head>  
<body>  
  
  <div id="container">  
    <div id="element"></div>  
  </div>
```

```
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Size for Circular Gauge

You can also set size for the gauge directly through [width](#) and [height](#) properties.

In Pixel

You can set the size of the gauge in pixel as demonstrated below.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    // Width and height for gauge in pixel.
    width: '650', height: '350'
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

In Percentage

By setting value in percentage, gauge gets its dimension with respect to its container. For example, when the height is '50%', gauge renders to half of the container height.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    // Width and height for gauge in percentage.
    width: '80%', height: '50%'
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: When you do not specify the size, it takes 450px as the height and window size as its width.

Gauge axes in EJ2 JavaScript Circular gauge control

By default, gauge will be displayed with an axis. Each axis contains its own ranges, pointers and annotation.

Axis Customization

You can customize the width and color of an axis line by using [lineStyle](#) property.

Background for an axis can be customized by using [background](#)

property.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    lineStyle: {
      width: 2,
      color: 'red'
    },
    background: 'rgba(0, 128, 128, 0.3)'
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Angles and Direction

Circular gauge axis can sweep from 0 to 360 degrees. By default start angle of an axis is 200 degree and end angle is 160 degree and you can customize this option by using [startAngle](#) and [endAngle](#)

property.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
```

```
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    startAngle: 270,
    endAngle: 90
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

The [direction](#) property enables you to render the gauge axis either in **ClockWise** or in **AntiClockWise** direction.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    direction: 'AntiClockWise'
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
```

```

<meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Axis Radius

By default, radius of an axis is calculated based on the available size.

You can customize this, by using [radius](#) property.

It takes value either in **percentage** or in **pixel**.

In Pixel

You can set the radius of the gauge in pixel as demonstrated below,

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        radius: '150'
    }]
}, '#element');

```

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Ticks

You can customize the [height](#),

[color](#) and [width](#) of major ticks and minor ticks by using [majorTicks](#) and [minorTicks](#) property.

By default, [interval](#) for

[majorTicks](#) will be calculated automatically and also you can customize the interval for major and minor ticks using [interval](#) property.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    majorTicks: {
      interval: 10,
      color: 'red',
      height: 10,
      width: 3
    },
    minorTicks: {
      interval: 5,
      color: 'green',
      height: 5,
      width: 2
    }
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Tick Position

Both minor and major ticks can be moved by using [offset](#) and [position](#) property. The [offset](#) defines the distance between the axis and ticks.

By default, offset value is 0. The [position](#) will place the ticks either inside or outside of the axis.

By default, ticks will be placed **inside** the axis.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        majorTicks: {
            interval: 10,
            color: 'red',
            height: 10,
            width: 3,
            position: 'Inside',
            offset: 5
        },
        minorTicks: {
            interval: 5,
            color: 'green',
            height: 5,
            width: 2,
            position: 'Inside',
            offset: 5
        }
    }]
}, '#element');

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Display the last label, even if it isn't in the visible range

If the last label is not in the visible range, it will be hidden by default. If you want to show the last label, set the `showLastLabel` property to `true` in the `axes` API of circular gauge.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        showLastLabel: true,
        minimum: 0,
        maximum: 170,
        startAngle: 210, endAngle: 150
    }]
}, '#element');

```

</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
```

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Smart Labels

When an axis makes a complete circle, then the first and last label of the axis will get overlap with each other.

In this scenario, you can either hide 1st or last label using [hiddenLabel](#) property.

When [hiddenLabel](#) value is [First](#), then the 1st label will be hidden and when the

[hiddenLabel](#) value is 'Last', then the last label will be hidden.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        minimum: 0,
        maximum: 12,
        startAngle: 0,
        endAngle: 360,
        majorTicks: {
            interval: 1,
            position: 'Inside',
            height: 10
        },
        minorTicks: {
            interval: 0.2,
            position: 'Inside',
            height: 5
        },
        labelStyle: {
            position: 'Inside',
            hiddenLabel: 'First'
        }
    }
    ]
}, '#element');
```

INDEX.HTML

    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table describes the result of applying some commonly used label formats on numeric values.

Label Value	Label Format property value	Result	Description
1000	n1	1000.0	The Number is rounded to 1 decimal place
1000	n2	1000.00	The Number is rounded to 2 decimal place
1000	n3	1000.000	The Number is rounded to 3 decimal place
0.01	p1	1.0%	The Number is converted to percentage with 1 decimal place
0.01	p2	1.00%	The Number is converted to percentage with 2 decimal place
0.01	p3	1.000%	The Number is converted to percentage with 3 decimal place
1000	c1	\$1,000.0	The Currency symbol is appended to number and number is rounded to 1 decimal place
1000	c2	\$1,000.00	The Currency symbol is appended to number and number is rounded to 2 decimal place

Custom Label Format

Axis labels support custom label format using placeholder like {value}°C, in which the value represent the axis label e.g 20°C.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        labelStyle: {
            format: '{value}°C'
        }
    }]
}, '#element');

```

```

Hide intersecting axis labels

When the axis labels overlap with each other, you can hide the intersected labels by setting the `hideIntersectingLabel` property to true in the axis.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    hideIntersectingLabel: true,
    minimum: 0,
    maximum: 200,
    startAngle: 270,
    endAngle: 90,
    majorTicks: {
      interval: 4
    },
    minorTicks: {
      interval: 2
    }
  }]
}, '#element');

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Multiple Axes

In addition to the default axis, you can add n number of axis to a gauge.

Each axis will have its own ranges, pointers, annotations and customization options.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        majorTicks: {
            interval: 10,
            position: 'Inside',
            height: 10,
        },
        pointers: [],
        minorTicks: {
            interval: 5,
            position: 'Inside',
            height: 5,
        }
    }, {
        pointers: [],
        majorTicks: {
            interval: 10,
            position: 'Inside',
            height: 10,
            color: '#27d5ff'
        },
        minorTicks: {
            interval: 5,
            position: 'Inside',
            height: 5,
            color: '#27d5ff'
        }
    }
}]
```

```
    }}
  }, '#element');
```

Gauge ranges in EJ2 JavaScript Circular gauge control

You can categories certain interval on gauge axis using [ranges](#) property.

Start and End

Start and end value of a range in an axis can be customized by using [start](#) and [end](#) properties.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    ranges: [{
      start: 40,
      end: 80
    }]
  }]
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Customization

Color and thickness of the range can be customized by using [color](#), [startWidth](#) and [endWidth](#) property.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    ranges: [{
      start: 40,
      end: 80, endWidth: 15,
      startWidth: 15,
      color: '#ff5985'
    }]
  }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Radius

You can place the range inside or outside of the axis by using [radius](#) property. The radius of the range can take value either in percentage or in pixels. By default, ranges

take 100% of the axis radius.

In Pixel

You can set the radius of the range in pixel as demonstrated below,

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        minimum: 0,
        maximum: 100,
        ranges: [{
            start: 40,
            end: 80,
            radius: '100'
        }]
    }]
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">

```

```
<link href="index.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

In Percentage

By setting value in percentage, range gets its dimension with respect to its axis radius. For example, when the radius is '50%', range renders to half of the axis radius.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        minimum: 0,
        maximum: 100,
        ranges: [{
            start: 40,
            end: 80,
            radius: '50%'
        }]
    }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
<title>EJ2 Animation</title>
<meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Dragging Range

The ranges can be dragged over the axis line by clicking and dragging the same. To enable or disable the range drag, use the [enableRangeDrag](#) property.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    enableRangeDrag: true,
    height: '250px',
    width: '250px',
    axes: [{
        ranges: [{
            start: 0,
            end: 100,
            startWidth: 8, endWidth: 8,
            radius: '108%',
            color: '#30B32D'
        }],
        pointers: [{
            value: 50
        }]
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Multiple Ranges

You can add multiple ranges to an axis with the above customization as demonstrated below.

Note: You can set the range color to axis ticks and labels by enabling `useRangeColor` property in [majorTicks](#),

[minorTicks](#) and [labelStyle](#) object.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        minimum: 0,
        maximum: 100,
        majorTicks: {
            useRangeColor: true
        },
        minorTicks: {
            useRangeColor: true
        },
        labelStyle: {
            useRangeColor: true
        },
    },
    ranges: [{
        start: 0,
        end: 25,
        radius: '108%'
    }, {
        start: 25,
        end: 50,
        radius: '70%'
    }, {

```

```

        start: 50,
        end: 75,
        radius: '70%'
    }, {
        start: 75,
        end: 100,
        radius: '108%'
    }
  ]
}, '#element');

```

INDEX.HTML

```

Gradient Color

Gradient support allows to add multiple colors in the ranges and pointers of the circular gauge. The following gradient types are supported in the circular gauge.

- Linear Gradient
- Radial Gradient

Linear Gradient

Using linear gradient, colors will be applied in a linear progression. The start value of the linear gradient will be set using the [startValue](#) property. The end value of the linear gradient will be set using the [endValue](#) property. The color stop values such as color, opacity and offset are set using [colorStop](#) property.

To apply linear gradient to the range, follow the below code sample.

INDEX.TS

```

import { CircularGauge, Gradient } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(Gradient);
let rangeLinearGradient: Object = {
  startValue: '0%', endValue: '100%',
  colorStop: [
    { color: '#9E40DC', offset: '0%', opacity: 0.9 },
    { color: '#E63B86', offset: '70%', opacity: 0.9 }
  ]
};
let gauge: CircularGauge = new CircularGauge({
  title: 'Short Put Distance',
  titleStyle: {
    size: '18px'
  },
  centerY: '57%',
  axes: [{
    annotations: [{
      content: '12 M', radius: '108%', angle: 98, zIndex: '1'
    }, {
      content: '11 M', radius: '80%', angle: 81, zIndex: '1'
    }, {
      content: '10 M', radius: '50%', angle: 69, zIndex: '1'
    }, {
      content: 'Doe', radius: '108%', angle: 190, zIndex: '1'
    }, {
      content: 'Almaida', radius: '80%', angle: 185, zIndex: '1'
    }, {
      content: 'John', radius: '50%', angle: 180, zIndex: '1'
    }
  ],
  lineStyle: {
    width: 0
  },
  radius: '90%',
  labelStyle: {
    font: {
      size: '0px'
    }
  },
  majorTicks: {
    width: 0
  },
  minorTicks: {
    width: 0
  },
  startAngle: 200, endAngle: 130,
  minimum: 0, maximum: 14,
  ranges: [{
    start: 0, end: 12, radius: '115%',
    startWidth: 25, endWidth: 25,
    linearGradient : rangeLinearGradient
  }, {
    start: 0, end: 11, radius: '85%',
    startWidth: 25, endWidth: 25,
    linearGradient : rangeLinearGradient
  }, {

```

```

        start: 0, end: 10, radius: '55%',
        startWidth: 25, endWidth: 25,
        linearGradient : rangeLinearGradient
    }],
    pointers: [{

Gauge supports 3 types of pointers such as **Needle**, **RangeBar** and **Marker**. You can choose any one of the pointer by using [type](#) property.

Needle Pointers

A needle pointer contains three parts, a needle, a cap / knob and a tail. The length of the needle can be customized by using [radius](#) property. The length of the tail can be

customized by using [length](#) property. The radius of the cap can be customized by using [radius](#) in cap object. The needle and tail

length takes value either in **percentage** or **pixel**.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    pointers: [{
      value: 90,
      radius: '50%',
      cap: {
        radius: 10
      },
      needleTail: {
        length: '25%'
      }
    }
  ]
}]
}, '#element');
```

```

RangeBar Pointer

RangeBar pointer is like ranges in an axis, that can be placed on gauge to mark the pointer value.

RangeBar starts from the beginning of the gauge and ends at the pointer value.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    pointers: [{
      value: 50,

```

```

        type: 'RangeBar',
        radius: '60%'
    }
  ]
}, '#element');

  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Customization

RangeBar can be customized in terms of color, border and thickness by using

[color](#), [border](#) and [pointerWidth](#) property.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    pointers: [{
      value: 50,
      type: 'RangeBar',
      radius: '60%',
      color: '#007DD1',
      border: {
        color: 'grey',

```

```

        width: 2
      },
      pointerWidth: 15
    ]
  }
}, '#element');

```

INDEX.HTML

```

Rounded corner for range bar pointer

The start and end pointers of range bar in the circular gauge are rounded to form arc gauges.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    lineStyle: {
      color: 'transparent'
    },
    ranges: [
      { start: 0, end: 50, color: '#30B32D', radius: '108%' },
      { start: 50, end: 100, color: '#FFDD00', radius: '108%' }
    ],
    pointers: [{
      value: 50,

```

```

        type: 'RangeBar',
        roundedCornerRadius: 6
    }
  }
}, '#element');

```

INDEX.HTML

</body></html>

```

Marker Pointer

Different type of marker shape can be used to mark the pointer value in axis. You can change the marker shape using [markerShape](#) property in pointer. Gauge supports the below marker shape.

- Circle
- Rectangle
- Triangle
- InvertedTriangle
- Diamond

We can use image instead of rendering marker shape to denote the pointer value. It can be achieved by setting [markerShape](#) to Image and assigning image path to [imageUrl](#) in pointer.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';

```

```
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    pointers: [{
      value: 90,
      type: 'Marker',
      markerShape: 'InvertedTriangle',
      radius: '100%',
      markerHeight: 15,
      markerWidth: 15
    }]
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Customization

The marker can be customized in terms of color, border, width and height by using

[color](#),

[border](#),

[markerWidth](#) and

[markerHeight](#) property in

[pointer.](#)

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    pointers: [{
      value: 90,
      type: 'Marker',
      markerShape: 'Triangle',
      radius: '100%',
      color: 'white',
      border: {
        color: '#007DD1',
        width: 2
      },
      markerHeight: 15,
      markerWidth: 15
    }
  ]
}],
  '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Dragging pointer

The pointers can be dragged over the axis line by clicking and dragging the same. To enable or disable the pointer drag, use the [enablePointerDrag](#) property.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    enablePointerDrag: true,
    height: '250px',
    width: '250px',
    axes: [{
        pointers: [{
            value: 50
        }]
    }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Multiple Pointers

In addition to the default pointer, you can add n number of pointer to an axis by using `pointers` property.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    pointers: [{
      value: 90,
      type: 'Marker',
      markerShape: 'InvertedTriangle',
      radius: '100%',
      markerHeight: 15,
      markerWidth: 15
    }, {
      value: 90,
      type: 'RangeBar',
      radius: '60%',
      pointerWidth: 10
    }, {
      value: 90,
      radius: '60%',
      cap: {
        radius: 15,
        border: {
          width: 5
        }
      },
      needleTail: {
        length: '22%',
      },
      pointerWidth: 25
    }
  ]
}]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Animation

Pointer will get animate on loading the gauge, this can be handled by using

[animation](#) property in pointer.

The [enable](#) property in animation allows you to enable or disable the animation.

The [duration](#) property specify the duration of the animation in milliseconds.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    pointers: [{
      value: 90,
      animation: {
        enable: true,
        duration: 1500
      }
    }
  ]
}]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

```
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Gradient Color

Gradient support allows to add multiple colors in the ranges and pointers of the circular gauge. The following gradient types are supported in the circular gauge.

- Linear Gradient
- Radial Gradient

Linear Gradient

Using linear gradient, colors will be applied in a linear progression. The start value of the linear gradient can be set using the [startValue](#) property. The end value of the linear gradient will be set using the [endValue](#) property. The color stop values such as color, opacity and offset are set using [colorStop](#) property.

The linear gradient can be applied to all pointer types like marker, range bar and needle. To do so, follow the below code sample.

INDEX.TS

```
import { CircularGauge, Gradient } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(Gradient);
let pointerLinearGradient: Object = {
  startValue: '0%',
  endValue: '100%',
  colorStop: [
    { color: '#FEF3F9', offset: '0%', opacity: 0.9 },
    { color: '#E63B86', offset: '70%', opacity: 0.9 }
  ]
};
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    startAngle: 270,
    endAngle: 90,
    lineStyle: { width: 3, color: '#E63B86' },
    labelStyle: {
      font: { size: '0px' }
    },
    majorTicks: {
      height: 0
    },
    minorTicks: {
      height: 0
    },
  },
  radius: '90%',
  minimum: 0,
  maximum: 100,
  pointers: [{
    radius: '80%',
    value: 80,
```

```

        animation: { enable: true, duration: 1000 },
        pointerWidth: 10,
        linearGradient: pointerLinearGradient,
        cap: {
            radius: 8,
            color: 'white',
            border: {
                color: '#E63B86',
                width: 1
            }
        },
        needleTail: {
            length: '20%',
            linearGradient: pointerLinearGradient,
        }
    }, {
        radius: '60%', value: 40,
        animation: { duration: 1000 },
        pointerWidth: 10,
        linearGradient: pointerLinearGradient,
        cap: {
            radius: 8, color: 'white',
            border: { color: '#E63B86', width: 1 }
        },
        needleTail: {
            length: '20%',
            linearGradient: pointerLinearGradient
        }
    }
    ]
    ], '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

Gauge annotations in EJ2 JavaScript Circular gauge control

Annotations are used to mark a specific area of interest in the gauge with texts, shapes or images.

Content

You can place any custom element on the axis area by assigning the id of the element to [content](#) property of [annotation](#) object.

Note: To use annotation feature, we need to inject `Annotations` module using `CircularGauge.Inject(Annotations)` method.

INDEX.TS

```
import { CircularGauge, Annotations } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(Annotations);
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    annotations: [{
      content: 'annotation-template', zIndex: '1'
    }],
    pointers: [{
      value: 50
    }]
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script id="annotation-template" type="text/x-template">
    <div id='templateWrap'>
      <div class='des'>
        <span>Pointer Value : 50</span>
      </div>
    </div>
  </script>
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
</body>
</html>
```

```
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Position

Annotation can be placed around the axis by using [radius](#) and [angle](#) property.

For example, if the angle is 90 degree and the radius is 110%, then the annotation, will be placed at the right side of the axis.

Radius of the annotation takes value either in pixel or percentage. By setting value in percentage, annotation gets its position with respect to its axis radius.

INDEX.TS

```
import { CircularGauge, Annotations } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(Annotations);
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        annotations: [{
            content: '#annotation-template',
            angle: 90,
            radius: '150%',
            zIndex: '1'
        }],
        pointers: [{
            value: 50
        }]
    }]
}, '#element');
```

Sub Gauge

As the annotation allows you to place any custom element, we can initialize a gauge to the element and can be used to place that in another gauge.

INDEX.TS

```

import { CircularGauge, Annotations } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(Annotations);
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        minimum: 0,
        maximum: 12,
        startAngle: 0,
        endAngle: 360,
        lineStyle: { width: 0 },
        ranges: [
            {
                start: 0, end: 3,
                color: 'rgba(29,29,29,0.7)'
            }, {
                start: 3, end: 12,
                color: 'rgba(168,145,102,0.1)'
            }
        ],
    },
    annotations: [{
        angle: 270,

Animation in EJ2 JavaScript Circular Gauge control

All of the elements in the Circular Gauge, such as the axis lines, ticks, labels, ranges, pointers, and annotations, can be animated sequentially by using the [animationDuration](#) property. The animation for the Circular Gauge is enabled when the [animationDuration](#) property is set to an appropriate value in milliseconds, providing a smooth rendering effect for the control. If the [animationDuration](#) property is set to 0, which is the default value, the animation effect is disabled. If the animation is enabled, the control will behave in the following order.

1. The axis line will be animated in the rendering direction (clockwise or anticlockwise).
2. Each tick line and label will then be animated.
3. If available, ranges will be animated.

4. If available, pointers will be animated in the same way as [pointer animation](#).
5. If available, annotations will be animated.

The animation of the Circular Gauge is demonstrated in the following example.

INDEX.TS

```
import { CircularGauge, Annotations, Gradient } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(Annotations, Gradient);
let circulargauge: CircularGauge = new CircularGauge({
  animationDuration: 2000,
  axes: [
    {
      annotations: [{
        angle: 165,
        radius: '35%',
        zIndex: 1,
        content: '<div style="font-size:18px;margin-left: -20px;margin-top: -12px; color:#9DD55A">60</div>'
      }],
      radius: '80%',
      startAngle: 230,
      endAngle: 130,
      majorTicks: {
        offset: 5,
      },
      lineStyle: { width: 8, color: '#E0E0E0' },

Gauge legend in EJ2 JavaScript Circular gauge control

Legend provides valuable information for interpreting what the circular gauge axis range displays, and they can be represented in various colors, shapes, and other identifiers based on the data. It gives a breakdown of what each symbol represents in the axis range of circular gauge.

You can add the legend for circular gauge ranges by setting the visible property of `legendSettings` to true.

Legend customization

Customization option is also provided for the legend shape, alignment, and position.

Position and alignment

The position of the legend is used to place legend in various positions. You can use the `position` property in `legendSettings`. Based on the position, the legend item will be aligned. The following options are available to customize the legend position:

- Top
- Bottom
- Left
- Right
- Custom
- Auto

The legend alignment is used to align the legend items in specific location. You can use the alignment property in `legendSettings` to align the legend items. The following options are available to customize the legend alignment:

- Near
- Center
- Far

The legends can also be positioned to absolute position using the `location.x` and `location.y` properties available in `legendSettings`.

Legend size

The legend size can be modified using the `height` and `width` properties in `legendSettings`.

Legend opacity

To specify the transparency for legend shape, set the `opacity` property in `legendSettings`.

Legend shape

To change the legend item shape, specify the desired shape in the `shape` property of the legend. By default, the shape of the legend is `circle`.

It also supports the following shapes:

- Circle
- Rectangle
- Diamond
- Triangle
- InvertedTriangle
- Image

You can customize a shape using the `shapeWidth` and `shapeHeight` properties.

Legend padding

You can control the spacing between the legend items using the `padding` option of the legend. The default value of padding is 5.

Legend border

You can customize the legend border using the border option in the legend. The legend border can be customized using the border `color` and `width` properties.

Font of the legend text

The font of the legend item text can be customized using the following properties:

- `fontFamily`
- `fontStyle`
- `fontWeight`
- `opacity`
- `color`
- `size`

The following code example shows how to add legend in the gauge.

INDEX.TS

```
import { CircularGauge, Legend } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(Legend);
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    minimum: 0,
    maximum: 100,
    majorTicks: {
      useRangeColor: true
    },
    minorTicks: {
      useRangeColor: true
    },
    labelStyle: {
      useRangeColor: true
    },
  }],
```

```

    ranges: [{
      start: 0,
      end: 25,
      radius: '108%'
    }, {
      start: 25,
      end: 50,
      radius: '108%'
    }, {
      start: 50,
      end: 75,
      radius: '108%'
    }, {
      start: 75,
      end: 100,
      radius: '108%'
    }
  ]
}, {
  legendSettings : {
    visible: true,
    shapeWidth: 30,
    shapeHeight: 30,
    padding: 15,
    border: {
      color: 'green',
      width: 3
    }
  }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

if(ele) {

```

```
ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Toggle option in legend

The toggle option has been provided for legend. So, if you toggle the legend, the given color will be changed to the corresponding circular gauge range. You can enable the toggle option using [toggleVisibility](#) in the `legendSettings` property.

INDEX.TS

```
import { CircularGauge, Legend } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(Legend);
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    minimum: 0,
    maximum: 100,
    majorTicks: {
      useRangeColor: true
    },
    minorTicks: {
      useRangeColor: true
    },
    labelStyle: {
      useRangeColor: true
    },
    ranges: [{
      start: 0,
      end: 25,
      radius: '108%'
    }, {
      start: 25,
      end: 50,
      radius: '108%'
    }, {
      start: 50,
      end: 75,
      radius: '108%'
    }, {
      start: 75,
      end: 100,
      radius: '108%'
    }
  ]
}],
  legendSettings : {
    visible: true,
    toggleVisibility: true
  }
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
```

```
<title>EJ2 Animation</title>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Paging support in legend

By default, paging will be enabled if the legend items exceed the legend bounds. You can view each legend item by navigating between the pages using navigation buttons.

INDEX.TS

```
import { CircularGauge, Legend } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(Legend);
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        minimum: 0,
        maximum: 100,
        majorTicks: {
            useRangeColor: true
        },
        minorTicks: {
            useRangeColor: true
        },
        labelStyle: {
            useRangeColor: true
        },
        ranges: [{
            start: 0,
            end: 25,
            radius: '108%'
        }, {
            start: 25,
```

```

        end: 50,
        radius: '108%'
    }, {
        start: 50,
        end: 75,
        radius: '108%'
    }, {
        start: 75,
        end: 100,
        radius: '108%'
    }
  ]],
  legendSettings : {
    visible: true,
    height: '50'
  }
}, '#element');

```

```

Legend text customization

You can customize the legend text using [legendText](#) property in `ranges`.

INDEX.TS

```
import { CircularGauge, Legend, ILegendRenderEventArgs } from
 '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(Legend);
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    minimum: 0,
    maximum: 100,
    majorTicks: {
      useRangeColor: true
    },
    minorTicks: {
      useRangeColor: true
    },
    labelStyle: {
      useRangeColor: true
    },
    ranges: [{
      start: 0,
      end: 25,
      radius: '108%',
      legendText: 'light air'
    }, {
      start: 25,
      end: 50,
      radius: '108%',
      legendText: 'light air'
    }, {
      start: 50,
      end: 75,
      radius: '108%',
      legendText: 'light breeze'
    }, {
      start: 75,
      end: 100,
      radius: '108%',
      legendText: 'Gentle breeze'
    }
  ]
}],
  legendSettings : {
    visible: true
  },
  legendRender: (args: ILegendRenderEventArgs) => {
    args.text = "Legend Modified Text Value";
  }
}, '#element');
```

```

legendRendering event will be triggered before rendering each legend item, using this event you can customize needed legend items using following arguments.

Argument name	Description
fill	Specifies the legend shape color
text	Specifies the current legend text
shape	Customize the shape of the legends
name	Specifies the name of the event
cancel	Set to true, to cancel the event status

Gauge user interaction in EJ2 JavaScript Circular gauge control

Tooltip for pointers

Circular gauge will displays the pointer details through [tooltip](#),when the mouse is moved over the pointer.

Enable Tooltip

By default, tooltip is not visible. Enable the tooltip by setting [enable](#) property to true and injecting GaugeTooltip module using `CircularGauge.Inject(GaugeTooltip)` method.

INDEX.TS

```

import { CircularGauge, GaugeTooltip } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(GaugeTooltip);
let gauge: CircularGauge = new CircularGauge({
    // Title for circular gauge.
    tooltip: {
        enable: true
    }
});

```

```

    },
    axes:[{
      pointers:[{
        value: 70
      }],
    }]
  }, '#element');

```

INDEX.HTML

```

Tooltip for ranges

Circular gauge displays the information about the ranges through tooltip when hovering the mouse over the ranges. You can enable this feature by setting the type property of tooltip to 'Range' in the array collection.

Range tooltip customization

To customize the range tooltip, use the `rangeSettings` property in tooltip. The following options are available to customize the range tooltip:

- `fill` - Specifies the range tooltip fill color.
- `textStyle` - Specifies the range tooltip text style.
- `format` - Specifies the range content format.
- `template` - Specifies the custom template for tooltip.
- `enableAnimation` - Animates as it moves from one point to another.
- `border` - Specifies the tooltip border.
- `showMouseAtPosition` - Displays the position of the tooltip on the cursor position.

Tooltip for annotation

Circular gauge displays the information about the annotations through tooltip when hovering the mouse over the annotation. You can enable this feature by setting the type property of tooltip to 'Annotation' in the array collection.

Annotation tooltip customization

To customize the annotation tooltip, use the `annotationSettings` property in tooltip. The following options are available to customize the annotation tooltip:

- `fill` - Specifies the annotation tooltip fill color.
- `textStyle` - Specifies the annotation tooltip text style.
- `format` - Specifies the annotation content format.
- `template` - Specifies the tooltip content with custom template.
- `enableAnimation` - Animates as it moves from one point to another.
- `border` - Specifies the tooltip border.

The following code example shows the tooltip for the ranges and annotation.

INDEX.TS

```
import { CircularGauge, GaugeTooltip, Annotations } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(GaugeTooltip, Annotations);
let gauge: CircularGauge = new CircularGauge({
  axes: [{
    radius: '90%',
    minimum: 0,
    maximum: 120,
    startAngle: 240,
    endAngle: 120,
    annotations: [{
      content: 'CircularGauge', zIndex: '1', angle: 180
    }],
    lineStyle: { width: 0 },
```

```

majorTicks: { color: 'white', offset: -5, height: 12 },
minorTicks: { width: 0 },
labelStyle: { useRangeColor: true, font: { color: '#424242', size:
'13px', fontFamily: 'Roboto' } },
pointers: [{
  value: 70,
  radius: '60%',
  color: '#33BCBD',
  cap: { radius: 10, border: { color: '#33BCBD', width: 5 } },
  animation: { enable: false }
}],
ranges: [{
  start: 0,
  end: 50,
  startWidth: 10, endWidth: 10,
  radius: '102%',
  color: '#3A5DC8',
}, {
  start: 50,
  end: 120,
  radius: '102%',
  startWidth: 10, endWidth: 10,
  color: '#33BCBD',
}]
}],
tooltip: {
  type: ['Pointer', 'Range', 'Annotation'],
  enable: true,
  enableAnimation: false,
  annotationSettings: { template: '<div>CircularGauge</div>' },
  rangeSettings: { fill: 'red' }
},
}, '#element');

```

```

Gauge print and export in EJ2 JavaScript Circular gauge control

Print

To use the print functionality, we should set the [allowPrint](#) property to **true**. The rendered circular gauge can be printed directly from the browser by calling the method [print](#).

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
    allowPrint: true
}, '#element');
document.getElementById('print').onclick = () => {
    circulargauge.print();
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>

```

```
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
        <button id="print" type="button" width="15%" style="float:right">Print</button>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Export

Image Export

To use the image export functionality, we should set the [allowImageExport](#) property to **true**. The rendered circular gauge can be exported as an image using the [export](#) method. The method requires two parameters: image type and file name. The circular gauge can be exported as an image in the following formats.

- JPEG
- PNG
- SVG

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
    allowImageExport: true
}, '#element');
document.getElementById('export').onclick = () => {
    circulargauge.export('PNG', 'Gauge');
};
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
    popups/styles/material.css" rel="stylesheet">
```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
        <button id="export" type="button" width="15%" style="float:
right">Export</button>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

We can get the image file as base64 string for the JPEG and PNG formats. The circular gauge can be exported to image as a base64 string using the [export](#) method. There are four parameters required: image type, file name, orientation of the exported PDF document which must be set as **null** for image export and finally **allowDownload** which should be set as **false** to return base64 string.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
    allowImageExport: true
}, '#element');
document.getElementById('export').onclick = () => {
    circulargauge.export('JPEG', 'Gauge', null, false).then((data) => {
        var base64 = data;
        document.writeln(base64);
    });
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

PDF Export

To use the PDF export functionality, we should set the [allowPdfExport](#) property to **true**. The rendered circular gauge can be exported as PDF using the [export](#) method. The [export](#) method requires three parameters: file type, file name and orientation of the PDF document. The orientation setting is optional and "0" indicates portrait and "1" indicates landscape.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
    allowPdfExport: true
}, '#element');
document.getElementById('export').onclick = () => {
    circulargauge.export("PDF", "Gauge");
};
```

INDEX.HTML

        <button id="export" type="button" width="15%" style="float:right">Export</button>
    </div>
</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: The exporting of the circular gauge as base64 string is not supported in the PDF export.

Gauge appearance in EJ2 JavaScript Circular gauge control

Gauge Title

Circular gauge can be given a title by using [title](#) property, to show the information about the gauge.

Title can be customized by using [titleStyle](#) property in gauge.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    title: 'Speedometer',
    titleStyle: {
        color: '#27d5ff'
    }
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
</script>
var ele = document.getElementById('container');
```

```
if(ele) {  
    ele.style.visibility = "visible";  
}  
  
</script>  
<script src="index.js" type="text/javascript"></script>  
</body></html>
```

Gauge Position

Gauge can be positioned anywhere in the container with the help of [centerX](#) and [centerY](#) property and it accepts values either in percentage or in pixels.

The default value of the [centerX](#) and

[centerY](#) property is 50%, which means gauge will get rendered to the centre of the container.

In Pixel

You can set the mid point of the gauge in pixel as demonstrated below,

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';  
let gauge: CircularGauge = new CircularGauge({  
    centerX: '20',  
    centerY: '20',  
    axes: [{  
        lineStyle: {  
            width: 2,  
            color: '#F8F8F8'  
        },  
        startAngle: 90,  
        endAngle: 180  
    }]  
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
    <title>EJ2 Animation</title>  
    <meta charset="utf-8">  
    <meta name="viewport" content="width=device-width, initial-scale=1.0">  
    <meta name="description" content="Typescript UI Controls">  
    <meta name="author" content="Syncfusion">  
    <link href="index.css" rel="stylesheet">  
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
popups/styles/material.css" rel="stylesheet">  
  
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"  
type="text/javascript"></script>  
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type  
="text/javascript"></script>  
</head>  
<body>  
  
    <div id="container">  
        <div id="element"></div>
```

```
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

In Percentage

By setting the value in percentage, gauge gets its mid point with respect to its plot area.

For example, when the [centerX](#) value as '0%' and [centerY](#) value is '50%', gauge will get positioned at the top left corner of the plot area.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    centerX: '10%',
    centerY: '50%',
    axes: [{
        lineStyle: {
            width: 2,
            color: '#F8F8F8'
        },
        startAngle: 0,
        endAngle: 180
    }]
}, '#element');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Area Customization

Customize the gauge background

Using [background](#) and [border](#) properties, you can change the background color and border of the circular gauge.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
    background: 'skyblue',
    //Customize the chart border and opacity.
    border: {color: "#FF0000", width: 2},
    axes: [{
        radius: '90%',
        maximum: 120,
        startAngle: 230,
        endAngle: 130,
        majorTicks: {
            width: 1, color: '#8c8c8c'
        },
        lineStyle: { width: 2 },
        minorTicks: {
            width: 1, color: '#8c8c8c'
        },
        pointers: [{
            value: 60,
            radius: '60%'
        }],
        ranges: [{
            start: 0,
            end: 70,
            radius: '110%'
        }, {
            start: 70,
            end: 110,
            radius: '110%'
        }, {
            start: 110,
            end: 120,
            radius: '110%'
        }
    ]
}],
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Gauge Margin

You can set margin for gauge from its container through [margin](#) property.

INDEX.TS

```

import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  background: 'skyblue',
  //Customize the chart border and opacity.
  border: { color: "#FF0000", width: 2 },
  //Change chart margin to left, right, top and bottom.
  margin: { left: 40, right: 40, top: 40, bottom: 40 },
  axes: [{
    radius: '90%',
    maximum: 120,
    startAngle: 230,
    endAngle: 130,
    majorTicks: {
      width: 1, color: '#8c8c8c'
    },
    lineStyle: { width: 2 },
    minorTicks: {
      width: 1, color: '#8c8c8c'
    },
    pointers: [{
      value: 60,

```

```

        radius: '60%'
    }],
    ranges: [{
        start: 0,
        end: 70,
        radius: '110%'
    }, {
        start: 70,
        end: 110,
        radius: '110%'
    }, {
        start: 110,
        end: 120,
        radius: '110%'
    }]
    }]
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

</body></html>
```

Radius calculation based on angles

Render semi or quarter circular gauges by modifying the start and end angles. By enabling the radius based on angle option, the radius of circular gauge will be calculated based on the start and end angles to avoid excess white space.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
let gauge: CircularGauge = new CircularGauge({
  moveToCenter: true,
  axes: [{
    lineStyle: {
      width: 2,
      color: '#F8F8F8'
    },
    startAngle: 270,
    endAngle: 90,
    radius: '80%'
  }]
}, '#element');
```

```

Accessibility in EJ2 JavaScript Circular gauge control

Circular Gauge has built-in accessibility features like screen reading and WAI-ARIA attributes.

WAI-ARIA attributes

The Circular Gauge control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Circular Gauge control:

| Attributes | Purpose |

| --- | --- |

| **role=region** | It is specified in the pointer where the interactive drag and drop function is supported to update the pointer value. |

| **aria-label** | Provides an accessible name for the axis labels, legend title, legend item label, text pointer and annotation. |

Screen reading in Circular Gauge

Accessibility in the Circular Gauge control ensures that all users, regardless of ability or disability, can use screen reading. The following Circular Gauge elements will be read aloud using screen reading software, such as Narrator for Windows.

| Elements | Description |

| --- | --- |

| Axis labels | Reads the axis labels of the Circular Gauge. |

| Legend title | Reads the title of the legend in the Circular Gauge. |

| Legend item label | Reads the label of the legend item in the Circular Gauge. |

| Text pointer | Reads the text content shown as a pointer in Circular Gauge. |

| Annotation | Reads the content specified in the annotation. |

Ensuring accessibility

The Circular Gauge control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Circular Gauge control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Circular Gauge control with accessibility tools.

Internationalization in EJ2 JavaScript Circular gauge control

Circular Gauge provides internationalization support for below elements.

- Axis Labels
- Tooltip

For more information about number formatter, you can refer [internationalization](#).

Globalization

Globalization is the process of designing and developing a control that works in different cultures/locales.

Internationalization library is used to globalize number in the Circular Gauge using [format](#) property in [labelStyle](#).

Numeric Format

In the below example, axis labels are globalized to **EUR**.

INDEX.TS

```
import { CircularGauge } from '@syncfusion/ej2-circulargauge';
import { loadCldr, L10n, setCulture, setCurrencyCode }
from '@syncfusion/ej2-base';
setCulture('de');
setCurrencyCode('EUR');
let gauge: CircularGauge = new CircularGauge({
    axes: [{
        labelStyle: {
            position: 'Inside',
            //Label format set as currency.
            format: 'c'
        }
    }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Right-to-left

Circular Gauge can render its elements from right to left, which improves the user experience for certain language users. To do so, set the [enableRtl](#) property to **true**. When this property is enabled, elements

such as the tooltip and legend will be rendered from right to left. Meanwhile, the axis can be rendered from right to left by setting the [direction](#) property to **AntiClockWise**. For more information on axis, click [here](#).

The following example illustrates the right to left rendering of the Circular Gauge.

INDEX.TS

```
import { CircularGauge, GaugeTooltip, Legend } from '@syncfusion/ej2-circulargauge';
CircularGauge.Inject(GaugeTooltip, Legend);
let gauge: CircularGauge = new CircularGauge({
  enableRtl: true,
  tooltip: {
    type: ['Pointer', 'Range'],
    format: 'Pointer : {value} ',
    enable: true,
    enableAnimation: false
  },
  legendSettings: {
    visible: true
  },
  axes: [{
    direction: 'AntiClockWise',
    lineStyle: { width: 10, color: 'transparent' },
    labelStyle: {
      position: 'Inside', useRangeColor: false,
      font: {
        size: '12px',
        color: '#424242',
        fontFamily: 'Roboto',
        fontStyle: 'Regular'
      }
    }
  },
  majorTicks: {
    height: 10,
    offset: 5,
    color: '#9E9E9E'
  },
  minorTicks: { height: 0 },
  startAngle: 210,

Ej1 api migration in EJ2 JavaScript Circular gauge control

This article describes the API migration process of Accordion component from Essential JS 1 to Essential JS 2.

Circular gauge dimensions

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Height | **Property:** *height*
 let gauge: CircularGauge = new CircularGauge({ height: 400 });
 gauge.appendTo('#container');

| Width | **Property:** *width*
 let gauge: CircularGauge = new CircularGauge({ width: 100 });
 gauge.appendTo('#container');

| Height(In Percentage) | Not Applicable | **Property:** *height*
 let gauge: CircularGauge = new CircularGauge({ height : '50%' });
 gauge.appendTo('#container');

| Width(In Percentage) | Not Applicable | **Property:** *width*
 let gauge: CircularGauge = new CircularGauge({ width : '80%' });
 gauge.appendTo('#container');

Axis Line

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Axisline Width | **Property:** *scales.size*
 let gauge: CircularGauge = new CircularGauge({ scales: [{ showScaleBar: true, size: 6 }] });
 gauge.appendTo('#container');

| Axisline Color | **Property:** *scales.size*
 let gauge: CircularGauge = new CircularGauge({ scales: [{ showScaleBar: true, backgroundColor: "red" }] });
 gauge.appendTo('#container');

| Axisline BackgroundColor | Not Applicable | **Property:** *axes.background*
 let gauge: CircularGauge = new CircularGauge({ axes: [{ background: 'red' }] });
 gauge.appendTo('#container');

| Axisline Direction | **Property:** *scales.direction*
 let gauge: CircularGauge = new CircularGauge({ scales: [{ direction: "counterclockwise" }] });
 gauge.appendTo('#container');

| Axisline Radius | **Property:** *scales.radius*
 let gauge: CircularGauge = new CircularGauge({ scales: [{ showScaleBar: true, radius: 150 }] });
 gauge.appendTo('#container');

| Axisline Startangle | **Property:** *scales.startAngle*
 let gauge: CircularGauge = new CircularGauge({ scales: [{ startAngle: 80 }] });
 gauge.appendTo('#container');

| Axisline Endangle | **Property:** *scales.sweepAngle*
 let gauge: CircularGauge = new CircularGauge({ scales: [{ sweepAngle: 250 }] });
 gauge.appendTo('#container');

axes.endAngle
let gauge: CircularGauge = new CircularGauge({
endAngle: 150 }
); gauge.appendTo('#container');

| Minimum Axisvalue | **Property:** *scales.minimum*
\$("#container").ejCircularGauge({
scales: [{
minimum: 20 }
]; | **Property:**
axes.minimum
let gauge: CircularGauge = new CircularGauge({
axes: [{
minimum: 20 }
];
gauge.appendTo('#container');

| Maximum Axisvalue | **Property:** *scales.maximum*
\$("#container").ejCircularGauge({
scales: [{
maximum: 200 }
]; | **Property:**
axes.maximum
let gauge: CircularGauge = new CircularGauge({
axes: [{
maximum: 200 }
];
gauge.appendTo('#container');

Ticks

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Type of Ticks | **Property:** *scales.ticks.type*
\$("#container").ejCircularGauge({
scales: [{
ticks: [{ type: "major" }
]; | **Property:**
axes.majorTicks
let gauge: CircularGauge = new CircularGauge({
axes: [{
majorTicks: { }
];
gauge.appendTo('#container');

| Height of Major Ticks | **Property:** *scales.ticks.height*
\$("#container").ejCircularGauge({
scales: [{
ticks: [{ height: 12 }
]; | **Property:**
axes.majorTicks.height
let gauge: CircularGauge = new CircularGauge({
axes: [{
majorTicks: { height: 12 }
];
gauge.appendTo('#container');

| Width of Major Ticks | **Property:** *scales.ticks.width*
\$("#container").ejCircularGauge({
scales: [{
ticks: [{ width: 3 }
]; | **Property:**
axes.majorTicks.width
let gauge: CircularGauge = new CircularGauge({
axes: [{
majorTicks: { width: 3 }
];
gauge.appendTo('#container');

| Color of Major Ticks | **Property:** *scales.ticks.color*
\$("#container").ejCircularGauge({
scales: [{
ticks: [{ color: "#777777" }
]; | **Property:**
axes.majorTicks.color
let gauge: CircularGauge = new CircularGauge({
axes: [{
majorTicks: { color: "#777777" }
];
gauge.appendTo('#container');

| Offset of Major Ticks | **Property:** *scales.ticks.distanceFromScale*
\$("#container").ejCircularGauge({
scales: [{
ticks: [{
distanceFromScale: 10 }
]; | **Property:** *axes.majorTicks.offset*
let gauge:
CircularGauge = new CircularGauge({
axes: [{
majorTicks: { offset: 10
}
];
gauge.appendTo('#container');

| Angle of Major Ticks | **Property:** *scales.ticks.angle*
\$("#container").ejCircularGauge({
scales: [{
ticks: [{ angle: 10 }
]; | Not Applicable

| Interval of Major Ticks | **Property:** *scales.majorIntervalValue*
\$("#container").ejCircularGauge({
scales: [{
majorIntervalValue: 10
}; | **Property:** *axes.majorTicks.interval*
let gauge: CircularGauge = new
CircularGauge({
axes: [{
majorTicks: { interval: 10 }
};
gauge.appendTo('#container');

| Height of Minor Ticks | **Property:** *scales.ticks.height*
 \$("#container").ejCircularGauge({
 scales: [{ ticks: [{ type: 'minor', height: 12 }] }];
Property: *axes.minorTicks.height*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ minorTicks: { height: 12 } }];
 gauge.appendTo('#container');

| Width of Minor Ticks | **Property:** *scales.ticks.width*
 \$("#container").ejCircularGauge({
 scales: [{ ticks: [{ type: 'minor', width: 3 }] }];
Property: *axes.minorTicks.width*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ minorTicks: { width: 3 } }];
 gauge.appendTo('#container');

| Color of Minor Ticks | **Property:** *scales.ticks.color*
 \$("#container").ejCircularGauge({
 scales: [{ ticks: [{ type: 'minor', color: "#777777" }] }];
Property: *axes.minorTicks.color*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ minorTicks: { color: "#777777" } }];
 gauge.appendTo('#container');

| Offset of Minor Ticks | **Property:** *scales.ticks.distanceFromScale*
 \$("#container").ejCircularGauge({
 scales: [{ ticks: [{ type: 'minor', distanceFromScale: 10 }] }];
Property: *axes.minorTicks.offset*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ minorTicks: { offset: 10 } }];
 gauge.appendTo('#container');

| Angle of Major Ticks | **Property:** *scales.ticks.angle*
 \$("#container").ejCircularGauge({
 scales: [{ ticks: [{ type: 'minor', angle: 10 }] }];
 Not Applicable

| Interval of Minor Ticks | **Property:** *scales.majorIntervalValue*
 \$("#container").ejCircularGauge({
 scales: [{ ticks: [{ type: 'minor' }], majorIntervalValue: 10 }];
Property: *axes.minorTicks.interval*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ minorTicks: { interval: 10 } }];
 gauge.appendTo('#container');

Labels

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Autoangle | **Property:** *scales.labels.autoAngle*
 \$("#container").ejCircularGauge({
 scales: [{ labels: [{ showLabels: true, autoAngle: true }] }];
Property: *axes.labelStyle.autoAngle*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ labelStyle: { autoAngle: true } }];
 gauge.appendTo('#container');

| Angle | **Property:** *scales.labels.angle*
 \$("#container").ejCircularGauge({
 scales: [{ labels: [{ showLabels: true, angle: 30 }] }];
 Not Applicable

| Offset | **Property:** *scales.labels.distanceFromScales*
 \$("#container").ejCircularGauge({
 scales: [{ labels: [{ showLabels: true, distanceFromScales: 10 }] }];
Property: *axes.labelStyle.offset*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ labelStyle: { offset: 5 } }];
 gauge.appendTo('#container');

| Format | **Property:** *scales.labels.unitText*
 \$("#container").ejCircularGauge({
 scales: [{ labels: [{ unitText: "kmph", unitTextPosition: "front" }] }];

}); | **Property:** *axes.labelStyle.format*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{
 labelStyle: { format: "kmph" }
 }
 }]);
 gauge.appendTo('#container');

| UnitText Position | **Property:** *scales.labels.placement*
 \$("#container").ejCircularGauge({
 scales: [{
 labels: [{ showLabels: true, placement: "near" }
 }
 }]); | **Property:** *axes.labelStyle.position*
 let gauge: CircularGauge = new
 CircularGauge({
 axes: [{
 labelStyle: { position: "Outside" }
 }
 }]);
 gauge.appendTo('#container');

| Label Range Color | Not Applicable | **Property:** *axes.labelStyle.useRangeColor*
 let gauge:
 CircularGauge = new CircularGauge({
 axes: [{
 labelStyle: {
 useRangeColor: true }
 }
 }]);
 gauge.appendTo('#container');

| LabelText Color | **Property:** *scales.labels.color*
 \$("#container").ejCircularGauge({
 scales: [{
 labels: [{ color: "red" }
 }
 }]); | **Property:**
axes.labelStyle.font.color
 let gauge: CircularGauge = new CircularGauge({
 axes: [{
 labelStyle: { font: { color: "red" } }
 }
 }]);
 gauge.appendTo('#container');

| Opacity | **Property:** *scales.labels.opacity*
 \$("#container").ejCircularGauge({
 scales: [{
 labels: [{ opacity: 0.3 }
 }
 }]); | **Property:**
axes.labelStyle.font.opacity
 let gauge: CircularGauge = new CircularGauge({
 axes: [{
 labelStyle: { font: { opacity: 0.5 } }
 }
 }]);
 gauge.appendTo('#container');

| Label Font Family | **Property:** *scales.labels.font.fontFamily*
 \$("#container").ejCircularGauge({
 scales: [{
 labels: [{ font: { fontFamily: "Arial" } }
 }
 }]); | **Property:** *axes.labelStyle.font.fontFamily*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{
 labelStyle: { font: { fontFamily: 'Roboto' } }
 }
 }]);
 gauge.appendTo('#container');

| Label Font Style | **Property:** *scales.labels.font.fontStyle*
 \$("#container").ejCircularGauge({
 scales: [{
 labels: [{ font: { fontStyle: "Bold" } }
 }
 }]); | **Property:** *axes.labelStyle.font.fontStyle*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{
 labelStyle: { font: { fontStyle: 'Bold' } }
 }
 }]);
 gauge.appendTo('#container');

| Label Font Size | **Property:** *scales.labels.font.size*
 \$("#container").ejCircularGauge({
 scales: [{
 labels: [{ font: { size: "12px" } }
 }
 }]); | **Property:**
axes.labelStyle.font.size
 let gauge: CircularGauge = new CircularGauge({
 axes: [{
 labelStyle: { font: { size: '12px' } }
 }
 }]);
 gauge.appendTo('#container');

| Label Font Weight | Not Applicable | **Property:** *axes.labelStyle.font.fontWeight*
 let gauge:
 CircularGauge = new CircularGauge({
 axes: [{
 labelStyle: { font: {
 fontWeight: 'Regular' } }
 }
 }]);
 gauge.appendTo('#container');

Ranges

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

|Start Value| **Property:** *scales.ranges.startValue*
 scales: [{ showRanges: true , startValue: 20 }]
Property: *axes.ranges.start* let gauge: CircularGauge = new CircularGauge({
 axes: [{ start: 20 }]
 gauge.appendTo('#container');

 | Not Applicable|

How To

Gauge range in EJ2 JavaScript Circular gauge control

Add a range to the circular gauge dynamically

You can add a range to the circular gauge dynamically by pushing the new ranges to the circular gauge axes in button click.

To add ranges dynamically to the circular gauge, follow the given steps:

Step 1:

Initialize the circular gauge with one range.

INDEX.TS

```
import { CircularGauge, Range } from '@syncfusion/ej2-circulargauge';
// initialize the circular gauge.
let circulargauge: CircularGauge = new CircularGauge({
  axes: [
    {
      minimum: 0, maximum: 120,
      // initialize the ranges.
      ranges: [
        {
          start: 0, end: 20
        }
      ]
    }
  ]
});
// render initialized circular gauge.
circulargauge.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <button id="addRange">Add Range</button>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
```

```
</body></html>
```

Step 2:

You can add ranges to the circular gauge dynamically using the button click event. In button click, add the new ranges to the circular gauge axes. To refresh the circular gauge, invoke the `refresh` method.

INDEX.TS

```
import { CircularGauge, Range } from '@syncfusion/ej2-circulargauge';
let circulargauge: CircularGauge = new CircularGauge({
  axes: [
    {
      minimum: 0, maximum: 120,
      ranges: [
        {
          start: 0, end: 20
        }
      ]
    }
  ]
});
circulargauge.appendTo('#element');
document.getElementById("addRange").onclick = function () {
  let start: number;
  let end: number;
  start =
+ (circulargauge.axes[0].ranges[circulargauge.axes[0].ranges.length -
1].start) + 20;
  end = start + 20;
  if (end > circulargauge.axes[0].maximum) {
    circulargauge.axes[0].maximum = end;
  }
  let range = { start: start, end: end };
  circulargauge.axes[0].ranges.push(new
Range(<Range>(circulargauge.axes[0].ranges[0]), 'ranges', range));
  circulargauge.refresh();
}
```

Color Picker

Mode and value in EJ2 JavaScript Color picker control

Rendering palette at initial load

By default, the **Picker** area will be rendered at initial load. To render the Palette area while opening the ColorPicker pop-up, and specify the **mode** property as **Palette**.

In the following sample, it will render the **Palette** at initial load.

INDEX.TS

```

import { ColorPicker } from '@syncfusion/ej2-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let colorPicker: ColorPicker = new ColorPicker({
    //To render palette at initial load.
    mode: 'Palette'
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div class="wrap">
            <h4>Select color</h4>
            <input id="element" type="color">
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 0 auto;
    width: 300px;
    text-align: center;
}
```

Color value

The [value](#) property can be used to specify the color value to the ColorPicker. It supports either **three** or **six** digit hex codes. To include **opacity**, set the color value as **four** or **eight** digit hex code.

In the following sample, the color value sets as **four** digit hex code, the last digit represents the **opacity** value.

INDEX.TS

```
import { ColorPicker } from '@syncfusion/ej2-inputs';
```

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let colorPicker: ColorPicker = new ColorPicker({
    //To set color value.
    value: '035a',
    mode: 'Picker',
    modeSwitcher: false
}, '#element');
```

Localization in EJ2 JavaScript Color picker control

Localization

The [Localization](#) library allows you to localize default text content of the ColorPicker. The ColorPicker component has static text for control buttons (apply / cancel) and mode switcher that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

The following list of properties and its values are used in the ColorPicker.

Locale key words | Text

Apply | Apply

Cancel | Cancel

ModeSwitcher | Switch Mode

Loading translations

To load translation object in an application use [load](#) function of [L10n](#) class.

The below example demonstrates the ColorPicker in **Deutsch** culture.

INDEX.TS

```
import { ColorPicker } from '@syncfusion/ej2-inputs';
import { enableRipple, L10n } from '@syncfusion/ej2-base';
enableRipple(true);
L10n.load({
  'de-DE': {
    'colorpicker': {
```

```

        "Apply": "Anwenden",
        "Cancel": "Abbrechen",
        "ModeSwitcher": "Modus wechseln"
    }
}
});
let colorPicker: ColorPicker = new ColorPicker({ locale: 'de-DE' },
'#element');
```

Right to Left - RTL

ColorPicker component has **RTL** support. It helps to render the ColorPicker from right-to-left direction. It improves the user experiences and accessibility for users who use right-to-left languages(Arabic, Farsi, Urdu, etc). This can be achieved by setting the [enableRtl](#) property to **true**.

The following example illustrates how to enable right-to-left support in ColorPicker component.

INDEX.TS

```

import { ColorPicker } from '@syncfusion/ej2-inputs';
import { enableRipple, L10n } from '@syncfusion/ej2-base';
enableRipple(true);
L10n.load({
  'ar-AE': {
    'colorpicker': {
      'Apply': 'تطبيق',
      'Cancel': 'إلغاء',
      'ModeSwitcher': 'مفتاح كهربائي الوضع'
    }
  }
});
let colorPicker: ColorPicker = new ColorPicker({ enableRtl: true, locale:
'ar-AE' }, '#element');

```

Accessibility in EJ2 JavaScript Color picker control

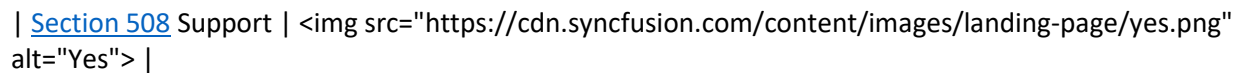

The Color picker component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

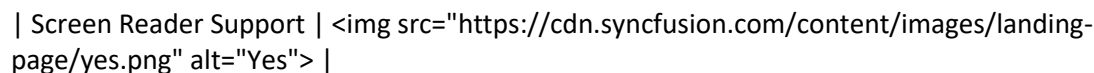

The accessibility compliance for the Color picker component is outlined below.

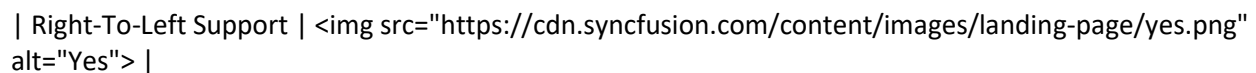

| Accessibility Criteria | Compatibility |

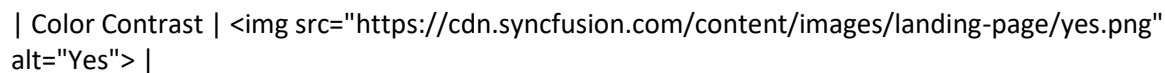

| -- | -- |

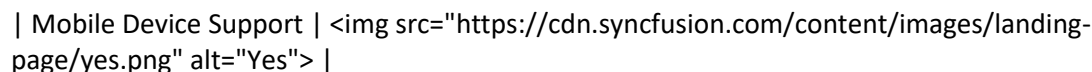

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

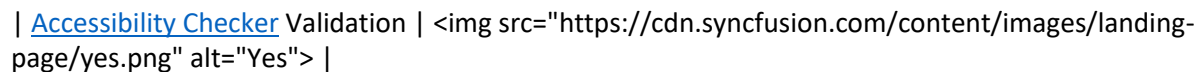

| Screen Reader Support |  |

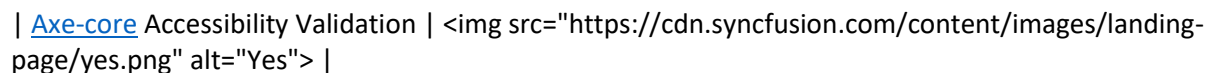

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Color picker component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Color picker component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the Color picker component as **color** and the tiles as **gridcell** in the color palette. |

| **aria-label** | Indicates the accessible name for the tiles. |

| **aria-selected** | Indicates the current selected state of the tile. |

| **aria-haspopup** | Indicates the availability of the popup element. |

| **aria-expanded** | Indicates whether the popup can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed. |

| **aria-owns** | Identifies an elements in order to define a visual, functional, or contextual parent/child relationship between DOM elements where the DOM hierarchy cannot be used to represent the relationship. |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

Keyboard interaction

The Color picker component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Color picker component.

| Press | To do this |

| --- | --- |

| Up Arrow | Moves the handler/tile up from the current position. |

| Down Arrow | Moves the handler/tile down from the current position. |

| Left Arrow | Moves the handler/tile left from the current position. |

| Right Arrow | Moves the handler/tile right from the current position. |

| Enter | Apply the selected color value. |

| Tab | To focus the next focusable element in the Color picker popup. |

Ensuring accessibility

The Color picker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Color picker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Color picker component with accessibility tools.

Style and appearance in EJ2 JavaScript Color picker control

To modify the ColorPicker appearance, you need to override the default CSS of ColorPicker component. Please find the list of CSS classes and its corresponding section in ColorPicker component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

- |.e-custom-picker .e-container .e-handler|To customized Color Picker selection handler
- |.color-picker.e-dropdown-popup ul .e-container|To customize the Color Picker container
- |.color-picker.e-dropdown-popup ul .e-item.e-palette-item|To customize the Color Picker palette item
- |.color-picker.e-dropdown-popup .e-container .e-switch|To customize the Color Picker switch control
- |.color-picker.e-dropdown-popup .e-container .e-slider-preview|To customize the Color Picker slider control

How To

Hide control buttons in EJ2 JavaScript Color picker control

ColorPicker can be rendered without control buttons (Apply/Cancel). In this case, while selecting a color, the ColorPicker pop-up is closed and selected colors can be applied directly. To hide control buttons, set the [showButtons](#) property to `false`.

INDEX.TS

```
import { ColorPicker } from '@syncfusion/ej2-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let colorPicker: ColorPicker = new ColorPicker({
    //To hide control buttons.
    showButtons: false
}, '#element');
```

Render palette alone in EJ2 JavaScript Color picker control

To render the **Palette** alone in ColorPicker, specify the **mode** property as **Palette**, and set the **modeSwitcher** property to **false**.

In the following sample, the **showButtons** property is disabled to hide the control buttons and it renders only the **Palette** area.

INDEX.TS

```

import { ColorPicker } from '@syncfusion/ej2-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);

```

```
let colorPicker: ColorPicker = new ColorPicker(
    {
        //To render Palette.
        mode: 'Palette',
        // To hide modeSwitcher.
        modeSwitcher: false,
        showButtons: false
    },
    '#element');
```

    }
}

```

> To render Picker alone specify the [mode](#) property as 'Picker'.

Colorpicker in dropdownbutton in EJ2 JavaScript Color picker control

This section explains about how to render the ColorPicker in DropDownButton. The [target](#) property of the DropDownButton helps to achieve this scenario. To know about the usage of [target](#) property refer to [Popup templating](#) section.

In the below sample, the color picker is rendered as inline type by setting [inline](#) property as `true` and the rendered color picker wrapper is passed as a [target](#) to the DropDownButton to achieve the above scenario.

INDEX.TS

```

import { ColorPicker, ColorPickerEventArgs } from '@syncfusion/ej2-inputs';
import { DropDownButton, BeforeOpenCloseMenuEventArgs,
OpenCloseMenuEventArgs } from '@syncfusion/ej2-splitbuttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let colorPicker: ColorPicker = new ColorPicker(
    {
        inline: true,
        change: (args: ColorPickerEventArgs): void => {
            (ddb.element.children[0] as HTMLElement).style.backgroundColor =
args.currentValue.rgba;
            closePopup();
        }
    },
    '#element');
let ddb: DropDownButton = new DropDownButton(
    {
        target: ".e-colorpicker-wrapper",
        iconCss: "e-dropdownbtn-preview",
        beforeClose: (args: BeforeOpenCloseMenuEventArgs): void => {
            args.element.parentElement.querySelector('.e-
cancel').removeEventListener('click', closePopup);
        },
        open: (args: OpenCloseMenuEventArgs): void => {

```

```

        args.element.parentElement.querySelector('.e-
cancel').addEventListener('click', closePopup);
        tooltip();
    }
},
'#dropdownbtn');
function closePopup(): void {
    ddb.toggle();
}
function tooltip(): void {
    let zIndex = (document.getElementsByClassName('e-color-picker-
tooltip')[0] as HTMLElement).style.zIndex;
    let zIndexIntValue = parseInt(zIndex) + 2;
    (document.getElementsByClassName('e-color-picker-tooltip')[0] as
HTMLElement).style.zIndex = zIndexIntValue.toString();
}

```

Customize colorpicker in EJ2 JavaScript Color picker control

Custom palette

By default, the Palette will be rendered with default colors. To load custom colors in the palette, specify the colors in the [presetColors](#) property. To customize the color palette, add a custom class to palette tiles using [beforeTileRender](#) event.

The following sample demonstrates the above functionalities.

INDEX.TS

```

import { ColorPicker, PaletteTileEventArgs, ColorPickerEventArgs } from
 '@syncfusion/ej2-inputs';
import { addClass, enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let colorPicker: ColorPicker = new ColorPicker({

```

```

mode: 'Palette',
inline: true,
modeSwitcher: false,
showButtons: false,
// To specify number of columns to be rendered.
columns: 4,
value: '#ba68c8',
//To load custom colors.
presetColors: {
  'custom1': ['#ef9a9a', '#e57373', '#ef5350', '#f44336',
    '#f48fb1', '#f06292',
    '#ec407a', '#e91e63', '#ce93d8', '#ba68c8', '#ab47bc',
    '#9c27b0', '#b39ddb',
    '#9575cd', '#7e57c2', '#673ab7'],
  'custom2': ['#9fa8da', '#7986cb', '#5c6bc0', '#3f51b5',
    '#90caf9', '#64b5f6',
    '#42a5f5', '#2196f3', '#81d4fa', '#4fc3f7', '#29b6f6',
    '#03a9f4',
    '#80deea', '#4dd0e1', '#26c6da', '#00bcd4'],
  'custom3': ['#80cbc4', '#4db6ac', '#26a69a', '#009688',
    '#a5d6a7', '#81c784',
    '#66bb6a', '#4caf50', '#c5e1a5', '#aed581', '#9ccc65',
    '#8bc34a', '#e6ee9c',
    '#dce775', '#d4e157', '#cddc39']
},
// Triggers before rendering each palette tile.
beforeTileRender: (args: PaletteTileEventArgs): void => {
  addClass([args.element], ['e-icons', 'e-custom-tile']);
},
// Triggers while selecting colors from palette.
change: (args: ColorPickerEventArgs): void => {
  document.getElementById('preview').style.backgroundColor =
args.currentValue.hex;
}
}, '#element');

```

  content: '\e933';
}
#element+.e-container .e-palette .e-custom-tile.e-selected {
  outline: none;
}
```

Hide input area from picker

By default, the input area will be rendered in ColorPicker. To hide the input area from it, add `e-hide-value` class to ColorPicker using the [cssClass](#) property.

In the following sample, the ColorPicker is rendered without input area.

INDEX.TS

```
import { ColorPicker } from '@syncfusion/ej2-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let colorPicker: ColorPicker = new ColorPicker(
  {
    // To hide the input area
    cssClass: 'e-hide-value',
    modeSwitcher: false
  },
  '#element');
```

INDEX.HTML

    text-align: center;
}
```

Custom handle

Color picker handle shape and UI can be customized. Here, we have customized the handle as **svg icon**. The same way you can customize the handle based on your requirement.

The following sample show the customized color picker handle.

INDEX.TS

```
import { ColorPicker, OpenEventArgs } from '@syncfusion/ej2-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let colorPicker: ColorPicker = new ColorPicker(
    {
        value: '#344aee',
        // To hide the input area
        cssClass: 'e-custom-picker',
        modeSwitcher: false,
        open: (args: OpenEventArgs): void => {
            args.element.querySelector('.e-handler').classList.add('e-
icons');
        },
    },
    '#element');
```

INDEX.HTML

```

```
}

```

Custom primary button

By default, the applied color will be updated in primary button of the color picker. You can customize that as **icon**.

In the following sample, the **picker** icon is added to primary button and using [change](#) event the selected color will be updated in bottom portion of the icon.

INDEX.TS

```
import { ColorPicker, ColorPickerEventArgs } from '@syncfusion/ej2-inputs';
import { addClass, enableRipple } from '@syncfusion/ej2-base';
let colorPicker: ColorPicker = new ColorPicker(
    {
        change: (args: ColorPickerEventArgs): void => {
            (colorPicker.element.nextElementSibling.querySelector('.e-selected-color') as HTMLElement).style.borderBottomColor =
            args.currentValue.rgba;
        },
        '#element');
addClass([colorPicker.element.nextElementSibling.querySelector('.e-selected-color')], 'e-icons');
```

INDEX.HTML

```

> The Essential JS 2 provides a set of icons that can be loaded by applying `e-icons` class name to the element. You can also use third party icon to customize the primary button.

Display hex code in input

The color picker input element can be showcased in the place of primary button. The applied color hex code will be updated in the primary button input.

The following sample shows the color picker with input.

INDEX.TS

```
import { ColorPicker } from '@syncfusion/ej2-inputs';
import { addClass, enableRipple } from '@syncfusion/ej2-base';
let colorPicker: ColorPicker = new ColorPicker({}, '#element');
let target: Element = colorPicker.element.nextElementSibling;
target.insertBefore(colorPicker.element, target.children[1]);
```

Custom UI

The color picker UI can be customized in all possible ways. The following sample shows the excel like UI customization with help of SplitButton and Dialog component. In that by clicking the more colors option from color palette, the dialog contains color picker will open.

INDEX.TS

```
import { ColorPicker, ColorPickerEventArgs } from '@syncfusion/ej2-inputs';
import { Dialog } from '@syncfusion/ej2-popups';
import { addClass, enableRipple, EmitType } from '@syncfusion/ej2-base';
import { SplitButton, OpenCloseMenuEventArgs, BeforeOpenCloseMenuEventArgs }
from '@syncfusion/ej2-splitbuttons';
let colorPalette: ColorPicker = new ColorPicker(
  {
    mode: 'Palette',
    inline: true,
    showButtons: false,
    modeSwitcher: false,
    change: paletteOnChange
  }
, '#palette');
let splitBtn: SplitButton = new SplitButton(
  {
    target: '#target',
    iconCss: 'e-icons e-font-icon',
    open: (args: OpenCloseMenuEventArgs) => {
      args.element.children[1].addEventListener('click', openDialog);
    },
    beforeClose: (args: BeforeOpenCloseMenuEventArgs): void => {
      args.element.children[1].removeEventListener('click',
openDialog);
    }
  }
, '#split-btn');
let modalDialog: Dialog = new Dialog(
  {
    target: '.wrap',
    width: '270px',
    height: '336px',
    isModal: true,
    visible: false,
    cssClass: 'e-dlg-picker',
    content: '<input type="color" id="picker" />',
    animationSettings: { effect: 'Zoom' },
    open: dialogOpen,
    overlayClick: dlgClose
  }
, '#modal-dialog');
let colorPicker: ColorPicker = new ColorPicker(
  {
    inline: true,
```

```

        modeSwitcher: false,
        change: pickerOnChange
    }
    , '#picker');
function openDialog(): void {
    modalDialog.show();
}
function dialogOpen(): void {
    colorPicker.refresh();
    colorPicker.element.nextElementSibling.querySelector('.e-ctrl-btn .e-
cancel').addEventListener('click', dlgClose);
}
function dlgClose(): void {
    modalDialog.hide();
}
function paletteOnChange(args: ColorPickerEventArgs): void {
    (splitBtn.element.querySelector('.e-font-icon') as
HTMLElement).style.borderBottomColor = args.currentValue.rgba;
}
function pickerOnChange(args: ColorPickerEventArgs): void {
    paletteOnChange(args);
    dlgClose();
}
}

```

```

Handle no color support in EJ2 JavaScript Color picker control

The ColorPicker component supports no color functionality. By clicking the no color tile from palette, the selected color becomes **empty** and considered as no color has been selected from color picker.

Default no color

To achieve this, set **noColor** property as **true**.

In the following sample, the first tile of the color palette represents the no color tile. By clicking the no color tile you can achieve the above functionalities.

INDEX.TS

```

import { ColorPicker, ColorPickerEventArgs } from '@syncfusion/ej2-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
let preview: HTMLElement = document.getElementById('preview');
let colorPicker: ColorPicker = new ColorPicker(
  {
    mode: "Palette",
    value: "#ba68c8",
    showButtons: false,
    modeSwitcher: false,
    //To enable no color support
    noColor: true,
    change: (args: ColorPickerEventArgs): void => {
      preview.style.backgroundColor = args.currentValue.hex;
      preview.textContent = args.currentValue.hex ?
args.currentValue.hex : 'No color';
    },
    '#element');
preview.style.backgroundColor = "#ba68c8";
preview.textContent = "#ba68c8";

```

INDEX.HTML

```

Disabled in EJ2 JavaScript Color picker control

To achieve disabled state in ColorPicker, set the [disabled](#) property to `true`. The ColorPicker pop-up cannot be accessed in disabled state.

The following example shows the `disabled` state of ColorPicker component.

INDEX.TS

```

import { ColorPicker } from '@syncfusion/ej2-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let colorPicker: ColorPicker = new ColorPicker({ disabled: true },
'#element');

```

INDEX.HTML

```

Ej1 api migration in EJ2 JavaScript Color picker control

This article describes the API migration process of ColorPicker component from Essential JS 1 to Essential JS 2.

Properties

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Default | **property:** `value`
`
</br>$("#colorpicker").ejColorPicker({ value: "#278787" });` | **property:** `value`
`
</br>var colorPickerObj = new ej.inputs.ColorPicker({ value: '#278787' });
colorPickerObj.appendTo('#colorpicker');` |

| Inline mode color picker | **property:** `displayInline`
`
</br>$("#colorpicker").ejColorPicker({ displayInline: true });` | **property:** `inline`
`
</br>var colorPickerObj = new ej.inputs.ColorPicker({ inline: true });
colorPickerObj.appendTo('#colorpicker');` |

| Adding custom class | **property:** `cssClass`
`
</br>$("#colorpicker").ejColorPicker({ cssClass: "e-custom" });` | **property:** `cssClass`
`
</br>var colorPickerObj = new ej.inputs.ColorPicker({ cssClass: 'e-custom' });
colorPickerObj.appendTo('#colorpicker');` |

| Disable the ColorPicker component | **property:** `enabled`
`
</br>$("#colorpicker").ejColorPicker({ enabled: false });` | **property:** `disabled`
`
</br>var colorPickerObj = new ej.inputs.ColorPicker({ disabled: true });
colorPickerObj.appendTo('#colorpicker');` |

| To display custom text in button elements | **property:** `buttonText`
`
</br>$("#colorpicker").ejColorPicker({ buttonText: { apply: "Apply", cancel: "Cancel", swatches: "Swatches" } });` | Not Applicable |

| To display customized text or content when mouse over the color picker elements | **property:** `tooltipText`
`
</br>$("#colorpicker").ejColorPicker({ tooltipText: { switcher: "Switch", currentColor: "New Color", selectedColor: "Old Color" } });` | Not Applicable |

| Disable / hide opacity | **property:** `enableOpacity`
`
</br>$("#colorpicker").ejColorPicker({ enableOpacity: false });` | **property:** `enableOpacity`
`
</br>var colorPickerObj = new ej.inputs.ColorPicker({ enableOpacity: false });
colorPickerObj.appendTo('#colorpicker');` |

| ColorPicker Button mode | **property:** `buttonMode`
`
</br>$("#colorpicker").ejColorPicker({ buttonMode: "Dropdown" });` | Not Applicable |

| To show / hide the control (apply / cancel) buttons | **property:** `showApplyCancel`
`
</br>$("#colorpicker").ejColorPicker({ showApplyCancel: false });` | **property:** `showButtons`
`
</br>var colorPickerObj = new ej.inputs.ColorPicker({ showButtons: false });
colorPickerObj.appendTo('#colorpicker');` |

| To show / hide the clear button | **property:** `showClearButton`
`
</br>$("#colorpicker").ejColorPicker({ showClearButton: true });` | Not Applicable |

| Show / hide the mode (picker / palette) switcher | **property:** `showSwitcher`
`
</br>$("#colorpicker").ejColorPicker({ showSwitcher: false });` | **property:** `modeSwitcher`
`
</br>var colorPickerObj = new ej.inputs.ColorPicker({ modeSwitcher: false });
colorPickerObj.appendTo('#colorpicker');` |

| To show / hide the preview area | **property:** `showPreview`
`
</br>$("#colorpicker").ejColorPicker({ showPreview: false });` | Not Applicable |

| To show / hide the recent selected color list | **property:** `showRecentColors`
`
</br>$("#colorpicker").ejColorPicker({ showRecentColors: true });` | Not Applicable |

| To show / hide the color picker slider tooltip | **property:**

showTooltip

\$("#colorpicker").ejColorPicker({
 showTooltip: false
}); | Not Applicable |

| Custom icon in dropdown control color area | **property:**

toolIcon

\$("#colorpicker").ejColorPicker({
 toolIcon: null
}); | Not Applicable |

| ColorPicker mode | **property:** *modelType*

\$("#colorpicker").ejColorPicker({

modelType: "picker"
}); | **property:** *mode*

var colorPickerObj = new ej.inputs.ColorPicker({
 mode: 'Palette'
});
colorPickerObj.appendTo('#colorpicker'); |

| Opacity value | **property:** *opacityValue*

\$("#colorpicker").ejColorPicker({
 opacityValue: 80
}); | Not Applicable |

| Number of columns in color palette | **property:**

columns

\$("#colorpicker").ejColorPicker({
 columns: 10
}); | **property:** *columns*

var colorPickerObj = new ej.inputs.ColorPicker({
 columns: 15
});
colorPickerObj.appendTo('#colorpicker'); |

| Custom colors | **property:** *palette*

\$("#colorpicker").ejColorPicker({
 palette:

ej.ColorPicker.Palette.CustomPalette
 custom: ["ffffff", "ffccff", "ff99ff", "ff66ff",
 "ff33ff", "ff00ff", "ccffff", "ccccff",
 "cc99ff", "cc66ff", "cc33ff", "cc00ff",
 "99ffff", "99ccff", "9999ff", "9966ff",
 "9933ff", "9900ff", "ffffcc", "ffcccc"
]
}); | **property:** *presetColors*

var colorPickerObj = new ej.inputs.ColorPicker({
 presetColors: {
 'custom': ["ffffff", "ffccff", "ff99ff", "ff66ff",
 "ff33ff", "ff00ff", "ccffff", "ccccff",
 "cc99ff", "cc66ff", "cc33ff", "cc00ff",
 "99ffff", "99ccff", "9999ff", "9966ff",
 "9933ff", "9900ff", "ffffcc", "ffcccc"
}
});
colorPickerObj.appendTo('#colorpicker'); |

| Rendering palette from the predefined set of palettes | **property:**

presetType

\$("#colorpicker").ejColorPicker({
 presetType: ej.ColorPicker.Presets.FlatColors
}); | Not Applicable |

| No color option in color palette | Not Applicable | **property:** *noColor*

var colorPickerObj = new ej.inputs.ColorPicker({
 noColor: true,
 modeSwitcher: false
 mode: 'Palette'
});
colorPickerObj.appendTo('#colorpicker'); |

| Localization | **property:** *locale*

\$("#colorpicker").ejColorPicker({
 locale: 'zh-

CN'
});
ej.ColorPicker.Locale["zh-CN"] = {
 buttonText: {
 apply: "应用",
 cancel: "取消",
 swatches: "色板"
 },
 tooltipText: {
 switcher: "切换器,
 addBtn: "添加颜色",
 basic: "基本"
 }
 } | **property:** *locale*

var colorPickerObj = new ej.inputs.ColorPicker({
 locale: 'ar'
});
colorPickerObj.appendTo('#colorpicker');
ej.base.L10n.load({
 'ar': {
 'colorpicker': {
 "Apply": "تطبيق",
 "Cancel": "إلغاء",
 "ModeSwitcher": "مفتاح كهربائي الوضع"
 }
 }
}); |

| Right to left | **property:** *enableRTL*

\$("#colorpicker").ejColorPicker({
 enableRTL:

true
}); | **property:** *enableRtl*

var colorPickerObj = new ej.inputs.ColorPicker({
 enableRtl: true
});
colorPickerObj.appendTo('#colorpicker'); |

Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Method to open color picker popup | **Method:** *show*

\$("#colorpicker").ejColorPicker({});
 var colorPickerObj = \$("#colorpicker").data("ejColorPicker");
 colorPickerObj.show(); | **Method:** *toggle*

var colorPickerObj = new ej.inputs.ColorPicker({});
 colorPickerObj.appendTo('#colorpicker');
 colorPickerObj.toggle(); |

| Method to close color picker popup | **Method:** *hide*

\$("#colorpicker").ejColorPicker({});
 var colorPickerObj = \$("#colorpicker").data("ejColorPicker");
 colorPickerObj.hide(); | **Method:** *toggle*

var colorPickerObj = new ej.inputs.ColorPicker({});
 colorPickerObj.appendTo('#colorpicker');
 colorPickerObj.toggle(); |

| Enable the color picker control | **Method:** *enable*

\$("#colorpicker").ejColorPicker({});
 var colorPickerObj = \$("#colorpicker").data("ejColorPicker");
 colorPickerObj.enable(); | Not Applicable |

| Disables the color picker control | **Method:** *disable*

\$("#colorpicker").ejColorPicker({});
 var colorPickerObj = \$("#colorpicker").data("ejColorPicker");
 colorPickerObj.disable(); | Not Applicable |

| Method returns the selected color value as hex code | **Method:** *getValue*

\$("#colorpicker").ejColorPicker({});
 var colorPickerObj = \$("#colorpicker").data("ejColorPicker");
 colorPickerObj.getValue(); | **Method:** *getValue*

var colorPickerObj = new ej.inputs.ColorPicker({});
 colorPickerObj.appendTo('#colorpicker');
 colorPickerObj.getValue(); |

| Method returns the selected color value in RGB format | **Method:** *getColor*

\$("#colorpicker").ejColorPicker({});
 var colorPickerObj = \$("#colorpicker").data("ejColorPicker");
 colorPickerObj.getColor(); | **Method:** *getValue*

| Event triggers after opening the ColorPicker popup | **Event:**
open

 \$("#colorpicker").ejColorPicker({
 open: function(args) {
 }); | **Event:**
open

 var colorPickerObj = new ej.inputs.ColorPicker({
open: function(args) {

});
 colorPickerObj.appendTo('#colorpicker');|

| Event triggers after closing the ColorPicker popup | **Event:**
close

 \$("#colorpicker").ejColorPicker({
 close: function(args) {
 }); | Not Applicable |

| Event triggers once the component rendering is completed | **Event:**
create

 \$("#colorpicker").ejColorPicker({
 create: function(args) {
 }); | **Event:**
created

 var colorPickerObj = new ej.inputs.ColorPicker({
created: function() {

});
 colorPickerObj.appendTo('#colorpicker');|

| Event triggers once the color picker control is destroyed | **Event:**
destroy

 \$("#colorpicker").ejColorPicker({
 destroy: function(args) {
 }); | Not
Applicable |

| Event triggers before Switching between Picker / Palette mode | Not Applicable | **Event:**
beforeModeSwitch

 var colorPickerObj = new ej.inputs.ColorPicker({
beforeModeSwitch:
function(args) {
 });
 colorPickerObj.appendTo('#colorpicker');|

| Event triggers after color value has been selected | **Event:**
select

 \$("#colorpicker").ejColorPicker({
 select: function(args) {
 }); | **Event:**
select

 var colorPickerObj = new ej.inputs.ColorPicker({
select: function(args) {

});
 colorPickerObj.appendTo('#colorpicker');|

| Event triggers after color value has been changed | **Event:**
change

 \$("#colorpicker").ejColorPicker({
 change: function(args) {
 }); | **Event:**
change

 var colorPickerObj = new ej.inputs.ColorPicker({
change: function(args) {

});
 colorPickerObj.appendTo('#colorpicker');|

ComboBox

Tags in EJ2 JavaScript Combo box control

The ComboBox can be initialized on three different tags as described in below. Though it is initialized in different tags, the UI appearance and built-in features behave in the same way.

Select element

When a ComboBox is initialized on SELECT element, the list items can be assigned through the option tag of the HTML select element.

- The nested items are wrapped and grouped based on the `optgroup` tag that is available within the element, by default. You can preselect the option by setting the `selected` attribute to an option tag.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
// initialize ComboBox component
let comboBoxObject: ComboBox = new ComboBox({
    placeholder: "Select a vegetable",
    popupHeight: "200px"
});
// render initialized ComboBox
comboBoxObject.appendTo('#selectElement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 ComboBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

UL element

The ComboBox can be initialized through `` element which contains a collection of `` element. The `` items act as a popup list items of the ComboBox. The inner text of the `` element is considered both as text and value fields.

INDEX.TS

```

import { ComboBox } from '@syncfusion/ej2-dropdowns';
// initialize ComboBox component
let comboBoxObject: ComboBox = new ComboBox({
    placeholder:"Select a vegetable"
});
// render initialized ComboBox
comboBoxObject.appendTo('#ulElement');

```

</body></html>

```

Input element

The ComboBox has also be rendered through `<input>` element with an array of either simple or complex data that is set through the [dataSource](#) property. It can retrieve data from local data sources as well as remote data services.

Detailed information about the data binding with an example is available in: [Data Binding to ComboBox](#)

Data binding in EJ2 JavaScript Combo box control

The ComboBox loads the data either from local data sources or remote data services using the [dataSource](#) property. It supports the data type of `array` or `DataManager`.

The ComboBox also supports different kinds of data services such as OData, OData V4, and Web API, and data formats such as XML, JSON, and JSONP with the help of `DataManager` adaptors.

Fields	Type	Description
text	string	Specifies the display text of each list item.
value	number or string	Specifies the hidden data value mapped to each list item that should contain a unique value.
groupBy	string	Specifies the category under which the list item has to be grouped.
iconCss	string	Specifies the icon class of each list item.

When binding complex data to the ComboBox, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Binding local data

Local data can be represented in two ways as described below.

1. Array of simple data

The ComboBox has support to load array of primitive data such as strings and numbers. Here, both value and text field act the same.

INDEX.TS

```

import { ComboBox } from '@syncfusion/ej2-dropdowns';
// defined the array of data

```

```
let sportsData: string[] = ['Badminton', 'Cricket', 'Football', 'Golf'];
// initialize ComboBox component
let comboBoxObject: ComboBox = new ComboBox({
    //set the data to dataSource property
    dataSource: sportsData,
    // set placeholder to ComboBox input element
    placeholder: "Select a game"
});
// render initialized ComboBox
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 ComboBox</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="styles.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <br>
        <input type="text" tabindex="1" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

2. Array of JSON data

The ComboBox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Id** column and **Game** column from complex data have been mapped to the **value** field and **text** field, respectively.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let sportsData: { [key: string]: Object }[] = [
    { Id: 'Game1', Game: 'Badminton' },
    { Id: 'Game2', Game: 'Basketball' },
    { Id: 'Game3', Game: 'Cricket' },
    { Id: 'Game4', Game: 'Football' },
    { Id: 'Game5', Game: 'Golf' }
];
//initiate the ComboBox
let comboBoxObject: ComboBox = new ComboBox({
    // bind the sports Data to datasource property
    dataSource: sportsData,
    // maps the appropriate column to fields property
    fields: { text: 'Game', value: 'Id' },
    //set the placeholder to ComboBox input
    placeholder:"Select a game"
});
//render the component
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 ComboBox</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="styles.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <br>
        <input type="text" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
```

```
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

3. Array of Complex data

The ComboBox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, `Code.Id` column and `Country.Name` column from complex data have been mapped to the `value` field and `text` field, respectively.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let countriesData: { [key: string]: Object }[] = [
    { Country: { Name: 'Australia' }, Code: { Id: 'AU' } },
    { Country: { Name: 'Bermuda' }, Code: { Id: 'BM' } },
    { Country: { Name: 'Canada' }, Code: { Id: 'CA' } },
    { Country: { Name: 'Cameroon' }, Code: { Id: 'CM' } },
    { Country: { Name: 'Denmark' }, Code: { Id: 'DK' } },
    { Country: { Name: 'France' }, Code: { Id: 'FR' } }
];
//initiate the ComboBox
let comboBoxObject: ComboBox = new ComboBox({
    // bind the sports Data to datasource property
    dataSource: countriesData,
    // maps the appropriate column to fields property
    fields: { text: 'Country.Name', value: 'Code.Id' },
    //set the placeholder to ComboBox input
    placeholder: "Select a country"
});
//render the component
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
```

```
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <br>
        <input type="text" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Binding remote data

The ComboBox supports retrieval of data from remote data services with the help of **DataManager** component. The **Query** property is used to fetch data from the database and bind it to the ComboBox.

In the following sample, displayed first 6 contacts from the **customer** table of **Northwind** Data Service.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
//import DataManager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let customers: ComboBox = new ComboBox({
    //bind the DataManager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'ContactName', value: 'CustomerID' },
    //sort the resulted items
    sortOrder: 'Ascending',
    //set the placeholder to ComboBox input
    placeholder: "Select a customer"
});
//render the component
customers.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 ComboBox</title>
    <meta charset="utf-8">

Templates in EJ2 JavaScript Combo box control

The ComboBox has been provided with several options to customize each list item, group title, selected value, header, and footer elements. It uses the Essential JS 2 [Template engine](#) to compile and render the elements properly.

Item template

The content of each list item within the ComboBox can be customized with the help of [itemTemplate](#) property.

In the following sample, each list item is split into two columns to display relevant data's.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
```

```
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let ComboBoxObject: ComboBox = new ComboBox({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Employees').select(['FirstName',
'City', 'EmployeeID']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'FirstName', value: 'EmployeeID' },
    //set the placeholder to ComboBox input
    placeholder: "Select an employee",
    //sort the resulted items
    sortOrder: 'Ascending',
    //set the value to itemTemplate property
    itemTemplate: "<span><span class='name'>${FirstName}</span><span class
='city'>${City}</span></span>"
});
//render the component
ComboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 ComboBox</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">

if(ele) {
    ele.style.visibility = "visible";
```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Group template

The group header title under which appropriate sub-items are categorized can also be customize with the help of [groupTemplate](#) property. This template is common for both inline and floating group header template.

In the following sample, employees are grouped according to their city.

INDEX.TS

```

import { ComboBox } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, Predicate , DataManager, ODataV4Adaptor } from
 '@syncfusion/ej2-data';
// form predicate to fetch the grouped data
let groupPredicate = new Predicate('City',
'equal','london').or('City','equal','seattle');
//initiates the component
let ComboBoxObject: ComboBox = new ComboBox({
  //bind the data manager instance to dataSource property
  dataSource: new DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
  }),
  //bind the Query instance to query property
  query: new Query().from('Employees').select(['FirstName',
'City','EmployeeID']).take(5)
  .where(groupPredicate),
  //map the appropriate columns to fields property
  fields: { text: 'FirstName', value: 'EmployeeID', groupBy: 'City' },
  //set the placeholder to ComboBox input
  placeholder: "Select an employee",
  //sort the resulted items
  sortOrder: 'Ascending',
  //set the value to groupTemplate
  groupTemplate: "<strong>${City}</strong>"
});
//render the component
ComboBoxObject.appendTo('#comboelement');

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Header template

The header element is shown statically at the top of the popup list items within the ComboBox, and any custom element can be placed as a header element using the [headerTemplate](#) property.

In the following sample, the list items and its headers are designed and displayed as two columns similar to multiple columns of the grid.

INDEX.TS

```

import { ComboBox } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let ComboBoxObject: ComboBox = new ComboBox({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Employees').select(['FirstName',
'City','EmployeeID']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'FirstName', value: 'EmployeeID' },
    //set the placeholder to ComboBox input
    placeholder: "Select an employee",
    //sort the resulted items
    sortOrder: 'Ascending',

```

```
//set the value to header template
headerTemplate:"<span class='head'><span class='name'>Name</span><span
class='city'>City</span></span>",
//set the value to item template
itemTemplate:"<span class='item' ><span
class='name'>${FirstName}</span><span class='city'>${City}</span></span>"
});
//render the component
ComboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Footer template

The ComboBox has options to show a footer element at the bottom of the list items in the popup list. Here, you can place any custom element as a footer element using the [footerTemplate](#) property.

In the following sample, footer element displays the total number of list items present in the ComboBox.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
let sportsData = ["Football", "BasketBall", "Golf", "Cricket"];
```

```
//initiates the component
let ComboBoxObject: ComboBox = new ComboBox({
  //bind the data manager instance to dataSource property
  dataSource: sportsData,
  //set the placeholder to ComboBox input
  placeholder:"Select a game",
  //sort the resulted items
  sortOrder: 'Ascending',
  //set the value to footer template
  footerTemplate:"<span class='foot'> Total list items: "+
sportsData.length + "</span>"
});
//render the component
ComboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

No records template

The ComboBox is provided with support to custom design the popup list content when no data is found and no matches found on search with the help of [noRecordsTemplate](#) property.

In the following sample, popup list content displays the notification of no data available.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
//initiates the component
let ComboBoxObject: ComboBox = new ComboBox({
    //bind the data manager instance to dataSource property
    dataSource: [],
    //set the placeholder to ComboBox input
    placeholder:"Select an item",
    //set the value to noRecords template
    noRecordsTemplate:"<span class='norecord'> NO DATA AVAILABLE</span>"
});
//render the component
ComboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 ComboBox</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <input type="text" tabindex="1" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Action failure template

There is also an option to custom design the popup list content when the data fetch request fails at the remote server. This can be achieved using the [actionFailureTemplate](#) property.

In the following sample, when the data fetch request fails, the ComboBox displays the notification.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let ComboBoxObject: ComboBox = new ComboBox({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        // Here, use the wrong url to display the action failure
        template
            url: 'https://services.odata.org/V4/Northwind/Northwind.svcs/',
            adaptor: new ODataV4Adaptor,
            crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Employees').select(['FirstName']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'FirstName', value: 'EmployeeID' },
    //set the placeholder to ComboBox input
    placeholder: "Select an employee",
    //set the value to action failure template
    actionFailureTemplate: "<span class='action-failure'> Data fetch get
fails</span>"
});
//render the component
ComboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

Grouping in EJ2 JavaScript Combo box control

The ComboBox supports wrapping nested elements into a group based on different categories. The category of each list item can be mapped through the [groupBy](#) field in the data table. The group header is displayed both as inline and fixed headers. The fixed group header content is updated dynamically on scrolling the popup list with its category value.

In the following sample, vegetables are grouped according on its category using `groupBy` field.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
//define the data with category
let vegetableData: { [key: string]: Object }[] = [
  { Vegetable: 'Chickpea', Category: 'Beans', Id: '1' },
  { Vegetable: 'Green bean', Category: 'Beans', Id: '2' },
  { Vegetable: 'Spinach', Category: 'Leafy and Salad', Id: '3' },
  { Vegetable: 'Horse gram', Category: 'Beans', Id: '4' },
  { Vegetable: 'Cabbage', Category: 'Leafy and Salad', Id: '5' },
  { Vegetable: 'Wheat grass', Category: 'Leafy and Salad', Id: '6' },
  { Vegetable: 'Yarrow', Category: 'Leafy and Salad', Id: '7' }
];
//initiate the ComboBox
let vegetables: ComboBox = new ComboBox({
  //set the grouped data to dataSource property
  dataSource: vegetableData,
  // map the groupBy field with Category column
  fields: { groupBy: 'Category', text: 'Vegetable', value: 'Id' },
  // set the placeholder to the ComboBox input
  placeholder: "Select a vegetable",
  // Set the popup list height
  popupHeight: '200px'
});
//render the ComboBox component
vegetables.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

HTML select

The ComboBox also supports grouping of list items under specific groups by initiating the `<select>` element using `optgroup`. The nested items are wrapped based on the `<optgroup>` tag that is presents in the `<select>` element

```
<select id="selectElement">
  <optgroup label="Beans">
    <option value="1">Chickpea</option>
    <option value="2">Green bean</option>
    <option value="3" selected="selected">Horse gram</option>
  </optgroup>
```

```
<optgroup label="Leafy and Salad">
<option value="4">Spinach</option>
<option value="5">Cabbage</option>
<option value="6">Wheat grass</option>
<option value="7">Yarrow</option>
</optgroup>
</select>
```

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
// initialize ComboBox component
let ComboBoxObject: ComboBox = new ComboBox({
  placeholder: "Select a vegetable",
  popupHeight: "200px"
});
// render initialized ComboBox
ComboBoxObject.appendTo('#selectElement');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customization

The grouping header is also provided with customization option. This allows custom designing using the [groupTemplate](#) property for both inline and fixed headers.

- [Group Template support to ComboBox.](#)

Filtering in EJ2 JavaScript Combo box control

The ComboBox has built-in support to filter data items when `allowFiltering` is enabled. The filter operation starts as soon as you start typing characters in the component.

To display filtered items in the popup, filter the required data and return it to the ComboBox via [updateData](#) method by using the [filtering](#) event.

The following sample illustrates how to query the data source and pass the data to the ComboBox through the `updateData` method in `filtering` event.

INDEX.TS

```

import { ComboBox, FilteringEventArgs } from '@syncfusion/ej2-dropdowns';
import { DataManager, Query } from '@syncfusion/ej2-data';
let searchData: { [key: string]: Object; }[] = [
    { Index: "s1", Country: "California" }, { Index: "s2", Country: "Florida" },
    { Index: "s3", Country: "Alaska" }, { Index: "s4", Country: "Georgia" }
];
let filter: ComboBox = new ComboBox({
    //set the search data to dataSource property
    dataSource: searchData,
    //map the appropriate columns to fields property
    fields: { text: "Country", value: "Index" },
    //set the placeholder to ComboBox input
    placeholder: "Select a country",
    //enable to filtering in ComboBox
    allowFiltering: true,
    //sort the resulted items
    sortOrder: 'Ascending',
    //Bind the filter event

```

```

    filtering: function (e: FilteringEventArgs) {
        let query = new Query();
        //frame the query based on search string with filter type.
        query = (e.text != "") ? query.where("Country", "startswith",
e.text, true) : query;
        //pass the filter data source, filter query to updateData method.
        e.updateData(searchData, query);
    }
});
filter.appendTo('#comboelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 ComboBox</title>

type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <br>
        <input type="text" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Limit the minimum filter character

When filtering the list items, you can set the limit for character count to raise remote request and fetch filtered data on the ComboBox. This can be done by manual validation within the filter event handler.

In the following example, the remote request does not fetch the search data until the search key contains three characters.

INDEX.TS

```
import { ComboBox, FilteringEventArgs } from '@syncfusion/ej2-dropdowns';
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
let searchData: DataManager = new DataManager({
    url:
    'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
});
let filter: ComboBox = new ComboBox({
    dataSource: searchData,
    query: new Query().select(['ContactName', 'CustomerID']).take(6),
    // map the appropriate column
    fields: { text: 'ContactName', value: 'CustomerID' },
    // set placeholder to ComboBox input element
    placeholder: "Select a customer",
    // set true to allowFiltering for enable filtering supports
    allowFiltering: true,
    //sort the resulted items
    sortOrder: 'Ascending',
    //bind the filtering event handler
    filtering: (e: FilteringEventArgs) => {
        // load overall data when search key empty.
        if(e.text == '') e.updateData(searchData);
        else{
            // restrict the remote request until search key contains 3
            characters.
            if (e.text.length < 3) { return; }
            let query: Query = new Query().select(['ContactName',
            'CustomerID']);
            query = (e.text !== '') ? query.where('ContactName', 'startswith',
            e.text, true) : query;
            e.updateData(searchData, query);
        }
    }
});
filter.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 ComboBox</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <br>
        <input type="text" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Change the filter type

While filtering, you can change the filter type to `contains`, `startsWith`, or `endsWith` for string type within the filter event handler.

In the following examples, data filtering is done with `endsWith` type.

INDEX.TS

```
import { ComboBox, FilteringEventArgs } from '@syncfusion/ej2-dropdowns';
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
let searchData: DataManager = new DataManager({
    url:
    'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
});
let filter: ComboBox = new ComboBox({
    dataSource: searchData,
    query: new Query().select(['ContactName', 'CustomerID']).take(6),
    // map the appropriate column
    fields: { text: 'ContactName', value: 'CustomerID' },
    // set placeholder to ComboBox input element
    placeholder: "Select a customer",
    //set the height of the popup element
    popupHeight: "250px",
    //sort the resulted items
    sortOrder: 'Ascending',
    // set true to allowFiltering for enable filtering supports
    allowFiltering: true,
    //bind the filtering event handler
    filtering: (e: FilteringEventArgs) => {
        // load overall data when search key empty.
        if(e.text == '') e.updateData(searchData);
        else{
            let query: Query = new Query().select(['ContactName',
            'CustomerID']);
```

```

        // change the type of filtering to ends with filtering
        query = (e.text !== '') ? query.where('ContactName', 'endswith',
e.text, true) : query;
        e.updateData(searchData, query);
    }
}
});
filter.appendTo('#comboelement');

```

Case sensitive filtering

Data items can be filtered either with or without case sensitivity using the DataManager. This can be done by passing the fourth optional parameter of the `where` clause.

The following example shows how to perform case-sensitive filter.

INDEX.TS

```

import { ComboBox, FilteringEventArgs } from '@syncfusion/ej2-dropdowns';
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';

```

```
// defined the dataManager
let searchData: DataManager = new DataManager({
    url:
    'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
});
let filter: ComboBox = new ComboBox({
    dataSource: searchData,
    query: new Query().select(['ContactName', 'CustomerID']).take(6),
    // map the appropriate column
    fields: { text: 'ContactName', value: 'CustomerID' },
    // set placeholder to ComboBox input element
    placeholder: "Select a customer",
    // set true to allowFiltering for enable filtering supports
    allowFiltering: true,
    //sort the resulted items
    sortOrder: 'Ascending',
    //set the height of the popup element
    popupHeight: "250px",
    //bind the filtering event handler
    filtering: (e: FilteringEventArgs) => {
        // load overall data when search key empty.
        if(e.text == '') e.updateData(searchData);
        else{
            let query: Query = new Query().select(['ContactName',
            'CustomerID']);
            //enable the case sensitive filtering by passing false to 4th
            parameter.
            query = (e.text !== '') ? query.where('ContactName', 'startswith',
            e.text, false) : query;
            e.updateData(searchData, query);
        }
    }
});
filter.appendTo('#comboelement');
```

INDEX.HTML

```

```

Diacritics Filtering

The ComboBox supports diacritics filtering which will ignore the [diacritics](#) and makes it easier to filter the results in international characters lists when the [ignoreAccent](#) is enabled.

In the following sample, data with diacritics are bound as dataSource for ComboBox.

INDEX.TS

```

import { ComboBox } from '@syncfusion/ej2-dropdowns';
// create local data
let data: string[] = [
    'Aeróbics',
    'Aeróbics en Agua',
    'Aerografía',
    'Aerodelaje',
    'Águilas',
    'Ajedrez',
    'Ala Delta',
    'Álbumes de Música',
    'Alusivos',
    'Análisis de Escritura a Mano'];
// initialize ComboBox component
let comboObj: ComboBox = new ComboBox({
    //set the local data to dataSource property
    dataSource: data,
    // set the placeholder to ComboBox input element
    placeholder: 'e.g: aero',
    // enabled the ignoreAccent property for ignore the diacritics
    ignoreAccent: true,
    // set true for enable the filtering support.
    allowFiltering: true
});
comboObj.appendTo('#comboelement');

```

INDEX.HTML

```

Virtualization in ComboBox Component

ComboBox virtualization is a technique used to efficiently render extensive lists of items while minimizing the impact on performance. This method is particularly advantageous when dealing with large datasets because it ensures that only a fixed number of DOM (Document Object Model) elements are created. When scrolling through the list, existing DOM elements are reused to display relevant data instead of generating new elements for each item. This recycling process is managed internally.

During virtual scrolling, the data retrieved from the data source depends on the popup height and the calculation of the list item height. Enabling the [enableVirtualization](#) option in a ComboBox activates this virtualization technique.

When fetching data from the data source, the [actionBegin](#) event is triggered before data retrieval begins. Then, the [actionComplete](#) event is triggered once the data is successfully fetched.

Furthermore, Incremental Search is supported with virtualization in the Combobox component. When a key is typed, the focus is moved to the respective element in the open popup state. In the closed popup

state, the popup opens, and focus is moved to the respective element in the popup list based on the typed key. The Incremental Search functionality is well-suited for scenarios involving remote data binding.

When the `enableVirtualization` property is enabled, the `skip` and `take` properties provided by the user within the Query class at the initial state or during the `actionBegin` or `actionComplete` events will not be considered, since it is internally managed and calculated based on certain dimensions with respect to the popup height.

Binding local data

The Combobox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the `fields` property. When using virtual scrolling, the list updates based on the scroll offset value, triggering a request to fetch more data from the server. As the data is being fetched, the `actionBegin` event occurs before the data retrieval starts. Once the data retrieval is successful, the `actionComplete` event is triggered, indicating that the data fetch process is complete.

In the following example, `id` column and `text` column from complex data have been mapped to the `value` field and `text` field, respectively.

INDEX.TS

```
import { ComboBox, VirtualScroll } from '@syncfusion/ej2-dropdowns';
ComboBox.Inject(VirtualScroll);
let records: { [key: string]: Object }[] = [];
for (let i: number = 1; i <= 150; i++) {
    let item = {
        id: 'id' + i,
        text: "Item " + i,
    };
    records.push(item);
}
//initiates the component
let ComboBoxObject: ComboBox = new ComboBox({
    //bind the dataSource property
    dataSource: records,
    //map the appropriate columns to fields property
    fields: { value: 'id', text: 'text' },
    //set the placeholder to DropDownList input
    placeholder: "Select an Item ",
    //set enableVirtualization property to true
    enableVirtualization: true,
    //set allowFiltering property to true
    allowFiltering: false,
    //set the height of the popup element
    popupHeight: '200px'
});
//render the component
ComboBoxObject.appendTo('#comboelement');
```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Binding Remote data

The Combobox supports retrieval of data from remote data services with the help of **DataManager** component. When using remote data, it initially fetches all the data from the server, triggering the **actionBegin** and **actionComplete** events, and then stores the data locally. During virtual scrolling, additional data is retrieved from the locally stored data, triggering the **actionBegin** and **actionComplete** events at that time as well.

The following sample displays the OrderId from the **Orders** Data Service.

INDEX.TS

```
import { ComboBox, VirtualScroll } from '@syncfusion/ej2-dropdowns';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
ComboBox.Inject(VirtualScroll);
//initiates the component
let ComboBoxObject: ComboBox = new ComboBox({
    //bind the data source property
    dataSource: new DataManager({
        url: 'https://ej2services.syncfusion.com/js/development/api/orders',
        adaptor: new WebApiAdaptor,
        crossDomain: true
    }),
    //map the appropriate columns to fields property
```

```

fields: { text: 'OrderID', value: 'OrderID' },
//set the placeholder to DropDownList input
placeholder:"Select an Item ",
//set enableVirtualization property to true
enableVirtualization: true,
//set allowFiltering property to true
allowFiltering: true,
//set the height of the popup element
popupHeight: '200px'
});
//render the component
ComboBoxObject.appendTo('#comboelement');

```

INDEX.HTML

  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Grouping with Virtualization

The Combobox component supports grouping with Virtualization. It allows you to organize elements into groups based on different categories. Each item in the list can be classified using the [groupBy](#) field in the data table. After grouping, virtualization works similarly to local data binding, providing a

seamless user experience. When the data source is bound to remote data, an initial request is made to retrieve all data for the purpose of grouping. Subsequently, the grouped data works in the same way as local data binding virtualization, enhancing performance and responsiveness.

The following sample shows the example for Grouping with Virtualization.

INDEX.TS

```
import { ComboBox, VirtualScroll } from '@syncfusion/ej2-dropdowns';
ComboBox.Inject(VirtualScroll);
let records: { [key: string]: Object }[] = [];
for (let i = 1; i <= 150; i++) {
    let item: { [key: string]: Object } = {};
    item.id = 'id' + i;
    item.text = `Item ${i}`;
    // Generate a random number between 1 and 4 to determine the group
    const randomGroup = Math.floor(Math.random() * 4) + 1;
    switch (randomGroup) {
        case 1:
            item.group = 'Group A';
            break;
        case 2:
            item.group = 'Group B';
            break;
        case 3:
            item.group = 'Group C';
            break;
        case 4:
            item.group = 'Group D';
            break;
        default:
            break;
    }
    records.push(item);
}
//initiates the component
let ComboBoxObject: ComboBox = new ComboBox({
    //bind the data source property
    dataSource: records,
    //map the appropriate columns to fields property
    fields: { groupBy: 'group', text: 'text', value: 'id' },
    //set the placeholder to DropDownList input
    placeholder: "Select an Item ",
    //set enableVirtualization property to true
    enableVirtualization: true,
    //set allowFiltering property to true
    allowFiltering: true,
    //set the height of the popup element
    popupHeight: '200px'
});
//render the component
ComboBoxObject.appendTo('#comboelement');
```

```

Filtering with Virtualization

The ComboBox component supports Filtering with Virtualization. The ComboBox includes a built-in feature that enables data filtering when the [allowFiltering](#) option is enabled. In the context of Virtual Scrolling, the filtering process operates in response to the typed characters. Specifically, the DropDownList sends a request to the server, utilizing the full data source, to achieve filtering. Before initiating the request, an action event is triggered. Upon successful retrieval of data from the server, an action complete event is triggered. The initial data is loaded when the popup is opened. Whether the filter list has a selection or not, the popup closes.

The following sample shows the example for Filtering with Virtualization.

INDEX.TS

```
import { ComboBox, VirtualScroll } from '@syncfusion/ej2-dropdowns';
ComboBox.Inject(VirtualScroll);
let records: { [key: string]: Object }[] = [];
for (let i: number = 1; i <= 150; i++) {
    let item = {
        id: 'id' + i,
        text: "Item " + i,
    };
};
```

```

        records.push(item);
    }
    //initiates the component
    let ComboBoxObject: ComboBox = new ComboBox({
        //bind the dataSorce property
        dataSource: records,
        //map the appropriate columns to fields property
        fields: { value: 'id', text: 'text' },
        //set the placeholder to DropDownList input
        placeholder: "Select an Item ",
        //set enableVirtualization property to true
        enableVirtualization: true,
        //set allowFiltering property to true
        allowFiltering: true,
        //set the height of the popup element
        popupHeight: '200px'
    });
    //render the component
    ComboBoxObject.appendTo('#comboelement');

```

INDEX.HTML

Localization in EJ2 JavaScript Combo box control

The Localization library allows you to localize static text content of the [noRecordsTemplate](#) and [actionFailureTemplate](#) properties according to the culture currently assigned to the ComboBox.

| Locale key | en-US (default) |

|-----|-----|

| noRecordsTemplate | No records found |

| actionFailureTemplate | The request failed |

Loading translations

To load translation object to your application, use `load` function of `L10n` class.

In the following sample, French culture is set to the ComboBox and no data is loaded. Hence, the [noRecordsTemplate](#) property displays its text in French culture initially, and if the sample is run offline, the [actionFailureTemplate](#) property displays its text appropriately.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
// import L10n class for load function
import { L10n, setCulture } from '@syncfusion/ej2-base';
import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
// bind remotedata to showcase actionFailureTemplate in offline.
let customerData: DataManager = new DataManager({
  url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
  adaptor: new ODataV4Adaptor,
  crossDomain: true
});
let ComboBoxObj: ComboBox = new ComboBox({
  dataSource: customerData,
  // set locale culture to ComboBox
  locale: 'fr-BE',
  // map appropriate column
  fields: { text: 'ContactName', value: 'CustomerID' },
  // take 0 item to showcase noRecordsTemplate property.
  query: new Query().select(['ContactName', 'CustomerID']).take(0);
  // set placeholder to ComboBox input element
  placeholder: 'Sélectionnez un client'
});
ComboBoxObj.appendTo('#comboelement');
L10n.load({
  'fr-BE': {
    'dropdowns': {
      'noRecordsTemplate': 'Aucun enregistrement trouvé',
      'actionFailureTemplate': 'Modèle d'échec d'action'
    }
  }
});
```

Style in EJ2 JavaScript Combo box control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of wrapper element

Use the following CSS to customize the appearance of wrapper element.

```
.e-ddl.e-input-group.e-control-wrapper .e-input {
font-size: 20px;
font-family: emoji;
```

```
color: #ab3243;
background: #32a5ab;
}
,
```

Customizing the dropdown icon's color

Use the following CSS to customize the dropdown icon's color.

```
,
.e-ddl.e-input-group .e-input-group-icon,.e-ddl.e-input-group.e-control-wrapper .e-input-group-
icon:hover {
color: #bb233d;
font-size: 13px;
}
,
```

Customizing the focus color

Use the following CSS to customize the focusing color of input element.

```
,
.e-ddl.e-input-group.e-control-wrapper.e-input-focus::before, .e-ddl.e-input-group.e-control-wrapper.e-
input-focus::after {
background: #c000ff;
}
,
```

Customizing the outline theme's focus color

Use the following CSS to customize the focusing color of outline theme.

```
,
.e-outline.e-input-group.e-input-focus:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-
disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus.e-control-wrapper:hover:not(.e-
success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-
input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled),.e-outline.e-input-group.e-
control-wrapper.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled) {
border-color: #b1bd15;
box-shadow: inset 1px 1px #b1bd15, inset -1px 0 #b1bd15, inset 0 -1px #b1bd15;
}
,
```

Customizing the disabled component's text color

Use the following CSS to customize the text color when the component is disabled.

```
,
```

```
.e-input-group.e-control-wrapper .e-input[disabled] {
-webkit-text-fill-color: #0d9133;
}
`
```

Customizing the float label element's focusing color

Use the following CSS to customize the focusing color of float label element.

```
`
.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-control-
wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-input-group:not(.e-
float-icon-left) .e-float-line::after,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left)
.e-float-line::after {
background-color: #2319b8;
}
.e-ddl.e-input-group.e-control-wrapper.e-float-input.e-input-focus .e-float-text.e-label-top, .e-float-
input.e-control-wrapper:not(.e-error).e-input-focus input ~ label.e-float-text {
color: #2319b8;
}
`
```

Customizing the color of the placeholder text

Use the following CSS to customize the text color of placeholder.

```
`
.e-ddl.e-input-group input.e-input::placeholder {
color: red;
}
`
```

Customizing the text selection color

Use the following CSS to customize the selection color of text and background.

```
`
.e-ddl.e-input-group input.e-input::selection {
color: red;
background: yellow;
}
`
```

Customizing the background color of focus, hover, and active item's

Use the following CSS to customize the background color of focus, hover and active item's.

```
.e-dropdownbase .e-list-item.e-item-focus, .e-dropdownbase .e-list-item.e-active, .e-dropdownbase .e-list-item.e-active.e-hover, .e-dropdownbase .e-list-item.e-hover {
background-color: #1f9c99;
color: #2319b8;
}
```

Customizing the appearance of pop-up element

Use the following CSS to customize the appearance of popup element.

```
.e-dropdownbase .e-list-item, .e-dropdownbase .e-list-item.e-item-focus {
background-color: #29c2b8;
color: #207cd9;
font-family: emoji;
min-height: 29px;
}
```

Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(*) to placeholder and float label using `.e-input-group.e-control-wrapper.e-float-input .e-float-text::after` class.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
// defined the array of data
let sportsData: string[] = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
// initialize ComboBox component
let comboBoxObject: ComboBox = new ComboBox({
  //set the data to dataSource property
  dataSource: sportsData,
  // set placeholder to ComboBox input element
  placeholder: "Select a game"
  floatLabelType: "auto"
});
// render initialized ComboBox
comboBoxObject.appendTo('#comboelement');
```

```

Accessibility in EJ2 JavaScript Combo box control

The ComboBox component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties along with keyboard support. This component is characterized by complete keyboard interaction support and ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The ComboBox component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the ComboBox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The ComboBox component uses the **combobox** role, and each list item has an **option** role. The following **ARIA attributes** denote the ComboBox state.

| Properties | Functionalities |

| --- | --- |

| aria-haspopup | Indicates whether the ComboBox input element has a popup list or not. |

| aria-expanded | Indicates whether the popup list has expanded or not. |

| aria-selected | Indicates the selected option. |

| aria-readonly | Indicates the readonly state of the ComboBox element. |

| aria-disabled | Indicates whether the ComboBox component is in a disabled state or not. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

| aria-autocomplete | This attribute contains the 'both' to a list of options shows and the currently selected suggestion also shows inline. |

Keyboard interaction

You can use the following key shortcuts to access the ComboBox without interruptions.

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Arrow Down | Selects the first item in the ComboBox when no item selected. Otherwise, selects the item next to the currently selected item. |

| Arrow Up | Selects the item previous to the currently selected one. |

| Page Down | Scrolls down to the next page and selects the first item when popup list opens. |

| Page Up | Scrolls up to the previous page and selects the first item when popup list opens. |

| Enter | Selects the focused item and popup list closes when it is in open state. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Shift + tab | Focuses on the previous TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Alt + Down | Open the popup list |

| Alt + Up | Close the popup list |

| Esc(Escape) | Closes the popup list when it is in an open state and the currently selected item remains the same. |

| Home | Cursor moves to before of first character in input |

| End | Cursor moves to next of last character in input |

In the following sample, focus the ComboBox component using alt+t keys.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
// defined the array of data
let gameList: { [key: string]: Object }[] = [
    { Id: 'Game1', Game: 'Badminton' },
    { Id: 'Game2', Game: 'Basketball' },
    { Id: 'Game3', Game: 'Cricket' },
    { Id: 'Game4', Game: 'Football' },
    { Id: 'Game5', Game: 'Golf' },
    { Id: 'Game6', Game: 'Hockey' },
    { Id: 'Game7', Game: 'Rugby' },
    { Id: 'Game8', Game: 'Snooker' },
    { Id: 'Game9', Game: 'Tennis' }
];
// initialize ComboBox component
let ComboBoxObject: ComboBox = new ComboBox({
    //set the data to dataSource property
    dataSource: gameList,
```

```
//map to colum to fields
fields: { text: 'Game', value:'Id' },
// set placeholder to ComboBox input element
placeholder: "Select a game",
// set the popup list height
popupHeight: '200px'
});
// render initialized ComboBox
ComboBoxObject.appendTo('#comboelement');
document.onkeyup = function (e) {
if (e.altKey && e.keyCode === 84 /* t */) {
// press alt+t to focus the control.
ComboBoxObject.focusIn();
}
};
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

    <br>
    <input type="text" tabindex="1" id="comboelement">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Ensuring accessibility

The ComboBox component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the ComboBox component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the ComboBox component with accessibility tools.

How To

Autofill in EJ2 JavaScript Combo box control

The ComboBox supports the **autofill** behaviour with the help of [autofill](#) property. Whenever you change the input value, the ComboBox will autocomplete your data by matching the typed character. Suppose, if no matches found then, comboBox doesn't suggest any item.

In the following sample, showcase that how to work autofill with ComboBox.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
// defined the array of data
let sportsData: string[] = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
// initialize ComboBox component
let comboBoxObject: ComboBox = new ComboBox({
    //set the data to dataSource property
    dataSource: sportsData,
    // enable the autofill behavior.
    autofill: true,
    // set placeholder to ComboBox input element
    placeholder: "Select a game"
});
// render initialized ComboBox
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 ComboBox</title>

</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <br>
        <input type="text" tabindex="1" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Cascading in EJ2 JavaScript Combo box control

The cascading ComboBox is a series of ComboBox, where the value of one ComboBox depends upon another's value. This can be configured by using the [change](#) event of the parent ComboBox. Within that change event handler, data has to be loaded to the child ComboBox based on the selected value of the parent ComboBox.

The following example, shows the cascade behavior of country, state, and city ComboBox. Here, the [dataBind](#) method is used to reflect the property changes immediately to the ComboBox.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
import { Query } from '@syncfusion/ej2-data';
//define the country ComboBox data
let countryData: { [key: string]: Object }[] = [
    { CountryName: 'Australia', CountryId: '2' },
    { CountryName: 'United States', CountryId: '1' }
];
//define the state ComboBox data
let stateData: { [key: string]: Object }[] = [
    { StateName: 'New York', CountryId: '1', StateId: '101' },
    { StateName: 'Virginia ', CountryId: '1', StateId: '102' },
    { StateName: 'Tasmania ', CountryId: '2', StateId: '105' }
];
//define the city ComboBox data
let cityData: { [key: string]: Object }[] = [
    { CityName: 'Albany', StateId: '101', CityId: 201 },
    { CityName: 'Beacon ', StateId: '101', CityId: 202 },
    { CityName: 'Emporia', StateId: '102', CityId: 206 },
    { CityName: 'Hampton ', StateId: '102', CityId: 205 },
    { CityName: 'Hobart', StateId: '105', CityId: 213 },
    { CityName: 'Launceston ', StateId: '105', CityId: 214 }
];
//initiates the country ComboBox
let countryObj: ComboBox = new ComboBox({
```

```

        dataSource: countryData,
        fields: { value: 'CountryId', text: 'CountryName' },
        //bind the change event handler
        change: () => {
            //Query the data source based on country ComboBox selected value
            stateObj.query = new Query().where('CountryId', 'equal',
countryObj.value);
            // enable the state ComboBox
            stateObj.enabled = true;
            //clear the existing selection.
            stateObj.text = null;
            // bind the property changes to state ComboBox
            stateObj.dataBind();
            //clear the existing selection in city ComboBox
            cityObj.text = null;
            //disabe the city ComboBox
            cityObj.enabled = false;
            //bind the property cahnges to City ComboBox
            cityObj.dataBind();
        },
        placeholder: 'Select a country',
    });
    //render the country ComboBox
    countryObj.appendTo('#countries');
    //initiates the state ComboBox
    let stateObj: ComboBox = new ComboBox({
        dataSource: stateData,
        fields: { value: 'StateId', text: 'StateName' },
        // set disable state by default to prevent user interact.
        enabled: false,
        change: () => {
            // Query the data source based on state ComboBox selected value
            cityObj.query = new Query().where('StateId', 'equal',
stateObj.value);
            // enable the city ComboBox
            cityObj.enabled = true;
            //clear the existing selection
            cityObj.text = null;
            // bind the property change to city ComboBox
            cityObj.dataBind();
        },
        placeholder: 'Select a state',
    });
    //render the state ComboBox
    stateObj.appendTo('#states');
    //initiates the city ComboBox
    let cityObj: ComboBox = new ComboBox({
        dataSource: cityData,
        fields: { text: 'CityName', value: 'CityId' },
        // disable the ComboBox by default to prevent the user interact.
        enabled: false,
        placeholder: 'Select a city',
    });
    //render the city ComboBox
    cityObj.appendTo('#cities');

```

Icons support in EJ2 JavaScript Combo box control

You can render **icons** to the list items by mapping the [iconCss](#) field. This `iconCss` field create a span in the list item with mapped class name to allow styling as per your need.

In the following sample, icon classes are mapped with `iconCss` field.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
let sortFormatData: { [key: string]: Object }[] = [
  { class: 'asc-sort', type: 'Sort A to Z', id: '1' },
  { class: 'dsc-sort', type: 'Sort Z to A', id: '2' },
  { class: 'filter', type: 'Filter', id: '3' },
```

```

    { class: 'clear', type: 'Clear', id: '4' }
  ];
  let sortFormat: ComboBox = new ComboBox({
    dataSource: sortFormatData,
    // map the icon column to iconCSS field.
    fields: { text: 'type', iconCss: 'class', value: 'id' },
    placeholder: 'Select a format'
  });
  sortFormat.appendTo('#comboelement');

```

INDEX.HTML

</body></html>

```

Achieve virtual scrolling in EJ2 JavaScript Combo box control

The Virtual Scrolling is used to display a large amount of data without buffering the entire load of a huge database record in the ComboBox, that is, when scrolling, the request is sent and fetch some amount of data from the server dynamically. Using the `scroll` event, get the data and generate the list add to popup using the `addItem` method.

Refer to the following code sample for virtual scrolling.

INDEX.TS

```
import { ComboBox } from '@syncfusion/ej2-dropdowns';
import { Query, DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
    url: 'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/',
    crossDomain: true
});

// initialize ComboBox component
let comboObj: ComboBox = new ComboBox({
    // bind the DataManager instance to dataSource property
    dataSource: data,
    // bind the Query instance to query property
    query: new Query().from('Customers').select('ContactName').take(7),
    // map the appropriate columns to fields property
    fields: { text: 'ContactName', value: 'ContactName' },
    // set the placeholder to ComboBox input element
    placeholder: 'Select a customer',
    // sort the resulted items
    sortOrder: 'Ascending',
    // set the height of the popup element
    popupHeight: '200px',
    actionComplete: function (e: any) {
        let operator: Query = new
Query().from('Customers').select('ContactName');
        let start: number = 7;
        let end: number = 12;
        let listElement: HTMLElement = this.list;
        listElement.addEventListener('scroll', () => {
            if ((listElement.scrollTop + listElement.offsetHeight >=
listElement.scrollHeight)) {
                let filterQuery = operator.clone();
                data.executeQuery(filterQuery.range(start,
end)).then((event: any) => {
                    start = end;
                    end += 5;
                    comboObj.addItem(event.result as { [key: string]: Object
}[]);

Ej1 api migration in EJ2 JavaScript Combo box control

This article describes the API migration process of ComboBox component from Essential JS 1 to Essential JS 2.

DataBinding

<!-- markdownlint-disable MD010 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Default	Property: <i>datasource</i> \$('#dropdown1').ejComboBox({dataSource: List});	Property: <i>DataSource</i> var comboBoxObject = new ej.dropdowns.ComboBox({dataSource: sportsData,});comboBoxObject.appendTo('#cmbelement');
Fields for mapping	Property: <i>fields</i> \$('#dropdown1').ejComboBox({fields: { text: "text", value: "empid" }});	Property: <i>fields</i> var comboBoxObject = new ej.dropdowns.ComboBox({fields: { text: "text", value: "empid" },});comboBoxObject.appendTo('#cmbelement');
Query	Property: <i>query</i> \$('#dropdown1').ejComboBox({query: ej.Query().requiresCount()})	Property: <i>query</i> var comboBoxObject = new ej.dropdowns.ComboBox({query: new Query().from('Customers').select(['ContactName', 'CustomerID']).take(6,);comboBoxObject.appendTo('#cmbelement');

| **Begin event** | **Event:***actionBegin*
\$('#dropdown1').ejComboBox({actionBegin: "begin"}); |
Event: *actionBegin*
var comboBoxObject = new ej.dropdowns.ComboBox({actionBegin:
"begin",});comboBoxObject.appendTo('#cmbelement'); |

| **Complete event** | **Event:***actionComplete*
\$('#dropdown1').ejComboBox({actionComplete:
"begin"}); | **Event:** *actionComplete*
var comboBoxObject = new
ej.dropdowns.ComboBox({actionComplete:
"begin",});comboBoxObject.appendTo('#cmbelement'); |

| **Failure event** | **Event:***actionFailure*
\$('#dropdown1').ejComboBox({actionFailure: "begin"}); |
Event: *actionFailure*
var comboBoxObject = new ej.dropdowns.ComboBox({actionFailure:
"begin",});comboBoxObject.appendTo('#cmbelement'); |

Filtering

<!-- markdownlint-disable MD010 -->

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| **Default** | **Property:** *allowFiltering*
\$('#dropdown1').ejComboBox({allowFiltering: true}); |
Property: *allowFiltering*
var comboBoxObject = new ej.dropdowns.ComboBox({allowFiltering:
true,});comboBoxObject.appendTo('#cmbelement'); |

| **No records template** | **Property:**
noRecordsTemplate
\$('#dropdown1').ejComboBox({allowFiltering: "
NO DATA AVAILABLE"}); | **Property:** *noRecordsTemplate*
var comboBoxObject = new
ej.dropdowns.ComboBox({allowFiltering: true,});comboBoxObject.appendTo('#cmbelement'); |

| **Ignore casing and diacritics** | **Not Applicable** | **Property:** *ignoreAccent*
var comboBoxObject =
new ej.dropdowns.ComboBox({ignoreAccent:
true,});comboBoxObject.appendTo('#cmbelement'); |

| **Custom value addition** | **Property:**
allowCustom
\$('#dropdown1').ejComboBox({allowCustom: true}); |
<https://ej2.syncfusion.com/demos/#/material/combo-box/custom-value.html> |

| **Search event** | **Event:** *filtering*
\$('#dropdown1').ejComboBox({filtering: "filtering"}); | **Event:**
filtering
var comboBoxObject = new ej.dropdowns.ComboBox({filtering:
"filtering",});comboBoxObject.appendTo('#cmbelement'); |

Template

<!-- markdownlint-disable MD010 -->

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| **Default** | **Property:** *itemTemplate*
\$('#dropdown1').ejComboBox({itemTemplate: "<span
class='item' >\${FirstName}<span
class='city'>\${City}"}); | **Property:** *itemTemplate*
var comboBoxObject = new
ej.dropdowns.ComboBox({itemTemplate: "<span

```

class='name'>${FirstName}</span><span
class='city'>${City}</span></span>“,,});comboBoxObject.appendTo('#cmbelement');|

| Group Template | Property: groupTemplate<br/>${('#dropdown1').ejComboBox({groupTemplate:
“<strong>${City}</strong>”}); | Property: groupTemplate<br/>var comboBoxObject = new
ej.dropdowns.ComboBox({groupTemplate:
“<strong>${City}</strong>“,,});comboBoxObject.appendTo('#cmbelement');|

| ValueTemplate | Not Applicable | Property: valueTemplate<br/>var comboBoxObject = new
ej.dropdowns.ComboBox({valueTemplate: “<span>${FirstName} -
${City}</span>“,,});comboBoxObject.appendTo('#cmbelement'); |

| Header Template | Property:
headerTemplate<br/>${('#dropdown1').ejComboBox({headerTemplate: “<span
class='head'><span class='name'>Name</span><span class='city'>City</span></span>”}); |
Property: headerTemplate<br/>var comboBoxObject = new
ej.dropdowns.ComboBox({headerTemplate: “<span class='head'><span
class='name'>Name</span><span
class='city'>City</span></span>“,,});comboBoxObject.appendTo('#cmbelement'); |

| FooterTemplate | Property: footerTemplate<br/>${('#dropdown1').ejComboBox({footerTemplate:
“<span class='foot'> Total list items: “ + sportsData.length + “</span>”}); | Property:
footerTemplate<br/>var comboBoxObject = new ej.dropdowns.ComboBox({footerTemplate:
“<span class='foot'> Total list items: “ + sportsData.length +
“</span>“,,});comboBoxObject.appendTo('#cmbelement'); |

| No records Template | Property:
noRecordsTemplate<br/>${('#dropdown1').ejComboBox({noRecordsTemplate: “<span
class='norecord'> NO DATA AVAILABLE</span>”}); | Property: noRecordsTemplate<br/>var
comboBoxObject = new ej.dropdowns.ComboBox({noRecordsTemplate: “<span
class='norecord'> NO DATA AVAILABLE</span>“,,});comboBoxObject.appendTo('#cmbelement');
|

| Auto fill | Property: autoFill<br/>${('#dropdown1').ejComboBox({autoFill: true}); | Property:
autoFill<br/>var comboBoxObject = new ej.dropdowns.ComboBox({autoFill:
true,});comboBoxObject.appendTo('#cmbelement');|

| Action failure Template | Property:
actionFailureTemplate<br/>${('#dropdown1').ejComboBox({actionFailureTemplate: “<span
class='action-failure'> Data fetch get fails</span>”}); | Property: actionFailureTemplate<br/>var
comboBoxObject = new ej.dropdowns.ComboBox({actionFailureTemplate: “<span class='action-
failure'> Data fetch get fails</span>“,,});comboBoxObject.appendTo('#cmbelement');|

```

Applying CSS

<!-- markdownlint-disable MD010 -->

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| **Default** | **Property:** *cssClass*
\$('#dropdown1').ejComboBox({cssClass: "className"}); |
Property: *cssClass*
var comboBoxObject = new ej.dropdowns.ComboBox({cssClass: "className",});comboBoxObject.appendTo('#cmbelement'); |

| **width** | **Property:** *width*
\$('#dropdown1').ejComboBox({width: "500px"}); | **Property:** *Width*
var comboBoxObject = new ej.dropdowns.ComboBox({width: "500px",});comboBoxObject.appendTo('#cmbelement'); |

Grouping

<!-- markdownlint-disable MD010 -->

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| **Default** | **Property:** *fields*
\$('#dropdown1').ejComboBox({fields: { groupBy: "text", value: "empid" }}); | **Property:** *fields*
var comboBoxObject = new ej.dropdowns.ComboBox({fields: { groupBy: "text", value: "empid" },});comboBoxObject.appendTo('#cmbelement'); |

Accessibility

<!-- markdownlint-disable MD010 -->

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| **Globalization** | **Property:** *locale*
\$('#dropdown1').ejComboBox({locale: true}); | **Property:** *locale*
var comboBoxObject = new ej.dropdowns.ComboBox({locale: true});comboBoxObject.appendTo('#cmbelement'); |

| **Rtl support** | **Property:** *enableRtl*
\$('#dropdown1').ejComboBox({enableRtl: true}); | **Property:** *enableRtl*
var comboBoxObject = new ej.dropdowns.ComboBox({enableRtl: true,});comboBoxObject.appendTo('#cmbelement'); |

Placeholder

<!-- markdownlint-disable MD010 -->

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| **Watermark text** | **Property:** *placeholder*
\$('#dropdown1').ejComboBox({placeholder: "Select"}); |
Property: *placeholder*
var comboBoxObject = new ej.dropdowns.ComboBox({placeholder: "Select",});comboBoxObject.appendTo('#cmbelement'); |

| **Floating of watermark text** | **Not applicable** | **Property:** *floatLabelType*
var comboBoxObject = new ej.dropdowns.ComboBox({floatLabelType: "Auto",});comboBoxObject.appendTo('#cmbelement'); |

Miscellaneous

<!-- markdownlint-disable MD010 -->

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Enable/disable | Property: `enabled`
`<#dropdown1>.ejComboBox({enabled: true});`
| Property: `enabled`
`var comboBoxObject = new ej.dropdowns.ComboBox({enabled: true,});comboBoxObject.appendTo('#cmbelement');`

| Read only | Property: `readOnly`
`<#dropdown1>.ejComboBox({readOnly: true});`
| Property: `readOnly`
`var comboBoxObject = new ej.dropdowns.ComboBox({readOnly: true,});comboBoxObject.appendTo('#cmbelement');`

| Addition of Html attributes | Property:
`htmlAttributes`
`<#dropdown1>.ejComboBox({htmlAttributes: { disabled: "disabled"}});`
| Property: `htmlAttributes`
`var comboBoxObject = new ej.dropdowns.ComboBox({htmlAttributes: { disabled: "disabled"},});comboBoxObject.appendTo('#cmbelement');`

Sorting

<!-- markdownlint-disable MD010 -->

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Order of sorting | Property: `sortOrder`
`<#dropdown1>.ejComboBox({sortOrder: SortOrder.Ascending});`
| Property: `sortOrder`
`var comboBoxObject = new ej.dropdowns.ComboBox({sortOrder: SortOrder.Ascending,});comboBoxObject.appendTo('#cmbelement');`

Selection

<!-- markdownlint-disable MD010 -->

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Selecting particular index | Property: `index`
`<#dropdown1>.ejComboBox({index: 1});`
| Property: `index`
`var comboBoxObject = new ej.dropdowns.ComboBox({index: 1,});comboBoxObject.appendTo('#cmbelement');`

| Selecting particular value | Property: `value`
`<#dropdown1>.ejComboBox({value: "data"});`
| Property: `value`
`var comboBoxObject = new ej.dropdowns.ComboBox({value: "data",});comboBoxObject.appendTo('#cmbelement');`

| Selecting particular text | Property: `text`
`<#dropdown1>.ejComboBox({text: "data"});`
| Property: `text`
`var comboBoxObject = new ej.dropdowns.ComboBox({text: "data",});comboBoxObject.appendTo('#cmbelement');`

| Getting data by using value | Method:
`getItemDataByValue`
`<#dropdown1>.ejComboBox({});`
`<#dropdown1>.ejComboBox('getItemDataByValue',"data")` | **| Method:** `getDataByValue`
`var comboBoxObject = new ej.dropdowns.ComboBox({enabled: true,});comboBoxObject.appendTo('#cmbelement');`
`comboBoxObject.getDataByValue("data");`

| **Select event** | **Event:** `select`
`<#dropdown1>.ejComboBox({select: "onSelect"});` | **Event:**
`select`
`var comboBoxObject = new ej.dropdowns.ComboBox({select:`
`"onSelect",});comboBoxObject.appendTo('#cmbelement');` |

Popup

<!-- markdownlint-disable MD010 -->

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| **Popup height** | **Property:** `popupHeight`
`<#dropdown1>.ejComboBox({popupHeight:`
`"300px"});` | **Property:**`popupheight`
`var comboBoxObject = new`
`ej.dropdowns.ComboBox({popupHeight:`
`"300px",});comboBoxObject.appendTo('#cmbelement');` |

| **Popup width** | **Property:** `popupWidth`
`<#dropdown1>.ejComboBox({popupWidth:`
`"300px"});` | **Property:**`popupWidth`
`var comboBoxObject = new`
`ej.dropdowns.ComboBox({popupWidth:`
`"300px",});comboBoxObject.appendTo('#cmbelement');` |

| **Popup showing manually** | **Method:** `showPopup`
`<#dropdown1>.ejComboBox({})`

`<#dropdown1>.ejComboBox("showPopup");` | **Method:** `showPopup`
`var`
`comboBoxObject = new`
`ej.dropdowns.ComboBox({});comboBoxObject.appendTo('#cmbelement');`

`cmbObj.sho`
`wPopup();` |

| **Popup hiding manually** | **Method:** `hidePopup`
`<#dropdown1>.ejComboBox({})`

`<#dropdown1>.ejComboBox("hidePopup");` | **Method:** `hidePopup`
`var comboBoxObject =`
`new ej.dropdowns.ComboBox({popupHeight:`
`"300px",});comboBoxObject.appendTo('#cmbelement');`

 `comboBoxObject.hidePopup();`
|

| **Popup hide event** | **Event:** `close`
`<#dropdown1>.ejComboBox({close: "onClose"});` | **Event:**
`close`
`var comboBoxObject = new ej.dropdowns.ComboBox({close:`
`"onclose",});comboBoxObject.appendTo('#cmbelement');` |

| **Popup shown event** | **Event:** `open`
`<#dropdown1>.ejComboBox({open: "onOpen"});` | **Event:**
`open`
`var comboBoxObject = new ej.dropdowns.ComboBox({open:`
`"onOpen",});comboBoxObject.appendTo('#cmbelement');` |

Common

<!-- markdownlint-disable MD010 -->

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| **Adding new item** | **Method :** `addItem`
`<#dropdown1>.ejComboBox({})`

`<#dropdown1>.ejComboBox("addItem",{ text : "India"});` | **Method:** `addItem`
`var`
`comboBoxObject = new`

```

ej.dropdowns.ComboBox({});comboBoxObject.appendTo('#cmbelement');<br/><br/>
comboBoxObject.addItem({Id: 'id', Game: 'Golf'},2);|

| Focus out event | Not applicable | Event: Blur<br/>var comboBoxObject = new
ej.dropdowns.ComboBox({blur: "onclose",});comboBoxObject.appendTo('#cmbelement'); |

| Focus in event | Event: Focus<br/>$('#dropdown1').ejComboBox({focus:"focus"}) | Event:
focusIn<br/>var comboBoxObject = new ej.dropdowns.ComboBox({focusIn:
"focus",});comboBoxObject.appendTo('#cmbelement'); |

| Focus out | Method: focusOut<br/>$('#dropdown1').ejComboBox({}) <br/>
<br/>$('#dropdown1').ejComboBox("focusOut");| Method: focusOut<br/>var comboBoxObject = new
ej.dropdowns.ComboBox({open:
"onOpen",});comboBoxObject.appendTo('#cmbelement');<br/><br/> comboBoxObject.focusOut();
|

| Focus in | Method: focusIn<br/>$('#dropdown1').ejComboBox({}) <br/>
<br/>$('#dropdown1').ejComboBox("focusIn"); | Method: focusIn<br/>var comboBoxObject = new
ej.dropdowns.ComboBox({});comboBoxObject.appendTo('#cmbelement');<br/><br/>
comboBoxObject.focusIn(); |

| Getting the data | Method : getItems<br/>$('#dropdown1').ejComboBox({}) <br/>
<br/>$('#dropdown1').ejComboBox("getItems"); | Method: getItems<br/>var comboBoxObject = new
ej.dropdowns.ComboBox({});comboBoxObject.appendTo('#cmbelement');<br/><br/>
comboBoxObject.getItems();|

| Create event | Event: create<br/>$('#dropdown1').ejComboBox({create:"onCreate"}) | Event:
created<br/>var comboBoxObject = new ej.dropdowns.ComboBox({created:
"oncreate",});comboBoxObject.appendTo('#cmbelement'); |

| Change event | Event: change<br/>$('#dropdown1').ejComboBox({focus:"focus"}) | Event:
change<br/>var comboBoxObject = new ej.dropdowns.ComboBox({change:
"onchange",});comboBoxObject.appendTo('#cmbelement'); |

| Custom value event | Event:
customValueSpecifier<br/>$('#dropdown1').ejComboBox({customValueSpecifier:"customValueSp
ecifier"}) | Event: customValueSpecifier<br/>var comboBoxObject = new
ej.dropdowns.ComboBox({customValueSpecifier:
"customValueSpecifier",});comboBoxObject.appendTo('#cmbelement'); |

```

ContextMenu

Icons and navigation in EJ2 JavaScript Context menu control

Icons

The ContextMenu item have an icon/image in it to provide visual representation of the action. To place the icon on a menu item, set the [iconCss](#) property to e-icons with the required icon CSS. By default, the icon is positioned to the left side of the menu item. In the following sample, the icons for Cut, Copy and Paste menu items are added using the [iconCss](#) property.

INDEX.TS

```
import { ContextMenu, MenuItemModel, ContextMenuModel } from
 '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize menu items.
let menuItems: MenuItemModel[] = [
    {
        text: 'Cut',
        iconCss: 'e-db-icons e-cut'
    },
    {
        text: 'Copy',
        iconCss: 'e-icons e-copy'
    },
    {
        text: 'Paste',
        iconCss: 'e-db-icons e-paste',
    }
];
// Initialize ContextMenu options.
let menuOptions: ContextMenuModel = {
    target: '#target',
    items: menuItems
};
// Initialize ContextMenu component.
let menuObj: ContextMenu = new ContextMenu(menuOptions, '#contextmenu')
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2</title>
  <meta charset="utf-8">

```

Navigation

Navigation in ContextMenu is usage to navigate to the other web page when menu item is clicked. This can be achieved by providing link to the menu item using the [url](#) property. In the following sample, Navigation URL for Flipkart, Amazon, and Snapdeal menu items are added using the [url](#) property.

INDEX.TS

```
import { ContextMenu, MenuEventArgs, MenuItemModel, ContextMenuModel } from
 '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize menu items.
let menuItems: MenuItemModel[] = [
  {
    text: 'Flipkart',
    iconCss: 'e-cart-icon e-link',
    url: 'https://www.google.co.in/search?q=flipkart'
  },
  {
    text: 'Amazon',
    iconCss: 'e-cart-icon e-link',
    url: 'https://www.google.co.in/search?q=amazon'
  },
  {
    text: 'Snapdeal',
    iconCss: 'e-cart-icon e-link',
    url: 'https://www.google.co.in/search?q=snapdeal'
  }
];
// Initialize ContextMenu options.
let menuOptions: ContextMenuModel = {
  target: '#target',
  items: menuItems,
  // To open url in blank page.
  beforeItemRender: (args: MenuEventArgs) => {
    args.element.getElementsByTagName('a')[0].setAttribute('target',
'_blank');
  }
}
```

```

    };
    // Initialize the ContextMenu component.
    let menuObj: ContextMenu = new ContextMenu(menuOptions, '#contextmenu')

```

INDEX.HTML

- [How to change menu items dynamically](#)

Template and multilevel nesting in EJ2 JavaScript Context menu control

Template

The ContextMenu items can be customized by using the [beforeItemRender](#) event. The item render event

triggers while rendering each menu item. The event argument will be used to identify the menu item and customize it based on the requirement. In the following sample, the menu item is rendered with keycode for specified action in ContextMenu using the template. Here, the keycode is specified for Save as, View page source, and Inspect in the right side corner of the menu items by adding span element in the [beforeItemRender](#) event.

INDEX.TS

```
import { createElement, enableRipple } from '@syncfusion/ej2-base';
import { ContextMenu, MenuEventArgs, MenuItemModel, ContextMenuModel } from
 '@syncfusion/ej2-navigations';
enableRipple(true);
// Initialize menu items.
let menuItems: MenuItemModel[] = [
    {
        text: 'Save as...'
    },
    {
        text: 'View page source'
    },
    {
        text: 'Inspect'
    }
];
// Initialize ContextMenu options.
let menuOptions: ContextMenuModel = {
    target: '#target',
    items: menuItems,
    beforeItemRender: (args: MenuEventArgs) => {
        // To render template in li.
        let shortCutSpan: HTMLElement = createElement('span');
        let text: string = args.item.text;
        let shortCutText: string = text === 'Save as...' ? 'Ctrl + S' :
(text === 'View page source' ?
        'Ctrl + U' : 'Ctrl + Shift + I');
        shortCutSpan.textContent = shortCutText;
        args.element.appendChild(shortCutSpan);
        shortCutSpan.setAttribute('class', 'shortcut');
    }
};
// Initialize ContextMenu component.
let menuObj: ContextMenu = new ContextMenu(menuOptions, '#contextmenu');

```

To create span element, `createElement` utility function used from `ej2-base`.

Multilevel nesting

The Multiple level nesting supports in ContextMenu. It can be achieved by mapping the `items` property inside the parent `menuitems`. In the below sample, three level nesting of ContextMenu is provided.

Accessibility in EJ2 JavaScript Context menu control

The Context menu component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Context menu component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

[WAI-ARIA attributes](#)

The Context menu component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Context menu component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates Context menu component popup as **menu**, and the popup items as **menuitem**. |

| **aria-haspopup** | Indicates the availability and type of interactive popup element. |

| **aria-expanded** | Indicates whether the subtree can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed. |

| **aria-label** | Indicates the menu item text. |

Keyboard interaction

The Context menu component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Context menu component.

| **Press** | **To do this** |

| --- | --- |

| **Esc** | Closes the opened sub menu. |

| **Enter** | Selects the focused item. |

| **Up** | Navigates up or to the previous menu item. |

| **Down** | Navigates down or to the next menu item. |

| **Left** | Close the current sub menu and navigates to the parent menu. |

| **Right** | Navigates and open the next sub menu. |

Ensuring accessibility

The Context menu component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Context menu component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Context menu component with accessibility tools.

Style and appearance in EJ2 JavaScript Context menu control

To modify the ContextMenu appearance, you need to override the default CSS of ContextMenu component. Please find the list of CSS classes and its corresponding section in ContextMenu component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

| **.e-contextmenu-wrapper** | To customize the context menu wrapper

| **.e-contextmenu-wrapper .e-menu-parent** | To customize the context menu items

| **.e-contextmenu-wrapper ul .e-menu-item.e-selected .e-caret::before** | To customize the context menu caret icon

|.e-contextmenu-wrapper ul .e-menu-item .e-menu-icon::before|To customize the icons of the context menu

How To

Populate menu items with data source in EJ2 JavaScript Context menu control

To bind local data source to the ContextMenu, menu items are populated from data source and mapped to [items](#) property.

The below example demonstrates how to bind local data source to the ContextMenu and separator is added using [insertAfter](#) method.

INDEX.TS

```
import { Record, data } from './datasource.ts';
import { ContextMenu, MenuItemModel, ContextMenuModel, MenuEventArgs } from
 '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let record: Record;
let menuItems: MenuItemModel[] = [];
// Iterate data from 'datasource.ts' to construct menu item model.
for (let i: number = 0; i < data.length; i++) {
    record = data[i] as Record;
    if (record.parentId) {
        if (!menuItems[record.parentId - 1].items) {
            menuItems[record.parentId - 1].items = []
        }
        menuItems[record.parentId - 1].items.push({ text: record.text });
    } else {
        menuItems.push({ text: record.text });
    }
}
// Initialize ContextMenu options.
let menuOptions: ContextMenuModel = {
    target: '#target',
    items: menuItems
};
// Initialize ContextMenu component.
let menuObj: ContextMenu = new ContextMenu(menuOptions, '#contextmenu');
// To insert an item after the particular item.
menuObj.insertAfter([{separator: true}], 'Sort by');
menuObj.insertAfter([{separator: true}], 'New');
```

Open and close contextmenu in EJ2 JavaScript Context menu control

ContextMenu can be opened and closed programmatically whenever required by using the open and close methods.

In the following example, the ContextMenu is opened using the [open](#) method at the specified position using **top** and **left**. Also, ContextMenu is closed using [close](#) method on ContextMenu item click or document click.

INDEX.TS

```

import { ContextMenu, MenuItemModel, ContextMenuModel } from
'@syncfusion/ej2-navigations';
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize menu items.
let menuItems: MenuItemModel[] = [
    {
        text: 'Cut'
    }

```

```
    },
    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    }
    ]];
// Initialize ContextMenu options.
let menuOptions: ContextMenuModel = {
    items: menuItems
};
// Initialize ContextMenu component.
let menuObj: ContextMenu = new ContextMenu(menuOptions, '#contextmenu');
// Initialize Button component.
let button: Button = new Button();
// Render initialized Button.
button.appendTo('#btnElement');
// To position ContextMenu on Button click.
document.getElementById('btnElement').onclick=function() {
    menuObj.open(60, 20);
}
```

Change menu items dynamically in EJ2 JavaScript Context menu control

The items visible in the ContextMenu can be changed dynamically based on the target in which you open the ContextMenu. To achieve this behavior, initialize ContextMenu with all items using [items](#) property and then based on the context you open hide/show required items using [hideItems](#)/[showItems](#) method in [beforeOpen](#) event.

In the following example, the datasource for Clipboard div is **Cut, Copy, Paste** and for the Editor div is **Add, Edit, Delete** is changed on [beforeOpen](#) event using [hideItems](#) and [showItems](#) method.

INDEX.TS

```

import { ContextMenu, MenuItemModel, ContextMenuModel,
BeforeOpenCloseMenuEventArgs } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize menu items.
let menuItems: MenuItemModel[] = [
  {
    text: 'Cut'
  },
  {
    text: 'Copy'
  },
  {
    text: 'Paste'
  },
  {
    text: 'Add'
  },
  {
    text: 'Edit'
  },
  {
    text: 'Delete'
  }
];
// Initialize ContextMenu options.
let menuOptions: ContextMenuModel = {
  target: '#target .e-div',
  items: menuItems,
  beforeOpen: (args: BeforeOpenCloseMenuEventArgs) => {
    // To hide/show items on right click.

```

```

        if ((args.event.target as HTMLElement).id === 'right') {
            menuObj.hideItems(['Cut', 'Copy', 'Paste']);
            menuObj.showItems(['Add', 'Edit', 'Delete']);
        } else if ((args.event.target as HTMLElement).id === 'left') {
            menuObj.showItems(['Cut', 'Copy', 'Paste']);
            menuObj.hideItems(['Add', 'Edit', 'Delete']);
        }
    }
};
// Initialize ContextMenu component.
let menuObj: ContextMenu = new ContextMenu(menuOptions, '#contextmenu');

```

Show table in sub ContextMenu

Menu items of the ContextMenu can be customized according to the requirement. The section explains about how to customize table template

in sub menu item.

This can be achieved by appending table layout while `li` rendering by using [beforeItemRender](#) event.

INDEX.TS

```

import { Browser } from '@syncfusion/ej2-base';
import { ContextMenu, MenuEventArgs, BeforeOpenCloseMenuEventArgs } from
 '@syncfusion/ej2-navigations';
import { MenuItemModel, ContextMenuModel } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// To create header element.
let header: HTMLElement = document.createElement('h4');
header.textContent = 'Insert Table';
// To create table with five rows and six columns.
let table: HTMLElement = document.createElement('table');
for (let i: number = 0; i < 5; i++) {
    let row: HTMLElement = document.createElement('tr');
    table.appendChild(row);
    for (let j: number = 0; j < 6; j++) {
        let col: HTMLElement = document.createElement('td');
        row.appendChild(col);
        col.setAttribute('class', 'e-border');
    }
}
// Initialize menu items.
let menuItems: MenuItemModel[] = [
    {
        text: 'Cut',
        iconCss: 'e-cm-icons e-cut'

```

Show UI components in ContextMenu

UI components can also be placed inside the each `li` element of ContextMenu.

In the following example, CheckBox component is placed inside each `li` element and this can be achieved by creating CheckBox component in [beforeItemRender](#) event and appending it into the `li` element.

INDEX.TS

```

import { closest, enableRipple} from '@syncfusion/ej2-base';
import { ContextMenu, MenuEventArgs, BeforeOpenCloseMenuEventArgs } from
 '@syncfusion/ej2-navigations';
import { ContextMenuModel, MenuItemModel } from '@syncfusion/ej2-
navigations';
import { CheckBox } from '@syncfusion/ej2-buttons';

```

```

enableRipple(true);
// Initialize menu items.
let menuItems: MenuItemModel[] = [
    { text: 'Option 1' },
    { text: 'Option 2' },
    { text: 'Option 3' }
];
let i = 1;
// Initialize ContextMenu options.
let menuOptions: ContextMenuModel = {
    target: '#target',
    items: menuItems,
    beforeItemRender: (args: MenuEventArgs) => {
        // To render CheckBox component on each li.
        let checkbox: CheckBox = new CheckBox({ label: 'Option'+ i,
checked: i%2 === 0 ? true : false });
        args.element.innerHTML = '';
        checkbox.appendTo('#checkbox'+i);
        let checkboxObj = document.getElementsByClassName('e-checkbox-
wrapper');
        args.element.appendChild(checkboxObj[0]);
        i++;
    },
    beforeClose: (args: BeforeOpenCloseMenuEventArgs) => {
        if ((args.event.target as HTMLElement).closest('.e-menu-item')) {
            // To prevent ContextMenu close on item click.
            args.cancel = true;
        }
    },
    select: (args: MenuEventArgs) => {
        let selectedElem: NodeList =
args.element.parentElement.querySelectorAll('.e-selected');
        for (let i:number=0; i < selectedElem.length; i++) {
            let ele: Element = selectedElem[i] as Element;
            ele.classList.remove('e-selected');
        }
        let checkbox: HTMLElement = args.element.childNodes[0] as
HTMLElement;
        let frame: Element = checkbox.querySelector('.e-frame');
        if (checkbox && frame.classList.contains('e-check')) {
            frame.classList.remove('e-check');
        } else if (checkbox) {
            frame.classList.add('e-check');
        }
    }
};
let menuObj: ContextMenu = new ContextMenu(menuOptions, '#contextmenu');

Open a dialog on contextmenu item click in EJ2 JavaScript Context menu control

This section explains about how to open a dialog on ContextMenu item click. This can be achieved by handling dialog open in [select](#) event of the ContextMenu.

In the following sample, Dialog will open while clicking **Save As...** item.

INDEX.TS

```

import { ContextMenu, MenuEventArgs, MenuItemModel } from '@syncfusion/ej2-
navigations';
import { ListView, ListViewModel } from '@syncfusion/ej2-lists';
import { Dialog } from '@syncfusion/ej2-popups';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// To initialize Dialog component.
let dialog: Dialog = new Dialog({
    content: "This file can be saved as PDF",
    buttons: [{
        buttonModel: {
            isPrimary: true,
            content: 'Submit',
            cssClass: 'e-flat',
        },
        click: function () {
            this.hide();
        }
    }],
    target: document.getElementById("container"),
    width: '200px',
    height: '110px',
    visible: false
});
// Render initialized dialog.
dialog.appendTo('#dialog');
// Initialize menu items.
let menuItems: MenuItemModel[] = [
    {
        text: 'Back'
    },
    {
        text: 'Forward'
    },
    {

```

```

        text: 'Reload'
    },
    {
        separator: true
    },
    {
        text: 'Save As...'
    },
    {
        text: 'Print'
    },
    {
        text: 'Cast'
    }
    ]];
// Initialize ContextMenu options.
let menuOptions: ContextMenu = {
    target: '#target',
    items: menuItems,
    select: (args: MenuEventArgs) => {
        if (args.item.text === 'Save As...') {
            dialog.show();
        }
    }
};
// Initialize ContextMenu component.
let menuObj: ContextMenu = new ContextMenu(menuOptions, '#contextmenu');
```

Change animation settings in EJ2 JavaScript Context menu control

To change the animation of the ContextMenu, [animationSettings](#) property is used. The supported effects for ContextMenu are,

| Effect | Functionality |

| ----- | ----- |

| None | Specifies the sub menu transform with no animation effect. |

| SlideDown | Specifies the sub menu transform with slide down effect. |

| ZoomIn | Specifies the sub menu transform with zoom in effect. |

| FadeIn | Specifies the sub menu transform with fade in effect. |

The following sample illustrates how to open ContextMenu with **FadeIn** effect with the **duration** of **800ms**.

Add or remove context menu items in EJ2 JavaScript Context menu control

ContextMenu items can be added or removed using the [insertAfter](#), [insertBefore](#) and [removeItems](#) methods.

In the following example, the **Display Settings** menu items are added before the **Personalize** item, the **Sort By** menu items are added after the **Refresh**, and the **Paste** item is removed from context menu.

<script src="index.js" type="text/javascript"></script>
</body></html>

```

To disable sub menu items, use the [beforeOpen](#) event.

DashboardLayout

Setting size of cells in EJ2 JavaScript Dashboard layout control

The entire layout dimensions are assigned based on the height and width of the parent element. Hence a responsive or static layout can be created by assigning a percentage or static dimension values to the parent element. The layout adapts to mobile resolutions by transforming the entire layout into a stacked orientation so that the panels will be displayed in a vertical column.

The **Dashboard Layout** is a grid structured component which can be split into subsections of equal size known as cells. The total number of cells in each row is defined using the [columns](#) property of the component. The width of each cell will be auto calculated based on total number of cells placed in a row and the height of a cell will be same as that of its width. However, the height of these cells can also be configured to any desired size using the [cellAspectRatio](#) property (cellwidth/cellheight ratio) which defines the cell width to height ratio.

The number of rows within the layout has no limits and can have any number of rows based on the panels count and position. Panels which acts as data containers will be placed or positioned over these cells.

Modifying cell size

In a dashboard, the data to be held by the panel in a cell may be of different size, hence different cell dimensions may be required in different scenarios. In this case, the size of these grid cells can be modified to the required size using the [columns](#) and [cellAspectRatio](#) properties.

The following sample demonstrates how to modify a cell size using [columns](#) and [cellAspectRatio](#) properties. In the below sample the width of the parent element is divided into 5 equal cells based on the columns property value resulting the width of each cell as 100px. The height of these cells will be 50px based on the cellAspectRatio value 100/50 (i.e. for every 100px of width, 50px will be the height of the cell).

INDEX.TS

```
import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [10, 10],
  columns: 5,
  cellAspectRatio: 100 / 50,
  panels: [{ "sizeX": 1, "sizeY": 1, "row": 0, "col": 0, content: '<div
class="content">0</div>' },
  { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content: '<div

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Setting cell spacing

The spacing between each panel in a row and column can be defined using the [cellSpacing](#) property. Adding spacing between the panels will make the layout effective and provides a clear data representation.

The following sample demonstrates the usage of the [cellSpacing](#) property which helps in a neat and clear representation of a data.

INDEX.TS

```

import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [20, 20],
  columns: 5,
  panels: [{ "sizeX": 1, "sizeY": 1, "row": 0, "col": 0, content: '<div
class="content">0</div>' },
  { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content: '<div
class="content">1</div>' },
  { "sizeX": 1, "sizeY": 3, "row": 0, "col": 4, content: '<div
class="content">2</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 1, "col": 0, content: '<div
class="content">3</div>' },
  { "sizeX": 2, "sizeY": 1, "row": 2, "col": 0, content: '<div
class="content">4</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 2, "col": 2, content: '<div
class="content">5</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 2, "col": 3, content: '<div
class="content">6</div>' }
  ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_layout');

```

INDEX.HTML

</body></html>

```

Graphical representation of layout

These cells combinedly will form a grid-structured layout which will be hidden initially. This grid structured layout can be made visible by enabling the [showGridLines](#) property which clearly pictures the cells split-up within the layout. These gridlines will be helpful in panels sizing and placement within the layout during initial designing of a dashboard.

In the following sample, the grid lines indicate the cells split-up of the layout and the data containers placed over these cells are known as panels.

INDEX.TS

```

import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [10, 10],
  columns: 5,
  showGridLines: true,
  panels: [

```

```

        { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content: '<div
class="content">1</div>' },
        { "sizeX": 1, "sizeY": 3, "row": 0, "col": 4, content: '<div
class="content">2</div>' },
        { "sizeX": 1, "sizeY": 1, "row": 2, "col": 2, content: '<div
class="content">3</div>' },
        { "sizeX": 1, "sizeY": 1, "row": 2, "col": 3, content: '<div
class="content">4</div>' }
    ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_layout');

```

Rendering component in right-to-left direction

It is possible to render the Dashboard Layout in right-to-left direction by setting the [enableRtl](#) API to true.

The following sample demonstrates Dashboard Layout in right-to-left direction.

INDEX.TS

```
import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [10, 10],
  enableRtl: true,
  columns: 5,
  panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, header:
'<div>Panel 0</div>', content: '<div class="content"></div>',
  { 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, header: '<div>Panel
1</div>', content: '<div class="content"></div>',
  { 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, header: '<div>Panel
2</div>', content: '<div class="content"></div>',
  { 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, header: '<div>Panel
3</div>', content: '<div class="content"></div>',
  { 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, header: '<div>Panel
4</div>', content: '<div class="content"></div>',
  { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, header: '<div>Panel
5</div>', content: '<div class="content"></div>',
  { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, header: '<div>Panel
6</div>', content: '<div class="content"></div>'}]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_layout');
```

```

You can refer to our [JavaScript Dashboard Layout](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Dashboard Layout example](#) to know how to present and manipulate data.

Panels

Position sizing of panels in EJ2 JavaScript Dashboard layout control

Panels are the basic building blocks of the dashboard layout component. They act as a container for the data to be visualized or presented. These panels can be positioned or resized for effective presentation of the data.

The below table represents all the available panel properties and the corresponding functionalities

PanelObject	Description
-------------	-------------

---	---
-----	-----

id	Specifies the id value of the panel.
----	--------------------------------------

row	Specifies the row value in which the panel to be placed.
-----	--

col	Specifies the column value in which the panel to be placed.
-----	---

sizeX	Specifies the width of the panel in cells count.
-------	--

sizeY	Specifies the height of the panel in cells count.
-------	---

minSizeX	Specifies the minimum width of the panel in cells count.
----------	--

minSizeY	Specifies the minimum height of the panel in cells count.
----------	---

maxSizeX	Specifies the maximum width of the panel in cells count.
----------	--

maxSizeY	Specifies the maximum height of the panel in cells count.
----------	---

header	Specifies the header template of the panel.
--------	---

content	Specifies the content template of the panel.
---------	--

cssClass	Specifies the CSS class name that can be appended with each panel element.
----------	--

Positioning of panels

The panels within the layout can be easily positioned or ordered using the `row` and `col` properties of the panels. Positioning of panels will be beneficial to represent the data in any desired order.

The following sample demonstrates the positioning of panels within the dashboard layout using the row, column properties of the panels.

INDEX.TS

```
import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [20, 20],
  columns: 3,
```

```

panels: [
  { "row": 0, "col": 0, content: '<div class="content">1</div>' },
  { "row": 0, "col": 1, content: '<div class="content">2</div>' },
  { "row": 0, "col": 2, content: '<div class="content">3</div>' },
  { "row": 1, "col": 0, content: '<div class="content">4</div>' },
  { "row": 1, "col": 1, content: '<div class="content">5</div>' },
  { "row": 1, "col": 2, content: '<div class="content">6</div>' }
]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
  <title>Essential JS 2 DashboardLayout </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 DashboardLayout
Component">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Sizing of panels

A panel's size can be varied easily by defining the `sizeX` and `sizeY` properties. The `sizeX` property defines the width and `sizeY` property defines height of a panel in cells count. These properties will be helpful in designing a dashboard, where the content of each panel may vary in size.

The following sample demonstrates the sizing of panels within the dashboard layout using the `sizeX` and `sizeY` properties of the panels.

INDEX.TS

```
import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
    cellSpacing: [10, 10],
    columns: 6,
    panels: [{ "sizeX": 1, "sizeY": 1, "row": 0, "col": 0, content: '<div
class="content">0</div>' },
    { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content: '<div
class="content">1</div>' },
    { "sizeX": 1, "sizeY": 3, "row": 0, "col": 4, content: '<div
class="content">2</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 1, "col": 0, content: '<div
class="content">3</div>' },
    { "sizeX": 2, "sizeY": 1, "row": 2, "col": 0, content: '<div
class="content">4</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 2, content: '<div
class="content">5</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 3, content: '<div
class="content">6</div>' }
    ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
```

Setting header of panels in EJ2 JavaScript Dashboard layout control

The Dashboard layout component is mostly used to represent the data used for monitoring or managing a process. These data or any HTML template can be placed as the content of a panel using the `content` property. Also, word or phrase that summarizes about the panel's content can be added as the header on the top of each panel using the `header` property of the panel.

The following sample demonstrates how to add content for each panel using the header and content properties of the panels.

INDEX.TS

```

import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [10, 10],
  columns: 6,
  panels: [{ 'id': 'Panel0', 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0,
    header: '<div>Panel 0</div>', content: '<div class="content">Panel
Content<div>' },
    { 'id': 'Panel1', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, header:
    '<div>Panel 1</div>', content: '<div class="content">Panel Content<div>' },
    { 'id': 'Panel2', 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, header:
    '<div>Panel 2</div>', content: '<div class="content">Panel Content<div>' },
    { 'id': 'Panel3', 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, header:
    '<div>Panel 3</div>', content: '<div class="content">Panel Content<div>' },
    { 'id': 'Panel4', 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, header:
    '<div>Panel 4</div>', content: '<div class="content">Panel Content<div>' },
    { 'id': 'Panel5', 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, header:
    '<div>Panel 5</div>', content: '<div class="content">Panel Content<div>' },
    { 'id': 'Panel6', 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, header:
    '<div>Panel 6</div>', content: '<div class="content">Panel Content<div>' }
  ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');

```

INDEX.HTML

```

</body></html>

```

Placing components as content of panels

In a dashboard, components like the chart, grids, maps, gauge etc. can be used to present a complex data. Any such components can be placed as the panel content by assigning the corresponding component element as the **content** of the panel.

The following sample demonstrates how to add ej2-chart components as the **content** for each panel in the dashboard layout component.

INDEX.TS

```

import { DashboardLayout } from '@syncfusion/ej2-layouts';
import { Chart, ColumnSeries, Category, LineSeries, AccumulationChart,
AccumulationTooltip, PieSeries } from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, Category, LineSeries);
AccumulationChart.Inject(AccumulationTooltip, PieSeries );
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [10, 10],
  columns: 6,
  panels: [{ 'id': 'Panel1', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 0,
header: '<div class="header"> Product usage ratio </div>', content: '<div
id="pie"><div>',
  { 'id': 'Panel2', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 3, header: '<div
class="header"> Last year Sales Comparison </div>', content: '<div
id="column"><div>' },
  { 'id': 'Panel3', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 3, header: '<div
class="header"> Mobile browsers usage </div>', content: '<div
id="pie1"><div>' },

```

```

        { 'id': 'Panel4', 'sizeX': 3, 'sizeY': 2, 'row': 1, 'col': 0, header: '<div
class="header"> Sales increase percentage </div>', content: '<div
id="line"><div>' }
    ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
let chartData: any[] = [
    { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
    { month: 'Mar', sales: 34 }, { month: 'Apr', sales: 32 },
    { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },
    { month: 'Jul', sales: 35 }, { month: 'Aug', sales: 55 },
    { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
    { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }
];
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category'
    },
    series: [{
        dataSource: chartData,
        xName: 'month',
        yName: 'sales',
        type: 'Column'
    }],
    height: "162px"
}, '#column');
let lineData: any[] = [
    { x: 2013, y: 28 }, { x: 2014, y: 25 }, { x: 2015, y: 26 }, { x: 2016,
y: 27 },
    { x: 2017, y: 32 }, { x: 2018, y: 35 },
];
let linechart: Chart = new Chart({

Add remove panels in EJ2 JavaScript Dashboard layout control

In real-time cases, the data being presented within the dashboard need to be updated frequently which includes adding or removing the data dynamically within the dashboard. This can be easily achieved by using the [addPanel](#) and [removePanel](#) public methods of the component.

Add or remove panels dynamically

Panels can be added dynamically by using the `addPanel` public method by passing the `panel` property as parameter. Also, they can be removed dynamically by using the `removePanel` public method by simply passing the `panel id` value as a parameter.

It is also possible to remove all the panels in a Dashboard Layout by calling [removeAll](#) method.

```
`js
```

```
dashboard.removeAll();
```

```
,
```

The following sample demonstrates how to add and remove the panels dynamically in the dashboard layout component. Here, panels can be added in any desired position of required size by selecting them in the numeric boxes and clicking add button and remove them by selecting the id of the panel.

INDEX.TS

```

import { DashboardLayout } from '@syncfusion/ej2-layouts';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { Button } from '@syncfusion/ej2-buttons';
import { NumericTextBox } from '@syncfusion/ej2-inputs';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [10, 10],
  columns: 5,
  panels: [{ 'id': 'Panel0', 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0,
  content: '<div class="content">0</div>' },
  { 'id': 'Panel1', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, content:
  '<div class="content">1</div>' },
  { 'id': 'Panel2', 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, content:
  '<div class="content">2</div>' },

```

```

    { 'id': 'Panel3', 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, content:
    '<div class="content">3</div>' },
    { 'id': 'Panel4', 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, content:
    '<div class="content">4</div>' },
    { 'id': 'Panel5', 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, content:
    '<div class="content">5</div>' },
    { 'id': 'Panel6', 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, content:
    '<div class="content">6</div>' }
  ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_layout');
let count: number = 7;
let data: string[] = ["Panel0", "Panel1", "Panel2", "Panel3", "Panel4",
"Panel5", "Panel6"];
let sizeX: NumericTextBox = new NumericTextBox({
  placeholder: 'Ex: 1',
  floatLabelType: 'Never',
  value: 1,
  min: 1,
  max: 5
});
sizeX.appendTo('#sizeX');
let idValue: DropDownList = new DropDownList({
  dataSource: data
});
idValue.appendTo("#value");
let sizeY: NumericTextBox = new NumericTextBox({
  //set the data to dataSource property
  placeholder: 'Ex: 1',
  floatLabelType: 'Never',
  value: 1,
  min: 1,
  max: 5
});
sizeY.appendTo('#sizeY');
let row: NumericTextBox = new NumericTextBox({
  //set the data to dataSource property
  placeholder: 'Ex: 1',
  floatLabelType: 'Never',
  value: 0,
  min: 0,
  max: 5
});
row.appendTo('#row');
let column: NumericTextBox = new NumericTextBox({
  //set the data to dataSource property
  placeholder: 'Ex: 1',
  floatLabelType: 'Never',
  value: 0,
  min: 0,
  max: 4
});
column.appendTo('#column');
document.getElementById('add').onclick = () => {
  let panel: any = {
    id: "Panel" + count.toString(),

```

```

        sizeX: sizeX.value,
        sizeY: sizeY.value,
        row: row.value,
        col: column.value,
        content: "<div class='content'>" + count + "</div>"
    }
    dashboard.addPanel(panel);
    count = count + 1;
    (<string[]>idValue.dataSource).push(panel.id);
    idValue.refresh();
};
document.getElementById('remove').onclick = () => {
    dashboard.removePanel(idValue.value.toString());

    (<string[]>idValue.dataSource).splice((<string[]>idValue.dataSource).indexOf(
    idValue.value.toString()), 1);
    idValue.refresh();
    idValue.value = null;
}

```

Interaction With Panels

Dragging moving of panels in EJ2 JavaScript Dashboard layout control

The Dashboard Layout component is provided with dragging functionality to drag and reorder the panels within the layout. While dragging a panel, a holder will be highlighted below the panel indicating the panel placement on panel drop. This helps the user to decide whether to place the panel in the current position or revert to previous position without disturbing the layout.

If one or more panels collide while dragging, then the colliding panels will be pushed towards left or right or top or bottom direction where an adaptive space for the collided panel is available. The position changes of these collided panels will be updated dynamically during dragging of a panel so the user can conclude whether to place the panel in the current position or not.

While dragging a panel in Dashboard layout the following dragging events will be triggered,

- [dragStart](#) - Triggers when panel drag starts
- [drag](#) - Triggers when panel is being dragged
- [dragStop](#) - Triggers when panel drag stops

The following sample demonstrates dragging and pushing of panels. Here, for e.g. While dragging the panel 0 over panel 1, these panels get collided and push the panel 1 towards the feasible direction so that panel 0 gets placed in the panel 1 position.

INDEX.TS

```
import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [10, 10],
  columns: 5,
  //Dashboard Layout's dragstart event
  dragStart: onDragStart,
  //Dashboard Layout's drag event
  drag: onDrag,
  //Dashboard Layout's dragstop event
  dragStop: onDragStop,
  panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, content: '<div
class="content">0</div>' },
    { 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, content: '<div
class="content">1</div>' },
    { 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, content: '<div
class="content">2</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, content: '<div
class="content">3</div>' },
    { 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, content: '<div
class="content">4</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, content: '<div
class="content">5</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, content: '<div
class="content">6</div>' } ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_layout');
//Dashboard Layout's dragstart event function
function onDragStart(args: any) {
```

```

    console.log("Drag start");
  }
  //Dashboard Layout's drag event function
  function onDrag(args: any) {
    console.log("Dragging");
  }
  //Dashboard Layout's dragstop event function
  function onDragStop(args: any) {
    console.log("Drag stop");
  }

```

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing the dragging handler

Initially, the complete panel will act as the handler for dragging the panel such that the dragging action occurs on clicking anywhere over a panel. However, this dragging handler for the panels can be customized using the [draggableHandle](#) property to restrict the dragging action within a particular element in the panel.

The following sample demonstrates customizing the dragging handler of the panels where dragging action of panel occurs only with the header of the panel.

INDEX.TS

```

import { DashboardLayout } from '@syncfusion/ej2-layouts';
import { Chart, ColumnSeries, Category, LineSeries, AccumulationChart,
AccumulationTooltip, PieSeries } from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, Category, LineSeries);
AccumulationChart.Inject(AccumulationTooltip, PieSeries);
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
    cellSpacing: [10, 10],
    columns: 6,

```

Disable dragging of panels

By default, the dragging of panels is enabled in Dashboard Layout. It can also be disabled with the help of [allowDragging](#) API. Setting [allowDragging](#) to false disables the dragging functionality in Dashboard Layout.

The following sample demonstrates Dashboard Layout with dragging support disabled.

INDEX.TS

```

import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [10, 10],
  allowDragging: false,
  columns: 5,
  panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, content: '<div
class="content">0</div>' },
  { 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, content: '<div
class="content">1</div>' },
  { 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, content: '<div
class="content">2</div>' },
  { 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, content: '<div
class="content">3</div>' },

```

```

    {'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, content:'<div

Moving panels in EJ2 JavaScript Dashboard layout control

Other than drag and drop, it is possible to move the panels in Dashboard Layout programmatically. This can be achieved using [movePanel](#) method. The method is invoked as follows,

```
`js
movePanel(id, row, col)
`
```

Where,

- id - ID of the panel which needs to be moved.
- row - New row position for moving the panel.
- col - New column position for moving the panel.

Each time a panel's position is changed(Programatically or through UI interaction), the Dashboard Layout's [change](#) event will be triggered.

The following sample demonstrates moving a panel programmatically to a new position in the Dashboard Layout's [created](#) event.

INDEX.TS

```
import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [10, 10],
  columns: 5,
  //Dashboard Layout's created event
  created: onCreated,
  //Dashboard Layout's change event
  change: onChange,
  panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, content: '<div

Resizing of panels in EJ2 JavaScript Dashboard layout control

The DashboardLayout component is also provided with the panel resizing functionality which can be enabled or disabled using the [allowResizing](#) property. This functionality allows to resize the panels dynamically through UI interactions using the resizing handlers which controls the panel resizing in various directions.

Initially, the panels can be resized only in south-east direction. However, panels can also be resized in east, west, north, south and south-west directions by defining the required directions with [resizableHandles](#) property.

On resizing a panel in Dashboard layout the following events will be triggered,

- [resizeStart](#) - Triggers when panel resize starts
- [resize](#) - Triggers when panel is being resized
- [resizeStop](#) - Triggers when panel resize stops

The following sample demonstrates how to enable and disable the resizing of panels in the DashboardLayout component in different directions.

INDEX.TS

```
import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
    cellSpacing: [10, 10],
    allowResizing: true,
    columns: 5,
    //Dashboard Layout's resizestart event
    resizeStart: onResizeStart,
    //Dashboard Layout's resize event
    resize: onResize,
    //Dashboard Layout's resizestop event
    resizeStop: onResizeStop,
    resizableHandles: ['e-south-east', 'e-east', 'e-west', 'e-north', 'e-south'],
    panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, content: '<div class="content">0</div>' },
        { 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, content: '<div class="content">1</div>' },
        { 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, content: '<div class="content">2</div>' },
        { 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, content: '<div class="content">3</div>' },
        { 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, content: '<div class="content">4</div>' },
        { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, content: '<div class="content">5</div>' },
        { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, content: '<div class="content">6</div>' } ]
    });
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
//Dashboard Layout's resizestart event function
function onResizeStart(args: any) {
    console.log("Resize start");
}
//Dashboard Layout's resize event function
function onResize(args: any) {
    console.log("Resizing");
}
//Dashboard Layout's resizestop event function
function onResizeStop(args: any) {
    console.log("Resize stop");
}

Resizing panels programatically

The Dashboard Layout panels can also be resized programatically by using [resizePanel](#) method. The method is invoked as follows,

```
`js
```

```
resizePanel(id, sizeX, sizeY)
```

```
,
```

Where,

- id - ID of the panel which needs to be resized.
- sizeX - New panel width in cells count for resizing the panel.
- sizeY - New panel height in cells count for resizing the panel.

The following sample demonstrates resizing panels programatically in the Dashboard Layout's [created](#) event.

INDEX.TS

```

import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({

```

```

    cellSpacing: [10, 10],
    columns: 5,
    //Dashboard Layout's created event
    created: onCreate,
    panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, content: '<div
class="content">0</div>' },
    { 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, content: '<div
class="content">1</div>' },
    { 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, content: '<div
class="content">2</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, content: '<div
class="content">3</div>' },
    { 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, content: '<div
class="content">4</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, content: '<div
class="content">5</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, content: '<div
class="content">6</div>' } ]
    });
    // render initialized dashboardlayout
    dashboard.appendTo('#dashboard_layout');
    //Dashboard Layout's created event function
    function onCreate(args: any) {
        //resizePanel("id", sizeX, sizeY)
        this.resizePanel("layout_4", 1, 1);
        this.resizePanel("layout_5", 2, 1);
    }

Floating of panels in EJ2 JavaScript Dashboard layout control

The floating functionality of the component allows to effectively use the entire layout for the panel's placement. If the floating functionality is enabled, the panels within the layout get floated upwards automatically to occupy the empty cells available in previous rows. This functionality can be enabled or disabled using the [allowFloating](#) property of the component.

The following sample demonstrates how to enable or disable the floating of panels in the DashboardLayout component.

INDEX.TS

```
import { DashboardLayout } from '@syncfusion/ej2-layouts';
import { Button } from '@syncfusion/ej2-buttons';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [10, 10],
  allowFloating: false,
  cellAspectRatio: 100 / 75,
  columns: 6,
  panels: [{ 'sizeX': 2, 'sizeY': 2, 'row': 1, 'col': 0, content: '<div
class="content">0</div>' },
  { 'sizeX': 2, 'sizeY': 2, 'row': 2, 'col': 2, content: '<div
class="content">1</div>' },
  { 'sizeX': 2, 'sizeY': 2, 'row': 3, 'col': 4, content: '<div
class="content">2</div>' } ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
let resetPanels = dashboard.serialize();
resetPanels[0].content = '<div class="content">0</div>';
resetPanels[1].content = '<div class="content">1</div>';
resetPanels[2].content = '<div class="content">2</div>';
let toggleBtn: Button = new Button({
  cssClass: "e-flat e-primary e-outline",
  content: "Enable Floating",
  isToggle: true
});
toggleBtn.appendTo("#toggle");
document.getElementById('toggle').onclick = () => {
  let panels = [];
  if (toggleBtn.content == "Disable Floating and Reset") {
    toggleBtn.content = 'Enable Floating';
    dashboard.allowFloating = false;
    dashboard.panels = resetPanels;
  }
}
```

```
    } else {  
        toggleBtn.content = 'Disable Floating and Reset';  
        dashboard.allowFloating = true;  
    }  
};
```

Responsive adaptive in EJ2 JavaScript Dashboard layout control

The control is provided with built-in responsive support, where panels within the layout get adjusted based on their parent element's dimensions to accommodate any resolution which relieves the burden of building responsive dashboards.

The dashboard layout is designed to automatically adapt with lower resolutions by transforming the entire layout into a stacked one so that the panels will be displayed in a vertical column. By default, whenever the screen resolution meets 600px or lower resolutions this layout transformation occurs. This transformation can be modified for any user defined resolution by defining the for the [mediaQuery](#) property of the component.

The following sample demonstrates the usage of [mediaQuery](#) property to turn out the layout into a stacked one in user defined resolution. Here, whenever, the window size reaches 700px or lesser, the layout becomes a stacked layout.

INDEX.TS

```
import { DashboardLayout } from '@syncfusion/ej2-layouts';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [20, 20],
  mediaQuery: 'max-width: 700px',
  columns: 5,
  panels: [{ "sizeX": 1, "sizeY": 1, "row": 0, "col": 0, content: '<div
class="content">0</div>' },
  { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content: '<div
class="content">1</div>' },
  { "sizeX": 1, "sizeY": 3, "row": 0, "col": 4, content: '<div
class="content">2</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 1, "col": 0, content: '<div
class="content">3</div>' },
  { "sizeX": 2, "sizeY": 1, "row": 2, "col": 0, content: '<div
class="content">4</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 2, "col": 2, content: '<div
class="content">5</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 2, "col": 3, content: '<div
class="content">6</div>' }
  ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
```

Save restore in EJ2 JavaScript Dashboard layout control

The current layout structure of the Dashboard Layout component can be obtained and saved to construct another dashboard with same panel structure using the `serialize` public method of the component. This method returns the component's current panel setting which can be used to construct a dashboard with the same layout settings.

The following sample demonstrates how to save and restore the state of the panels using the `serialize` method. Here, the panel's settings are stored on the save button click and restored to the previously saved panel setting on clicking the restore button.

INDEX.TS

```

import { DashboardLayout } from '@syncfusion/ej2-layouts';
import { Button } from '@syncfusion/ej2-buttons';
// initialize dashboardlayout component
let dashboard: DashboardLayout = new DashboardLayout({
  cellSpacing: [20, 20],
  columns: 5,
  panels: [{ "sizeX": 1, "sizeY": 1, "row": 0, "col": 0, content: '<div
class="content">0</div>' },
  { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content: '<div
class="content">1</div>' },
  { "sizeX": 1, "sizeY": 3, "row": 0, "col": 4, content: '<div
class="content">2</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 1, "col": 0, content: '<div
class="content">3</div>' },
  { "sizeX": 2, "sizeY": 1, "row": 2, "col": 0, content: '<div
class="content">4</div>' },

```

```

    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 2, content: '<div
class="content">5</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 3, content: '<div
class="content">6</div>' }
  ],
  created: restorePanelModel
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
let restoreModel: any;
let saveBtn: Button = new Button({
  cssClass: "e-primary",
  content: "Save",
});
saveBtn.appendTo("#save");
let restoreBtn: Button = new Button({
  cssClass: "e-flat e-outline",
  content: "Restore",
});
restoreBtn.appendTo("#restore");
document.getElementById('save').onclick = () => {
  restorePanelModel();
};
document.getElementById('restore').onclick = () => {
  dashboard.panels = restoreModel;
};
function restorePanelModel() {
  restoreModel = dashboard.serialize();
  restoreModel[0].content = '<div class="content">0</div>';
  restoreModel[1].content = '<div class="content">1</div>';
  restoreModel[2].content = '<div class="content">2</div>';
  restoreModel[3].content = '<div class="content">3</div>';
  restoreModel[4].content = '<div class="content">4</div>';
  restoreModel[5].content = '<div class="content">5</div>';
  restoreModel[6].content = '<div class="content">6</div>';
}

Style in EJ2 JavaScript Dashboard layout control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the dashboard layout panel header

Use the following CSS to customize the dashboard layout panel header.

,

```

.e-dashboardlayout.e-control .e-panel .e-panel-container .e-panel-header {
color: #754131;
background-color: #c9e2f7;
text-align: center;
}

```

,

Customizing the dashboard layout panel content

Use the following CSS to customize the dashboard layout panel content.

,

```

.e-dashboardlayout.e-control .e-panel .e-panel-container .e-panel-content {

```

```
background-color: #c9e2f7;
padding: 50px;
}
```

Customizing the dashboard layout panel resize icon

Use the following CSS to customize the dashboard layout resize icon.

```
.e-dashboardlayout.e-control .e-panel .e-panel-container .e-resize.e-double{
color: #0378d5;
font-size: 30px;
height: 20px;
width: 20px;
}
```

Customizing the dashboard layout panel background

Use the following CSS to customize the dashboard layout panel background.

```
.e-dashboardlayout.e-control.e-responsive {
background: #b3d3ed;
}
```

You can refer to our [JavaScript Dashboard Layout](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Dashboard Layout example](#) to know how to present and manipulate data.

How To

Resize the panel dynamically in EJ2 JavaScript Dashboard layout control

In Dashboard Layout, the height of a panel is based on its width. While resizing the panel, the height and width should be changed.

To resize the height of a panel alone, the [resizePanel](#) method is used. In this case, the [cellAspectRatio](#) property configures the height of the cells based on the cell width to height ratio (cell width/cell height ratio) when the height will not be completely adjusted to `sizeY` value.

Refer to the following code snippet to determine the height of a panel.

```
`ts
let panelContent: HTMLElement = document.getElementById("panelContent");
let panelHeight: number = panelContent.offsetHeight;
```

INDEX.TS

```
import { DashboardLayout } from '@syncfusion/ej2-layouts';
import { Button } from '@syncfusion/ej2-buttons';
let dashboardObject: DashboardLayout = new DashboardLayout({
    cellAspectRatio: 100/70,
    columns: 4,
    panels: [{
        id: 'panel0', 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, header:
        '<div>Panel 0</div>',
        content: '<div class="content" id="panelContent">Place your
content here</div>'
    },
    {
        id: 'panel1', 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 1,
        header: '<div>Panel 1</div>',
        content: '<div class="content" id="panelContent">Place your
content here</div>'
    },
    {
        id: 'panel2', 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 2,

```

You can refer to our [JavaScript Dashboard Layout](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Dashboard Layout example](#) to know how to present and manipulate data.

Accessibility in EJ2 JavaScript Dashboard Layout component

The Dashboard Layout component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Dashboard Layout component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

```
<style>
```

```
.post .post-content img {
```

```
display: inline-block;
```

```
margin: 0.5em 0;
```

```
}
```

```
</style>
```

```
<div> - All features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Dashboard Layout component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Dashboard Layout component:

| **Attributes** | **Purpose** |

| --- | --- |

| **role=list** | Indicates the role as a list for the Dashboard Layout element. |

| **role=listitem** | Indicates the role as a listitem for the Dashboard panels. |

| **role=presentation** | Indicates the role as a presentation for the table when the **showGridLines** property is enabled. |

| **aria-grabbed** | When the panel is chosen for dragging, the aria-grabbed attribute is set to "true." If it's set to "false," the element can be grabbed for drag-and-drop, but it won't be actively held. |

Keyboard interaction

Keyboard support is not applicable for the Dashboard Layout.

Ensuring accessibility

The Dashboard Layout component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Dashboard Layout component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Dashboard Layout component with accessibility tools.

DataManager

Getting started in EJ2 JavaScript Data control

This section explains you the steps required to create a simple Essential JS 2 Data Manager and demonstrate the basic usage of the Data Manager control in a JavaScript application.

Dependencies

Below is the list of minimum dependencies required to use the DataManager.

```
`javascript
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-base
|-- es6-promise (Required when window.Promise is not available)
`
```

@syncfusion/ej2-data requires the presence of a Promise feature in global environment. In the browser, window.Promise must be available.

Setup for local environment

Refer the following steps for setup your local environment.

Step 1: Create a root folder `myapp` for your application.

Step 2: Create `myapp/resources` folder to store local scripts files.

Step 3: Create `myapp/index.js` and `myapp/index.html` files for initializing Essential JS 2 data manager control.

Adding Syncfusion resources

The Essential JS 2 Data Manager control can be initialized by using either of the following ways.

- Using local script.
- Using CDN link for script.

Using local script

You can get the global script from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

After installing the Essential JS 2 product build, you can copy the data manager and its dependencies scripts file into the `resources/scripts` folder.

Refer the below code to find location data manager's script file.

Syntax:

Script: **(installed location)**/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js

Example:

Script: C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-data/dist/global/ej2-data.min.js

After copying the files, then you can refer the pager's scripts into the `index.html` file.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 Data Manager's dependent script -->
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<!-- Essential JS 2 Data Manager's global script -->
<script src="resources/scripts/ej2-data.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

Using CDN link for script

Using CDN link, you can directly refer the data manager and its dependencies script into the `index.html`.

Refer the data manager's CDN links as below

Syntax:

Script: `http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Example:

Script: <http://cdn.syncfusion.com/ej2/ej2-data/dist/global/ej2-data.min.js>

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 Data Manager's dependent script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-base/dist/global/ej2-base.min.js"
type="text/javascript"></script>
<!-- Essential JS 2 Pager's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-data/dist/global/ej2-data.min.js"
type="text/javascript"></script>
</head>
<body>
```

```
</body>
```

```
</html>
```

```
,
```

Connection to a data source

The DataManager can act as gateway for both local and remote data source which will uses the query to interact with the data source.

Binding to JSON data

DataManager can be bound to local data source by assigning the array of JavaScript objects to the **json** property or simply passing them to the constructor while instantiating.

Create **my-app/es5-datasource.js** file to bind JSON data.

Add the CSS below to the **myapp/index.html** file to style the table.

```
`html
```

```
<style>
```

```
.e-table {
```

```
border: solid 1px #e0e0e0;
```

```
border-collapse: collapse;
```

```
font-family: Roboto;
```

```
}
```

```
.e-table td,
```

```
.e-table th {
```

```
border-style: solid;
```

```
border-width: 1px 0 0;
```

```
border-color: #e0e0e0;
```

```
display: table-cell;
```

```
font-size: 14px;
```

```
line-height: 20px;
```

```
overflow: hidden;
```

```
padding: 8px 21px;
```

```
vertical-align: middle;
```

```
white-space: nowrap;
```

```
width: auto;
```

```
}
```

```
</style>
```

```
,
```

INDEX.JS

```
var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
var result = new ej.data.DataManager(data).executeLocal(new
ej.data.Query().take(8));
var table = (document.getElementById('datatable'));
result.forEach((data) => {
    table.appendChild(compiledFunction(data)[0]);
});
```

INDEX.HTML

```

  ]];

```

Binding to OData

DataManager can be bound to remote data source by assigning service end point URL to the **url** property. Now all **DataManager** operations will address the provided service end point.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>'

```

```
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.syncfusion.com/js/production/api/Orders';
var table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI }).executeQuery(new
ej.data.Query()).then((e) => {
    (e.result).forEach((data) => {
        table.appendChild(compiledFunction(data)[0]);
    });
});
```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Grid"></div>
        <table id="datatable" class="e-table">
            <thead>
                <tr><th>Order ID</th><th>Customer ID</th><th>Employee
ID</th></tr>
            </thead>
            <tbody>
            </tbody>
        </table>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Filter

The data filtering is a trivial operation which will let us to get reduced view of data based on filter criteria. The filter expression can be built easily using `where` method of `Query` class.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
var result = new ej.data.DataManager(data).executeLocal(new
ej.data.Query().where('EmployeeID', 'equal', 3));
var table = (document.getElementById('datatable'));
result.forEach((data) => {
    table.appendChild(compiledFunction(data) [0]);
});

```

INDEX.HTML

Component binding

DataManager component can be used with Syncfusion components which supports data binding.

In the following samples, the grid component is bound. To render the grid with the necessary configurations, please refer to the [Grid Getting Started](#) documentation.

Local data binding

A DataSource can be created in-line with other Syncfusion component configuration settings.

INDEX.JS

```

(document.getElementById('datatable')).style.display = 'none';
var grid = new ej.grids.Grid({
    dataSource: new ej.data.DataManager(data),
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign:
        'Right', width: 90, type: 'number' },
        { field: 'CustomerID', width: 120, headerText: 'Customer
        ID', type: 'string' },
        { field: 'Freight', headerText: 'Freight', textAlign:
        'Right', width: 90, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 120,
        format: 'yMd' },
    ],
    height: 315,
    allowPaging: false
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

Remote data binding

To bind remote data to Syncfusion component, you can assign a service data as an instance of **DataManager** to the **dataSource** property.

INDEX.JS

```

const SERVICE_URI =
'https://services.syncfusion.com/js/production/api/orders';
var grid = new ej.grids.Grid({
  dataSource: new ej.data.DataManager({ url: SERVICE_URI }),
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign:
    'Right', width: 90, type: 'number' },
    { field: 'CustomerID', width: 120, headerText: 'Customer
    ID', type: 'string' },
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
    'Right', width: 90 }
  ],
  height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

Data binding in EJ2 JavaScript Data control

DataManager supports both RESTful JSON data services binding and local JavaScript object array binding.

Local data binding

DataManager can be bound to local data source by assigning the array of JavaScript objects to the `json` property or simply passing them

to the constructor while instantiating. Now the JavaScript object array can be queried and manipulated.

INDEX.TS

```

import { DataManager, Query } from '@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
import { data } from './datasource.ts';
let template: string =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
let result: Object[] = new DataManager(data).executeLocal(new
Query().take(8));
let table: HTMLElement =
(<HTMLElement>document.getElementById('datatable'));
result.forEach((data: Object) => {
    table.appendChild(compiledFunction(data) [0]);
});

```

INDEX.HTML

        <table id="datatable" class="e-table">
            <thead>
                <tr><th>Order ID</th><th>Customer ID</th><th>Employee
ID</th></tr>
            </thead>
            <tbody>
            </tbody>
        </table>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Remote data binding

DataManager can be bound to remote data source by assigning service end point URL to the **url** property. With the provided **url**, the **DataManager** handles all communication with the data server with help of queries.

When querying data, the **DataManager** will convert the query object(**Query**) into server request after calling **executeQuery** and waits for the server response(**JSON** format).

INDEX.TS

```
import { DataManager, Query, ReturnOption } from '@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
let template: string =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
'https://services.syncfusion.com/js/production/api/orders';
let table: HTMLElement =
(<HTMLElement>document.getElementById('datatable'));
new DataManager({ url: SERVICE_URI }).executeQuery(new
Query().take(8)).then((e: ReturnOption) => {
    (<Object[]>e.result).forEach((data: Object) => {
        table.appendChild(compiledFunction(data)[0]);
    });
});
```

INDEX.HTML

Adaptors in EJ2 JavaScript Data control

Each data source or remote service uses different way in accepting request and sending back the response. **DataManager** cannot anticipate every way a data source works. To tackle this problem the **DataManager** uses the adaptor concept to communicate with particular data source.

For local data sources, the role of the data adaptor is to query the JavaScript object array based on the **Query** object and manipulate them.

When comes with remote datasource, the data adaptor is used to send the request that the server can understand and process the server response.

The adaptor can be assigned using the **adaptor** property of the **DataManager**.

Json adaptor

JsonAdaptor is used to query and manipulate JavaScript object array.

INDEX.TS

```
import { DataManager, Query, JsonAdaptor } from '@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
import { data } from './datasource.ts';
let template: string =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
let result: Object[] = new DataManager({ json: data, adaptor: new
JsonAdaptor })
                                .executeLocal(new Query().take(8));
let table: HTMLElement =
(<HTMLElement>document.getElementById('datatable'));
result.forEach((data: Object) => {
    table.appendChild(compiledFunction(data)[0]);
});
```

```

</head>
<body>

    <div id="container">
        <div id="Grid"></div>
        <table id="datatable" class="e-table">
            <thead>
                <tr><th>Order ID</th><th>Customer ID</th><th>Employee
ID</th></tr>
            </thead>
            <tbody>
            </tbody>
        </table>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Url adaptor

UrlAdaptor act as the base adaptor for interacting with remote data services. Most of the built-in adaptors are derived from the **UrlAdaptor**.

`ts

```

import { DataManager, Query, UrlAdaptor } from '@syncfusion/ej2-data';
const SERVICE_URI: string = 'https://services.syncfusion.com/js/production/api/UrlDataSource';
new DataManager({
url: SERVICE_URI,
adaptor: new UrlAdaptor
}).executeQuery(new Query().take(8)).then((e) => {
//e.result will contain the records
});

```

UrlAdaptor expects response as a JSON object with properties **result** and **count** which contains the collection of entities and the total number of records respectively.

The sample response object should be as follows,

```

{
"result": [{..}, {..}, {..}, ...],
"count": 67

```

```
}
,
```

OData adaptor

[OData](#) is standardized protocol for creating and consuming data. You can retrieve data from OData service using **DataManager**. The **ODataAdaptor** helps you to interact with OData service. You can refer to the following code example of remote Data binding using OData service.

INDEX.TS

```
import { DataManager, Query, ReturnOption, ODataAdaptor } from
 '@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
let template: string =
 '<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
 'https://services.syncfusion.com/js/production/api/Orders';
let table: HTMLElement =
 (<HTMLElement>document.getElementById('datatable'));
new DataManager({ url: SERVICE_URI, adaptor: new ODataAdaptor
 }).executeQuery(new Query().take(8)).then((e: ReturnOption) => {
    (<Object[]>e.result.items).forEach((data: Object) => {
        table.appendChild(compiledFunction(data)[0]);
    });
});
```

INDEX.HTML

```

ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

By default, **ODataAdaptor** is used by **DataManager**.

ODataV4 adaptor

The ODataV4 is an improved version of OData protocols and the **DataManager** can also retrieve and consume OData v4 services. For more details on OData v4 Services, refer the [odata documentation](#). You can use the **ODataV4Adaptor** to interact with ODataV4 service.

INDEX.TS

```

import { DataManager, Query, ReturnOption, ODataV4Adaptor } from
'@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
let template: string =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
let table: HTMLElement =
(<HTMLElement>document.getElementById('datatable'));
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor
}).executeQuery(new Query().take(8)).then((e: ReturnOption) => {
(<Object[]>e.result).forEach((data: Object) => {

```

```

        table.appendChild(compiledFunction(data)[0]);
    });
});

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Grid"></div>
        <table id="datatable" class="e-table">
            <thead>
                <tr><th>Order ID</th><th>Customer ID</th><th>Employee
ID</th></tr>
            </thead>
            <tbody>
            </tbody>
        </table>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {

```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Web API adaptor

You can use the **WebApiAdaptor** to interact with Web API created with OData endpoint. The **WebApiAdaptor** is extended from the **ODataAdaptor**. Hence to use **WebApiAdaptor**, the endpoint should understand the OData formatted queries send along with request.

To enable OData query option for Web API, please refer to the [documentation](#)

`ts

```

import { DataManager, Query, WebApiAdaptor } from '@syncfusion/ej2-data';
const SERVICE_URI: string = 'https://services.syncfusion.com/js/production/api/Orders';
new DataManager({
  url: SERVICE_URI,
  adaptor: new WebApiAdaptor
}).executeQuery(new Query().take(8)).then((e) => {
  //e.result will contain the records
});
`

```

WebApiAdaptor expects JSON response from the server and the response object should contain properties **Items** and **Count** whose values are collection of entities and total count of the entities respectively.

The sample response object should look like below.

```

{
  Items: [{..}, {..}, {..}, ...],
  Count: 830
}
`

```

WebMethod Adaptor

The **WebMethodAdaptor** is used to bind data source from remote services and code behind methods. It can be enabled in Grid using Adaptor property of DataManager as **WebMethodAdaptor**.

For every operations, an Fetch post will be send to the specified data service.

`ts

```

import { DataManager, Query, WebMethodAdaptor } from '@syncfusion/ej2-data';

```

```
let SERVICE_URI = 'Default.aspx/DataSource';
new DataManager({
url: SERVICE_URI,
adaptor: new WebMethodAdaptor
}).executeQuery(new Query().take(8)).then((e) => {
//e.result will contain the records
});
`
```

WebMethodAdaptor expects JSON response from the server and the response object should contain properties **result** and **count** whose values are collection of entities and total count of the entities respectively.

The sample response object should look like below.

```
`
{
result: [{..}, {..}, {..}, ...],
count: 830
}
`
```

The controller method's data parameter name must be **value**.

Custom Data Adaptor

The **CustomDataAdaptor** provides an option to send your own request to handle the data operations.

You can get the current action details inside the **getData** method of **CustomDataAdaptor** to build the request. Once the data is fetched from the service successfully, then the **onSuccess** method can be invoked to handle the further data processing. In failure case, invoke the **onFailure** method.

```
`ts
import { DataManager, Query, CustomDataAdaptor, FetchOption } from '@syncfusion/ej2-data';
const SERVICE_URI: string = 'http://controller.com/actions';
new DataManager({
adaptor: new CustomDataAdaptor({
getData: function (option: FetchOption) {
let request: object;
fetch(SERVICE_URI, {
method: 'POST',
headers: {
```

```

'Content-Type': 'application/json; charset=utf-8',
},
}).then((response) => {
  request = extend({}, option, { httpRequest: response });
  if (response.status >= 200 && response.status <= 299) {
    return response.json();
  }
}).then((data) => {
  option.onSuccess(data, request);
}).catch((error) => {
  option.onFailure(request);
});
},
}),
}).executeQuery(new Query().take(8)).then((e) => {
  //e.result will contain the records
});
`

```

Since the `CustomDataAdaptor` is extended from the `UrlAdaptor`, it expects response as a JSON object with properties `result` and `count` which

contains the collection of entities and the total number of records respectively.

The sample response object should be as follows,

```

`
{
  "result": [{..}, {..}, {..}, ...],
  "count": 67
}
`

```

Performing CRUD action with CustomDataAdaptor

You can perform the CRUD actions using the `addRecord`, `updateRecord`, `deleteRecord` and `batchUpdate` methods.

```

`ts
import { DataManager, Query, CustomDataAdaptor, FetchOption } from '@syncfusion/ej2-data';
let createRequest: Function = (url: string, option: FetchOption) => {

```

```
let request: object;
fetch(SERVICE_URI, {
  method: 'POST',
  headers: {
    'Content-Type': 'application/json; charset=utf-8',
  },
}).then((response) => {
  request = extend({}, option, { httpRequest: response });
  if (response.status >= 200 && response.status <= 299) {
    return response.json();
  }
}).then((data) => {
  option.onSuccess(data, request);
}).catch((error) => {
  option.onFailure(request);
});

let baseUrl: string = "http://localhost:65327/Home/";
new DataManager({
  adaptor: new CustomDataAdaptor({
    getData: function (option: FetchOption) {
      createRequest(baseUrl + 'UrlDatasource', option);
    },
    addRecord: function (option: FetchOption) {
      createRequest(baseUrl + 'Insert', option);
    },
    updateRecord: function (option: FetchOption) {
      createRequest(baseUrl + 'Update', option);
    },
    deleteRecord: function (option: FetchOption) {
      createRequest(baseUrl + 'Delete', option);
    }
  })
});
// to handle Batch operation
```

```
//batchUpdate: function (option: FetchOption) {
// createRequest(baseUrl + 'Delete', option);
//}
}
}).executeQuery(new Query().take(8)).then((e) => {
//e.result will contain the records
});
`
```

GraphQL Adaptor

The **GraphQLAdaptor** provides an option to retrieve data from the GraphQL server. It performs CRUD and data operations such as paging, sorting, filtering etc by sending the required arguments to the server.

You can provide the GraphQL query string by using the **query** property of the **GraphQLAdaptor**. Since, the **GraphQLAdaptor** is extended from the **UrlAdaptor**, it expects response as a JSON object with properties **result** and **count** which contains the collection of entities and the total number of records respectively. The GraphQL response should be returned in JSON format like { "data": { ... } } with query name as field, you need to set the **result** and **count** properties to map the response.

```
`ts
import { DataManager, Query, GraphQLAdaptor } from '@syncfusion/ej2-data';
const SERVICE_URI: string = 'http://controller.com/actions';
new DataManager({
url: SERVICE_URI, adaptor: new GraphQLAdaptor({
response: {
result: 'getOrders.OrderData',
count: 'getOrders.OrderCount'
},
query: `query getOrders($datamanager: String) {
getOrders(datamanager: $datamanager) {
OrderCount,
OrderData{OrderID, CustomerID, EmployeeID, ShipCity, ShipCountry}
}
}`
})
}).executeQuery(new Query().take(8)).then((e) => {
//e.result will contain the records
```

```
});  
`
```

The Schema for the GraphQL server is

```
`ts
```

```
input OrderInput {  
  OrderID: Int!  
  CustomerID: String!  
  EmployeeID: Int!  
  ShipCity: String!  
  ShipCountry: String!  
}  
  
type Order {  
  OrderID: Int!  
  CustomerID: String!  
  EmployeeID: Int!  
  ShipCity: String!  
  ShipCountry: String!  
}  
  
type Returntype {  
  getOrders: [Order]  
  count: Int  
}  
  
type Query {  
  getOrders(datamanager: String): Returntype  
}  
  
type Mutation {  
  createOrder(value: OrderInput): Order!  
  updateOrder(key: Int!, keyColumn: String, value: OrderInput): Order!  
  deleteOrder(key: Int!, keyColumn: String, value: OrderInput): Order!  
}  
`
```

The resolver for the corresponding action is

```
`ts
```

```
import { data } from "./db";
const resolvers = {
  Query: {
    getOrders: (parent, { datamanager }, context, info) => {
      if (datamanager.search) {
        // Perform searching
      }
      if (datamanager.sorted) {
        // Perform sorting
      }
      if (datamanager.where) {
        // Perform filtering
      }
      if (datamanager.search) {
        // Perform search
      }
      if (datamanager.skip && datamanager.take) {
        // Perform Paging
      }
      return { OrderData: data, OrderCount: data.length };
    },
    Mutation: {
      createOrder: (parent, { value }, context, info) => {
        // Perform Insert
        return value;
      },
      updateOrder: (parent, { key, keyColumn, value }, context, info) => {
        // Perform Update
        return value;
      },
      deleteOrder: (parent, { key, keyColumn, value }, context, info) => {
        // Perform Delete
      }
    }
  }
}
```

```

return value;
},
}
};
export default resolvers;
`

```

The query parameters will be send in a string format which contains the below details.

Parameters	Description
<code>RequiresCounts</code>	If it is <code>true</code> then the total count of records will be included in response.
<code>Skip</code>	Holds the number of records to skip.
<code>Take</code>	Holds the number of records to take.
<code>Sorted</code>	Contains details about current sorted column and its direction.
<code>Where</code>	Contains details about current filter column name and its constraints.
<code>Group</code>	Contains details about current Grouped column names.

Performing CRUD action with GraphQLAdaptor

You can perform the CRUD actions by returning the mutation queries inside the `getMutation` method based on the action.

```

`ts
import { DataManager, Query, GraphQLAdaptor } from '@syncfusion/ej2-data';
const SERVICE_URI: string = 'http://controller.com/actions';
new DataManager({
  url: SERVICE_URI, adaptor: new GraphQLAdaptor({
    response: {
      result: 'getOrders.getOrders',
      count: 'getOrders.count'
    },
    query: `query getOrders($datamanager: String) {
      getOrders(datamanager: $datamanager) {
        count,
        getOrders{OrderID, CustomerID, EmployeeID, ShipCity, ShipCountry}
      }
    }`,
  }
}

```

```

getMutation: function (action): string {
  if (action === 'insert') {
    return `mutation CreateOrderMutation($value: OrderInput!){
      createOrder(value: $value){
        OrderID, CustomerID, EmployeeID, ShipCity, ShipCountry
      }
    }`;
  }
  if (action === 'update') {
    return `mutation Update($key: ID!, $keyColumn: String,$value: OrderInput){
      updateOrder(key: $key, keyColumn: $keyColumn, value: $value) {
        OrderID, CustomerID, EmployeeID, ShipCity, ShipCountry
      }
    }`;
  } else {
    return `mutation Remove($key: ID!, $keyColumn: String, $value: OrderInput){
      deleteOrder(key: $key, keyColumn: $keyColumn, value: $value) {
        OrderID, CustomerID, EmployeeID, ShipCity, ShipCountry
      }
    }`;
  }
}
}).executeQuery(new Query().take(8)).then((e) => {
  //e.result will contain the records
});
`

```

Writing custom adaptor

Sometimes the built-in adaptors does not meet your requirement. In such cases you can create your own adaptor.

To create and use custom adaptor, please refer to the below steps.

- Select an built-in adaptor which will act as base class for your custom adaptor.
- Override the desired method to achieve your requirement.
- Assign the custom adaptor to the **adaptor** property of **DataManager**.

For the sake of demonstrating custom adaptor approach, we are going to see how to add serial number for the records by overriding the built-in response processing using `processResponse` method of the `ODataV4Adaptor`.

INDEX.TS

```
import { DataManager, Query, ReturnOption, ODataV4Adaptor } from
'@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
class SerialNoAdaptor extends ODataV4Adaptor {

    public processResponse(): Object {
        let i: number = 0;
        //calling base class processResponse function
        let original: Object[] = super.processResponse.apply(this,
arguments);
        //Adding serial number
        original.forEach((item: Object) => item['SNO'] = ++i);
        return original;
    }
}
let template: string =
'<tr><td>${SNO}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
let table: HTMLElement =
(<HTMLElement>document.getElementById('datatable'));
table.innerHTML = '<tr><th>SNO</th><th>Customer ID</th><th>Employee
ID</th></tr>';
new DataManager({ url: SERVICE_URI, adaptor: new SerialNoAdaptor
}).executeQuery(new Query().take(8)).then((e: ReturnOption) => {
    (<Object[]>e.result).forEach((data: Object) => {
        table.appendChild(compiledFunction(data)[0]);
    });
});
```

```

Querying in EJ2 JavaScript Data control

In this section, you will see in detail about how to build query using [Query](#) class and consume the data source.

Specifying resource name using `from`

The [from](#) method is used to specify the resource name or table name from where the data should be retrieved.

INDEX.TS

```

import { DataManager, Query, ReturnOption, ODataV4Adaptor } from
'@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
let template: string =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);

```

```

const SERVICE_URI: string =
'https://services.odata.org/V4/Northwind/Northwind.svc/';
let table: HTMLElement =
(<HTMLElement>document.getElementById('datatable'));
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor })
    .executeQuery(new Query().from('Orders').take(8)).then((e: ReturnOption)
=> {
    (<Object[]>e.result).forEach((data: Object) => {
        table.appendChild(compiledFunction(data)[0]);
    });
});

```

INDEX.HTML

```

```

Eager loading navigation properties

You can use the [expand](#) method to eagerly load navigation properties. The navigation properties values are accessed using appropriate field names separated by dot(.) sign.

INDEX.TS

```

import { DataManager, Query, ReturnOption, ODataV4Adaptor } from
'@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
let template: string =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${Employee.FirstName}</td>
</tr>';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';

```

```

let table: HTMLElement =
  (<HTMLElement>document.getElementById('datatable'));
table.innerHTML = '<tr><th>OrderID</th><th>CustomerID</th><th>Employee
Name</th></tr>';
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor })
  .executeQuery(new Query().expand('Employee').select(['OrderID',
'CustomerID', 'Employee.FirstName']).take(8))
  .then((e: ReturnOption) => {
    (<Object[]>e.result).forEach((data: Object) => {
      table.appendChild(compiledFunction(data)[0]);
    });
  });

```

INDEX.HTML

</body></html>

```

Sorting

You can use the [sortBy](#) method to perform sort operation in the data source. Default sorting order is **ascending**. To change the sort order, either you can specify the second argument of [sortBy](#) as **descending** or use the [sortByDesc](#) method.

INDEX.TS

```

import { DataManager, Query, ReturnOption, ODataV4Adaptor } from
'@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
let template: string =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
let table: HTMLElement =
(<HTMLElement>document.getElementById('datatable'));
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor })
    .executeQuery(new Query().sortBy('CustomerID', 'descending').take(8))
    .then((e: ReturnOption) => {
        (<Object[]>e.result).forEach((data: Object) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

INDEX.HTML

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Multi sorting can be performed by simply chaining the multiple `sortBy` methods.

Filtering

You can use the [where](#) method to build filter criteria which allows you to get reduced view of records. The [where](#) method can also be chained to form multiple filter criteria.

INDEX.TS

```

import { DataManager, Query, ReturnOption, ODataV4Adaptor } from
'@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';

```

```

let template: string =
  '<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
  'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
let table: HTMLElement =
  (<HTMLElement>document.getElementById('datatable'));
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor })
  .executeQuery(new Query().where('EmployeeID', 'equal', 3).take(8))
  .then((e: ReturnOption) => {
    (<Object[]>e.result).forEach((data: Object) => {
      table.appendChild(compiledFunction(data)[0]);
    });
  });

```

```

Filter Operators

Filter operators are generally used to specify the filter type. The various filter operators supported by **DataManager** is listed below.

- greaterthan
- greaterthanorequal
- lessthan

These filter operators are used for creating filter query using [where](#) method and [Predicate](#) class.

Build complex filter criteria using `Predicate`

Sometimes chaining [where](#) method is not sufficient to create very complex filter criteria, in such cases we can use [Predicate](#) class to create composite filter criteria.

INDEX.TS

```

import { DataManager, Query, ODataV4Adaptor, Predicate, ReturnOption } from
'@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
let template: string =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
let table: HTMLElement =
(<HTMLElement>document.getElementById('datatable'));
//Building complex filter criteria using `Predicate`
let predicate: Predicate = new Predicate('EmployeeID', 'equal', 3);
predicate = predicate.or('EmployeeID', 'equal', 2);
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor })
    .executeQuery(new Query().where(predicate).take(8))

```

```
.then((e: ReturnOption) => {
    (<Object[]>e.result).forEach((data: Object) => {
        table.appendChild(compiledFunction(data) [0]);
    });
});
```

```

Searching

You can use the [search](#) method to create search criteria, it differs from the filter in the way that search criteria will applied to all fields in the data source whereas filter criteria will be applied to a particular field.

INDEX.TS

```

import { DataManager, Query, ReturnOption } from '@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
import { data } from './datasource.ts';
let template: string =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
let table: HTMLElement =
(<HTMLElement>document.getElementById('datatable'));
new DataManager(data)
    .executeQuery(new Query().search('VI', ['CustomerID']))
    .then((e: ReturnOption) => {
        (<Object[]>e.result).forEach((data: Object) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can search particular fields by passing the field name collection in the second argument of [search](#) method.

Grouping

DataManager allow you to group records by category. The [group](#) method is used to add group query.

INDEX.TS

```

import { DataManager, Query, ReturnOption, ODataV4Adaptor } from
'@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
let template: string = '<tr><td>${field} -
${key}</td><td></td><td></td></tr>${for(item of
items)}<tr><td>${item.OrderID}</td><td>${item.CustomerID}</td><td>${item.Emp
loyeeID}</td></tr>${/for}';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
let table: HTMLElement =
(<HTMLElement>document.getElementById('datatable'));

```

```

new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor })
    .executeQuery(new Query().group('CustomerID').take(8))
    .then((e: ReturnOption) => {
        (<Object[]>e.result).forEach((data: Object) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Grid"></div>
        <table id="datatable" class="e-table">
            <thead>
                <tr><th>Order ID</th><th>Customer ID</th><th>Employee
ID</th></tr>
            </thead>
            <tbody>
                <tbody>
            </tbody>
        </table>

```

```

    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Multiple grouping can be done by simply chaining the [group](#) method.

Paging

You can query paged data using [page](#) method. This allow you to query particular set of records based on the page size and index.

INDEX.TS

```

import { DataManager, Query, ReturnOption, ODataV4Adaptor } from
 '@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
let template: string =
 '<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
 'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
let table: HTMLElement =
 (<HTMLElement>document.getElementById('datatable'));
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor })
    .executeQuery(new Query().page(2, 8))
    .then((e: ReturnOption) => {
        (<Object[]>e.result).forEach((data: Object) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

Hierarchical query

You can use the [hierarchy](#) method to build nested query. The hierarchical queries are commonly required when you use foreign key binding.

The [foreignKey](#) method is used to specify the key field of the foreign table and the second argument of the [hierarchy](#) method accepts a selector function which selects the records from the foreign table.

INDEX.TS

```

import { DataManager, Query, ReturnOption, ODataV4Adaptor } from
'@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
let template: string =

Manipulation in EJ2 JavaScript Data control

In this section, you will see in detail about how to manipulate data using **DataManager**. The **DataManager** can create, update and delete records either in local data source or remote data source.

Each data sources uses different way in handling the CRUD operations and hence **DataManager** uses data adaptors to manipulate data that can be understood by a particular data source.

Insert

The [insert](#) method of **DataManager** is used to add new record to the data source. For remote data source, the new record will be send along with the request to the server.

INDEX.TS

```

import { DataManager, Query, ReturnOption } from '@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
import { data } from './datasource.ts';
let template: string =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
let table: HTMLTableElement =
(<HTMLTableElement>document.getElementById('datatable'));
let dm: DataManager = new DataManager(data.slice(0, 4));
dm.executeQuery(new Query())
    .then((e: ReturnOption) => {

Primary key name and its value are required to find the record to be removed.

Batch Edit Operation

DataManager supports batch processing for the CRUD operations. You can use the [saveChanges](#) method to batch the edit operation. For remote data source, requests to add, remove and change are handled altogether at a time rather than passing the request separately for each operation.

INDEX.TS

```

import { DataManager, Query, ReturnOption } from '@syncfusion/ej2-data';

State persistence in EJ2 JavaScript Data control

State persistence refers to the ability of the DataManager to maintain its state in the browser's localStorage, even when the browser is refreshed or when navigating to a different page within the same browser. To enable this feature, you need to set the `id` and `enablePersistence` properties in the DataManager. This allows the DataManager's query object to persistently store in the local storage.

```
`ts  
import { DataManager, Query, UrlAdaptor } from "@syncfusion/ej2-data";  
let SERVICE_URI =  
"https://services.syncfusion.com/js/production/api/UrlDataSource";  
new DataManager({  
  url: SERVICE_URI,  
  adaptor: new UrlAdaptor(),  
  //Mandatory properties to use state persistence.  
  enablePersistence: true,  
  id: "johnDoe",  
})  
.executeQuery(new Query().take(8))  
.then((e) => {  
  //e.result will contain the records  
});  
`
```

Preventing a query from persistence

By default, the DataManager can persist various types of queries, such as sorting, searching, filtering, and selection queries. However, there may be cases where you want to exclude specific queries from persistence. To achieve this, you can utilize the `ignoreOnPersist` property and specify the queries you wish to exclude. Refer to the table below for the naming conventions of DataManager queries:

Sorting: `onSortBy`

Searching: `onSearch`

Selection: `onSelect`

Filtering: `onWhere`

Grouping: `onGroup`

The `ignoreOnPersist` property type is an array, allowing you to exclude multiple queries from persistence according to your requirements.

Refer to the following example, which demonstrates how to exclude the sorting query ("onSortBy") and the search query ("onSearch") from being persisted in the DataManager:

```
`ts
import { DataManager, Query, UrlAdaptor } from "@syncfusion/ej2-data";
let SERVICE_URI =
"https://services.syncfusion.com/js/production/api/UrlDataSource";
new DataManager({
url: SERVICE_URI,
adaptor: new UrlAdaptor(),
enablePersistence: true,
id: "DataManagerid",
//sort and search query won't persist now.
ignoreOnPersist: ["onSortBy", "onSearch"],
})
.executeQuery(new Query().sortBy("Designation", "descending").take(8))
.then((e) => {
//e.result will contain the records
});
`
```

How to get or set the existing persisted data

To access or modify the existing persisted data in the DataManager, you can utilize the [getPersistedData](#) and [setPersistData](#) methods available in the DataManager.

The [getPersistedData](#) method allows you to retrieve the existing persisted data. It takes a single argument, which is the DataManager's `id`. By passing the DataManager's id, you can retrieve the persisted data associated with the DataManager from the window.localStorage. Here is an example of how to use the `getPersistedData` method:

```
`ts
import { DataManager, Query, UrlAdaptor } from "@syncfusion/ej2-data";
let SERVICE_URI =
"https://services.syncfusion.com/js/production/api/UrlDataSource";
let dataManager = new DataManager({
url: SERVICE_URI,
adaptor: new UrlAdaptor(),
```

```
enablePersistence: true,  
id: "Johndoe",  
});  
let persistedQuery = dataManager.getPersistedData("Johndoe");  
`
```

On the other hand, the [setPersistData](#) method enables you to add a query to the existing persisted data. It accepts three arguments:

Original event: Set this argument to null.

Id: Pass the DataManager's id value.

Query: Provide the query that you want to add to the persisted data.

Here is an example demonstrating how to add a query to the existing persisted data:

```
`ts  
import { DataManager, Query, UrlAdaptor } from "@syncfusion/ej2-data";  
let SERVICE_URI =  
"https://services.syncfusion.com/js/production/api/UrlDataSource";  
let dataManager = new DataManager({  
url: SERVICE_URI,  
adaptor: new UrlAdaptor(),  
enablePersistence: true,  
id: "Johndoe",  
});  
let query = new Query().sortBy("Designation", "descending").take(8);  
dataManager.setPersistData(null, "Johndoe", query);  
`
```

By using the setPersistData method, you can append the specified query to the DataManager's existing persisted data.

Restoring the initial state of Datamanager

If you have enabled the `enablePersistence` feature in the DataManager, it automatically retains the previous state when the browser is refreshed or reloaded. However, there might be situations where you want to clear the persistence and load the initial state of the DataManager. In such cases, you can utilize the `clearPersistence()` method provided by the DataManager.

Here is a code example demonstrating how to clear the persistence in the DataManager:

```
`ts  
import { DataManager, Query, UrlAdaptor } from "@syncfusion/ej2-data";  
let SERVICE_URI =
```

```
"https://services.syncfusion.com/js/production/api/UrlDataSource";  
let dataManager = new DataManager({  
  url: SERVICE_URI,  
  adaptor: new UrlAdaptor(),  
  enablePersistence: true,  
  id: "dataManagerid",  
});  
let query = new Query().sortBy("Designation", "descending").take(8);  
//sets persist query to browser storage.  
dataManager.setPersistData(null, "Johndoe", query);  
//clears the persisted query.  
dataManager.clearPersistence();  
`
```

By invoking the `clearPersistence()` method, you can remove the persisted data and restore the `DataManager` to its initial state.

[Use case example demonstrating state persistence with the DataManager](#)

This demonstration involves two controls, namely the **Grid** control and the **Chart** control, which both fetch data from the same instance of the `DataManager`, which has the state persistence feature enabled.

The `Grid` control is responsible for displaying the entire dataset, while the `Chart` control presents user reviews based on specific data from the "column name" field. Both controls are associated with the same `DataManager` instance and it has enabled the state persistence feature. The query state of the `DataManager` is automatically saved in the browser's local storage as the user applies filtering and sorting actions. In both controls are reloaded the data with the last persisted state while refreshing or reloading the browser.

In this demo, the filter query and sort query are persisted, whereas the search query is not persisted. The `onSearch` query is excluded from persistence by setting it in the `ignoreOnPersist` property of the `DataManager`.

For a more detailed explanation and steps of this use case, refer to the following:

Step 1: To initiate the demo, users are required to select a username from the dropdown list. After making a selection, the `Grid` and `Chart` controls will load with initial data using the `Datamanager`. Specifically for this demo, the `Datamanager`'s id will be set to the chosen username. The `Datamanager` will then store the query with this id in the `window.localStorage`. Refer to the code example for your reference:

Step 2: This demo allows you to select `Grid` items by clicking checkboxes and adding them to your cart using the "Add" button in the toolbar. Additionally, you can sort the products from high price to low price by clicking the "Price Low-High" and "Price High-Low" buttons. Furthermore, you can view the added products from the wishlist by clicking the wishlist icon. All this information is persisted and stored by the `DataManager` based on the user ID.

You also can filter the product items using the product category filter. However, this category filter is also not persisted.

The Chart control allows you to see the product reviews.

Step 3: To log out, simply use the "Logout" button.

Step 4: After logging out or refreshing the browser, you will need to select a username from the dropdown list once again (repeat step 1). However, the Grid data will now be loaded based on the last persisted wishlist, associated with the chosen username. The complete example is as follows:

To clear the wishlist for a specific user, click the "Clear Wishlist" button. This will remove all the saved wishlist items for that user.

[Here](#), you can find the Use case example demonstrating state persistence with the DataManager.

How to in EJ2 JavaScript Data control

Work in offline mode

On remote data binding, every time invoking [executeQuery](#) will send request to the server and the query will be processed on server-side. To avoid post back to server on calling [executeQuery](#), you can set the **DataManager** to load all the data on initialization time and make the query processing in client-side. To enable this behavior, you can use **offline** property of **DataManager**.

INDEX.TS

```
import { DataManager, ReturnOption, ODataV4Adaptor } from '@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';
let template: string =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/?$top=7';
let table: HTMLElement =
(<HTMLElement>document.getElementById('datatable'));
let dm: DataManager = new DataManager({ url: SERVICE_URI, adaptor: new
ODataV4Adaptor, offline: true });
dm.ready.then((e: ReturnOption) => {
    (<Object[]>e.result).forEach((data: Object) => {
        table.appendChild(compiledFunction(data)[0]);
    });
});
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Grid"></div>
        <table id="datatable" class="e-table">
            <thead>
                <tr><th>Order ID</th><th>Customer ID</th><th>Employee
ID</th></tr>
            </thead>
            <tbody>
            </tbody>
        </table>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The loaded data will be cached in the `json` property of **DataManager**.

Sending additional parameters to server

You can use the [addParams](#) method of [Query](#) class, to add custom parameter to the data request.

INDEX.TS

```

import { DataManager, Query, ReturnOption, ODataV4Adaptor } from
'@syncfusion/ej2-data';
import { compile } from '@syncfusion/ej2-base';

```

```

let template: string =
  '<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
let compiledFunction: Function = compile(template);
const SERVICE_URI: string =
  'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
let table: HTMLElement =
  (<HTMLElement>document.getElementById('datatable'));
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor })
  .executeQuery(new Query().addParams('$top', '7'))
  .then((e: ReturnOption) => {
    (<Object[]>e.result).forEach((data: Object) => {
      table.appendChild(compiledFunction(data)[0]);
    });
  });

```

INDEX.HTML

="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Grid"></div>
    <table id="datatable" class="e-table">

```

```

        <thead>
            <tr><th>Order ID</th><th>Customer ID</th><th>Employee
ID</th></tr>
        </thead>
        <tbody>
        </tbody>
    </table>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Adding custom headers

You can add custom headers to the request made by **DataManager** using the **headers** property.

```

`ts
import { DataManager, Query, ReturnOption, ODataV4Adaptor } from '@syncfusion/ej2-data';
const SERVICE_URI: string = 'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor, headers:[{ 'syncfusion': 'true' }] })
.executeQuery(new Query())
.then((e: ReturnOption) => {
//get result from e.result
});
`

```

Adding custom headers while making cross domain request will initiate preflight request.

DatePicker

Date range in EJ2 JavaScript Datepicker control

DatePicker provides an option to select a date value within a specified range by using the [min](#) and [max](#) properties. Always the min value has to be lesser than the max value.

When the min and max properties are configured and the selected date value is out-of-range or invalid, then the model value will be set to **out of range** date value or **null** respectively with highlighted **error** class to indicates the date is out of range or invalid.

The value property depends on the min/max with respect to [strictMode](#) property.

The below example allows selecting a date within the range from 7th to 27th day in a month.

INDEX.TS

```

import { DatePicker } from '@syncfusion/ej2-calendars';
let today: Date = new Date();

```

```
let currentYear: number = today.getFullYear();
let currentMonth: number = today.getMonth();
let currentDay: number = today.getDate();
// creates a datepicker with min max property
let datePickerObject: DatePicker = new DatePicker({
    //sets the min.
    min: new Date(currentYear, currentMonth, 7),
    //sets the max.
    max: new Date(currentYear, currentMonth, 27),
    //sets the value.
    value: new Date(new Date().setDate(14))
});
datePickerObject.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DatePicker control</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
calendars/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <input id="element" type="text">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

If the value of `min` or `max` properties changed through code behind, then you have to update the `value` property to set within the range.

Date format in EJ2 JavaScript Datpicker control

Date format is a way of representing the date value in different string format in the textbox.

By default, the DatePicker's format is based on the culture. You can also set the own custom format by using the `format` property.

Once the date format property has been defined it will be common to all the cultures.

To know more about the date format standards, refer to the [Internationalization Date Format](#) section.

The following example demonstrates the DatePicker with the custom format (yyyy-MM-dd).

INDEX.TS

```
import { DatePicker } from '@syncfusion/ej2-calendars';  
// creates a DatePicker component with custom format.  
let datePickerObject: DatePicker = new DatePicker({  
    value: new Date(),  
    // sets the format.  
    format: 'yyyy-MM-dd'  
});  
datePickerObject.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
    <title>Essential JS 2 DatePicker control</title>  
    <meta charset="utf-8">  
    <meta name="viewport" content="width=device-width, initial-scale=1.0">  
    <meta name="description" content="Typescript UI Controls">  
    <meta name="author" content="Syncfusion">  
    <link href="styles.css" rel="stylesheet">  
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">

    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-calendars/styles/material.css" rel="stylesheet">  
  
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js" type="text/javascript"></script>  
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>  
</head>  
<body>  
  
    <div id="container">  
        <input id="element" type="text">  
    </div>
```

```
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Date masking in EJ2 JavaScript Datepicker control

DatePicker has `enableMask` property that provides the option to enable the built-in date masking support. Also, you must inject the MaskedDateTime module to enable the masking support.

INDEX.TS

```
import { DatePicker, MaskedDateTime } from '@syncfusion/ej2-calendars';
DatePicker.Inject(MaskedDateTime);
let datepickerObject: DatePicker = new DatePicker({
    enableMask: true
});
datepickerObject.appendTo('#mask');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 DatePicker control</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="styles.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-buttons/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-inputs/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-popups/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-calendars/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-dropdowns/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <input id="mask">
    </div>
```

```
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

The mask pattern is defined based on the provided date format to the component. If the format is not specified, the mask pattern is formed based on the default format of the current culture.

| Keys | Actions |

| --- | --- |

| Up / Down arrows | To increment and decrement the selected portion of the date. |

| Left / Right arrows and Tab | To navigate the selection from one portion to next portion |

The following example demonstrates default and custom format of DatePicker component with mask.

INDEX.TS

```
import { DatePicker, MaskedDateTime } from '@syncfusion/ej2-calendars';
DatePicker.Inject(MaskedDateTime);
let datePickerObject: DatePicker = new DatePicker({
    enableMask: true
});
datePickerObject.appendTo('#mask');
let datePickerFormat: DatePicker = new DatePicker({
    enableMask: true,
    format: "M/d/yyyy",
});
datePickerFormat.appendTo('#format');
```

INDEX.HTML

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Configure Mask Placeholder

You can change mask placeholder value through property `maskPlaceholder`. By default , it takes the full name of date and time co-ordinates such as `day`, `month`, `year`, `hour` etc.

While changing to a culture other than `English`, ensure that locale text for the concerned culture is loaded through load method of `L10n` class for mask placeholder values like below.

```
`ts
```

```
//Load the L10n from ej2-base
```

```
import { L10n } from '@syncfusion/ej2-base';
```

```
//load the locale object to set the localized mask placeholder value
```

```
L10n.load({
```

```
'de': {
```

```
'datepicker': { day: 'Tag' , month: 'Monat', year: 'Jahr' }
```

```
}
```

```
});
```

The following example demonstrates default and customized mask placeholder value.

INDEX.TS

```
import { DatePicker, MaskedDateTime } from '@syncfusion/ej2-calendars';
DatePicker.Inject(MaskedDateTime);
let datePickerObject: DatePicker = new DatePicker({
    enableMask: true
});
datePickerObject.appendTo('#mask');
let datePickerPlaceholder: DatePicker = new DatePicker({
    enableMask: true,
    maskPlaceholder: {day: 'd', month: 'M', year: 'Y'}
});
datePickerPlaceholder.appendTo('#placeholder');
```

INDEX.HTML

```

        <br><br>
        <input id="placeholder">
```

```
</div>

<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Globalization in EJ2 JavaScript Datepicker control

Globalization is the combination of adapting the component to various languages by means of parsing and formatting the date or number [Internationalization](#) and also by adding cultural specific customizations and translating the text [localization](#)

By default, DatePicker date format, week and month names are specific to English culture. It utilizes the [Essential JavaScript 2 Internationalization](#) package to parse and format the date object based on the culture by using the official [UNICODE CLDR](#) JSON data and it allows to load the culture specific CLDR JSON data by using `loadCldr` method

The DatePicker component supports only the Gregorian type of calendar. All the Essential JS 2 component are specific to English culture ('en-US'). If you want to go with the different culture other than English, follow the below steps.

- Install the `CLDR-Data` package by using the below command (it installs the CLDR JSON data). To know more about CLDR-Data refer the

[CLDR-Data](#) link.

,

```
npm install cldr-data --save
```

,

Once the package installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Now import the installed CLDR JSON data into the `app.ts` file. To import JSON data we need to install the JSON plugin loader. Here we have used the SystemJS JSON plugin loader.

,

```
npm install systemjs-plugin-json --save-dev
```

,

- Once installed, configure the `system.config.js` configuration settings as like below to map the `systemjs-plugin-json` loader.

```
`ts
System.config({
  paths: {
    'npm:': './node_modules/',
    'syncfusion:': 'npm:@syncfusion/'
  },
  map: {
    app: 'app',
    //Syncfusion packages mapping
    "@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
    "@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
    "@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
    "@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
    "@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
    "@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
    "@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
    "@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
    "cldr-data": 'npm:cldr-data',
    "plugin-json": "npm:systemjs-plugin-json/json.js"
  },
  meta: {
    '*.json': { loader: 'plugin-json' }
  },
  packages: {
    'app': { main: 'app', defaultExtension: 'js' },
    'cldr-data': { main: 'index.js', defaultExtension: 'js' }
  }
});
System.import('app');
```

- Now use the `loadCldr` method to load the culture specific CLDR JSON data from the installed location to `app.ts` file.

- DatePicker displayed **Sunday** as the first day of week based on default culture ("en-US"). If you want to display the DatePicker with loaded culture's first day of week, you need to import **weekdata.json** file from the **cldr-data/supplemental** as given in the code example.

```
`ts
```

```
//Load the loadCldr from ej2-base
```

```
import { loadCldr } from '@syncfusion/ej2-base';
```

```
declare var require: any;
```

```
loadCldr(
```

```
  require('cldr-data/main/de/ca-gregorian.json'),
```

```
  require('cldr-data/main/de/numbers.json'),
```

```
  require('cldr-data/main/de/timeZoneNames.json'),
```

```
  require('cldr-data/supplemental/weekdata.json') // To load the culture based first day of week
```

```
);
```

```
`
```

The **Localization** library allows you to localize default text content of the DatePicker. The DatePicker component has static text for **today** feature that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the **locale** value and translation object.

Locale keywords | Text

today | Name of the button to choose Today date.

placeholder | Hint to describe expected value in input element.

- Before changing the culture other than **English**, ensure that locale text for the concerned culture is loaded through **load** method of

[L10n](#) class.

```
`ts
```

```
//Load the L10n from ej2-base
```

```
import { L10n } from '@syncfusion/ej2-base';
```

```
//load the locale object to set the localized placeholder value
```

```
L10n.load({
```

```
  'de': {
```

```
    'datepicker': { placeholder: 'Wählen Sie ein Datum aus',
```

```
    today: 'heute' }
  }
```

```
});
```

```
`
```

- Set the culture by using the [locale](#) property. The below code example, initialize the DatePicker component in **German** culture with corresponding localized text.

```
`ts
//Load the L10n from ej2-base
import { L10n } from '@syncfusion/ej2-base';
import { DatePicker } from '@syncfusion/ej2-calendars';
//load the locale object to set the localized placeholder value
L10n.load({
  'de': {
    'datepicker': { placeholder: 'Wählen Sie ein Datum aus',
    today:'heute' }
  }
});
let datePickerObject: DatePicker = new DatePicker({
  //sets the locale.
  locale: 'de'
});
datePickerObject.appendTo('#element');
```

The following example demonstrates the DatePicker in **German** culture.

INDEX.TS

```
import { DatePicker } from '@syncfusion/ej2-calendars';
//Load the L10n, loadCldr from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
//load the CLDR data files.
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
L10n.load({
  'de': {
    'datepicker': {
      placeholder: 'Wählen Sie ein Datum aus',
      today: 'heute'
    }
  }
});
// creates the simple DatePicker component
```

```
let datePickerObject: DatePicker = new DatePicker({
    // sets the locale property.
    locale: 'de',
    value: new Date()
});
datePickerObject.appendTo('#element');
```

INDEX.HTML

calendars/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <input id="element">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Right-To-Left

The DatePicker supports right-to-left functionality for languages like Arabic, Hebrew to displays the text in the right-to-left direction. Use

[enableRtl](#) property to set the RTL direction.

`ts

```

import { DatePicker } from '@syncfusion/ej2-calendars';
//Load the L10n from ej2-base
import { L10n, loadCldr } from '@syncfusion/ej2-base';
declare var require: any;
loadCldr(
  require('cldr-data/supplemental/numberingSystems.json'),
  require('cldr-data/main/he/ca-gregorian.json'),
  require('cldr-data/main/he/numbers.json')
  require('cldr-data/main/he/timeZoneNames.json')
);
//load the locale object to set the localized placeholder value
L10n.load({
  'he': {
    'datepicker': { placeholder: 'הזן תאריך',
    today:'היום' }
  }
});
// creates the datepicker with Hebrew culture.
let datepickerobject: DatePicker = new DatePicker({
  //sets the locale
  locale: 'he',
  value: new Date(),
  //sets the enableRtl
  enableRtl: true
});
datepickerobject.appendTo('#element');

```

The below code example demonstrates the DatePicker component in **Hebrew** culture and also explains how to set the localized text to

the placeholder using **load** method of [L10n](#) class.

INDEX.TS

```

import { loadCldr, L10n } from '@syncfusion/ej2-base';
import { DatePicker } from '@syncfusion/ej2-calendars';
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';

```

```
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
L10n.load({
  'he': {
    'datepicker': {
      placeholder: 'הזן תאריך',
      today: 'היום'
    }
  }
});
// creates the simple DatePicker component
let datePickerObject: DatePicker = new DatePicker({
  //sets the locale
  locale: 'he',
  //sets the enableRtl
  enableRtl: true,
  //sets the value
  value: new Date()
});
datePickerObject.appendTo('#element');
```

    ele.style.visibility = "visible";
}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Strict mode in EJ2 JavaScript Datepicker control

The [strictMode](#) is an act, that allows the user to enter only the valid date within the specified min/max range in textbox. If the date is invalid, then the component will stay with the previous value. Else, if the date is out of range, then the component will set the date to the min/max date.

The following example demonstrates the DatePicker in `strictMode` with min/max range of 5th to 25th in a month of May. Here, it allows to enter

only the valid date within the specified range. If you are trying to enter the out-of-range value as like 28th of May, then the value will set to the max date of 25th May. Since the value 28th is greater than to `max` value of 25th. Or else if you are trying to enter the invalid date, then the value will stay with the previous value.

INDEX.TS

```
import { DatePicker } from '@syncfusion/ej2-calendars';
// creates a datepicker with strictMode property
let datepickerObject: DatePicker = new DatePicker({
    // sets the strictMode
    strictMode: true,
    // sets the format
    format: 'dd/MM/yyyy',
    // sets the value
    value: new Date('5/28/2017'),
    //sets the min
    min: new Date('5/5/2017'),
    //sets the max
    max: new Date('5/25/2017')
});
datepickerObject.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 DatePicker control</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="styles.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-buttons/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-inputs/styles/material.css" rel="stylesheet">
```

```

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
calendars/styles/material.css" rel="stylesheet">

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <input id="element" type="text">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, the DatePicker act in strictMode **false** state, that allows to enter the invalid or out-of-range date in textbox.

If the date is out-of-range or invalid, then the model value will be set to **out of range** date value or **null** respectively with highlighted **error** class to indicates the date is out of range or invalid.

The following example demonstrates the **strictMode** as **false**. Here, it allows to enter the valid or invalid value in textbox. If you are entering out-of-range or invalid date value, then the model value will be set to **out of range** date value or **null** respectively with highlighted **error** class to indicates the date is out of range or invalid.

INDEX.TS

```

import { DatePicker } from '@syncfusion/ej2-calendars';
// creates a datepicker with strictMode property
let datePickerObject: DatePicker = new DatePicker({
    // sets the value
    value: new Date('5/28/2017'),
    //sets the min
    min: new Date('5/5/2017'),
    //sets the max
    max: new Date('5/25/2017'),
    // sets the format
    format: 'dd/MM/yyyy',
    // sets the placeholder
    placeholder: 'Enter date'
});
datePickerObject.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DatePicker control</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
calendars/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <input id="element" type="text">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

If the value of `min` or `max` properties changed through code behind, then you have to update the `value` property to set within the range.

Customization in EJ2 JavaScript Datpicker control

You can customize the entire appearance of the input element and Calendar by using custom [cssClass](#) property.

and also you can use the calendar's [renderDayCell](#) event to customize the appearance of the each day cell.

Below is the list of classes that provides flexible way to customize the DatePicker component.

Class Name	Description
------------	-------------

---	---
-----	-----

e-date-wrapper	Applied to DatePicker wrapper
----------------	-------------------------------

- | e-datepicker | Applied to the DatePicker element. |
- | e-float-text | Applied to the floating label. |
- | e-date-icon | Applied to the DatePicker icon. |
- | e-popup-wrapper | Applied to DatePicker popup wrapper. |
- | e-calendar | Applied to Calendar element. |
- | e-header | Applied to Calendar header. |
- | e-title | Applied to Calendar title. |
- | e-icon-container | Applied to Calendar previous and next icon container. |
- | e-prev | Applied to Calendar previous icon. |
- | e-next | Applied to Calendar next icon. |
- | e-weekend | Applied to Calendar weekend dates. |
- | e-other-month | Applied to Calendar other month dates. |
- | e-day | Applied to each day cell of the Calendar. |
- | e-selected | Applied to Calendar selected dates. |
- | e-disabled | Applied to Calendar disabled dates. |

The following example disables the weekends of every month using `renderDayCell` event. Here we have used the `e-disabled` class to highlight the disabled date.

INDEX.TS

```
import { DatePicker, RenderDayCellEventArgs } from '@syncfusion/ej2-calendars';
// creates datepicker with placeholder.
let datepickerObject: DatePicker = new DatePicker({
    // Bind the renderDayCell event to customize the each day cell.
    renderDayCell: onRenderCell,
    // sets the placeholder
    placeholder: 'Enter date',
    cssClass: 'e-custom-style'
});
datepickerObject.appendTo('#element');
function onRenderCell(args: RenderDayCellEventArgs): void {
    if (args.date.getDay() == 0 || args.date.getDay() == 6) {
        //sets isDisabled to true to disable the date.
        args.isDisabled = true;
        //To know about the disabled date customization, you can refer in
        "styles.css".
    }
}
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Calendar control</title>
  <meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(*) to placeholder and float label using `.e-input-group.e-control-wrapper.e-float-input.e-float-text::after` class.

INDEX.TS

```

import { DatePicker } from '@syncfusion/ej2-calendars';
let month: number = new Date().getMonth();
let fullYear: number = new Date().getFullYear();
// creates a datepicker with min max property
let datePickerObject: DatePicker = new DatePicker({
    // Sets the min.
    min: new Date(fullYear, month , 9),
    //Sets the max.
    max: new Date(fullYear, month, 15),
    // Sets the value.
    value: new Date(fullYear, month , 11)
    floatLabelType: 'Auto'
    placeholder:"Select Date"
});
datePickerObject.appendTo('#element');

```

Date views in EJ2 JavaScript Datepicker control

The DatePicker has the following predefined views that provides a flexible way to navigate back and forth to select the date.

| **View** | **Description** |

| --- | --- |

| month (default) | Displays the days in a month |

| year | Displays the months in a year |

| decade | Displays the years in a decade |

Start view

You can use the [start](#) property to define the initial rendering view.

The following example demonstrates how to create a DatePicker with **decade** as initial rendering view.

INDEX.TS

```
import { DatePicker } from '@syncfusion/ej2-calendars';  
//creates a datepicker with year view.  
let datePickerObj: DatePicker = new DatePicker({  
    // sets the placeholder  
    placeholder: 'Enter date',  
    //sets the start  
    start: 'Decade'  
});  
datePickerObj.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
    <title>Essential JS 2 DatePicker control</title>

</script>
```

```
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Depth view

Define the [depth](#) property to control the view navigation.

Always the depth view has to be smaller than the start view, otherwise the view restriction will be not restricted.

The following example demonstrates how to create a DatePicker that allows users to select a month.

INDEX.TS

```
import { DatePicker } from '@syncfusion/ej2-calendars';
//creates a datepicker with decade view and navigate up to year view.
let datePickerObj: DatePicker = new DatePicker({
    //sets the start
    start: 'Decade',
    //sets the depth
    depth: 'Year',
    // sets the placeholder
    placeholder: 'Enter date',
});
datePickerObj.appendTo('#element');
```

```

To know more about Calendar views refer the Calendar's [Calendar Views](#) section.

Accessibility in EJ2 JavaScript Datepicker control

The DatePicker component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the DatePicker component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Web accessibility defines a way to make web content and web applications more accessible to disabled people. It especially helps the dynamic content change and advanced user interface controls developed with Ajax, HTML, JavaScript, and related technologies.

DatePicker provides built-in compliance with the [WAI-ARIA](#) specifications. WAI-ARIA

supports is achieved through the attributes like `aria-expanded`, `aria-disabled`, `aria-activedescendant` applied to the input element.

To know about the accessibility of Calendar refer to the Calendar's [Accessibility](#) section.

It helps to provide information about the widget for assistive technology to the disabled person in screen reader.

- **Aria-expanded:** attributes indicates the state of a collapsible element.
- **Aria-disabled:** attribute indicates the disabled state of this DatePicker component.
- **Aria-activedescendent:** attribute helps in managing the current active child of the DatePicker component.

Keyboard Interaction

You can use the following keys to interact with the DatePicker. The component implements the keyboard navigation support by following the [WAI-ARIA practices](#).

It supports the below list of shortcut keys.

Input Navigation

Before opening the popup, use the below list of keys to control the popup element.

| **Press** | **To do this** |

| --- | --- |

| **Alt + Down Arrow** | **Opens the popup.** |

| **Alt + Up Arrow** | **Closes the popup.** |

| **Esc** | **closes the popup.** |

Calendar Navigation

Use the below list of keys to navigate the Calendar after the popup has opened.

| **Press** | **To do this** |

| --- | --- |

| Upper Arrow | Focus the previous week date. |

| Down Arrow | Focus the next week date. |

| Left Arrow | Focus the previous date. |

| Right Arrow | Focus the next date. |

| Home | Focus the first date in the month. |

| End | Focus the last date in the month. |

| Page Up | Focus the same date in the previous month. |

| Page Down | Focus the same date in the next month. |

| Enter | Select the currently focused date. |

| Shift + Page Up | Focus the same date in the previous year. |

| Shift + Page Down | Focus the same date in the previous year. |

| Control + Upper Arrow | Moves into the inner level of view like month-year, year-decade |

| Control + Down Arrow | Moves out from the depth level view like decade-year, year-month |

| Control + Home | Focus the starting date in the current year. |

| Control + End | Focus the ending date in the current year. |

To focus the DatePicker component use the alt+t keys.

INDEX.TS

```
import { DatePicker } from '@syncfusion/ej2-calendars';
// creates a DatePicker component
let datePickerObject: DatePicker = new DatePicker({
    // sets the placeholder
    placeholder: 'Enter date'
});
datePickerObject.appendTo('#element');
document.onkeyup = function (e) {
    if (e.altKey && e.keyCode === 84 /* t */) {
        // press alt+t to focus the component.
        datePickerObject.element.focus();
    }
};
```

</body></html>

```

Ensuring accessibility

The DatePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DatePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DatePicker component with accessibility tools.

Style appearance in EJ2 JavaScript Datepicker control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of DatePicker wrapper element

Use the following CSS to customize the appearance of wrapper element.

,

/ To specify height and font size /

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input {
```

```
height: 40px;
font-size: 20px;
}
```

Customizing the DatePicker icon element

Use the following CSS to customize the DatePicker icon element

/ To specify background color and font size /

```
.e-input-group .e-input-group-icon:last-child, .e-input-group.e-control-wrapper .e-input-group-icon:last-child {
font-size: 12px;
background-color: darkgray;
}
```

Customizing the Calendar popup of the DatePicker

Please check the below section, to customize the style and appearance of the Calendar component

Customizing Calendar's style and appearance

Full screen mode support in mobiles and tablets

The DatePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the DatePicker component, simply set the [fullScreenMode](#) API value to `true`. This action will extend the calendar element to occupy the entire screen on mobile devices.

```
`typescript
import { DatePicker } from '@syncfusion/ej2-calendars';
// creates a datepicker with fullScreenMode property
let datePickerObject: DatePicker = new DatePicker({
// Enable Full Screen Mode
fullScreenMode: true,
});
datePickerObject.appendTo('#element');
```

Default Sample

5/7/2018

How To

Disabled the datepicker component in EJ2 JavaScript Datepicker control

To disable the DatePicker, use its [enable](#) property.

The following example demonstrates the DatePicker in a disabled state.

INDEX.TS

```
import { DatePicker } from '@syncfusion/ej2-calendars';  
// creates datepicker with enabled property  
let datepickerObject: DatePicker = new DatePicker({  
    // sets the enabled  
    enabled: false  
});  
datepickerObject.appendTo('#element');
```

INDEX.HTML

```

    ele.style.visibility = "visible";  
}  
</script>  
<script src="index.js" type="text/javascript"></script>  
</body></html>
```

Set the placeholder in EJ2 JavaScript Datepicker control

The following example demonstrates how to set `placeholder` in the DatePicker component.

Using `placeholder` you can display a short hint in the input element.

INDEX.TS

```
import { DatePicker } from '@syncfusion/ej2-calendars';  
// creates datepicker with placeholder.  
let datePickerObject: DatePicker = new DatePicker({  
    // sets the palceholder property.  
    placeholder: 'Enter date'  
});  
datePickerObject.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
    <title>Essential JS 2 DatePicker control</title>  
    <meta charset="utf-8">  
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {  
    ele.style.visibility = "visible";  
}  
</script>  
<script src="index.js" type="text/javascript"></script>  
</body></html>
```

Set the readonly in EJ2 JavaScript DatePicker control

The following example demonstrates how to set `readonly` in DatePicker component. You can achieve this by using `readonly` property.

INDEX.TS

```
import { DatePicker } from '@syncfusion/ej2-calendars';
// creates datepicker with readonly.
let datePickerObject: DatePicker = new DatePicker({
    // sets the readonly.
    readonly: true,
    // sets the value.
    value: new Date(),
    // sets the palceholder property.
    placeholder: 'Enter date'
});
datePickerObject.appendTo('#element');
```

INDEX.HTML

```

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
```

```
</body></html>
```

Prevent the popup close in EJ2 JavaScript DatePicker control

To prevent the DatePicker popup from closing, use the `preventDefault` method from the `PreventableEventArgs`.

The following example demonstrates how to prevent the popup from closing.

INDEX.TS

```
import { DatePicker, PreventableEventArgs } from '@syncfusion/ej2-  
calendars';  
// creates datepicker with readonly.  
let datePickerObject: DatePicker = new DatePicker({  
  close: function (args: PreventableEventArgs) {  
    // prevent the popup close  
    args.preventDefault();  
  },  
  // sets the palceholder property.  
  placeholder: 'Enter date'  
});  
datePickerObject.appendTo('#element');  
// open the datepicker popup  
datePickerObject.show();
```

INDEX.HTML

```

</body></html>
```

Customize the datepicker day header in EJ2 JavaScript Datepicker control

You can change the format of the day that to be displayed in header using [dayHeaderFormat](#) property. By default, the format is **Short**.

You can find the possible formats on below.

| **Name** | **Description** |

|-----|-----|

| **Short** | Sets the short format of day name (like Su) in day header. |

| **Narrow** | Sets the single character of day name (like S) in day header. |

| **Abbreviated** | Sets the min format of day name (like Sun) in day header. |

| **Wide** | Sets the long format of day name (like Sunday) in day header. |

INDEX.TS

```
import { DatePicker } from '@syncfusion/ej2-calendars';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
// creates datepicker component
let datePickerObject: DatePicker = new DatePicker({
    dayHeaderFormat: "Short"
});
datePickerObject.appendTo('#element');
let formatLabel: DropDownList = new DropDownList({
    // set the height of the popup element
    popupHeight: '200px',
    // bind the change event
    change: (args: any) => {
        datePickerObject.dayHeaderFormat = args.value;
    }
});
formatLabel.appendTo('#select');
```

Client side validation in EJ2 JavaScript Datpicker control

To achieve the client side validation in a DatePicker component by using [Essential JavaScript 2 FormValidator](#). It provides an option to customize the feedback error messages to the corresponding fields to take action to resolve the issue.

In this below example, the required field validation is implemented by mapping the name attribute value to the rules property. It will validate the DatePicker component and display the validation message when the textbox value is empty during form post back or focus out.

INDEX.TS

```

import { DatePicker } from '@syncfusion/ej2-calendars';
import { FormValidator, FormValidatorModel } from '@syncfusion/ej2-inputs';
// creates datepicker with readonly.
let datePickerObject: DatePicker = new DatePicker({
    // sets the palceholder property.
    placeholder: 'Enter date',
    // sets the value
    value: new Date()
});
datePickerObject.appendTo('#element');
let options: FormValidatorModel = {
    rules: {
        'datevalue': { required: true }
    },
    customPlacement: function (inputElement, errorElement) {
        //to place the error message in custom position.
        (<HTMLElement>inputElement).parentElement.parentElement.appendChild(errorElement);
    }
}
let formObject: FormValidator = new FormValidator('#form-element', options);

```

Ej1 api migration in EJ2 JavaScript Datepicker control

This article describes the API migration process of DatePicker component from Essential JS 1 to Essential JS 2.

Date Selection

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Setting the value	property: valuejavascript\$("#datepicker").ejDatePicker({ value: new Date("5/5/2014") });	property: valuejavascriptvar datepicker = new ej.calendars.DatePicker({ value: new Date("05/11/2017")});datepicker.appendTo('#datepicker');

Date Format

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Display the date format	property: dateFormatjavascript\$("#datepicker").ejDatePicker({ dateFormat: "dd/MM/yyyy"});	property: formatjavascriptvar datepicker = new ej.calendars.DatePicker({ value: new Date("05/11/2017"); format: 'yyyy-MM-dd'});datepicker.appendTo('#element');
Day header format	property: dayHeaderFormatjavascript\$("#datepicker").ejDatePicker({ dayHeaderFormat: ej.DatePicker.Header.Short});	Not Applicable

Calendar Views

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Start	property: startLeveljavascript\$("#datepicker").ejDatePicker({ startLevel: ej.DatePicker.Level.Year});	property: startjavascriptvar datepicker = new ej.calendars.DatePicker({ start:'Decade'});datepicker.appendTo('#element');
Depth	property: depthLeveljavascript\$("#datepicker").ejDatePicker({depthLevel: ej.DatePicker.Level.Year});	property: depthjavascriptvar datepicker = new ej.calendars.DatePicker({ depth:'Year'});datepicker.appendTo('#element');

Date Range

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Minimum date	property: minDatejavascript\$("#datepicker").ejDatePicker({ minDate: new Date("5/1/2013")});	property: minjavascriptvar datepicker = new ej.calendars.DatePicker({ min: new Date("5/1/2013")});datepicker.appendTo('#element');
Maximum date	property: maxDatejavascript\$("#datepicker").ejDatePicker({ maxDate : new Date("5/30/2015")});	property: maxjavascriptvar datepicker = new ej.calendars.DatePicker({ max : new Date("5/30/2015")});datepicker.appendTo('#element');

Disabled Dates

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Block-out dates	property: blackoutDatesjavascript\$("#datepicker").ejDatePicker({ blackoutDates: [new Date(2016, 4, 10), new Date(2016, 4, 15), new Date(2016, 4, 20), new Date(2016, 4, 22), new Date(2016, 5, 12), new Date(2016, 5, 24)]});	Can be achieved byjavascriptvar datepicker = new ej.calendars.DatePicker({ renderDayCell: disableDate});datepicker.appendTo('#element');function disableDate(args) { if (args.date.getDay() === 0 args.date.getDay() === 6) { args.isDisabled = true; } }

Customization

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
CSS Class	property: cssClassjavascript\$("#datepicker").ejDatePicker({ cssClass: "gradient-lime"});	property: cssClassjavascriptvar datepicker = new ej.calendars.DatePicker({ cssClass: 'e-custom-style'});datepicker.appendTo('#element');
Event callback for each cell creation	Not Applicable	Event: renderDayCelljavascriptvar datepicker = new ej.calendars.DatePicker({ renderDayCell: onRenderCell});datepicker.appendTo('#element');function onRenderCell(args) {/code block/}
Show/Hide the today button	property: showFooterjavascript\$("#datepicker").ejDatePicker({ showFooter: false});	property: showTodayButtonjavascriptvar datepicker = new ej.calendars.DatePicker({ showTodayButton: false});datepicker.appendTo('#element');
Show?Hide the other month dates	property: showOtherMonthsjavascript\$("#datepicker").ejDatePicker({ showOtherMonths: false});	javascriptvar datepicker = new ej.calendars.DatePicker();datepicker.appendTo('#element');.e-datepicker .e-calendar .e-content tr.e-month-hide,.e-datepicker .e-calendar .e-content td.e-other-month > .e-day { visibility: none;}.e-datepicker .e-calendar .e-content td.e-month-hide,.e-datepicker .e-calendar .e-content td.e-other-month { pointer-events: none; touch-action: none;}
Show/Hide the disabled range	property: showDisabledRangejavascript\$("#datepicker").ejDatePicker({ blackoutDates: [new Date(2016, 4, 10), new Date(2016, 4, 15), new Date(2016, 4, 20), new Date(2016, 4, 22), new Date(2016, 5, 12), new Date(2016, 5, 24)] showDisabledRange: false});	Not Applicable
Show/Hide the popup button	property: showPopupButtonjavascript\$("#datepicker").ejDatePicker({ showPopupButton: true});	Can be achieved byjavascriptvar datepicker = new ej.calendars.DatePicker({ focus: onFocus});datepicker.appendTo('#element');function onFocus(args) {

	<code>r").ejDatePicker({ showPopupButton: false});</code>	<code>datepicker.show();</code> ; <code>.e-control-wrapper .e-input-group-icon.e-date-icon { display: none;}</code>
Enable/Disable rounded corner	property: <code>showRoundedCorner</code> <code>javascript\$("#datepicker").ejDatePicker({ showRoundedCorner: true});</code>	Can be achieved by <code>javascript</code> <code>var datepicker = new ej.calendars.DatePicker({ cssClass: 'e-custom-style' });</code> <code>datepicker.appendTo('#element');</code> ; <code>.e-control-wrapper.e-custom-style.e-date-wrapper.e-input-group { border-radius: 4px;}</code>
Skip a month	property: <code>stepMonths</code> <code>javascript\$("#datepicker").ejDatePicker({ stepMonths: 2});</code>	Can be achieved by <code>javascript</code> <code>var datepicker = new ej.calendars.DatePicker({ value: new Date("09/04/2018"), open: onOpen});</code> <code>datepicker.appendTo('#element');</code> <code>function onOpen(args) {</code> <code> datepicker.navigateTo('Year', new Date("03/18/2018"));</code> <code>}</code>
Show/Hide the tooltip	property: <code>showTooltip</code> <code>javascript\$("#datepicker").ejDatePicker({ showTooltip: false});</code>	Not Applicable
Today button text	property: <code>buttonText</code> <code>javascript\$("#datepicker").ejDatePicker({ buttonText : "Now"});</code>	Can be achieved by <code>javascript</code> <code>L10n.load({ 'en': { 'datepicker': { today: 'Now' } } });</code> <code>var datepicker = new ej.calendars.DatePicker({ locale: 'en' });</code> <code>datepicker.appendTo('#element');</code>
Display inline	property: <code>displayInline</code> <code>javascript\$("#datepicker").ejDatePicker({ displayInline: true});</code>	Not Applicable
Enable/Disable the animation	property: <code>enableAnimation</code> <code>javascript\$("#datepicker").ejDatePicker({ enableAnimation : false});</code>	Not Applicable
Highlight dates	property: <code>highlightSection</code> <code>javascript\$("#datepicker").ejDatePicker({ highlightSection: "week"});</code>	Can be achieved by <code>javascript</code> <code>var datepicker = new ej.calendars.DatePicker({ renderDayCell: highlightDate});</code> <code>datepicker.appendTo('#element');</code> <code>function highlightDate(args) {</code> <code> if (args.date.getDate() === 10) {</code> <code> args.element.classList.add('e-</code>

		<code>highlightweekend'); }}.e-highlightweekend { background-color: #cfe9f3;}</code>
Highlight weekend	property: <code>highlightWeekendjavascript\$("#datepicker").ejDatePicker({ highlightWeekend : true});</code>	Can be achieved by <code>javascriptvar datepicker = new ej.calendars.DatePicker({ renderDayCell: highlightDate});datepicker.appendTo('#element');function highlightDate(args) { if (args.date.getDay() === 0 args.date.getDay() === 6) { args.element.classList.add('e-highlightweekend'); }}.e-highlightweekend { background-color: #cfe9f3;}</code>
Tooltip format	property: <code>tooltipFormatjavascript\$("#datepicker").ejDatePicker({ tooltipFormat : "dd/MM/yyyy"});</code>	Not Applicable
Special Dates	property: <code>specialDatesjavascriptspecialDays = [{ date: new Date(2018, 09, 08), tooltip: "In Australia", iconClass: "flags sprite-Australia" }, { date: new Date(2018, 09, 21), tooltip: "In France", iconClass: "flags sprite-France" }]\$("#datepicker").ejDatePicker({ specialDates: specialDays});</code>	Can be achieved by <code>javascriptvar datepicker = new ej.calendars.DatePicker({ renderDayCell: customDates, value: new Date('5/5/2017')});datepicker.appendTo('#element');function customDates(args) { if (args.date.getDate() === 10) { var span = document.createElement('span'); span.setAttribute('class', 'e-icons highlight'); args.element.firstElementChild.setAttribute('title', 'Birthday !'); args.element.setAttribute('title', 'Birthday !'); args.element.setAttribute('data-val', 'Birthday !'); args.element.appendChild(span); }}</code>
FocusIn event	Event: <code>focusInjavascript\$("#datepicker").ejDatePicker({ focusIn: function (args) { /code block/}});</code>	Event: focus <code>javascriptvar datepicker = new ej.calendars.DatePicker({ focus: onFocus});datepicker.appendTo('#element');function onFocus(args){ /code block/}</code>
FocusOut event	Event: <code>focusOutjavascript\$("#datepicker").ejDatePicker({ focusOut: function (args) { /code block/}});</code>	Event: blur <code>javascriptvar datepicker = new ej.calendars.DatePicker({ blur: onBlur});datepicker.appendTo('#element');function onBlur(args){ /code block/}</code>

FocusIn method	Not Applicable	Method: focusIn() javascriptvar datepicker = new ej.calendars.DatePicker({ placeholder: 'Enter date'});datepicker.appendTo('#element');datepicker.focusIn();
FocusOut method	Not Applicable	Method: focusOut() javascriptvar datepicker = new ej.calendars.DatePicker({ placeholder: 'Enter date'});datepicker.appendTo('#element');datepicker.focusOut();
Prevent popup close	Not Applicable	Event: close javascriptvar datepicker = new ej.calendars.DatePicker({ close: function (args) { args.preventDefault(); }});datepicker.appendTo('#element');datepicker.show();
Prevent popup open	Not Applicable	Event: open javascriptvar datepicker = new ej.calendars.DatePicker({ open: function (args) { args.preventDefault(); }});datepicker.appendTo('#element');

Accessibility

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Enable/Disable the RTL	property: enableRTL javascript\$("#datepicker").ejDatePicker({ enableRTL : true});	property: enableRtl javascriptvar datepicker = new ej.calendars.DatePicker({ enableRtl : true});datepicker.appendTo('#element');

Persistence

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2

Navigation callback	Event: navigatejavascript\$("#datepicker").ejDatePicker({ navigate: function (args) { /code block/}});	Event: navigatedjavascriptvar datepicker = new ej.calendars.DatePicker({navigated: onNavigate});datepicker.appendTo('#element');function onNavigate(args) { /code block/}
Enable/Disable the drill down	property: allowDrillDownjavascript\$("#datepicker").ejDatePicker({ allowDrillDown : true});	Not Applicable

DateRangePicker

Range restriction in EJ2 JavaScript Daterangepicker control

Range selection in a date range picker can be made-to-order with desire restrictions based on the application needs.

Restrict the range within a range

You can restrict the minimum and maximum date that can be allowed as start and end date in a range selection with the help of [min](#), [max](#) properties.

- **min** – sets the minimum date that can be selected as startDate.
- **max** – sets the maximum date that can be selected as endDate.

In the following sample, you can select a range from 15th day of this month to 15th day of next month.

INDEX.TS

```
import { DateRangePicker } from '@syncfusion/ej2-calendars';
let today: Date = new Date();
let currentYear: number = today.getFullYear();
let currentMonth: number = today.getMonth();
let currentDay: number = today.getDate();
// creates a daterangepicker with min max property
let daterangeObject: DateRangePicker = new DateRangePicker({
    //sets the min.
    min: new Date(currentYear, currentMonth, 15),
    //sets the max.
    max: new Date(currentYear, currentMonth+1, 15),
    placeholder:"Select a Range"
});
daterangeObject.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 DateRangePicker control</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="styles.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
lists/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
calendars/styles/material.css" rel="stylesheet">
```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <input id="element" type="text">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

If the value of `min` or `max` properties changed through code behind, then you have to update the `start date`, `end date` property to set within the range. Or else, if the `start` and `end date` is out of specified date range, a validation error class will be appended to the input element. If `strictMode` is enabled, and both the `start`, `end date` is lesser than the `min date` then `start` and `end date` will be updated with `min date`. If both the `start` and `end date` is higher than the `max date` then `start` and `end date` will be updated with `max date`. Or else, if `startDate` is less than `min date`, `startDate` will be updated with `min date` or if `endDate` is greater than `max date`, `endDate` will be updated with the `max date`.

Range span

Days span between ranges can be limited in order to avoid excess or less days selection towards the required days in a range. In this, minimum and maximum span allowed within the date range can be customized by `minDays` and `maxDays` properties.

- `minDays`- Sets the minimum number of days between start and end date.
- `maxDays`- Sets the maximum number of days between start and end date.

In the following sample, the range selection should be greater than 3 days and less than 8 days else it will not set.

INDEX.TS

```

import { DateRangePicker } from '@syncfusion/ej2-calendars';
let today: Date = new Date();
let currentYear: number = today.getFullYear();
let currentMonth: number = today.getMonth();
let currentDay: number = today.getDate();
// creates a daterangepicker with min max property
let daterangeObject: DateRangePicker = new DateRangePicker({
    //sets the minimum number of days
    minDays: 4,
    //sets the maximum number of days
    maxDays: 7,
    placeholder:"Select a Range"
});

```

```
daterangeObject.appendTo('#element');
```

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Strict mode

DateRangePicker provides an option to limit the user towards entering the valid date. With strict mode, you can set only the valid date. If any invalid range is specified, the date range value resets to previous value. This restriction can be availed by enabling [strictMode](#) property as true.

INDEX.TS

```
import { DateRangePicker } from '@syncfusion/ej2-calendars';
// creates a daterangepicker in strict mode
let daterangeObject: DateRangePicker = new DateRangePicker({
  //enabling strict mode
```

```

        strictMode: true, placeholder:"Select a Range"
    });
    daterangeObject.appendTo('#element');

```

Globalization in EJ2 JavaScript Daterangepicker control

Globalization is the combination of internalization and localization. You can adapt the component to various languages by parsing and formatting the date or number (Internationalization), and also add culture specific customization and translation to the text (Localization).

By default, DateRangePicker date format, week, and month names are specific to the English culture. It utilizes the [Essential JavaScript 2 Internationalization](#) package to parse and format the date object based

on the culture by using the official [UNICODE CLDR](#) JSON data. It allows to load culture specific CLDR JSON data by using `loadCldr` method.

To use a different culture other than `English`, follow the below steps:

- Install the `CLDR-Data` package by using the below command (Installs the CLDR JSON data). To know more about CLDR-Data refer to the [CLDR-Data](#) link.

`

```
npm install cldr-data --save
```

`

Once the package is installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Import the installed CLDR JSON data into the `app.ts` file. To import JSON data, install the JSON plugin loader. Here, The SystemJS JSON plugin loader is used.

`

```
npm install systemjs-plugin-json --save-dev
```

`

- After installation, configure the `system.config.js` configuration settings as given below to map the `systemjs-plugin-json` loader.

```
`ts
```

```
System.config({
```

```
paths: {
```

```
'npm:': './node_modules/',
```

```
'syncfusion:': 'npm:@syncfusion/'
```

```
},
```

```
map: {
```

```
app: 'app',
```

```
//Syncfusion packages mapping
```

```
"@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
```

```
"@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
```

```
"@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
```

```
"@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
```

```
"@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
```

```
"@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
```

```

"@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
"@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
"cldr-data": 'npm:cldr-data',
"plugin-json": "npm:systemjs-plugin-json/json.js"
},
meta: {
  '*.json': { loader: 'plugin-json' }
},
packages: {
  'app': { main: 'app', defaultExtension: 'js' },
  'cldr-data': { main: 'index.js', defaultExtension: 'js' }
}
});
System.import('app');
`

```

- Use the `loadCldr` method to load the culture specific CLDR JSON data from the installed location to `app.ts` file.
- DateRangePicker displayed `Sunday` as the first day of week based on default culture ("en-US"). If you want to display the DateRangePicker with loaded culture's first day of week, you need to import `weekdata.json` file from the `cldr-data/supplemental` as given in the code example.

```

`ts
declare var require: any;
loadCldr(
  require('cldr-data/main/de/numbers.json'),
  require('cldr-data/main/de/ca-gregorian.json'),
  require('cldr-data/main/de/numbers.json'),
  require('cldr-data/main/de/timeZoneNames.json'),
  require('cldr-data/supplemental/weekdata.json') // To load the culture based first day of week
);
`

```

The [Localization](#) library allows you to localize default text content of the DateRangePicker. The DateRangePicker component has static text for **today** feature that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

Locale keywords | Text

placeholder | Hint to describe expected value in input element.

startLabel | Label to represent the start date.

endLabel | Label to represent the end date.

applyText | Text present in the apply button.

cancelText | Text present in the cancel button.

selectedDays | Text to represent selected days.

days | Text represents days.

customRange | Text present in the custom range button in presets container.

- Before changing to a culture other than **English**, ensure that locale text for the concerned culture is loaded through **load** method of

[L10n](#) class.

```
`ts
```

```
//Load the L10n, loadCldr from ej2-base
```

```
import { loadCldr, L10n } from '@syncfusion/ej2-base';
```

```
//load the locale object to set the localized placeholder value
```

```
L10n.load({
```

```
'de': {
```

```
'daterangepicker': { placeholder: 'Wählen Sie ein Datum aus' }
```

```
}
```

```
});
```

```
`
```

- Set the culture by using the [locale](#) property. In the following code example, the DateRangePicker is initialized in **German** culture with corresponding localized text.

The following example demonstrates the DateRangePicker in **German** culture.

INDEX.TS

```
import { DateRangePicker } from '@syncfusion/ej2-calendars';
//Load the L10n, loadCldr from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
//load the CLDR data files.
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as detimeZoneNames from './timeZoneNames.json';
loadCldr(numberingSystems, gregorian, numbers, detimeZoneNames);
L10n.load({
  'de': {
    'daterangepicker': {
```

```

        placeholder: 'Wählen Sie einen Bereich aus',
        startLabel: 'Wählen Sie Startdatum',
        endLabel: 'Wählen Sie Enddatum',
        applyText: 'Sich bewerben',
        cancelText: 'Stornieren',
        selectedDays: 'Ausgewählte Tage',
        days: 'Tage',
        customRange: 'benutzerdefinierten Bereich'
    }
});
// creates the simple DateRangePicker component with de culture
let daterangeObject: DateRangePicker = new DateRangePicker({
    // sets the locale property.
    locale: 'de',
    value: new Date(),
});
daterangeObject.appendTo('#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 DateRangePicker control</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <input id="element">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Right-To-Left

The DateRangePicker supports RTL (right-to-left) functionality for languages like Arabic and Hebrew to displays the text in the right-to-left direction. Use [enableRtl](#) property to set the RTL direction. The following code example initialize the DateRangePicker component in **Hebrew** culture and also explains how to set the localized text to the placeholder using **load** method of

[L10n](#) class.

INDEX.TS

```

import { loadCldr, L10n } from '@syncfusion/ej2-base';
import { DateRangePicker } from '@syncfusion/ej2-calendars';
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as hetimeZoneNames from './timeZoneNames.json';
loadCldr(numberingSystems, gregorian, numbers, hetimeZoneNames);
L10n.load({
  'he': {
    'daterangepicker': {
      placeholder: 'בחר טווח',
      startLabel: 'תווית התחלה',
      endLabel: 'סוף',
      applyText: 'להחיל טקסט',
      cancelText: 'בטל טקסט',
      selectedDays: 'ימים נבחרים',
      days: 'ימים',
      customRange: 'טווח מותאם אישית'
    }
  }
});
// creates the simple DateRangePicker component
let daterangeobject: DateRangePicker = new DateRangePicker({
  //sets the locale
  locale: 'he',
  //sets the enableRtl
  enableRtl: true,
});
daterangeobject.appendTo('#element');

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Customize the date format

Representation of start and end date strings can be customized to required format by using [format](#) property. By default, the format is based on the culture. To know more about the date format standards, refer to the Internationalization Date Format section. In the following sample, the date strings are formatted to `yyyy-MM-dd` and in between the string "to" is set as a [separator](#).

INDEX.TS

```
import { DateRangePicker } from '@syncfusion/ej2-calendars';
// creates a daterangepicker with format property
let daterangeObject: DateRangePicker = new DateRangePicker({
    format: "yyyy-MM-dd",
    separator: "to",
    placeholder: "Select Range"
});
daterangeObject.appendTo('#element');
```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customization in EJ2 JavaScript Daterangepicker control

The DateRangePicker is available for UI customization that can be achieved by using available properties and events in the component.

Day cell format

The DateRangePicker is available for UI customization based on your application requirements. It can be achieved by using [renderDayCell](#) event that provides an option to customize each day cell on rendering.

The following example disables the weekends of every month by using `renderDayCell` event.

INDEX.TS

```

import { DateRangePicker, RenderDayCellEventArgs } from '@syncfusion/ej2-
calendars';
// creates daterangepicker with placeholder.
let daterangeObject: DateRangePicker = new DateRangePicker({
    // Bind the renderDayCell event to customize the each day cell.
    renderDayCell: onRenderCell,
    // sets the placeholder

```

```

        placeholder: 'Select a range'
    });
    daterangeObject.appendTo('#element');
    function onRenderCell(args: RenderDayCellEventArgs): void {
        if (args.date.getDay() == 0 || args.date.getDay() == 6) {
            //sets isDisabled to true to disable the date.
            args.isDisabled = true;
        }
    }
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 DateRangePicker control</title>

if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Preset Ranges

DateRangePicker provides an option to set the predefined ranges via [presets](#) property with the corresponding label. This property will accept the values in the order of label, start date (date object),

end date (date object), and append these ranges to the presets pop-up for quick selection. In the following sample, you can easily choose the frequently used range options from the list of ranges.

INDEX.TS

```
import { DateRangePicker } from '@syncfusion/ej2-calendars';
let today: Date = new Date();
let currentYear: number = today.getFullYear();
let currentMonth: number = today.getMonth();
let currentDay: number = today.getDate();
// creates a daterangepicker with predefined ranges (label, start date, end date)
let daterangeObject: DateRangePicker = new DateRangePicker({
    placeholder: 'Select a range',
    presets: [
        { label: 'Today', start: new Date(), end: new Date() },
        { label: 'This Month', start: new Date(new Date().setDate(1)),
end: new Date() },
        { label: 'Last Month', start: new Date(new Date(new
Date().setMonth(new Date().getMonth() - 1)).setDate(1)), end: new Date() },
        { label: 'Last Year', start: new Date(new Date().getFullYear() -
1, 0, 1), end: new Date() },
    ]
});
daterangeObject.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 DateRangePicker control</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="styles.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

First day of week

Start day in a week will differ based on the culture, but you can also customize this based on the application needs. For this, you have to make use of [firstDayOfWeek](#) property. By default, first day of a week in en-US is Sunday. In the following example it is customized to Monday with the help of this property.

INDEX.TS

```

import { DateRangePicker } from '@syncfusion/ej2-calendars';
// creates daterangepicker with readonly.
let daterangeObject: DateRangePicker = new DateRangePicker({
  // sets the firstDayOfWeek to Monday.
  firstDayOfWeek:1, placeholder:"Select Range"
});
daterangeObject.appendTo('#element');

```

Accessibility in EJ2 JavaScript Daterangepicker control

The DateRangePicker component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the DateRangePicker component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The web accessibility makes web content and web applications more accessible for people with disabilities. It especially helps in dynamic content change and development of advanced user interface controls with AJAX, HTML, JavaScript, and related technologies. DateRangePicker provides built-in compliance with [WAI-ARIA](#) specifications. WAI-ARIA support is achieved through the attributes like `aria-expanded`, `aria-disabled`, and `aria-activedescendant` applied as an input element.

To know about the accessibility of Calendar, refer to the Calendar's [Accessibility](#) section.

It helps people with disabilities by providing information about the widget for assistive technology in the screen readers. DateRangePicker component contains grid role and grid cell for each day cell.

- **Aria-expanded:** Indicates the currently selected date of the DateRangePicker component.
- **Aria-disabled:** Indicates the disabled state of the DateRangePicker component.

Keyboard Interaction

Use the below keys to interact with the DateRangePicker.

This component implements the keyboard navigation support by following the [WAI-ARIA practices](#).

It supports the following list of shortcut keys:

Input Navigation

Before opening the popup, use the following list of keys to control the popup element.

| **Press** | **To do this** |

| --- | --- |

| **Alt + Down Arrow** | **Opens the popup.** |

| **Alt + Up Arrow** | **Closes the popup.** |

| **Esc** | **Closes the popup.** |

Calendar Navigation

Use the following list of keys to navigate the currently focused Calendar after the popup has opened.

| **Press** | **To do this** |

| --- | --- |

| **Upper Arrow** | **Focuses the same day of the previous week.** |

| **Down Arrow** | **Focuses the same day of the next week.** |

| **Left Arrow** | **Focuses the day before.** |

| **Right Arrow** | **Focuses the next day.** |

| **Home** | **Focuses the first day of the month.** |

| **End** | **Focuses the last day of the month.** |

| **Page Up** | **Focuses the same date of the previous month.** |

| **Page Down** | **Focuses the same date of the next month.** |

| **Enter** | **Selects the currently focused date.** |

| **Shift + Page Up** | **Focuses the same date for the previous year.** |

| **Shift + Page Down** | **Focuses the same date for the next year.** |

| **Control + Home** | **Focuses the first date of the current year.** |

| **Control + End** | **Focuses the last date of the current year.** |

| **Alt + Right** | **Focuses through out the pop-up container in forward direction.** |

| **Alt + Left** | **Focuses through out the pop-up container in backward direction.** |

To focus the DateRangePicker component, use the alt+t keys.

INDEX.TS

```
import { DateRangePicker } from '@syncfusion/ej2-calendars';
// creates a DateRangePicker component
let daterangeObject: DateRangePicker = new DateRangePicker({
    // sets the placeholder
    placeholder: 'Select a range'
});
daterangeObject.appendTo('#element');
document.onkeyup = function (e) {
    if (e.altKey && e.keyCode === 84 /* t */) {
        // press alt+t to focus the component.
        daterangeObject.element.focus();
    }
};

Ensuring accessibility

The DateRangePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DateRangePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DateRangePicker component with accessibility tools.

Style appearance in EJ2 JavaScript Daterangepicker control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of DateRangePicker wrapper element

Use the following CSS to customize the appearance like height and font size of the wrapper element.

`

/ To specify height and font size /

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input {  
font-size: 20px;  
height: 40px;  
}
```

`

Customizing the DateRangePicker icon element

Use the following CSS to customize the DateRangePicker icon element

`

/ To specify background color and font size /

```
.e-input-group .e-input-group-icon:last-child, .e-input-group.e-control-wrapper .e-input-group-icon:last-child {  
background-color: darkgray;  
font-size: 14px;  
}
```

`

Customizing the DateRangePicker popup calendar header

Use the following CSS to customize the DateRangePicker popup calendar header

`

/ To specify background and height /

```
.e-daterangepicker.e-popup .e-range-header {  
background: beige;  
height: 80px;  
}
```

`

Customizing the DateRangePicker popup calendar header title

Use the following CSS to customize the DateRangePicker popup calendar header title

`

/ To specify color and font size /

```
.e-daterangepicker.e-popup .e-range-header .e-start-label, .e-daterangepicker.e-popup .e-range-header .e-end-label {  
color: brown;
```

```
font-size: 30px;
```

```
}
```

```
,
```

Customizing the DateRangePicker popup calendar content

Use the following CSS to customize the DateRangePicker popup calendar content

```
,
```

/ To specify background color /

```
.e-daterangepicker.e-popup .e-calendar {
```

```
background-color: brown;
```

```
}
```

```
,
```

Customizing the DateRangePicker popup calendar content title

Use the following CSS to customize the DateRangePicker popup calendar content title

```
,
```

/ To specify color and font size /

```
.e-daterangepicker.e-popup .e-calendar .e-header .e-title {
```

```
color: beige;
```

```
font-size: 20px;
```

```
}
```

```
,
```

Customizing the DateRangePicker popup calendar previous and next icon

Use the following CSS to customize the DateRangePicker popup calendar previous and next icon

```
,
```

/ To specify font size /

```
.e-calendar .e-header .e-prev, .e-calendar .e-header .e-next, .e-bigger.e-small .e-calendar .e-header .e-prev, .e-bigger.e-small .e-calendar .e-header .e-next {
```

```
font-size: 20px;
```

```
}
```

```
,
```

Customizing the DateRangePicker popup calendar date cell grid on hovering

Use the following CSS to customize the DateRangePicker popup calendar date cell grid on hovering

```
,
```

/ To specify background color and border /

```
.e-calendar .e-content td:hover span.e-day {
```

```
background-color: beige;
border: 1px solid black;
}
`
```

Customizing the DateRangePicker popup calendar primary button in footer

Use the following CSS to customize the DateRangePicker popup calendar primary button in footer

/ To specify background color and border color /

```
.e-daterangepicker.e-popup .e-footer .e-btn.e-apply.e-flat.e-primary:disabled, .e-daterangepicker.e-
popup .e-footer .e-btn.e-apply.e-flat.e-primary:disabled, .e-daterangepicker.e-popup .e-footer .e-css.e-
btn.e-apply.e-flat.e-primary:disabled, .e-daterangepicker.e-popup .e-footer .e-css.e-btn.e-apply.e-flat.e-
primary:disabled {
background-color: brown;
border-color: black;
}
`
```

Customizing the DateRangePicker popup calendar cancel button in footer

Use the following CSS to customize the DateRangePicker popup calendar cancel button in footer

/ To specify background color, color, and border color /

```
.e-daterangepicker.e-popup .e-footer .e-btn.e-flat, .e-daterangepicker.e-popup .e-footer .e-css.e-btn.e-
flat {
background-color: beige;
border-color: black;
color: maroon;
}
`
```

Customizing the footer element in the DateRangePicker popup calendar

Use the following CSS to customize the DateRangePicker popup calendar footer element

/ To specify background color, color, and border color /

```
.e-daterangepicker.e-popup .e-footer {
background-color: beige;
height: 50px;
}
`
```

Customizing the selected date cell grid in the DateRangePicker popup calendar

Use the following CSS to customize the selected date cell grid in the DateRangePicker popup calendar

/ To specify background and border /

```
.e-calendar .e-content td.e-focused-date.e-today span.e-day {  
background: lightgrey;  
border: 1px solid black;  
}
```

Full screen mode support in mobiles and tablets

The DateRangePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the DateRangePicker component, simply set the [fullScreenMode](#) API value to `true`. This action will extend the calendar and presets popup element to occupy the entire screen on mobile devices.

```
`typescript  
import { DateRangePicker } from '@syncfusion/ej2-calendars';  
// creates a daterangepicker with fullScreenMode property  
let daterangeObject: DateRangePicker = new DateRangePicker({  
// Enable Full Screen Mode  
fullScreenMode: true,  
});  
daterangeObject.appendTo('#element');
```

![DateRangePickerPresetsFullScreen](../images/DateRangePickerPresetsFullScreen.gif)

How To

Disable the `daterangepicker` component in EJ2 JavaScript `Daterangepicker` control

`DateRangePicker` can be inactivated on a page, by setting `enabled` value as `false` that will disable the component completely from all the user interactions including in form post. The following example demonstrates the disabled component.

INDEX.TS

```
import { DateRangePicker } from '@syncfusion/ej2-calendars';  
// creates daterangepicker with enabled property  
let daterangeObject: DateRangePicker = new DateRangePicker({  
    // sets the enabled as false  
    enabled: false, placeholder: "Select Range"  
});  
daterangeObject.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
    <title>Essential JS 2 DateRangePicker control</title>  
    <meta charset="utf-8">  
    <meta name="viewport" content="width=device-width, initial-scale=1.0">  
    <meta name="description" content="Typescript UI Controls">

="text/javascript"></script>  
</head>  
<body>  
  
    <div id="container">  
        <input id="element" type="text">  
    </div>  
<script>  
var ele = document.getElementById('container');  
if(ele) {  
    ele.style.visibility = "visible";  
}
```

```
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Set the placeholder in EJ2 JavaScript Daterangepicker control

The following example demonstrates how to set [placeholder](#) in the DateRangePicker control.

Using `placeholder` you can display a short hint in the input element.

INDEX.TS

```
import { DateRangePicker } from '@syncfusion/ej2-calendars';
// creates DateRangePicker with placeholder.
let daterangeObject: DateRangePicker = new DateRangePicker({
    // sets the placeholder property.
    placeholder: 'Select a range'
});
daterangeObject.appendTo('#element');
```

INDEX.HTML

```

="text/javascript"></script>
</head>
<body>

  <div id="container">
    <input id="element" type="text">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
```

```
}  
    </script>  
<script src="index.js" type="text/javascript"></script>  
</body></html>
```

Customization using cssclass in EJ2 JavaScript Daterangepicker control

To customize UI, you can make use of [cssClass](#) that will be added to the DateRangePicker component as the root CSS class. With this CSS class, you can override existing styles of DateRangePicker.

Following is the list of classes that provides flexible way to customize the DateRangePicker component.

Class Name	Description
---	---
e-date-range-wrapper	Applied to DateRangePicker wrapper.
e-range-icon	Applied to DateRangePicker icon.
e-popup	Applied to DateRangePicker popup wrapper.
e-calendar	Applied to both Calendar element.
e-right-calendar	Applied to right Calendar element.
e-left-calendar	Applied to left Calendar element.
e-start-label	Applied to start label in a popup.
e-end-calendar	Applied to end label in a popup.
e-day-span	Applied to day span details label in a popup.
e-footer	Applied to footer elements in a popup.
e-apply	Applied to apply button in footer in a popup.
e-cancel	Applied to cancel button in footer in a popup.
e-header	Applied to Calendar header.
e-title	Applied to Calendar title.
e-icon-container	Applied to Calendar previous and next icon container.
e-prev	Applied to Calendar previous icon.
e-next	Applied to Calendar next icon.
e-weekend	Applied to Calendar weekend dates.
e-other-month	Applied to Calendar other month dates.
e-day	Applied to each day cell of the Calendar.
e-selected	Applied to Calendar selected dates.
e-disabled	Applied to Calendar disabled dates.

INDEX.TS

```
import { DateRangePicker } from '@syncfusion/ej2-calendars';  
let daterangeObject: DateRangePicker = new DateRangePicker({
```

```
// set the css class.
cssClass:"customCSS", placeholder:"Select Range"
});
daterangeObject.appendTo('#element');
```

```

Customize the daterangepicker day header in EJ2 JavaScript Daterangepicker control

You can change the format of the day that to be displayed in header using [dayHeaderFormat](#) property. By default, the format is **Short**.

You can find the possible formats on below.

Name	Description
------	-------------

|-----|-----|

| **Short** | Sets the short format of day name (like Su) in day header. |

| **Narrow** | Sets the single character of day name (like S) in day header. |

| **Abbreviated** | Sets the min format of day name (like Sun) in day header. |

| **Wide** | Sets the long format of day name (like Sunday) in day header. |

INDEX.TS

```
import { DateRangePicker } from '@syncfusion/ej2-calendars';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
// creates daterangepicker component
let daterangepickerObject: DateRangePicker = new DateRangePicker({
    dayHeaderFormat: "Short",
    cssClass: "format-wide"
});
daterangepickerObject.appendTo('#element');
let formatLabel: DropDownList = new DropDownList({
    // set the height of the popup element
    popupHeight: '200px',
    // bind the change event
    change: (args: any) => {
        daterangepickerObject.dayHeaderFormat = args.value;
    }
});
formatLabel.appendTo('#select');
```

Ej1 api migration in EJ2 JavaScript Daterangepicker control

This article describes the API migration process of DateRangePicker component from Essential JS 1 to Essential JS 2.

Date Selection

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Setting the value	property: value valuejavascript\$("#daterangepicker").ejDateRangePicker({value: "5/5/2014 - 6/6/2018"});	property: valuejavascriptvar daterangepicker = new ej.calendars.DateRangePicker({ value : [new Date("5/5/2019"), new Date("6/6/2019")]});daterangepicker.appendTo('#element');

Date Format

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
----------	-----------------------	-----------------------

Display the date format	<pre> property: dateFormatjavascript\$("#daterangepicker").ejDateRangePicker({dateFormat: "dd/MM/yyyy"}); </pre>	<pre> property: formatjavascriptvar daterangepicker = new ej.calendars.DateRangePicker({ format: 'dd\'\'\'MMM\'\'\'\'yy hh:mm a', startDate: new Date("11/9/2017"), endDate: new Date("11/21/2017"))};daterangepicker. appendTo('#element'); </pre>
-------------------------	--	---

Date Range

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Minimum date	<pre> property: minDatejavascript\$("#daterangepicker").ejDateRangePicker({minDate: new Date("1/1/2017")}); </pre>	<pre> property: minjavascriptvar daterangepicker = new ej.calendars.DateRangePicker({min: new Date("1/1/2017")});daterangepicker.appendTo('# element'); </pre>
Maximum date	<pre> property: maxDatejavascript\$("#daterangepicker").ejDateRangePicker({maxDate: new Date("1/1/2017")}); </pre>	<pre> property: maxjavascriptvar daterangepicker = new ej.calendars.DateRangePicker({max: new Date("1/1/2017")});daterangepicker.appendTo('# element'); </pre>
Start date	<pre> property: startDatejavascript\$("#daterangepicker").ejDateRangePicker({startDate : new Date("5/30/2015")}); </pre>	<pre> property: startDatejavascriptvar daterangepicker = new ej.calendars.DateRangePicker({startDate: new Date("11/9/2017")});daterangepicker.appendTo('# element'); </pre>
End date	<pre> property: endDatejavascript\$("#daterangepicker").ejDateRangePicker({endDate: new Date("5/1/2013")}); </pre>	<pre> property: endDatejavascriptvar daterangepicker = new ej.calendars.DateRangePicker({endDate: new Date("11/21/2017")});daterangepicker.appendTo('#element'); </pre>
Presets ranges	<pre> property: rangesjavascript\$("#daterangepicker").ejDateRangePicker({ ranges: [{ label: "Today", range: [new Date(), new Date()] }, { label: "Last 1 Week", range: [new Date(new Date().setDate(new Date().getDate() - 7)), new Date()] }, { label: "Last 1 Month", range: [new Date(new Date().setMonth(new Date().getMonth() - 1)), new Date()] }, { </pre>	<pre> property: presetsjavascriptvar daterangepicker = new ej.calendars.DateRangePicker({ presets: [{ label: 'Today', start: new Date(), end: new Date() }, { label: 'This Month', start: new Date(new Date().setDate(1)), end: new Date() }, { label: 'Last Month', start: new Date(new Date(new Date().setMonth(new Date().getMonth() - 1)).setDate(1)), end: new Date() }, { label: 'Last Year', start: new Date(new Date().getFullYear() - </pre>

	label: "Last 2 Month", range: [new Date(new Date().setMonth(new Date().getMonth() - 2)), new Date()],],});	1, 0, 1), end: new Date(),]);daterangepicker.appendTo('#element');
Add ranges	Method: addRanges()javascript\$("#daterangepicker").ejDateRangePicker();var dateObj = \$("#daterangepicker").data("ejDateRangePicker");dateObj.addRanges("new Range", [new Date("11/12/2019"),new Date("11/12/2021")]);	Not Applicable
Clear ranges	Method: clearRanges()javascript\$("#daterangepicker").ejDateRangePicker();var dateObj = \$("#daterangepicker").data("ejDateRangePicker");dateObj.clearRanges();	Not Applicable
Get selected range	Method: getSelectedRange()javascript\$("#daterangepicker").ejDateRangePicker();var dateObj = \$("#daterangepicker").data("ejDateRangePicker");dateObj.getSelectedRange();	Method: getSelectedRange()javascriptvar daterangepicker = new ej.calendars.DateRangePicker({ startDate: new Date("11/9/2017"), endDate: new Date("11/21/2017")});daterangepicker.appendTo('#element');daterangepicker.getSelectedRange();
Set date range	Method: setRange()javascript\$("#daterangepicker").ejDateRangePicker();var dateObj = \$("#daterangepicker").data("ejDateRangePicker");dateObj.setRange([new Date("11/12/2011"), new Date("11/12/2019")]);	Not Applicable

Disabled Dates

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Disabled dates	Not Applicable	Can be achieved by:javascriptvar daterangepicker = new ej.calendars.DateRangePicker({renderDayCell: onRenderCell});daterangepicker.appendTo('#element');function

		onRenderCell(args){ if (args.date.getDay() === 0 args.date.getDay() === 6) { args.isDisabled = true; }}
--	--	--

Customization

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2

DateTimePicker

Globalization in EJ2 JavaScript Datetimepicker control

Globalization is the combination of internalization and localization. You can adapt the component to various languages by parsing and formatting the date or number [Internationalization](#), and also add culture specific customization and translation to the text [localization](#).

By default, the date format, week, month, time format and meridian names are specific to the American English culture. It utilizes the

[Essential JavaScript 2 Internationalization](#) package to parse and format the date object based on the culture by using the official [UNICODE CLDR](#) JSON data. It provides the `loadCldr` method to load culture specific CLDR JSON data. To use a different culture other than `English`, follow the steps below:

- Install the `CLDR-Data` package by using the following command (installs all the CLDR JSON data). To know more about CLDR-Data refer to the [CLDR-Data](#) link.

`

```
npm install cldr-data --save
```

`

Once the package is installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Import the installed CLDR JSON data into the `app.ts` file. To import JSON data, install the JSON plugin loader. Here, The SystemJS JSON plugin loader is used.

`

```
npm install systemjs-plugin-json --save-dev
```

`

- After installation, configure the `system.config.js` configuration settings as given below to map the

`systemjs-plugin-json` loader.

```
`ts
```

```
System.config({
```

```
paths: {
```

```
'npm:': './node_modules/',
```

```
'syncfusion:': 'npm:@syncfusion/'
```

```
},
```

```
map: {
```

```
app: 'app',
```

```
//Syncfusion packages mapping
```

```
"@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
```

```
"@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
```

```
"@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
```

```
"@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
```

```
"@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
```

```
"@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
```

```
"@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
```

```
"@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
```

```
"@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
"cldr-data": 'npm:cldr-data',
"plugin-json": "npm:systemjs-plugin-json/json.js"
},
meta: {
  '*.json': { loader: 'plugin-json' }
},
packages: {
  'app': { main: 'app', defaultExtension: 'js' },
  'cldr-data': { main: 'index.js', defaultExtension: 'js' }
}
});
System.import('app');
```

- Use the [loadCldr](#) method to load the culture specific CLDR JSON data from the installed location to **app.ts** file.
- DateTimePicker displayed **Sunday** as the first day of week based on default culture ("en-US"). If you want to display the DateTimePicker with loaded culture's first day of week, you need to import **weekdata.json** file from the **cldr-data/supplemental** as given in the code example.

```
`ts
import { loadCldr } from '@syncfusion/ej2-base';
declare var require: any;
loadCldr(
  require('cldr-data/main/de/numbers.json'),
  require('cldr-data/main/de/ca-gregorian.json'),
  require('cldr-data/main/de/numbers.json'),
  require('cldr-data/supplemental/numberingSystems.json'),
  require('cldr-data/main/de/timeZoneNames.json'),
  require('cldr-data/supplemental/weekdata.json') // To load the culture based first day of week
);
```

The **Localization** library allows you to localize default text content of the DateTimePicker. The DateTimePicker component has static text for **today** feature that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

Locale keywords | Text

today | Name of the button to choose Today date.

placeholder | Hint to describe expected value in input element.

- Before changing to a culture other than **English**, ensure that locale text for the concerned culture is loaded through **load** method of

[L10n](#) class.

```
`ts
//Load the L10n, loadCldr from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized placeholder value
L10n.load({
  'de': {
    'datetimepicker': {
      placeholder: 'Wählen Sie ein Datum und eine Uhrzeit aus',
      today: 'heute'
    }
  }
});
`
```

- Set the culture by using the [locale](#) property. In the following code example, the DateTimePicker is initialized in **German** culture with corresponding localized text.

The following example demonstrates the DateTimePicker in **German** culture.

INDEX.TS

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';
//Load the L10n, loadCldr from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
//load the CLDR data files.
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as detimeZoneNames from './timeZoneNames.json';
import { enableRipple } from '@syncfusion/ej2-base';
loadCldr(numberingSystems, gregorian, numbers, detimeZoneNames);
L10n.load({
  'de': {
    'datetimepicker': {
      placeholder: 'Wählen Sie ein Datum und eine Uhrzeit aus',
      today: 'heute'
    }
  }
});
```

```

    }
  }
});
// creates the simple DateTimePicker component with de culture
let datetimeObject: DateTimePicker = new DateTimePicker({
  // sets the locale property.
  locale: 'de',
  value: new Date("12/11/2017 1:00 AM"),
});
datetimeObject.appendTo('#element');

```

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Right-To-Left

The DateTimePicker supports RTL (right-to-left) functionality for languages like Arabic and Hebrew to displays the text in the right-to-left direction. Use [enableRtl](#) property to set the RTL direction. The following code example initialize the DateTimePicker component in Arabic culture and also explains how to set the localized text to the placeholder using [load](#) method of

[L10n](#) class.

INDEX.TS

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';
//Load the L10n, loadCldr from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
//load the CLDR data files.
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as detimeZoneNames from './timeZoneNames.json';
import { enableRipple } from '@syncfusion/ej2-base';
loadCldr(numberingSystems, gregorian, numbers, detimeZoneNames);
L10n.load({
    'ar': {
        'datetimepicker': {
            placeholder: 'حدد التاريخ والوقت',
            today: 'اليوم'
        }
    }
});
// creates the simple DateTimePicker component
let datetimeobject: DateTimePicker = new DateTimePicker({
    //sets the locale
    locale: 'ar',
    //sets the enableRtl
    enableRtl: true,
});
datetimeobject.appendTo('#element');
```

Strict mode in EJ2 JavaScript Datetimepicker control

The [strictMode](#) is an act, that allows the user to enter only the valid date and time within the specified min/max range in textbox. If the input entered is invalid, then the component will stay with the previous value. Else, if the date and time is

out of range, then the component will set the date to the min/max value.

The following example demonstrates the DateTimePicker in `strictMode` with min/max range of 5/5/2019 2:00 AM to 5/25/2019 2:00 AM. Here, it allows to enter only the valid date and time within the specified range. If you are trying to enter the out-of-range value as

like 5/28/2019, then the value will set to the `max` value as 5/25/2019 2:00 AM. Since the value 28 is greater than to `max` value

of 25. Or else if you are trying to enter the invalid date, then the value will stay with the previous value.

INDEX.TS

```

import { DateTimePicker } from '@syncfusion/ej2-calendars';
// creates a datetimepicker with strictMode property
let datetimepickerObject: DateTimePicker = new DateTimePicker({
    // sets the strictMode
    strictMode: true,
    // sets the value
    value: new Date('5/28/2019 2:00 AM'),
    //sets the min
    min: new Date('5/5/2019 2:00 AM'),
    //sets the max
    max: new Date('5/25/2019 2:00 AM')
});
datetimepickerObject.appendTo('#element');

```

INDEX.HTML

  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

By default, the DateTimePicker act in strictMode **false** state, that allows to enter the invalid or out-of-range datetime in textbox.

If the datetime is out-of-range or invalid, then the model value will be set to **out of range** datetime value or **null** respectively with highlighted **error** class to indicates the datetime is out of range or invalid.

The following example demonstrates the **strictMode** as **false**. Here, it allows to enter the valid or invalid value in textbox. If you are entering the out-of-range or invalid datetime value, then the model value will be set to **out of range** datetime value or **null** respectively with highlighted **error** class to indicates the datetime is out of range or invalid.

INDEX.TS

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';
// creates a datetimepicker with strictMode property
let datetimepickerObject: DateTimePicker = new DateTimePicker({
  // sets the value
  value: new Date('5/25/2017 4:00 PM'),
  //sets the min
  min: new Date('5/5/2017 2:00 PM'),
  //sets the max
  max: new Date('5/25/2017 3:00 PM'),
  // sets the placeholder
  placeholder: 'Select a date and time'
});
datetimepickerObject.appendTo('#element');
```

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

If the value of `min` or `max` properties changed through code behind, then you have to update the `value` property to set within the range.

Date time range in EJ2 JavaScript Datetimepicker control

DateTimePicker provides an option to select a date and time value within a specified range by using the `min`

and `max` properties. Always the min value has to be lesser than the max value.

When the min and max properties are configured and the selected datetime value is out-of-range or invalid, then the model value will be set to `out of range` datetime value or `null` respectively with highlighted `error` class to indicates the datetime is out of range or invalid.

The value property depends on the min/max with respect to `strictMode` property.

The below example allows selecting a date within the range from 7th to 27th day in a month.

INDEX.TS

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';
let today: Date = new Date();
let currentYear: number = today.getFullYear();
let currentMonth: number = today.getMonth();
let currentDay: number = today.getDate();
let currentHour: number = today.getHours();
let currentMinute: number = today.getMinutes();
let currentSecond: number = today.getSeconds();
// creates a datetimepicker with min max property
let datetimepickerObject: DateTimePicker = new DateTimePicker({
    //sets the min.
    min: new Date(currentYear, currentMonth, 7, 0, 0, 0),
    //sets the max.
    max: new Date(currentYear, currentMonth,
27, currentHour, currentMinute, currentSecond),
    //sets the value.
    value: new Date(new Date().setDate(14))
});
datetimepickerObject.appendTo('#element');
```

INDEX.HTML

```

    <div id="container">  
        <input id="element" type="text">  
    </div>  
<script>  
var ele = document.getElementById('container');  
if(ele) {  
    ele.style.visibility = "visible";  
}  
    </script>  
<script src="index.js" type="text/javascript"></script>  
</body></html>
```

If the value of `min` or `max` properties changed through code behind, then you have to update the `value` property to set within the range.

Date time format in EJ2 JavaScript Datetimepicker control

DateTime format is a way of representing the date and time value in different string format in the textbox.

By default, the DateTimePicker's format is based on the culture. You can also set the own custom format by using the [format](#) property.

Once the format property has been defined it will be common to all the cultures.

To know more about the date format standards, refer to the [Internationalization Date Time Format](#) section.

The following example demonstrates the DateTimePicker with the custom format (yyyy-MM-dd hh:mm).

INDEX.TS

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';  
// creates a DatePicker component with custom format.  
let datetimepickerObject: DateTimePicker = new DateTimePicker({  
    value: new Date(),  
    // sets the format.  
    format: 'yyyy-MM-dd hh:mm'  
});  
datetimepickerObject.appendTo('#element');
```

INDEX.HTML

```

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

[Date time masking in EJ2 JavaScript Datetimepicker control](#)

DateTimePicker has `enableMask` property that provides the option to enable the built-in date masking support. Also, you must inject the MaskedDateTime module to enable the masking support.

INDEX.TS

```
import { DateTimePicker, MaskedDateTime } from '@syncfusion/ej2-calendars';
DateTimePicker.Inject(MaskedDateTime);
let datetimepickerObject: DateTimePicker = new DateTimePicker({
  enableMask: true
});
datetimepickerObject.appendTo('#mask');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DateTimePicker control</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">

dropdowns/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <input id="mask">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

The mask pattern is defined based on the provided date format to the component. If the format is not specified, the mask pattern is formed based on the default format of the current culture.

| Keys | Actions |

| --- | --- |

| Up / Down arrows | To increment and decrement the selected portion of the date and time. |

| Left / Right arrows and Tab | To navigate the selection from one portion to next portion |

The following example demonstrates default and custom format of DateTimePicker component with mask.

INDEX.TS

```
import { DateTimePicker, MaskedDateTime } from '@syncfusion/ej2-calendars';
DateTimePicker.Inject(MaskedDateTime);
let datetimepickerObject: DateTimePicker = new DateTimePicker({
    enableMask: true
});
datetimepickerObject.appendTo('#mask');
let datetimepickerFormat: DateTimePicker = new DateTimePicker({
    enableMask: true,
    format: "M/d/yyyy hh:mm a",
});
datetimepickerFormat.appendTo('#format');
```

INDEX.HTML

```

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
  <body>

    <div id="container" style="margin:50px auto 0; width:250px;">
      <br><br>
      <label class="custom-input-label">Mask support with default
format</label>
      <br><br>
      <input id="mask">
      <br><br><br>
      <label class="custom-input-label">Mask support with custom
format</label>
      <br><br>
      <input id="format">
    </div>
```

```
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Configure Mask Placeholder

You can change mask placeholder value through property `maskPlaceholder`. By default , it takes the full name of date and time co-ordinates such as `day`, `month`, `year`, `hour` etc.

While changing to a culture other than `English`, ensure that locale text for the concerned culture is loaded through load method of L10n class for mask placeholder values like below.

```
`ts
//Load the L10n from ej2-base
import { L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized mask placeholder value
L10n.load({
  'de': {
    'datetimepicker': { day: 'Tag', month: 'Monat', year: 'Jahr', hour: 'Stunde', minute: 'Minute',
      second: 'Sekunden' }
  }
});
`
```

The following example demonstrates default and customized mask placeholder value.

INDEX.TS

```
import { DateTimePicker, MaskedDateTime } from '@syncfusion/ej2-calendars';
DateTimePicker.Inject(MaskedDateTime);
let datetimepickerObject: DateTimePicker = new DateTimePicker({
    enableMask: true
});
datetimepickerObject.appendTo('#mask');
let datetimeplaceholder: DateTimePicker = new DateTimePicker({
    enableMask: true,
    maskPlaceholder: { day: 'd', month: 'M', year: 'y', hour: 'h', minute:
      'm', second: 's' }
});
datetimeplaceholder.appendTo('#placeholder');
```

Customization in EJ2 JavaScript Datetimepicker control

The DateTimePicker is available for UI customization that can be achieved by using available properties and events in the component.

Day and Time Cell format

The DateTimePicker is available for UI customization based on your application requirements. It can be achieved by using [renderDayCell](#) event that provides an option to customize each day cell on rendering.

The following example disables the weekends of every month by using `renderDayCell` event.

INDEX.TS

```
import { DateTimePicker, RenderDayCellEventArgs, ItemEventArgs } from
 '@syncfusion/ej2-calendars';
// creates datetimepicker with placeholder.
let datetimeObject: DateTimePicker = new DateTimePicker({
    // Bind the renderDayCell event to customize the each day cell.
    renderDayCell: onRenderCell,
    // sets the placeholder
    placeholder: 'Select a date and time'
});
datetimeObject.appendTo('#element');
function onRenderCell(args: RenderDayCellEventArgs): void {
    if (args.date.getDay() == 0 || args.date.getDay() == 6) {
        //sets isDisabled to true to disable the date.
        args.isDisabled = true;
    }
}
```

INDEX.HTML

```

```

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(*) to placeholder and float label using `.e-input-group.e-control-wrapper.e-float-input .e-float-text::after` class.

INDEX.TS

```

import { DateTimePicker } from '@syncfusion/ej2-calendars';
// creates a simple datetimepicker component
let datetimepicker: DateTimePicker = new DateTimePicker({
    //sets the place holder
    placeholder:"Select DateTime"
    floatLabelType: 'Auto'
});
datetimepicker.appendTo('#element');

```

Accessibility in EJ2 JavaScript Datetimepicker control

The DateTimePicker component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the DateTimePicker component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

```

WAI-ARIA attributes

The Web accessibility defines a way to make web content and web applications more accessible to disabled people. It especially helps the dynamic content change and advanced user interface controls developed with Ajax, HTML, JavaScript, and related technologies.

DateTimePicker provides built-in compliance with the [WAI-ARIA](#) specifications. WAI-ARIA supports is achieved through the attributes like `aria-expanded`, `aria-disabled`, `aria-activedescendant` applied to the input element.

To know about the accessibility of Calendar refer to the Calendar's [Accessibility](#) section.

It helps to provide information about the widget for assistive technology to the disabled person in screen reader.

- **Aria-expanded:** attributes indicates the state of a collapsible element.
- **Aria-disabled:** attribute indicates the disabled state of this DateTimePicker component.
- **Aria-activedescendent:** attribute helps in managing the current active child of the DateTimePicker component.

Keyboard Interaction

You can use the following keys to interact with the DateTimePicker. The component implements the keyboard navigation support by following the [WAI-ARIA practices](#).

DateTimePicker supports the below list of shortcut keys.

Input Navigation

Before opening the popup, use the below list of keys to `DateTimePicker` control the popup element.

| **Press** | **To do this** |

| --- | --- |

| **Alt + Down Arrow** | **Open the select popup** |

| **Alt + Down Arrow + Alt + Down Arrow** | **Toggle between two popups** |

Calendar Navigation

Use the below list of keys to interact with the Calendar after the DatePicker popup has opened.

| **Press** | **To do this** |

| --- | --- |

| Upper Arrow | Focus the previous week date. |

| Down Arrow | Focus the next week date. |

| Left Arrow | Focus the previous date. |

| Right Arrow | Focus the next date. |

| Home | Focus the first date in the month. |

| End | Focus the last date in the month. |

| Page Up | Focus the same date in the previous month. |

| Page Down | Focus the same date in the next month. |

| Enter | Select the currently focused date. |

| Shift + Page Up | Focus the same date in the previous year. |

| Shift + Page Down | Focus the same date in the previous year. |

| Control + Upper Arrow | Moves into the inner level of view like month-year, year-decade |

| Control + Down Arrow | Moves out from the depth level view like decade-year, year-month |

| Control + Home | Focus the starting date in the current year. |

| Control + End | Focus the ending date in the current year. |

Use the below list of shortcut keys to interact with the TimePicker after the TimePicker Popup has opened.

| Press | To do this |

| --- | --- |

| Upper Arrow | Navigate and select the previous item. |

| Down Arrow | Navigate and select the next item. |

| Left Arrow | Move the cursor towards arrow key pressed direction. |

| Right Arrow | Move the cursor towards arrow key pressed direction. |

| Home | Navigate and select the first item. |

| End | Navigate and select the last item. |

| Enter | Select the currently focused item and close the popup. |

| Alt + Upper Arrow | Close the popup. |

| Alt + Down Arrow | Open the popup. |

| Esc | Close the popup. |

To focus the DateTimePicker component use the alt+t keys.

INDEX.TS

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';
// creates a DateTimePicker component
let datetimepickerObject: DateTimePicker = new DateTimePicker({
    // sets the placeholder
    placeholder: 'Select a date and time'
});
datetimepickerObject.appendTo('#element');
document.onkeyup = function (e) {
    if (e.altKey && e.keyCode === 84 /* t */) {
        // press alt+t to focus the component.
        datetimepickerObject.element.focus();
    }
};
```

```

Ensuring accessibility

The DateTimePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DateTimePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DateTimePicker component with accessibility tools.

Style appearance in EJ2 JavaScript Datetimepicker control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of DateTimePicker wrapper element

Use the following CSS to customize the appearance of wrapper element.

`

/ To specify height and font size /

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input {  
font-size: 20px;  
height: 40px;  
}
```

`

Customizing the DateTimePicker icons element

Use the following CSS to customize the DateTimePicker icons element

`

/ To specify background color and font size /

```
.e-datetime-wrapper .e-input-group-icon.e-date-icon, .e-datetime-wrapper .e-input-group-icon.e-time-  
icon {  
font-size: 16px;  
background-color: blanchedalmond;  
}
```

`

Customizing the time picker popup in the DateTimePicker

Use the following CSS to customize the time picker popup in the DateTimePicker

`

/ To specify height /

```
.e-datetimepicker.e-popup {  
height: 100px;  
}  
`
```

Customizing the Calendar popup of the DateTimePicker

Please check the below section, to customize the style and appearance of the Calendar component in the DateTimePicker

[Customizing Calendar's style and appearance](#)

Full screen mode support in mobiles and tablets

The DateTimePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the DateTimePicker component, simply set the [fullScreenMode](#) API value to `true`. This action will extend the calendar and time popup element to occupy the entire screen on mobile devices.

```
`typescript  
import { DateTimePicker } from '@syncfusion/ej2-calendars';  
// creates a datetimepicker with fullScreenMode property  
let datetimepickerObject: DateTimePicker = new DateTimePicker({  
// Enable Full Screen Mode  
fullScreenMode: true,  
});  
datetimepickerObject.appendTo('#element');  
`
```

Default Sample

How To

Disable the datetimepicker component in EJ2 JavaScript Datetimepicker control

To disable the DateTimePicker, use its [enable](#) property to `false`.

INDEX.TS

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';  
// creates datetimepicker with enabled property  
let datetimeObject: DateTimePicker = new DateTimePicker({  
    // sets the enabled as false  
    enabled: false, placeholder: "Select a date and time"  
});  
datetimeObject.appendTo('#element');
```

INDEX.HTML

```

    ele.style.visibility = "visible";  
}  
</script>  
<script src="index.js" type="text/javascript"></script>  
</body></html>
```

Set the placeholder in EJ2 JavaScript Datetimepicker control

The following example demonstrates how to set [placeholder](#) in the DateTimePicker component.

Using `placeholder` you can display a short hint in the input element.

INDEX.TS

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';  
// creates DateTimePicker with placeholder.  
let datetimeObject: DateTimePicker = new DateTimePicker({  
    // sets the placeholder property.  
    placeholder: 'Select a date and time'  
});  
datetimeObject.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
    <title>Essential JS 2 DateTimePicker control</title>  
    <meta charset="utf-8">  
    <meta name="viewport" content="width=device-width, initial-scale=1.0">  
    <meta name="description" content="Typescript UI Controls">

</body></html>
```

Customize the datetimepicker day header in EJ2 JavaScript Datetimepicker control

You can change the format of the day that to be displayed in header using [dayHeaderFormat](#) property.

By default, the format is **Short**.

You can find the possible formats on below.

Name	Description
Short	Sets the short format of day name (like Su) in day header.
Narrow	Sets the single character of day name (like S) in day header.
Abbreviated	Sets the min format of day name (like Sun) in day header.
Wide	Sets the long format of day name (like Sunday) in day header.

INDEX.TS

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
// creates datetimepicker component
let datetimepickerObject: DateTimePicker = new DateTimePicker({
    dayHeaderFormat: "Short"
});
datetimepickerObject.appendTo('#element');
let formatLabel: DropDownList = new DropDownList({
    // set the height of the popup element
    popupHeight: '200px',
    // bind the change event
    change: (args: any) => {
        datetimepickerObject.dayHeaderFormat = args.value;
    }
});
formatLabel.appendTo('#select');
```

Ej1 api migration in EJ2 JavaScript Datetimepicker control

This article describes the API migration process of DateTimePicker component from Essential JS 1 to Essential JS 2.

DateTime Selection

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Setting the value	property: valuejavascript\$("#datetimepicker").ejDateTimePicker({value: new Date("5/5/2014 12:00 PM")});	property: valuejavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ value: new Date("05/11/2017 12:00 PM")});datetimepicker.appendTo("#element");

DateTime Format

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Display the datetime format	property: <code>dateTimeFormatjavascript\$("#datetimepicker").ejDateTimePicker({ value: new Date("05/11/2017 12:00 PM"), dateTimeFormat: "dd/MM/yyyy hh:mm tt"});</code>	property: <code>formatjavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ value: new Date("05/11/2017 12:00 PM"), format: 'dd/MM/yyyy hh:mm a'});datetimepicker.appendTo('#element');</code>
Day header format	property: <code>dayHeaderFormatjavascript\$("#datetimepicker").ejDateTimePicker({ dayHeaderFormat: "short"});</code>	Not Applicable

Calendar Views

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Start view	property: <code>startLeveljavascript\$("#datetimepicker").ejDateTimePicker({ startLevel: ej.DateTimePicker.Level.Year});</code>	property: <code>startjavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ start:'Decade'});datetimepicker.appendTo('#element');</code>
Depth view	property: <code>depthLeveljavascript\$("#datetimepicker").ejDateTimePicker({ depthLevel: ej.DateTimePicker.Level.Year});</code>	property: <code>depthjavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ depth:'Year'});datetimepicker.appendTo('#element');</code>

Date Range

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Minimum datetime	property: <code>minDateTimejavascript\$("#datetimepicker").ejDateTimePicker({ minDateTime: new Date("5/1/2013 10:00 AM")});</code>	property: <code>minjavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ min: new Date("5/1/2013 10:00</code>

		AM"))});datetimepicker.appendTo('#element');
Maximum datetime	property: maxDateTimejavascript\$("#datetimepicker").ejDateTimePicker({ maxDateTime : new Date("5/30/2015 10:00 PM"))});	property: maxjavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ max : new Date("5/30/2015 10:00 PM"))});datetimepicker.appendTo('#element');

Disabled Dates

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Disabled dates	property: disabledDateRangesjavascript\$("#datetimepicker").ejDateTimePicker({ disabledDateRanges: [{ startDateTime: new Date("11/30/2018 11:59 PM"), endDateTime:new Date("12/1/2018 11:59 PM")}]});	Can be achieved by:javascriptvar datetimepicker = new ej.calendars.DateTimePicker({ renderDayCell: disableDate});datetimepicker.appendTo('#element');function disableDate(args) { if (args.date.getDay() === 0 args.date.getDay() === 6) { args.isDisabled = true; }}

Customization

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
CSS Class	property: cssClassjavascript\$("#datetimepicker").ejDateTimePicker({ cssClass: "gradient-lime"});	property: cssClassjavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ cssClass: 'e-custom- style'});datetimepicker.appendTo('#element');
Show/Hide the button	Can be achieved by:javascript\$("#datetimepicker").ejDateTimePicker({ cssClass: "e-custom-class").e-datetime-popup.e-popup.e-custom-class.e-button-container { display: none !important;}	property: showTodayButtonjavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ showTodayButton: false});datetimepicker.appendTo('#element');

Show/Hide the other month dates	property: showOtherMonths: false});	Can be achieved by: <pre>javascriptvar datetimepicker = new ej.calendars.DateTimePicker();datetimepic ker.appendTo('#element');.e- DateTimePicker .e-calendar .e-content tr.e-month-hide,.e-DateTimePicker .e- calendar .e-content td.e-other-month > .e- day { visibility: none;}.e-DateTimePicker .e- calendar .e-content td.e-month-hide,.e- DateTimePicker .e-calendar .e-content td.e-other-month { pointer-events: none; touch-action: none;}}</pre>
Show/Hide the popup button	property: showPopupButton: false});	Can be achieved by: <pre>javascriptvar datetimepicker = new ej.calendars.DateTimePicker({ focus: onFocus});datetimepicker.appendTo('#ele ment');function onFocus(args) { datetimepicker.show();.e-control-wrapper .e-input-group-icon.e-date-icon { display: none; }</pre>
Enable/Disable the rounded corner	property: showRoundedCorner: true});	Can be achieved by: <pre>javascriptvar datetimepicker = new ej.calendars.DateTimePicker({ cssClass: 'e- custom- style'});datetimepicker.appendTo('#eleme nt');.e-control-wrapper.e-custom-style.e- date-wrapper.e-input-group { border- radius: 4px;}</pre>
Skip a month	property: stepMonths: 2});	Can be achieved by: <pre>javascriptvar datetimepicker = new ej.calendars.DateTimePicker({ value: new Date("09/04/2018"), open: onOpen});datetimepicker.appendTo('#element');function onOpen(args) { datetimepicker.navigateTo('Year', new Date("03/18/2018"));</pre>
Show/Hide the tooltip	property: showTooltip: false});	Not Applicable

Interval	property: intervaljavascript\$("#datetimepicker").ejDateTimePicker({ interval: 60});	property: stepjavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ step: 60});datetimepicker.appendTo('#element');
Button text	property: buttonTextjavascript\$("#datetimepicker").ejDateTimePicker({ buttonText : { today: "Today", timeNow: "Time Now", done: "Done", timeTitle: "Time" }});	Can be achieved by:javascriptL10n.load({'en': { 'DateTimePicker': {today:'Now' } }});var datetimepicker = new ej.calendars.DateTimePicker({ locale: 'en'});datetimepicker.appendTo('#element');
Enable/Disable the animation	property: enableAnimationjavascript\$("#datetimepicker").ejDateTimePicker({ enableAnimation : false});	Not Applicable
FocusIn method	Not Applicable	Method: focusIn()javascriptvar datetimepicker = new ej.calendars.DateTimePicker({ placeholder: 'Enter date'});datetimepicker.appendTo('#element');datetimepicker.focusIn();
FocusOut method	Not Applicable	Method: focusOut()javascriptvar datetimepicker = new ej.calendars.DateTimePicker({ placeholder: 'Enter date'});datetimepicker.appendTo('#element');datetimepicker.focusOut();
Prevent popup close	Not Applicable	Event: closejavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ close: function (args) { args.preventDefault(); }});datetimepicker.appendTo('#element');datetimepicker.show();
Prevent popup open	Not Applicable	Event: openjavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ open: function (args) { args.preventDefault(); }});datetimepicker.appendTo('#element');datetimepicker.show();

Accessibility

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Enable RTL	<pre>property: enableRTLjavascript\$("#datetimepicker").ejDateTimePicker({ enableRTL : true});</pre>	<pre>property: enableRtljavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ enableRtl : true});datetimepicker.appendTo('#element');</pre>

Persistence

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Enable Persistence	<pre>property: enablePersistencejavascript\$("#datetimepicker").ejDateTimePicker({ enablePersistence : true});</pre>	<pre>property: enablePersistencejavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ enablePersistence : true});datetimepicker.appendTo('#element');</pre>

Validation

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Validation rules	<pre>property: validationRulesjavascript\$("#datetimepicker").ejDateTimePicker({ validationRules:{ required : true }});</pre>	<pre>Can be achieved by:javascriptvar datetimepicker = new ej.calendars.DateTimePicker({ placeholder: 'Enter date'});datetimepicker.appendTo('#element'); var options = { rules: { 'datetime': { required: true }} }var formObject: FormValidator = new FormValidator('#form-element', options);</pre>
Validation message	<pre>property: validationMessagejavascript\$("#datetimepicker").ejDateTimePicker({ validationRules:{required:true},validation Message:{ required: "Required Date value" }});</pre>	<pre>Can be achieved by:javascriptvar datetimepicker = new ej.calendars.DateTimePicker({ placeholder: 'Enter date'});datetimepicker.appendTo('#element'); var options = { rules: { 'datetime': { required:</pre>

		<pre>[true, 'DateTime value required'] } }, customPlacement: function (inputElement, errorElement) { inputElement.parentElement.parentElement. appendChild(errorElement); }); var formObject = new ej.inputs.FormValidator('#form-element', options);</pre>
--	--	--

Common

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2

Open	<pre>Event: openjavascript\$("#datetimepicker").ej DateTimePicker({open: function (args) {/code block/}});</pre>	<pre>Event: openjavascriptvar datetimepicker = new ej.calendars.DateTimePicker({ open: function (args) {/code block/}});datetimepicker.appendTo('#element');</pre>
Show	<pre>Method: show()javascript\$("#datetimepicker"). ejDateTimePicker();var dateObj = \$("#datetimepicker").data("ejDateTim ePicker");dateObj.show();</pre>	<pre>Method: show()javascriptvar datetimepicker = new ej.calendars.DateTimePicker({ value: new Date("05/11/2017")});datetimepicker.appendTo('# element');datetimepicker.show();</pre>

View Navigation

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
----------	-----------------------	-----------------------

Navigate to specific month	Not Applicable	Method: navigateTo() javascriptvar datetimepicker = new ej.calendars.DateTimePicker({ value: new Date("09/04/2018"), open: onOpen}); datetimepicker.appendTo ('#element'); function onOpen(args) { datetimepicker.navigateTo('Year', new Date("03/18/2018")); }
Navigation callback	Not Applicable	Event: navigated javascriptvar datetimepicker = new ej.calendars.DateTimePicker({ navigated: onNavigate}); datetimepicker.appendTo('# element'); function onNavigate(args) { }
Enable/Disable the drill down	property: timeDrillDown javascript\$(" #datetimepicker ").ejDateTimePicker({ timeDrillDown: { enabled: true, showMeridian: true, autoClose: true, interval: 10 }});	Not Applicable

Diagram

Getting started in EJ2 JavaScript Diagram control

This section explains the steps required to create a simple diagram and demonstrates the basic usage of the diagram control.

```
<!-- markdownlint-disable MD033 -->
```

Dependencies

The following list of dependencies are required to use the **Diagram** component in your application.

```
`javascript
|-- @syncfusion/ej2-diagrams
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-splitbuttons
```

,

Installation and Configuration

- To get started with the diagram component, clone the [Essential JS 2 quickStart](https://github.com/syncfusion/ej2-quickstart) project and install necessary packages by using the following commands.

,

```
git clone https://github.com/syncfusion/ej2-quickstart.git quickstart
```

```
cd quickstart
```

```
npm install
```

,

- **Diagram packages** should be mapped in the **system.config.js** configuration file.

```
`javascript
```

```
System.config({
```

```
paths: {
```

```
'syncfusion:': './node_modules/@syncfusion/',
```

```
},
```

```
map: {
```

```
app: 'app',
```

```
//Syncfusion packages mapping
```

```
"@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
```

```
"@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
```

```
"@syncfusion/ej2-navigations": "syncfusion:ej2-navigations/dist/ej2-navigations.umd.min.js",
```

```
"@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
```

```
"@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
```

```
"@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
```

```
"@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
```

```
"@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
```

```
"@syncfusion/ej2-diagrams": "syncfusion:ej2-diagrams/dist/ej2-diagrams.umd.min.js",
```

```
},
```

```
packages: {
```

```
'app': { main: 'app', defaultExtension: 'js' }
```

```
}
```

```
});
```

The [project](#) is preconfigured with common settings (`src/styles/styles.css`, `system.config.js`) to start with all Essential JS 2 components.

Add diagram to the project

Add the HTML div element for the diagram into your `index.html`. [`src/index.html`]

```
`html
<!DOCTYPE html>
<html lang="en">
<head>
<title>EJ2 Diagram</title>
<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0" />
<meta name="description" content="Typescript UI Controls" />
<meta name="author" content="Syncfusion" />
<link href="index.css" rel="stylesheet" />
<script src="https://cdnjs.cloudflare.com/ajax/libs/systemjs/0.19.38/system.js"></script>
<script src="systemjs.config.js"></script>
</head>
<body>
<!--container which is going to render the Diagram-->
<div id='container'>
</div>
</body>
</html>
```

Now, import the diagram component into your `app.ts` to instantiate a diagram and append the diagram instance to the `#container`. [`src/app/app.ts`]

The following example shows a basic diagram.

INDEX.TS

```
import { Diagram } from '@syncfusion/ej2-diagrams';
let diagram: Diagram = new Diagram({
  width: '100%', height: '600px'
});
diagram.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
diagrams/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/fabric.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Now, the `npm run start` command is used to run the application in the browser.

`npm run start`

Module Injection

The diagram component is divided into individual feature-wise modules. In order to use a particular feature, inject the required module. The following list describes the module names and their description.

- `BpmnDiagrams`: Inject this provider to add built-in BPMN shapes to diagrams.
- `ConnectorBridging`: Inject this provider to add bridges to connectors.

- **ConnectorEditing**: Inject this provider to edit the segments for connector.
- **ComplexHierarchicalTree**: Inject this provider to complex hierarchical tree like structure.
- **DataBinding**: Inject this provider to populate nodes from given data source.
- **DiagramContextMenu**: Inject this provider to manipulate context menu.
- **HierarchicalTree**: Inject this provider to use hierarchical tree like structure.
- **LayoutAnimation**: Inject this provider animation to layouts.
- **MindMap**: Inject this provider to use mind map.
- **PrintAndExport**: Inject this provider to print or export the objects.
- **RadialTree**: Inject this provider to use radial tree like structure.
- **Snapping**: Inject this provider to snap the objects.
- **SymmetricLayout**: Inject this provider to render layout in symmetrical method.
- **UndoRedo**: Inject this provider to revert and restore the changes.

These modules should be imported and injected into the Diagram component using **Diagram.Inject** method as follows.

```
`javascript
```

```
import { Diagram, HierarchicalTree, MindMap, RadialTree, ComplexHierarchicalTree, DataBinding, Snapping, PrintAndExport, BpmnDiagrams, SymmetricLayout, ConnectorBridging, UndoRedo, LayoutAnimation, DiagramContextMenu, ConnectorEditing } from '@syncfusion/ej2-diagrams';
```

```
Diagram.Inject(BpmnDiagrams, ConnectorBridging, ConnectorEditing, ComplexHierarchicalTree, DataBinding, DiagramContextMenu, HierarchicalTree, LayoutAnimation, MindMap, PrintAndExport, RadialTree, Snapping, SymmetricLayout, UndoRedo);
```

```
,
```

Flow Diagram

Create and add node

Create and add a **node** (JSON data) with specific position, size, label, and shape.

INDEX.TS

```
import { Diagram, NodeModel } from '@syncfusion/ej2-diagrams';
// A node is created and stored in nodes array.
let nodes: NodeModel[] = [{
  // Unique name for the node
  name: "Start",
  // Position of the node
  offsetX: 300,
  offsetY: 50,
  // Size of the node
  width: 140,
  height: 50,
  // Text(label) added to the node
  annotations: [{
    id: 'label1',
    content: 'Start'
  }],
  // Shape for the node
  shape: { type: 'Flow', shape: 'Terminator' }
}]
```

```
    ];  
    // initialize Diagram component  
    let diagram: Diagram = new Diagram({  
        width: '100%', height: '600px',  
        // Add node  
        nodes: nodes  
    });  
    // render initialized Diagram  
    diagram.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
    <title>EJ2 Diagram</title>  
    <meta charset="utf-8">  
    <meta name="viewport" content="width=device-width, initial-scale=1.0">  
    <meta name="description" content="Typescript UI Controls">  
    <meta name="author" content="Syncfusion">  
    <link href="index.css" rel="stylesheet">  
  
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
base/styles/material.css" rel="stylesheet">  
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
buttons/styles/material.css" rel="stylesheet">  
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
popups/styles/material.css" rel="stylesheet">  
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
splitbuttons/styles/material.css" rel="stylesheet">  
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
diagrams/styles/material.css" rel="stylesheet">  
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
navigations/styles/fabric.css" rel="stylesheet">  
  
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"  
type="text/javascript"></script>  
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type  
="text/javascript"></script>  
</head>  
<body>  
  
    <div id="container">  
        <div id="element"></div>  
    </div>  
<script>  
var ele = document.getElementById('container');  
if(ele) {  
    ele.style.visibility = "visible";  
}  
</script>  
<script src="index.js" type="text/javascript"></script>  
</body></html>
```

Note: The `annotations` property is an array, which indicates that more than one label can be added to a node.

Connect Nodes

Add two node to the diagram as shown in the previous example. Connect these nodes by adding a connector using the `connector` property and refer the source and target end by using the `sourceNode` and `targetNode` properties.

INDEX.TS

```
import { Diagram, NodeModel, ConnectorModel } from '@syncfusion/ej2-
diagrams';
let nodes: NodeModel[] = [
  {
    id: 'Start', width: 140, height: 50, offsetX: 300, offsetY: 50,
    annotations: [{
      id: 'label1',
      content: 'Start'
    }],
    shape: { type: 'Flow', shape: 'Terminator' }
  },
  {
    id: 'Init', width: 140, height: 50, offsetX: 300, offsetY: 140,
    shape: { type: 'Flow', shape: 'Process' },
    annotations: [{ content: 'var i = 0;' }]
  }
];
let connectors: ConnectorModel = {
  // Unique name for the connector
  id: "connector1",
  // Source and Target node's name to which connector needs to be
  // connected.
  sourceID: "Start",
  targetID: "Init",
  type: 'Orthogonal'
};
let diagram: Diagram = new Diagram({
  width: '100%', height: '600px', nodes: nodes, connectors: [connectors]
});
diagram.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
```

```

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
diagrams/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/fabric.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Default values for all **nodes** and **connectors** can be set using the **getNodeDefaults** and **getConnectorDefaults** properties, respectively. For example, if all nodes have the same width and height, such properties can be moved into **getNodeDefaults**.

[Complete flow diagram](#)

Similarly, the required nodes and connectors can be added to form a complete flow diagram.

INDEX.TS

```

import {
    Diagram, NodeModel, ConnectorModel
} from '@syncfusion/ej2-diagrams';
let nodes: NodeModel[] = [
    { id: 'Start', offsetY: 50, annotations: [{ content: 'Start' }], shape:
    { type: 'Flow', shape: 'Terminator' } },
    { id: 'Init', offsetY: 140, annotations: [{ content: 'var i = 0;' }],
    shape: { type: 'Flow', shape: 'Process' } },
    { id: 'Condition', offsetY: 230, annotations: [{ content: 'i < 10?' }],
    shape: { type: 'Flow', shape: 'Decision' } },

      segments: [
        { type: 'Orthogonal', length: 30, direction: "Left" },
        { type: 'Orthogonal', length: 200, direction: "Top" }
      ]
    }
  ]];
let diagram: Diagram = new Diagram({
  width: '100%', height: '600px', nodes: nodes, connectors: connector,
  getNodeDefaults: (node: NodeModel) => {
    node.height = 50;
    node.width = 140;
    node.offsetX = 300;
    return node;
  },
  getConnectorDefaults: (obj: ConnectorModel): ConnectorModel => {
    obj.type = "Orthogonal";
    obj.targetDecorator = { shape: 'Arrow', width: 10, height: 10 };
    return obj;
  }
});
diagram.appendTo('#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Automatic organization chart

In the 'Flow Diagram' section, how to create a diagram manually was discussed. This section explains how to create and position the diagram automatically.

Business object (Employee information)

Define Employee Information as JSON data. The following code example shows an employee array whose, **Name** is used as an unique identifier and **ReportingPerson** is used to identify the person to whom an employee report to, in the organization.

```

`ts
//Initialize data source...
let data: object[] = [{Name: "Elizabeth", Role: "Director" },
{ Name: "Christina", ReportingPerson: "Elizabeth", Role: "Manager" },
{ Name: "Yoshi", ReportingPerson: "Christina", Role: "Lead" },
{ Name: "Philip", ReportingPerson: "Christina", Role: "Lead" },
{ Name: "Yang", ReportingPerson: "Elizabeth", Role: "Manager" },
{ Name: "Roland", ReportingPerson: "Yang", Role: "Lead" },
{ Name: "Yvonne", ReportingPerson: "Yang", Role: "Lead" }
];
`

```

Map data source

You can configure the above "Employee Information" with diagram, so that the nodes and connectors are automatically generated using the mapping properties. The following code example show how **dataSourceSettings** is used to map ID and parent with property name identifiers for employee information.

```

`ts

```

```
//Initialize data source...
let data: object[] = [{Name: "Elizabeth", Role: "Director" },
{ Name: "Christina", ReportingPerson: "Elizabeth", Role: "Manager" },
{ Name: "Yoshi", ReportingPerson: "Christina", Role: "Lead" },
{ Name: "Philip", ReportingPerson: "Christina", Role: "Lead" },
{ Name: "Yang", ReportingPerson: "Elizabeth", Role: "Manager" },
{ Name: "Roland", ReportingPerson: "Yang", Role: "Lead" },
{ Name: "Yvonne", ReportingPerson: "Yang", Role: "Lead" }
];

let items: DataManager = new DataManager(data as JSON[], new Query().take(7));

//Initialize data source...

let diagram: Diagram = new Diagram({
width: '100%', height: '600px',
//Configure data source for diagram
dataSourceSettings: {
id: 'Name', parentId: 'ReportingPerson', dataManager: items
}
});
,
```

Visualize employee

The following code examples indicate how to define the default appearance of nodes and connectors. The `setNodeTemplate` is used to update each node based on employee data.

INDEX.TS

```
import {
    Diagram, ConnectorModel, Node, DataBinding, HierarchicalTree, TreeInfo,
    SnapConstraints,
} from '@syncfusion/ej2-diagrams';
Diagram.Inject(DataBinding, HierarchicalTree);
import { DataManager, Query } from '@syncfusion/ej2-data';
export interface EmployeeInfo {
    Name: string;
    Role: string;
}
//To represent the roles
let codes: object[] = {
    Director: "rgb(0, 139,139)",
    Manager: "rgb(30, 30,113)",
    Lead: "rgb(0, 100,0)"
}
// Bind custom data with node
function getNodeTemplate(node) {
```

```

node.annotations[0].content = (node.data as EmployeeInfo).Name;
node.style.fill = codes[(node.data as EmployeeInfo).Role];
}
let data: object[] = [{Name: "Elizabeth", Role: "Director" },
{ Name: "Christina", ReportingPerson: "Elizabeth", Role: "Manager" },
{ Name: "Yoshi", ReportingPerson: "Christina", Role: "Lead" },
{ Name: "Philip", ReportingPerson: "Christina", Role: "Lead" },
{ Name: "Yang", ReportingPerson: "Elizabeth", Role: "Manager" },
{ Name: "Roland", ReportingPerson: "Yang", Role: "Lead" },
{ Name: "Yvonne", ReportingPerson: "Yang", Role: "Lead" }
];
let items: DataManager = new DataManager(data as JSON[], new
Query().take(7));
let diagram: Diagram = new Diagram({
width: '100%', height: '600px',

You can refer to our [JavaScript Diagram](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Diagram example](#) that shows how to render the Diagram in JavaScript.

Nodes in EJ2 JavaScript Diagram control

Nodes are graphical objects used to visually represent the geometrical information, process flow, internal business procedure, entity, or any other kind of data.

<!-- markdownlint-disable MD033 -->

Create node

A node can be created and added to the diagram, either programmatically or interactively. Nodes are stacked on the diagram area from bottom to top in the order they are added.

Add node through nodes collection

To create a node, define the [node](#) object and add that to nodes collection of the diagram model. The following code example illustrates how to add a node to the diagram.

INDEX.JS

```
var node = {  
  // Position of the node  
  offsetX: 250,  
  offsetY: 250,  
  // Size of the node  
  width: 100,  
  height: 100,  
  style: { fill: '#6BA5D7', strokeColor: 'white' },  
  // Text(label) added to the node  
};  
// initialize Diagram component  
var diagram = new ej.diagrams.Diagram({  
  width: '100%', height: '600px', nodes: [node]  
}, '#element');
```

INDEX.HTML

```

</head>  
<body>  
  
    <div id="container">  
        <div id="element"></div>  
    </div>  
<script>  
var ele = document.getElementById('container');  
if(ele) {  
    ele.style.visibility = "visible";  
}  
    </script>  
<script src="index.js" type="text/javascript"></script>  
</body></html>
```

Note: Node id should not begin with numbers(should begin with a letter).Node Id should be unique for all the shapes and connectors.

Add/Remove node at runtime

- Nodes can be added at runtime by using public method, add and can be removed at runtime by using public method, remove. On adding node at runtime, the nodes collection is changed and the [collectionChange](#) event will trigger.
- The node's ID property is used to define the name of the node and its further used to find the node at runtime and do any customization.

The following code illustrates how to add a node.

INDEX.JS

```
var node = {  
    // Position of the node  
    offsetX: 250,  
    offsetY: 250,  
    // Size of the node  
    width: 100,  
    height: 100,  
    style: { fill: '#6BA5D7', strokeColor: 'white' },  
    // Text(label) added to the node  
};
```

```
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px'
}, '#element');
diagram.add(node);
```

INDEX.HTML

```

  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Add node from palette

Nodes can be predefined and added to the palette, and can be dropped into the diagram when needed. For more information about adding nodes from symbol palette, refer to [Symbol Palette](#).

- Once you drag a node/connector from the palette to the diagram, the following events can be used to do your customization.

- When a symbol is dragged into diagram from symbol palette, the [dragEnter](#) event gets triggered.
- When a symbol is dragged over diagram, the [dragOver](#) event gets triggered.
- When a symbol is dragged and dropped from symbol palette to diagram area, the [drop](#) event gets triggered.
- When a symbol is dragged outside of the diagram, the [dragLeave](#) event gets triggered.

Create node through data source

Nodes can be generated automatically with the information provided through data source. The default properties for these nodes are fetched from default settings. For more information about data source, refer to Data Binding.

Draw nodes

Nodes can be interactively drawn by clicking and dragging the diagram surface by using [NodeDrawingTool](#). For more information about drawing nodes, refer to Draw Nodes.

Position

- Position of a node is controlled by using its [offsetX](#) and [offsetY](#) properties. By default, these offset properties represent the distance between the origin of the diagram's page and node's center point.
- You may expect this offset values to represent the distance between page origin and node's top-left corner instead of center. The Pivot property helps to solve this problem. Default value of node's [pivot](#) point is (0.5, 0.5), that means center of the node.
- The size of the node can be controlled by using its [width](#) and [height](#) properties.
- Rotation of a node is controlled by using its [rotateAngle](#) property.

The following table illustrates how pivot relates offset values with node boundaries.

Pivot	Offset
-----	-----
(0.5,0.5)	offsetX and offsetY values are considered as the node's center point.
(0,0)	offsetX and offsetY values are considered as the top-left corner of the node.
(1,1)	offsetX and offsetY values are considered as the bottom-right corner of the node.

The following code illustrates how to change the [pivot](#) value.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: { fill: '#6BA5D7', strokeColor: 'white' },
  pivot: {x: 0, y: 0}
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
```

```
width: '100%', height: '600px', nodes: [node]
}, '#element');
diagram.select([diagram.nodes[0]]);
```

INDEX.HTML

```

```

Flip

The diagram Provides support to flip the node. [flip](#) is performed to give the mirrored image of the original element.

The flip types are as follows:

- HorizontalFlip

[Horizontal](#) is used to change the element in horizontal direction.

- VerticalFlip

[Vertical](#) is used to change the element in vertical direction

- Both

[Both](#) which involves both vertical and horizontal changes of the element.

The following code illustrates how to provide the mirror image of the original element.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: { fill: '#6BA5D7', strokeColor: 'white' },
  pivot: {x: 0, y: 0}
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');
diagram.select([diagram.nodes[0]]);
```

INDEX.HTML

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Appearance

- The appearance of a node can be customized by changing its [fill](#) color, [borderColor](#), [borderWidth](#), [strokeDashArray](#), [opacity](#), and [shadow](#).
- The [visible](#) property of the node enables or disables the visibility of the node.

The following code illustrates how to customize the appearance of the shape.

INDEX.JS

```
var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: { fill: '#6BA5D7', strokeDashArray: '5,5', borderWidth: 2,
borderColor: 'red',
    // Text(label) added to the node
    };
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
}, '#element');
```

INDEX.HTML

</head>  
<body>  
  
    <div id="container">  
        <div id="element"></div>  
    </div>  
<script>  
var ele = document.getElementById('container');  
if(ele) {  
    ele.style.visibility = "visible";  
}  
    </script>  
<script src="index.js" type="text/javascript"></script>  
</body></html>
```

Note: The flip is also applicable for group and BPMN shapes.

Gradient

The [gradient](#) property of the node allows you to define and apply the gradient effect to that node.

The gradient stop property defines the color and a position, where the previous color transition ends and a new color transition starts.

The gradient stop's opacity property defines the transparency level of the region.

There are two types of gradients as follows:

- Linear gradient
- Radial gradient

Linear gradient

- [LinearGradient](#) defines a smooth transition between a set of colors (so-called stops) on a line.
- A linear gradient's x1, y1, x2, y2 properties are used to define the position (relative to the node) of the rectangular region that needs to be painted.

INDEX.JS

```
var linearGradient;
```

```

linearGradient = {
    //Start point of linear gradient
    x1: 0, y1: 0,
    //End point of linear gradient
    x2: 50, y2: 50,
    //Sets an array of stop objects
    stops: [{ color: 'white', offset: 0 },
    { color: '#6BA5D7', offset: 100 }],
    type: 'Linear'
};
var radialGradient;
radialGradient = {
    //Center point of outer circle
    cx: 50, cy: 50,
    //Center point of inner circle
    fx: 25, fy: 25,
    //Radius of a radial gradient
    r: 50,
    //Sets an array of stop objects
    stops: [{ color: 'white', offset: 0 },
    { color: '#6BA5D7', offset: 100 }],
    type: 'Radial'
};
var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {gradient: linearGradient, strokeColor: 'white' }
    // Text(label) added to the node
};
var node2 = {
    // Position of the node
    offsetX: 400,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {gradient: radialGradient, strokeColor: 'white' }
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node, node2]
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Radial gradient

- [RadialGradient](#) defines a smooth transition between stops on a circle.
- A radial gradient's cx, cy, fx, fy properties are used to define the position (relative to the node) of the outermost or the innermost circle of the radial gradient.

INDEX.JS

```
var linearGradient;
linearGradient = {
    //Start point of linear gradient
    x1: 0, y1: 0,
    //End point of linear gradient
    x2: 50, y2: 50,
    //Sets an array of stop objects
    stops: [{ color: 'white', offset: 0 },
    { color: '#6BA5D7', offset: 100 }],
    type: 'Linear'
};
var radialGradient;
radialGradient = {
    //Center point of outer circle
```

```

        cx: 50, cy: 50,
        //Center point of inner circle
        fx: 25, fy: 25,
        //Radius of a radial gradient
        r: 50,
        //Sets an array of stop objects
        stops: [{ color: 'white', offset: 0 },
        { color: '#6BA5D7', offset: 100 }],
        type: 'Radial'
    };
var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {gradient: linearGradient, strokeColor: 'white' }
    // Text(label) added to the node
};
var node2 = {
    // Position of the node
    offsetX: 400,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {gradient: radialGradient, strokeColor: 'white' }
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node, node2]
}, '#element');
```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Shadow

Diagram provides support to add [shadow](#) effect to a node that is disabled, by default. It can be enabled with the constraints property of the node. The following code illustrates how to drop shadow.

INDEX.JS

```

var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: { fill: '#6BA5D7', strokeColor: 'white' },
    constraints: ej.diagrams.NodeConstraints.Default |
ej.diagrams.NodeConstraints.Shadow,
    // Text(label) added to the node
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Diagram</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing shadow

The angle, distance, and opacity of the shadow can be customized with the shadow property of the node. The following code

example illustrates how to customize shadow.

INDEX.JS

```

var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: { fill: '#6BA5D7', strokeColor: 'white' },
    constraints: ej.diagrams.NodeConstraints.Default |
ej.diagrams.NodeConstraints.Shadow,
    shadow: { angle: 50, opacity: 0.8, distance: 9 }
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
}, '#element');

```

INDEX.HTML

```

```

Icon

Diagram provides support to describe the state of the node. i.e., the node is expanded or collapsed state.

Note: Icon can be created only when the node has outEdges.

- To explore the properties of expand and collapse icon, refer to [expandIcon](#) and [collapseIcon](#).
- The expandIcon's and collapseIcon's shape properties allow to define the shape of the icon.

The following code example illustrates how to create an icon of various shapes.

INDEX.JS

```

var nodes = [
  {
    id: 'Start', width: 140, height: 50, offsetX: 300, offsetY: 50,
    annotations: [{
      content: 'Node1'
    }],
    style: { fill: '#6BA5D7', strokeColor: 'white' },
    expandIcon: {shape: 'ArrowDown', width: 10, height: 10},
    collapseIcon: {shape: 'ArrowUp', width: 10, height: 10}
  },
  {
    id: 'Init', width: 140, height: 50, offsetX: 300, offsetY: 140,
    style: { fill: '#6BA5D7', strokeColor: 'white' },
    annotations: [{
      content: 'Node2'
    }],
  }
];
var connectors = [{
  // Unique name for the connector
  id: "connector1",
  // Source and Target node's name to which connector needs to be
  // connected.
  sourceID: "Start",
  targetID: "Init",
  type: 'Orthogonal'
}];
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: nodes, connectors: connectors
}, '#element');

```

INDEX.HTML

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Customizing expand icon

- Set the `borderColor`, `borderWidth`, and background color for an `expandIcon` using `borderColor`, `borderWidth`, and `fill` properties.
- Set a size for an `expandIcon` by using `width` and `height` properties.
- The `expand icon` can be aligned relative to the node boundaries. It has `margin`, `offset`, `horizontalAlignment`, and `verticalAlignment` settings. It is quite tricky, when all four alignments are used together but gives you more control over alignment.
- The [iconColor](#) property can be used to set the `strokeColor` of the Icon.

Customizing collapse icon

- Set the [borderColor](#), [borderWidth](#), background color for an `collapseIcon` using `borderColor`, `borderWidth`, and [fill](#) properties.
- Set a size for `collapseIcon` by using [width](#) and [height](#) properties.
- Like `expand icon`, `collapse icon` also can be aligned relative to the node boundaries. It has `margin`, `offset`, `horizontalAlignment`, and `verticalAlignment` settings. It is quite tricky, when all four alignments are used together but gives you more control over alignment.
- The [iconColor](#) property can be used to set the `strokeColor` of the Icon.

Interaction

Diagram provides support to drag, resize, or rotate the node interactively. For more information about editing a node at runtime, refer to [Edit Nodes](#).

Constraints

The `constraints` property of the node allows you to enable/disable certain features. For more information about node constraints, refer to [Node Constraints](#).

Custom properties

The [addInfo](#) property of the node allows to maintain additional information to the node.

Stack order

The nodes z-order property specifies the stack order of the node. A node with greater stack order is always in front of a node with a lower stack order.

Data flow

Node has the InEdges and OutEdges read-only property. In this property, you can find what are all the connectors that are connected to the node, and then you can find these connectors by using the [getObject](#) method in the diagram.

```
`javascript
var node = {
id: 'node1',
// Position of the node
offsetX: 450,
offsetY: 100,
// Size of the node
width: 80,
height: 50,
style: { fill: '#6BA5D7', strokeColor: 'white' },
};
var node2 = {
id: 'node2',
// Position of the node
offsetX: 350,
offsetY: 200,
// Size of the node
width: 80,
height: 50,
style: { fill: '#6BA5D7', strokeColor: 'white' },
};
var node3 = {
id: 'node3',
// Position of the node
offsetX: 450,
offsetY: 200,
// Size of the node
width: 80,
```

```
height: 50,
style: { fill: '#6BA5D7', strokeColor: 'white' },
};
var node4 = {
id: 'node4',
// Position of the node
offsetX: 550,
offsetY: 200,
// Size of the node
width: 80,
height: 50,
style: { fill: '#6BA5D7', strokeColor: 'white' },
};
var connector = {
id: 'connector1', sourceID: 'node1', targetID: 'node2', type: 'Orthogonal'
};
var connector2 = {
id: 'connector2', sourceID: 'node1', targetID: 'node3', type: 'Orthogonal'
};
var connector3 = {
id: 'connector3', sourceID: 'node1', targetID: 'node4', type: 'Orthogonal'
};
var diagram = new ej.diagrams.Diagram({
width: '100%', height: 600, nodes: [node, node2, node3, node4],
connectors: [connector, connector2, connector3]
}, '#element');
diagram.getObject('connector1');
```

Shapes in EJ2 JavaScript Diagram control

Diagram provides support to add different kind of nodes. They are as follows:

- Text node
- Image node
- HTML node
- Native node
- Basic shapes
- Flow shapes

<!-- markdownlint-disable MD033 -->

<!-- markdownlint-disable MD010 -->

Text

Texts can be added to the diagram as [text](#) nodes. The shape property of the node allows you to set the type of node and for text nodes, it should be set as **text**. In addition, define the content object that is used to define the text to be added and style is used to customize the appearance of that text. The following code illustrates how to create a text node.

INDEX.TS

```
import { Diagram, NodeModel } from '@syncfusion/ej2-diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  //Sets type of the shape as text
  shape: {
    type: 'Text',
    content: 'Text Element'
  },
  //Customizes the appearances such as text, font, fill, and stroke.
  style: {
    strokeColor: 'none',
    fill: 'none',
    color: 'black',
    textAlign: 'Center'
  }
};
// initialize diagram component
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  // Add node
  nodes: [node]
});
// render initialized diagram
```

```

diagram.appendTo('#element');
diagram.select([diagram.nodes[0]]);

```

INDEX.HTML

```

```

Image

Diagram allows to add images as [image](#) nodes. The shape property of node allows you to set the type of node and for image nodes, it should be set as **image**. In addition, the source property of shape enables you to set the image source.

The following code illustrates how an image node is created.

INDEX.TS

```
import { Diagram, NodeModel } from '@syncfusion/ej2-diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    // sets the type of the shape as image
    shape: {
        type: 'Image',
        source:
        'https://ej2.syncfusion.com/demos/src/diagram/employees/image16.png'
    },
    //Customizes the appearances such as text, font, fill, and stroke.
    style: {
        fill: 'none'
    }
};
// initialize diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    // Add node
    nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');
```

</body></html>

```

Note: Deploy your HTML file in the web application and export the diagram (image node) or else the image node will not be exported in the Chrome and Firefox due to security issues. Refer to the following link.

Link 1: <http://asked.online/draw-images-on-canvas-locally-using-chrome/2546077/>

Link 2: <http://stackoverflow.com/questions/4761711/local-image-in-canvas-in-chrome>

Image alignment

Stretch and align the image content anywhere but within the node boundary.

The scale property of the node allows to stretch the image as you desired (either to maintain proportion or to stretch). By default, the [scale](#) property of the node is set as **meet**.

The following code illustrates how to scale or stretch the content of the image node.

INDEX.TS

```

import {
  Diagram,
  NodeModel,
  NodeConstraints
} from '@syncfusion/ej2-diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  //sets the type of the shape as Image

```

```

        shape: {
            type: 'Image',
            source:
'https://ej2.syncfusion.com/demos/src/diagram/employees/image16.png',
            scale: 'None'
        },
        //Customizes the appearances such as text, font, fill, and stroke.
        style: {
            fill: 'none'
        }
    };
    // initialize diagram component
    let diagram: Diagram = new Diagram({
        width: '100%',
        height: '600px',
        // Add node
        nodes: [node]
    });
    // render initialized diagram
    diagram.appendTo('#element');

```

</body></html>
```

The following table illustrates all the possible scale options for the image node.

Values	Images
None	
Meet	
Slice	

HTML

Html elements can be embedded in the diagram through [Html](#) type node. The shape property of node allows you to set the type of node and to create a HTML node it should be set as **HTML**. The following code illustrates how an Html node is created.

INDEX.TS

```
import { Diagram, NodeModel, NodeConstraints } from '@syncfusion/ej2-
diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: {
    fill: '#6BA5D7',
    strokeColor: 'white'
  },
  //sets the type of the shape as HTML
  shape: {
    type: 'HTML',
    content: '<div
style="background:#6BA5D7;height:100%;width:100%;"><button type="button"
style="width:100px"> Button</button></div>'
  }
  as NodeModel
};
// initialize diagram component
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  // Add node
  nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: HTML node cannot be exported to image format, like JPEG, PNG, and BMP. It is by design, while exporting the diagram is drawn in a canvas. Further, this canvas is exported into image formats. Currently, drawing in a canvas equivalent from all possible HTML is not feasible. Hence, this limitation.

HTML Node With Template

Html elements can be embedded in the diagram using [Html](#) type node. The shape property of the node allows you to set the type of node. The following code shows how an Html node is created with a template.

INDEX.TS

```

import { Diagram, NodeModel, NodeConstraints } from '@syncfusion/ej2-
diagrams';
// A node is created and stored in nodes array.
let nodes: NodeModel[] = [{
  //Id of the node
  id: "Node",

```

```

    //Position of the node
    offsetX: 100,
    offsetY: 100,
    //Size of the node
    width: 100,
    height: 100,
    //sets the type of the shape as HTML
    shape: {
        type: 'HTML'
    }
}
];
//initialize diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    // Add node
    nodes: nodes,
    nodeTemplate: "#nodetemplate"
});
//render initialized diagram
diagram.appendTo('#element');

```

INDEX.HTML

```

```

Native

Diagram provides support to embed SVG element into a node. The shape property of node allows you to set the type of node. To create a [native](#) node, it should be set as **native**. The following code illustrates how a native node is created.

INDEX.TS

```

import { Diagram, NodeModel, NodeConstraints } from '@syncfusion/ej2-
diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  //sets the type of the shape as Native
  shape: {
    type: 'Native',
    content: '<g xmlns="http://www.w3.org/2000/svg"> <g
transform="translate(1 1)"><g>    <path style="fill:#61443C;"

```

Note: Like HTML node, the native node also cannot be exported to image format. Fill color of native node can be overridden by the inline style or fill of the SVG element specified in the template.

SVG content alignment

Stretch and align the svg content anywhere but within the node boundary.

The scale property of the node allows to stretch the svg content as you desired (either to maintain proportion or to stretch). By default, the `scale` property of node is set as **meet**.

The following code illustrates how to scale or stretch the content of the node.

The following tables illustrates all the possible scale options for the node.

| Values | Images |

|-----| -----|

Basic shapes

- The [Basic](#) shapes are common shapes that are used to represent the geometrical information visually. To create basic shapes, the type of the shape should be set as **basic**. Its shape property can be set with any one of the built-in shape.
- To render a rounded rectangle, you need to set the type as basic and shape as rectangle. Set the [cornerRadius](#) property to specify the radius of rounded rectangle.

The following code example illustrates how to create a basic shape.

INDEX.TS

```
import { Diagram, NodeModel, NodeConstraints} from '@syncfusion/ej2-
diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  //sets the type of the shape as Basic
  shape: {
    type: 'Basic',
    shape: 'Rectangle',
    cornerRadius: 10
  },
  style: {
    fill: '#6BA5D7',
    strokeColor: 'white'
  },
  // Text(label) added to the node
};
// initialize diagram component
let diagram: Diagram = new Diagram({
  width: '100%',
```

```

        height: '600px',
        // Add node
        nodes: [node]
    });
    // render initialized diagram
    diagram.appendTo('#element');

```

    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: By default, the shape property of the node is set as **basic**.

Default property for shape is Rectangle.

Note: When the **shape** is not set for a basic shape, it is considered as a **rectangle**.

The list of basic shapes are as follows.

Path

The [Path](#) node is a commonly used basic shape that allows visually to represent the geometrical information. To create a path node, specify the shape as **path**. The path property of node allows you to define the path to be drawn. The following code illustrates how a path node is created.

INDEX.TS

```
import { Diagram, NodeModel, NodeConstraints } from '@syncfusion/ej2-diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  //sets the type of the shape as Path
  shape: {
    type: 'Path',
    data: 'M35.2441,25 L22.7161,49.9937 L22.7161,0.00657536 L35.2441,25
z M22.7167,25 L-0.00131226,25 M35.2441,49.6337 L35.2441,0.368951 M35.2441,25
L49.9981,25'
  },
};
// initialize diagram component
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  // Add node
  nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');

Flow Shapes

The [flow](#) shapes are used to represent the process flow. It is used for analyzing, designing, and managing for documentation process. To create a flow shape, specify the shape type as **flow**. Flow shapes and by default, it is considered as **process**. The following code example illustrates how to create a flow shape.

INDEX.TS

```

import { Diagram, NodeModel, NodeConstraints } from '@syncfusion/ej2-
diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  //sets the type of the shape as Flow

```

```
    shape: {
      type: 'Flow',
      shape: 'Document'
    },
    style: {
      fill: '#6BA5D7',
      strokeColor: 'white'
    },
  },
};
// initialize diagram component
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  // Add node
  nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');
```

```

The list of flow shapes are as follows.

Bpmn shapes in EJ2 JavaScript Diagram control

BPMN shapes are used to represent the internal business procedure in a graphical notation and enable you to communicate the procedures in a standard manner. To create a BPMN shape, in the node property shape, type should be set as "bpmn" and its shape should be set as any one of the built-in shapes. The following code example illustrates how to create a simple business process.

Note: If you want to use BPMN shapes in diagram, you need to inject BpmnDiagrams in the diagram.

INDEX.TS

```

import { Diagram, NodeModel, BpmnShape, BpmnSubProcessModel, BpmnDiagrams,
BpmnActivityModel, BpmnFlowModel } from '@syncfusion/ej2-diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  //Sets type as Bpmn and shape as Event
  shape: {
    type: 'Bpmn',
    shape: 'Event',
    // set the event type as End
    event: {
      event: 'End'
    }
  },
};
// initialize Diagram component

```

```
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  // Add node
  nodes: [node]
});
// render initialized Diagram
diagram.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>

  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note : The default value for the property `shape` is "event".

The list of BPMN shapes are as follows:

| Shape | Image |

| ----- | ----- |

| Event |

| Gateway |

| Task |

| Message |

| DataSource |

| DataObject |

| Group |

The BPMN shapes and its types are explained as follows.

<!-- markdownlint-disable MD033 -->

Event

An [event](#) is notated with a circle and it represents an event in a business process. The type of events are as follows:

- Start
- End
- Intermediate

The [event](#) property of the node allows you to define the type of the event. The default value of the event is **start**. The following code example illustrates how to create a BPMN event.

INDEX.TS

```
import { Diagram, NodeModel, BpmnShape, BpmnSubProcessModel, BpmnDiagrams,
BpmnActivityModel, BpmnFlowModel } from '@syncfusion/ej2-diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let node: NodeModel = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as event
    shape: {
        type: 'Bpmn',
        shape: 'Event',
        // Sets event as End and trigger as None
        event: {
            event: 'End',
            trigger: 'None'
        }
    },
};
// initialize diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    // Add node
    nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Event triggers are notated as icons inside the circle and they represent the specific details of the process. The [trigger](#) property of the node allows you to set the type of trigger and by default, it is set as **none**. The following table illustrates the type of event triggers.

| Triggers | Start | Non-Interrupting Start | Intermediate | Non-Interrupting Intermediate | Throwing Intermediate | End |

	-----	-----	-----	-----	-----	-----	-----
None							
Message							
Timer							
Conditional							

Gateway

Gateway is used to control the flow of a process and it is represented as a diamond shape. To create a gateway, the shape property of the node should be set as [gateway](#) and the gateway property can be set with any of the appropriate gateways. The following code example illustrates how to create a BPMN Gateway.

INDEX.TS

```
import { Diagram, NodeModel, BpmnShape, BpmnSubProcessModel, BpmnDiagrams,
BpmnActivityModel, BpmnFlowModel, BpmnGatewayModel } from '@syncfusion/ej2-
diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
```

```

width: 100,
height: 100,
//Sets type as Bpmn and shape as Gateway
shape: {
  type: 'Bpmn',
  shape: 'Gateway',
  //Sets type of the gateway as None
  gateway: {
    type: 'None'
  }
  as BpmnGatewayModel
},
};
// initialize diagram component
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  // Add node
  nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');
```

INDEX.HTML

```

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: By default, the gateway will be set as **none**.

There are several types of gateways as tabulated:

Shape	Image
-----	-----
Exclusive	
Parallel	
Inclusive	
Complex	
EventBased	
ExclusiveEventBased	

| ParallelEventBased |

Activity

The [activity](#) is the task that is performed in a business process. It is represented by a rounded rectangle.

There are two types of activities. They are listed as follows:

- Task: Occurs within a process and it is not broken down to a finer level of detail.
- Subprocess: Occurs within a process and it is broken down to a finer level of detail.

To create a BPMN activity, set the shape as **activity**. You also need to set the type of the BPMN activity by using the activity property of the node. By default, the type of the activity is set as **task**. The following code example illustrates how to create an activity.

INDEX.TS

```
import { Diagram, NodeModel, BpmnShape, BpmnSubProcessModel, BpmnDiagrams,
BpmnActivityModel, BpmnFlowModel, BpmnGatewayModel } from '@syncfusion/ej2-
diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  //Sets type as Bpmn and shape as Activity
  shape: {
    type: 'Bpmn',
    shape: 'Activity',
    //Sets activity as Task
    activity: {
      activity: 'Task'
    }
  },
};
// initialize diagram component
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  // Add node
  nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');

```

The different activities of BPMN process are listed as follows.

Tasks

The [task](#) property of the node allows you to define the type of task such as sending, receiving, user based task, etc. By default, the type property of task is set as **none**. The following code illustrates how to create different types of

BPMN tasks. The [type](#) property of tasks allows to represent these results as an event attached to the task.

INDEX.TS

```

import { Diagram, NodeModel, BpmnShape, BpmnSubProcessModel, BpmnDiagrams,
BpmnActivityModel, BpmnFlowModel, BpmnGatewayModel } from '@syncfusion/ej2-
diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.

```

```
let node: NodeModel = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as activity
    shape: {
        type: 'Bpmn',
        shape: 'Activity',
        //Sets activity as Task
        activity: {
            activity: 'Task',
            //Sets the type of the task as Send
            task: {
                type: 'Send'
            }
        },
    },
};
// initialize diagram component
let diagram: Diagram = new Diagram({

The different types of subprocess are as follows:

- Event subprocess
- Transaction

Event subprocess

A subprocess is defined as an event subprocess, when it is triggered by an event. An event subprocess is placed within another subprocess which is not part of the normal flow of its parent process. You can set event to a subprocess with the [event](#) and [trigger](#) property of the subprocess. The [type](#) property of subprocess allows you to define the type of subprocess whether it should be event subprocess or transaction subprocess.

```

Transaction subprocess

- [transaction](#) is a set of activities that logically belong together, in which all contained activities must complete their parts of the transaction; otherwise the process is undone. The execution result of a transaction is one of Successful Completion, Unsuccessful Completion (Cancel), and Hazard (Exception). The [events](#) property of subprocess allows to represent these results as an event attached to the subprocess.
- The event object allows you to define the type of event by which the subprocess will be triggered. The name of the event can be defined to identify the event at runtime.
- The event's offset property is used to set the fraction/ratio (relative to parent) that defines the position of the event shape.
- The trigger property defines the type of the event trigger.
- You can also use define ports and labels to subprocess events by using event's ports and labels properties.

Process

Processes is an array collection that defines the children values for BPMN subprocess.

Loop

[Loop](#) is a task that is internally being looped. The loop property of task allows you to define the type of loop. The default value for **loop** is **none**. You can define the loop property in subprocess BPMN shape as shown in the following code.

INDEX.TS

```

import { Diagram, NodeModel, BpmnShape, BpmnSubProcessModel, BpmnDiagrams,
BpmnActivityModel, BpmnFlowModel, BpmnGatewayModel } from '@syncfusion/ej2-
diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 100,
  offsetY: 100,
  // Size of the node
  width: 100,
  height: 100,
  //Sets type as Bpmn and shape as Activity
  shape: {
    type: 'Bpmn',
    shape: 'Activity',
    //Sets activity as Task
    activity: {
      activity: 'Task',
      //Sets loop of the task as Standard
      task: {
        loop: 'Standard'
      }
    },
  },
};
let node2: NodeModel = {
  // Position of the node
  offsetX: 300,
  offsetY: 100,
  // Size of the node
  width: 100,
  height: 100,
  //Sets type as Bpmn and shape as activity
  shape: {
    type: 'Bpmn',
    shape: 'Activity',

```

The following table contains various types of BPMN loops.

Loops	Task	Subprocess
-----	-----	-----
Standard		
SequenceMultiInstance		
ParallelMultiInstance		

Compensation
[Compensation](#) is triggered, when operation is partially failed and enabled it with the compensation property of the task and the subprocess.

INDEX.TS

```

Boundary

Boundary represents the type of task that is being processed. The [boundary](#) property of subprocess allows you to define the type of boundary. By default, it is set as **default**.

INDEX.TS

```

import { Diagram, NodeModel, BpmnShape, BpmnSubProcessModel, BpmnDiagrams,
BpmnActivityModel, BpmnFlowModel, BpmnGatewayModel } from '@syncfusion/ej2-
diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let node: NodeModel = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as Activity
    shape: {
        type: 'Bpmn',

```

```

        shape: 'Activity',
        //Sets activity as SubProcess
        activity: {
            activity: 'SubProcess',
            //Sets collapsed as true and boundary as Call
            subprocess: {
                collapsed: true,
                boundary: 'Call'
            }
            as BpmnSubProcessModel
        },
    },
};
// initialize diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    // Add node
    nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');
```

</body></html>
```

The following table contains various types of BPMN boundaries.

| Boundary | Image |

| ----- | ----- |

| Call |

| Event |

| Default |

Data

A data object represents information flowing through the process, such as data placed into the process, data resulting from the process, data that needs to be collected, or data that must be stored. To define a [data object](#), set the shape as **DataObject** and the type property defines whether data is an input or an output. You can create multiple instances of data object with the collection property of data.

INDEX.TS

```
import { Diagram, NodeModel, BpmnShape, BpmnSubProcessModel, BpmnShapeModel,
BpmnDiagrams, BpmnActivityModel, BpmnFlowModel, BpmnGatewayModel } from
'@syncfusion/ej2-diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
```

```

    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type as Bpmn and shape as DataObject
    shape: {
        type: 'Bpmn',
        shape: 'DataObject',
        //Sets collection as true and type as Input
        dataObject: {
            collection: true,
            type: 'Input'
        }
    }
    as BpmnShapeModel,
};
// initialize diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    // Add node
    nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');
```

| Boundary | Image |

| ----- | ----- |

| Collection Data Object |

| Data Input |

| Data Output |

Datasource

Datasource is used to store or access data associated with a business process. To create a datasource, set the shape as **datasource**. The following code example illustrates how to create a datasource.

INDEX.TS

```
import { Diagram, NodeModel, BpmnShape, BpmnSubProcessModel, BpmnDiagrams,
BpmnActivityModel, BpmnFlowModel, BpmnGatewayModel } from '@syncfusion/ej2-
diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
```

```
height: 100,  
//Sets type as Bpmn and shape as DataSource  
shape: {  
    type: 'Bpmn',  
    shape: 'DataSource',  
}  
};  
// initialize diagram component  
let diagram: Diagram = new Diagram({  
    width: '100%',  
    height: '600px',  
    // Add node  
    nodes: [node]  
});  
// render initialized diagram  
diagram.appendTo('#element');
```

INDEX.HTML

```

Artifact

Artifact is used to show additional information about a process in order to make it easier to understand. There are two types of artifacts in BPMN.

- Text annotation
- Group

Text annotation

- A BPMN object can be associated with a text annotation which does not affect the flow but gives details about objects within a flow. The annotation property of the node is used to connect an annotation element to the BPMN node.
- The annotation element can be displaced into a different position interactively by dragging the annotation to a particular position.
- The annotation element can be switched from a BPMN node to another BPMN node simply by dragging the source end of the annotation connector into the other BPMN node.
- The annotation angle property is used to set the angle between the BPMN shape and the annotation.
- The annotation direction property is used to set the direction of the text annotation.
- To set the size for text annotation, use width and height properties.
- The annotation length property is used to set the distance between the BPMN shape and the annotation.
- The annotation text property defines the additional information about the flow object in a BPMN process.

INDEX.TS

```
import { Diagram, NodeModel, BpmnShape, BpmnSubProcessModel,
BpmnShapeModel, BpmnDiagrams, BpmnActivityModel, BpmnFlowModel,
BpmnGatewayModel } from '@syncfusion/ej2-diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 100,
  offsetY: 100,
  // Size of the node
  width: 100,
  height: 100,
  //Sets type as Bpmn and shape as DataObject
  shape: {
    type: 'Bpmn',
    shape: 'DataObject',
    //Sets collection as true and type as Input
    dataObject: {
      collection: true,
      type: 'Input'
    },
  },
};
```

```
//Sets the id, angle, length and text for the annotation
annotations: [{
    id: 'left',
    angle: 45,
    length: 150,
    text: 'Left',
}]
}
as BpmnShapeModel,
};
// initialize diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    // Add node
    nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');
```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Group

A group is used to frame a part of the diagram, shows that elements included in it are logically belong together and does not have any other semantics other than organizing elements. To create a group, the shape property of the node should be set as **group**. The following code example illustrates how to create a BPMN group.

INDEX.TS

```

import { Diagram, NodeModel, BpmnShape, BpmnSubProcessModel,
BpmnShapeModel, BpmnDiagrams, BpmnActivityModel, BpmnFlowModel,
BpmnGatewayModel } from '@syncfusion/ej2-diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  // Sets type as Bpmn and shape as Group
  shape: {
    type: 'Bpmn',
    shape: 'Group',
  }
};
// initialize diagram component
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  // Add node
  nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');

```

```

BPMN flows

[BPMN Flows](#) are lines that connects BPMN flow objects.

Association

[BPMN Association](#) flow is used to link flow objects with its corresponding text or artifact. An association is represented as a dotted graphical line with opened arrow. The types of association are as follows:

- Directional
- BiDirectional
- Default

The `association` property allows you to define the type of association. The following code example illustrates how to create an association.

INDEX.TS

```

import { Diagram, NodeModel, ConnectorModel, BpmnShape, BpmnSubProcessModel,
BpmnShapeModel, BpmnDiagrams, BpmnActivityModel, BpmnFlowModel,
BpmnGatewayModel } from '@syncfusion/ej2-diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let connector: ConnectorModel = {
    // Position of the node
    sourcePoint: {

```

```

        x: 100,
        y: 200
    },
    targetPoint: {
        x: 300,
        y: 200
    },
    //Sets type of the connector as Orthogonal
    type: 'Orthogonal',
    //Sets type as Bpmn, shflowape as Association and association as
    BiDirectional
    shape: {
        type: 'Bpmn',
        flow: 'Association',
        association: 'BiDirectional'
    },
};
// initialize diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    // Add Connectors
    connectors: [connector]
});
// render initialized diagram
diagram.appendTo('#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table demonstrates the visual representation of association flows.

Association	Image
Default	
Directional	
BiDirectional	

Note : The default value for the property **association** is **default**.

Sequence

A [sequence](#) flow shows the order in which the activities are performed in a BPMN process and is represented by a solid graphical line. The types of sequence are as follows:

- Normal
- Conditional
- Default

The sequence property allows you to define the type of sequence. The following code example illustrates how to create a sequence flow.

INDEX.TS

```

import { Diagram, NodeModel, ConnectorModel, BpmnShape, BpmnSubProcessModel,
BpmnShapeModel, BpmnDiagrams, BpmnActivityModel, BpmnFlowModel,
BpmnGatewayModel } from '@syncfusion/ej2-diagrams';
Diagram.Inject(BpmnDiagrams);
// A node is created and stored in nodes array.
let connector: ConnectorModel = {
  // Position of the node
  sourcePoint: {
    x: 100,
    y: 200
  },
  targetPoint: {
    x: 300,
    y: 200
  },
};

```

```

    type: 'Orthogonal',
    //Sets type as Bpmn, flow as Sequence, and sequence as Conditional
    shape: {
        type: 'Bpmn',
        flow: 'Sequence',
        sequence: 'Conditional'
    },
};
// initialize diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    // Add node
    connectors: [connector]
});
// render initialized diagram
diagram.appendTo('#element');
```

```

The following table contains various representation of sequence flows.

Sequence	Image
Default	
Conditional	
Normal	

Note: The default value for the property sequence is **normal**.

Message

A [message](#) flow shows the flow of messages between two participants and is represented by dashed line. The types of message are as follows:

- InitiatingMessage
- NonInitiatingMessage
- Default

The message property allows you to define the type of message. The following code example illustrates how to define a message flow.

INDEX.TS

```

import { Diagram, NodeModel, ConnectorModel, BpmnShape, BpmnSubProcessModel,
BpmnShapeModel, BpmnDiagrams, BpmnActivityModel, BpmnFlowModel,
BpmnGatewayModel } from '@syncfusion/ej2-diagrams';
Diagram.Inject(BpmnDiagrams)
// A node is created and stored in nodes array.
let connector: ConnectorModel = {
  // Position of the node
  sourcePoint: {
    x: 100,
    y: 200
  },
  targetPoint: {
    x: 300,
    y: 200
  },
  type: 'Orthogonal',
  // Sets type as Bpmn, flow as Message, and message as InitiatingMessage
  shape: {
    type: 'Bpmn',
    flow: 'Message',
    message: 'InitiatingMessage'
  },
};
// initialize diagram component
let diagram: Diagram = new Diagram({

```

```

    width: '100%',
    height: '600px',
    // Add node
    connectors: [connector]
  });
  // render initialized diagram
  diagram.appendTo('#element');

```

UML diagram in EJ2 JavaScript Diagram control

UML Class Diagram

A class diagram visually depicts the static structure of an application and is extensively employed in modeling object-oriented systems. It holds a unique position in UML diagrams, as it directly aligns with object-oriented languages. The diagram also facilitates the automatic generation of class diagram shapes based on business logic, streamlining the translation from conceptual models to practical implementation.

UML Class Diagram Shapes

The UML class diagram shapes are explained as follows.

Class

- A class defines a group of objects that share common specifications, features, constraints, and semantics. To create a class object, the classifier should be defined using the [class] (`../api/diagram/umlClassifierShapeModel#class`) notation. This notation serves as a foundational element in object-oriented programming, encapsulating the essential characteristics and behavior that objects belonging to the class will exhibit.
- Also, define the [name](#), [attributes](#), and [methods](#) of the class using the class property of node.
- The attribute's [name](#), [type](#), and [scope](#) properties allow you to define the name, data type, and visibility of the attribute.
- The method's [name](#), [parameters](#), [type](#), and [scope](#) properties allow you to define the name, parameter, return type, and visibility of the methods.
- The method parameters object properties allow you to define the name and type of the parameter.
- The following code example illustrates how to create a class.

INDEX.TS

```
import {
  Diagram,
  NodeModel,
  UmlClassifierShapeModel
} from "@syncfusion/ej2-diagrams";
let node: NodeModel = {
  id: "Patient",
  style: {
    fill: '#26A0DA',
  },
  //Position of the node
  offsetX: 200,
  offsetY: 200,
  shape: {
    type: "UmlClassifier",
```

```

//Define class object
classShape: {
  name: "Patient",
  //Define class attributes
  attributes: [{ name: "accepted", type: "Date" }],
  //Define class methods
  methods: [{ name: "getHistory", type: "getHistory" }]
},
classifier: "Class"
} as UmlClassifierShapeModel
};
//Initializes diagram control
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  //Add node
  nodes: [node]
});
diagram.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">

  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
</body>
</html>

```

```
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Interface

- An interface is a specific type of classifier that signifies a declaration of a cohesive set of public features and obligations. When creating an interface, involves defining the classifier property using the [interface](#) notation. This essential concept in object-oriented programming outlines a contract for classes to adhere to, specifying the required methods and behaviors without delving into the implementation details.
- Also, define the [name](#), [attributes](#), and [methods](#) of the interface using the interface property of the node.
- The attribute's name, type, and scope properties allow you to define the name, data type, and visibility of the attribute.
- The method's name, parameter, type, and scope properties allow you to define the name, parameter, return type, and visibility of the methods.
- The method parameter object properties of name and type allow you to define the name and type of the parameter.
- The following code example illustrates how to create an interface.

INDEX.TS

```
import {
  Diagram,
  NodeModel,
  UmlClassifierShapeModel
} from "@syncfusion/ej2-diagrams";
let node: NodeModel = {
  id: "Patient",
  //Position of the node
  offsetX: 200,
  offsetY: 200,
  style: {
    fill: '#26A0DA',
  },
  shape: {
    type: "UmlClassifier",
    //Define interface object
    interfaceShape: {
      name: "Patient",
      //Define interface attributes
      attributes: [{ name: "owner", type: "String[*]" }],
      //Define interface methods
      methods: [
        {
          name: "deposit",
          parameters: [
            {

```

```

        name: "amount",
        type: "Dollars"
    }
    ]
    }
    ],
    classifier: "Interface"
} as UmlClassifierShapeModel
};
//Initializes diagram control
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    //Add node
    nodes: [node]
});
diagram.appendTo("#element");

```

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');

```

```

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Enumeration

- To establish an enumeration, designate the classifier property of the node as [enumeration](#). Additionally, define the name and enumerate the members of the enumeration using the appropriate enumeration property of the node. This process encapsulates a set of distinct values within the enumeration, allowing for a clear representation of specific, and named constants within a system.
- You can set a name for the enumeration members collection using the name property of the members collection.
- The following code example illustrates how to create an enumeration.

INDEX.TS

```

import {
  Diagram,
  NodeModel,
  UmlClassifierShapeModel
} from "@syncfusion/ej2-diagrams";
let node: NodeModel = {
  id: "Patient",
  offsetX: 200,
  offsetY: 200,
  style: {
    fill: '#26A0DA',
  },
  shape: {
    type: "UmlClassifier",
    //Define enumeration object
    enumerationShape: {
      name: "AccountType",
      //set the members of enumeration
      members: [
        {
          name: "Checking Account",
        },
        {
          name: "Savings Account"
        },
        {
          name: "Credit Account"
        }
      ]
    },
    classifier: "Enumeration"
  } as UmlClassifierShapeModel
};
//Initializes diagram control

```

```
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  //Add node
  nodes: [node]
});
diagram.appendTo("#element");
```

  <script src="index.js" type="text/javascript"></script>
</body></html>
```

UML Class Relationships

- A class may be involved in one or more relationships with other classes. A relationship can be one of the following types:

Association

Association is basically a set of links that connects elements of a UML model. The type of association is as follows.

1. Directional
2. BiDirectional

The association property allows you to define the type of association. The default value of association is "Directional". The following code example illustrates how to create an association.

INDEX.TS

```
import {
  Diagram,
  ConnectorModel
} from "@syncfusion/ej2-diagrams";
let connector: ConnectorModel = {
  id: "connector",
  //Define connector start and end points
  sourcePoint: { x: 100, y: 100 },
  targetPoint: { x: 300, y: 300 },
  type: "Straight",
  shape: {
    type: "UmlClassifier",
    relationship: "Association",
    //Define type of association
    association: "BiDirectional"
  }
};
//Initializes diagram control
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
```

```
//Add connector
connectors: [connector]
});
diagram.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  splitbuttons/styles/material.css" rel="stylesheet">

<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Aggregation

Aggregation is a binary association between a property and one or more composite objects that group together a set of instances. Aggregation is decorated with a hollow diamond. To create an aggregation shape, define the relationship as “aggregation”.

The following code example illustrates how to create an aggregation.

INDEX.TS

```
import {
    Diagram,
    ConnectorModel
} from "@syncfusion/ej2-diagrams";
let connector: ConnectorModel = {
    id: "connector",
    //Define connector start and end points
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 300, y: 300 },
    type: "Straight",
    shape: {
        type: "UmlClassifier",
        //Set an relationship for connector
        relationship: "Aggregation"
    }
};
//Initializes diagram control
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    connectors: [connector]
});
diagram.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Diagram</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
diagrams/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/fabric.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
```

```
<body>

  <div id="container">
    <div id="element"></div>
  </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Composition

Composition is a “strong” form of “aggregation”. The composition is decorated with a black diamond. To create a composition shape, define the relationship property of the connector as “composition”.

The following code example illustrates how to create a composition.

INDEX.TS

```
import {
  Diagram,
  ConnectorModel
} from "@syncfusion/ej2-diagrams";
let connector: ConnectorModel = {
  id: "connector",
  //Define connector start and end points
  sourcePoint: { x: 100, y: 100 },
  targetPoint: { x: 300, y: 300 },
  type: "Straight",
  shape: {
    type: "UmlClassifier",
    //Set an relationship for connector
    relationship: "Composition"
  }
};
//Initializes diagram control
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  //Add connector
  connectors: [connector]
});
diagram.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
```

```

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
diagrams/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/fabric.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Dependency

Dependency is a directed relationship, which is used to show that some UML elements need or depend on other model elements for specifications. Dependency is shown as a dashed line with an opened arrow. To create a dependency, define the relationship property of the connector as “dependency”.

The following code example illustrates how to create a dependency.

INDEX.TS

```

import {
    Diagram,
    ConnectorModel,
} from "@syncfusion/ej2-diagrams";
let connector: ConnectorModel = {
    id: "connector",
    //Define connector start and end points
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 300, y: 300 },
    type: "Straight",
    shape: {
        type: "UmlClassifier",

```

```
//Set relationship for connector
relationship: "Dependency"
}
};
//Initializes diagram control
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  connectors: [connector]
});
diagram.appendTo("#element");
```

INDEX.HTML

```

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Inheritance

Inheritance is also called a “generalization”. Inheritance is a binary taxonomic directed relationship between a more general classifier (superclass) and a more specific classifier (subclass). Inheritance is shown as a line with a hollow triangle.

To create an inheritance, define the relationship as “inheritance”.

The following code example illustrates how to create an inheritance.

INDEX.TS

```
import {
  Diagram,
  ConnectorModel
} from "@syncfusion/ej2-diagrams";
let connector: ConnectorModel = {
  id: "connector",
  //Define connector start and end points
  sourcePoint: { x: 100, y: 100 },
  targetPoint: { x: 300, y: 300 },
  type: "Straight",
  shape: {
    type: "UmlClassifier",
    //set an relation of connector
    relationship: "Inheritance"
  }
};
//Initializes diagram control
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  connectors: [connector]
});
diagram.appendTo("#element");
```

INDEX.HTML

```

```

Multiplicity

Multiplicity is a definition of an inclusive interval of non-negative integers to specify the allowable number of instances of a described element. The type of multiplicity are as follows.

1. OneToOne
2. ManyToOne
3. OneToMany
4. ManyToMany
 - By default the multiplicity will be considered as “OneToOne”.
 - The multiplicity property in UML allows you to specify large number of elements or some collection of elements.
 - The shape multiplicity’s source property is used to set the source label to the connector and the target property is used to set the target label to the connector.
 - To set an optionality or cardinality for the connector source label, use the optional property.
 - The [lowerBounds](#) and [upperBounds](#) could be natural constants or constant expressions evaluated to a natural (non negative) number. The upper bound could also be specified as an asterisk ‘*’ which denotes an unlimited number of elements. The upper bound should be greater than or equal to the lower bound.
 - The following code example illustrates how to customize the multiplicity.

INDEX.TS

```

import {
    Diagram,
    ConnectorModel
} from "@syncfusion/ej2-diagrams";
let connector: ConnectorModel = {
    id: "connector",
    //Define connector start and end points

```

```

sourcePoint: { x: 100, y: 100 },
targetPoint: { x: 300, y: 300 },
type: "Straight",
shape: {
  type: "UmlClassifier",
  relationship: "Dependency",
  multiplicity: {
    //Set multiplicity type
    type: "OneToMany",
    //Set source label to connector
    source: {
      optional: true,
      lowerBounds: 89,
      upperBounds: 67
    },
    //Set target label to connector
    target: {
      optional: true,
      lowerBounds: 78,
      upperBounds: 90
    }
  }
}
};
//Initializes diagram control
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  connectors: [connector]
});
diagram.appendTo("#element");

```

How to add UML child at runtime

In UML nodes, child elements such as members, methods and attributes can be added either programmatically or interactively.

Adding UML child through code

The [addChildToUmlNode](#) method is employed for dynamically adding a child to the UML node during runtime, providing flexibility in modifying the diagram structure programmatically.

The following code illustrates how to add methods to UML nodes in the diagram.

```

`ts
let node = diagram.selectedItems.nodes[0];

let methods = { name: 'getHistory', style: { color: "red", }, parameters: [{ name: 'Date', style: {} }], type:
'History' };

diagram.addChildToUmlNode(node, methods, 'Methods');
`

```

The following code illustrates how to add attributes to UML nodes in the diagram.

```

`ts
let node = diagram.selectedItems.nodes[0];

let attributes = { name: 'accepted', type: 'Date', style: { color: "red", } };

diagram.addChildToUmlNode(node, attributes, "Attributes");
`

```

The following code illustrates how to add members to UML nodes in the diagram.

```

`ts
let node = diagram.selectedItems.nodes[0];

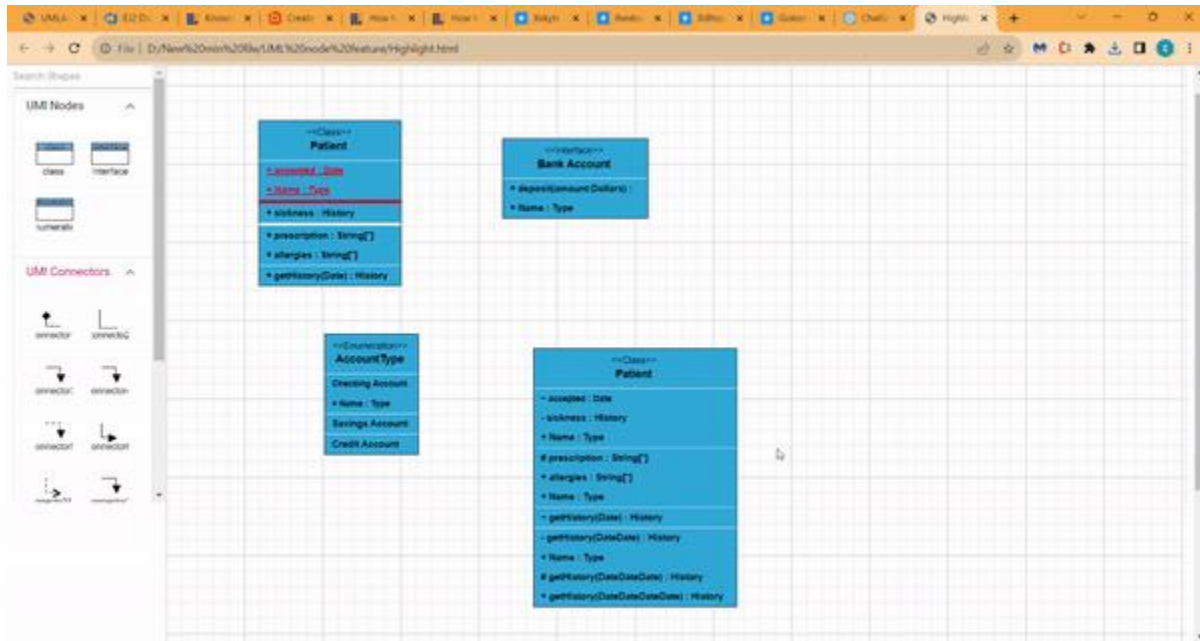

let members = { name: 'Checking new', style: { color: "red", }, isSeparator: true };

```

```
diagram.addChildToUmlNode(node, members, "Members");
```

Adding UML child through user interaction

To include a child, select a node, move the mouse outside it, and position the pointer near the right side. A highlighter emerges between the two child elements. Click the highlighter to add a child type to the chosen UML node seamlessly. The following gif illustrates how to add a Child through user interaction.

Adding UML Nodes in Symbol palette

UML built-in shapes are efficiently rendered in a symbol palette. The `symbols` property is utilized to define UML symbols with the necessary classes and methods. By incorporating this feature, you can seamlessly augment the palette with a curated collection of predefined UML symbols, thereby enhancing the versatility of your UML diagramming application.

The following code example showcases the rendering of UML built-in shapes in a symbol palette

INDEX.TS

```
import {
  Diagram,
  NodeModel,
  SymbolPalette,
  SymbolInfo
} from '@syncfusion/ej2-diagrams';
let diagram: Diagram = new Diagram({
  width: '100%', height: '500px'
});
diagram.appendTo('#diagram');
//Initialize the basicshapes for the symbol palette
export function getUmlShapes(): NodeModel[] {
  let umlShapes: NodeModel[] = [
    {
      id: 'class',
      style: {
```

```

        fill: '#26A0DA',
    },
    borderColor: 'white',
    shape: {
        type: 'UmlClassifier',
        classShape: {
            attributes: [
                { name: 'accepted', type: 'Date', style: { color:
"red", fontFamily: "Arial", textDecoration: 'Underline', italic: true
},isSeparator: true },
            ],
            methods: [{ name: 'getHistory', style: {}, parameters: [{
name: 'Date', style: {} }], type: 'History' }],
            name: 'Patient'
        },
        classifier: 'Class'
    },
},
{
    id: 'Interface',
    style: {
        fill: '#26A0DA',
    }, borderColor: 'white',
    shape: {
        type: 'UmlClassifier',
        interfaceShape: {
            name: "Bank Account",
        },
        classifier: 'Interface'
    },
},
{
    id: 'Enumeration',
    style: {
        fill: '#26A0DA',
    }, borderColor: 'white',
    shape: {
        type: 'UmlClassifier',
        enumerationShape: {
            name: 'AccountType',
            members: [
                {
                    name: 'Checking Account', style: {}
                },
            ]
        },
        classifier: 'Enumeration'
    },
},
];
return umlShapes;
}
function setPaletteNodeDefaults(node:NodeModel) {
    node.width = 100;
    node.height = 100;
}
let palette: SymbolPalette = new SymbolPalette({

```

```

    palettes: [
      { id: 'UML', expanded: true, symbols: getUmlShapes(), title: 'UMLClass
Nodes' },
    ],
    width: '100%', height: '100%', symbolHeight: 90, symbolWidth: 90,
    getNodeDefaults: setPaletteNodeDefaults,
    symbolMargin: { left: 12, right: 12, top: 12, bottom: 12 },
    //Defines the symbol description for the symbols in the palette
    getSymbolInfo: (symbol: NodeModel): SymbolInfo => {
      return { fit: true, description: { text: symbol.id, } };
    }
  });
  palette.appendTo('#element');

```

```

Editing in UML nodes

You can edit the name, attributes, and methods of the class diagram shapes just double clicking, similar to editing a node annotation.

The following image illustrates how the text editor looks in an edit mode.

UML Activity diagram

An Activity diagram functions as a visual flowchart, illustrating the progression from one activity to the next within a system. Each activity corresponds to a system operation, providing a clear depiction of the sequential flow in a dynamic process..

The purpose of an activity diagram can be described as follows.

1. Draw the activity flow of a system.
2. Describe the sequence from one activity to another.
3. Describe the parallel, branched, and concurrent flow of the system.

UML Activity diagram Shapes

To create a UmlActivity, define the type as "UmlActivity" and the list of built-in shapes as demonstrated as follows and it should be set in the "shape" property.

| AcceptingEvent |

| SendSignal |

| ReceiveSignal |

| StructuredNode |

| Note |

The following code illustrates how to create a UmlActivity shapes.

INDEX.TS

```
import {  
    Diagram,  
    NodeModel,  
    UmlClassifierShapeModel
```

```
} from "@syncfusion/ej2-diagrams";
let node: NodeModel = {
  id: "UmlDiagram",
  //Set node size
  width: 100,
  height: 100,
  //position the node
  offsetX: 200,
  offsetY: 200,
  shape: {
    type: "UmlActivity",
    //Define UmlActivity shape
    shape: "Action"
  }
};
//Initializes diagram control
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  nodes: [node]
});
diagram.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

</body></html>

```

UML Activity connector

To establish a UML Activity connector, specify the type as "UmlActivity" and define the flow as either "Exception," "Control," or "Object." This configuration delineates the nature of the connection, allowing for a precise representation of the interaction within the activity diagram.

The following code illustrates how to create a UmlActivity connector.

INDEX.TS

```

import {
    Diagram,
    ConnectorModel,
    UmlClassifierShapeModel
} from "@syncfusion/ej2-diagrams";
let connector: ConnectorModel = {
    id: 'connector',
    type: 'Straight',
    //Define connector start and end points
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 200, y: 200 },
    shape: { type: 'UmlActivity', flow: 'Exception' }
};
//Initializes diagram control
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    connectors: [connector]
});
diagram.appendTo("#element");

```

INDEX.HTML

Connectors in EJ2 JavaScript Diagram control

Connectors are objects used to create link between two points, nodes or ports to represent the relationships between them.

Create connector

Connector can be created by defining the source and target point of the connector. The path to be drawn can be defined with a collection of segments. To explore the properties of a [connector](#), refer to [Connector Properties](#).

Add connectors through connectors collection

The [sourcePoint](#) and [targetPoint](#) properties of connector allow you to define the end points of a connector.

The following code example illustrates how to add a connector through connector collection.

INDEX.JS

```

var connectors = [{
    id: "connector1",
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7',
        strokeWidth: 2
    },
    targetDecorator: {
        style: {

```

```

        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
    },
    sourcePoint: {
        x: 100,
        y: 100
    },
    targetPoint: {
        x: 200,
        y: 200
    }
}
]]
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '600px',
    connectors: connectors
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Diagram</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Add connector at runtime

Connectors can be added at runtime by using public method, `diagram.add` and can be removed at runtime by using public method, `diagram.remove`.

The following code example illustrates how to add connector at runtime.

INDEX.JS

```

var connectors = {
  // Unique name for the connector
  id: "connector1",
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',

Connectors from palette

Connectors can be predefined and added to the symbol palette. You can drop those connectors into the diagram, when required.

For more information about adding connectors from symbol palette, refer to [Symbol Palette](#).

Draw connectors

Connectors can be interactively drawn by clicking and dragging on the diagram surface by using [drawingObject](#).

For more information about drawing connectors, refer to [Draw Connectors](#).

Update connector at runtime

Various connector properties such as [sourcePoint](#), [targetPoint](#), [style](#), [sourcePortID](#), [targetPortID](#), etc., can be updated at the runtime.

The following code example illustrates how to update a connector's source point, target point, styles properties at runtime.

INDEX.JS

```

var connectors = [{
    // Unique name for the connector
    id: "connector1",
    sourcePoint: {
        x: 100,

```

```
        y: 100
      },
      targetPoint: {
        x: 200,
        y: 200
      }
    }
  }];
  var diagram = new ej.diagrams.Diagram({
    width: 1500,
    height: 1500,
    connectors: connectors
  }, '#element');
  diagram.appendTo('#element');
  diagram.connectors[0].style.strokeColor = '#6BA5D7';
  diagram.connectors[0].style.fill = '#6BA5D7';
  diagram.connectors[0].style.strokeWidth = 2;
  diagram.connectors[0].targetDecorator.style.fill = '#6BA5D7';
  diagram.connectors[0].targetDecorator.style.strokeColor = '#6BA5D7';
  diagram.connectors[0].sourcePoint.x = 150;
  diagram.connectors[0].targetPoint.x = 150;
  diagram.dataBind();
```

Connect nodes

- The [sourceID](#) and [targetID](#) properties allow to define the nodes to be connected.
- The [connectorSpacing](#) property allows you to define the distance between the source node and the connector. It is the minimum distance the connector will re-route or the new segment will create.
- The following code example illustrates how to connect two nodes.

INDEX.JS

```
var nodes = [{
  id: 'Start',
  width: 140,
  height: 50,
  offsetX: 300,
  offsetY: 50,
  annotations: [{
    id: 'label1',
    content: 'Start'
  }],
  shape: {
    type: 'Flow',
    shape: 'Terminator'
  }
},
{
  id: 'Init',
  width: 140,
  height: 50,
  offsetX: 300,
  offsetY: 140,
  shape: {
    type: 'Flow',
    shape: 'process'
  },
  annotations: [{
    content: 'var i = 0;'
  }]
}
];
var connector = {
  id: "connector1",
  id: "connector1",
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
```

```

        strokeWidth: 2
    },
    targetDecorator: {
        style: {
            fill: '#6BA5D7',
            strokeColor: '#6BA5D7'
        }
    },
    sourceID: "Start",
    targetID: "Init",
    connectorSpacing: 7,
    type: 'Orthogonal'
};
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '350px',
    getNodeDefaults: function(node) {
        node.height = 100;
        node.width = 100;
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
        return node;
    },
    nodes: nodes,
    connectors: [connector]
}, '#element');
```

INDEX.HTML

```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

- When you remove NodeConstraints [InConnect](#) from Default, the node accepts only an outgoing connection to dock in it. Similarly, when you remove NodeConstraints [OutConnect](#) from Default, the node accepts only an incoming connection to dock in it.
- When you remove both InConnect and OutConnect NodeConstraints from Default, the node restricts connector to establish connection in it.
- The following code illustrates how to disable InConnect constraints.

```

`javascript
//Initialize diagram
var diagram = new ej.diagrams.Diagram({
  nodes:[
    {
      id: 'node', width: 100, height: 100, offsetX: 100, offsetY: 150,
      shape: { type: 'Basic', shape: 'Rectangle' },
      //Disable InConnect constraints
      constraints: NodeConstraints.Default & ~NodeConstraints.InConnect,
    }
  ],'#diagram');
`

```

Connections with ports

The [sourcePortID](#) and [targetPortID](#) properties allow to create connections between some specific points of source/target nodes.

The following code example illustrates how to create port to port connections.

INDEX.JS

```

var port1 = {
  style: {
    strokeColor: '#366F8C',
    fill: '#366F8C'
  }
}

```

```
    }
  }
  port1.shape = 'Circle';
  port1.id = 'nodeportnew';
  port1.visibility = ej.diagrams.PortVisibility.Visible;
  port1.id = 'port';
  port1.offset = {
    x: 1,
    y: 1
  };
  var port2 = {
    style: {
      strokeColor: '#366F8C',
      fill: '#366F8C'
    }
  };
  port2.offset = {
    x: 1,
    y: 0.5
  };
  port2.id = 'port1';
  port2.visibility = ej.diagrams.PortVisibility.Visible;
  port2.shape = 'Circle';
  var port3 = {
    style: {
      strokeColor: '#366F8C',
      fill: '#366F8C'
    }
  };
  port3.offset = {
    x: 0,
    y: 1
  };
  port3.id = 'newnodeport1';
  port3.visibility = ej.diagrams.PortVisibility.Visible;
  port3.shape = 'Circle';
  var nodes = [{
    id: 'node',
    width: 100,
    height: 100,
    offsetX: 100,
    offsetY: 100,
    ports: [port1]
  },
  {
    id: 'node1',
    width: 100,
    height: 100,
    offsetX: 300,
    offsetY: 100,
    ports: [port2, port3]
  },
  ];
  var connectors = {
    id: "connector1",
    sourcePoint: {
      x: 100,
```

```

        y: 100
      },
      type: 'Orthogonal',
      targetPoint: {
        x: 200,
        y: 200
      },
      sourceID: 'node',
      targetID: 'node1',
      sourcePortID: 'port',
      targetPortID: 'port1'
    }
  }
  var diagram = new ej.diagrams.Diagram({
    width: 900,
    height: 900,
    nodes: nodes,
    connectors: [connectors],
    getNodeDefaults: (node) => {
      node.height = 100;
      node.width = 100;
      node.style.fill = '#6BA5D7';
      node.style.strokeColor = 'white';
      return node;
    },
  }, '#element');

```

INDEX.HTML

```

```

- When you set PortConstraints to [InConnect](#), the port accepts only an incoming connection to dock in it. Similarly, when you set PortConstraints to [OutConnect](#), the port accepts only an outgoing connection to dock in it.
- When you set PortConstraints to None, the port restricts connector to establish connection in it.

```

`javascript
//Initialize diagram
var diagram = new ej.diagrams.Diagram({
nodes:[
{
id: 'node', width: 100, height: 100, offsetX: 100, offsetY: 150,
shape: { type: 'Basic', shape: 'Rectangle' },
ports: [
//Enable portConstraints Inconnect

```

```
{ id: 'port', height: 10, width: 10, offset: { x: 1, y: 0.5 }, constraints: PortConstraints.InConnect },
]
}
]
},'#diagram');
`
```

Segments

The path of the connector is defined with a collection of segments. There are three types of segments.

Straight

To create a straight line, specify the [type](#) of the segment as **straight** and add a straight segment to [segments](#) collection and need to specify [type](#) for the connector. The following code example illustrates how to create a default straight segment.

INDEX.JS

```
var connectors = {
  // Unique name for the connector
  id: "connector1",
  segments: [{
    type: 'Straight'
  }],
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
    strokeWidth: 2
  },
  targetDecorator: {
    style: {
      fill: '#6BA5D7',
      strokeColor: '#6BA5D7'
    }
  },
  sourcePoint: {
    x: 100,
    y: 100
  },
  targetPoint: {
    x: 200,
    y: 200
  }
}
var diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '600px',
  connectors: [connectors]
}, '#element');
```

INDEX.HTML

```

The [point](#) property of straight segment allows you to define the end point of it. The following code example illustrates how to define the end point of a straight segment.

INDEX.JS

```

var connectors = {
    // Unique name for the connector
    id: "connector1",
    type: 'Straight',
    segments: [{
        type: 'Straight',
        point: {
            x: 100,
            y: 150
        }
    }],
    style: {
        strokeColor: '#6BA5D7',
    }
}

```

```

        fill: '#6BA5D7',
        strokeWidth: 2
    },
    targetDecorator: {
        style: {
            fill: '#6BA5D7',
            strokeColor: '#6BA5D7'
        }
    },
    sourcePoint: {
        x: 100,
        y: 100
    },
    targetPoint: {
        x: 300,
        y: 200
    }
}
}
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '600px',
    connectors: [connectors]
}, '#element');
```

Orthogonal

Orthogonal segments is used to create segments that are perpendicular to each other.

Set the segment [type](#) as orthogonal to create a default orthogonal segment and need to specify [type](#). The following code example illustrates how to create a default orthogonal segment.

Multiple segments can be defined one after another. To create a connector with multiple segments, define and add the segments to [connector.segments](#) collection. The following code example illustrates how to create a connector with multiple segments.

The property [maxSegmentThumb](#) is used to limit the number of segment thumb in the connector.

INDEX.JS

```

ej.diagrams.Diagram.Inject(ej.diagrams.ConnectorEditing);
var connectors = [{
    id: "connector1",
    type: 'Orthogonal',
    segments: [{
        type: 'Orthogonal',
        // Defines the direction for the segment lines
        direction: 'Right',
        // Defines the length for the segment lines
        length: 50
    }],
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7',
        strokeWidth: 2
    },

```

The [length](#) and [direction](#) properties allow to define the flow and length of segment. The following code example illustrates how to create customized orthogonal segments.

INDEX.JS

```

ej.diagrams.Diagram.Inject(ej.diagrams.ConnectorEditing);
var connectors = [{
    id: "connector1",
    type: 'Orthogonal',
    segments: [{
        type: 'Orthogonal',
        // Defines the direction for the segment lines
        direction: 'Right',

```

```

        // Defines the length for the segment lines
        length: 50
    }],
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7',
        strokeWidth: 2
    },
    targetDecorator: {
        style: {
            fill: '#6BA5D7',
            strokeColor: '#6BA5D7'
        }
    },
    sourcePoint: {
        x: 100,
        y: 100
    },
    targetPoint: {
        x: 200,
        y: 200
    }
},
{
    id: "connector2",
    type: 'Orthogonal',
    // Defines multile segemnts for the connectors
    segments: [{
        type: 'Orthogonal',
        direction: 'Bottom',
        length: 150
    },
    {
        type: 'Orthogonal',
        direction: 'Right',
        length: 150
    }
    ],
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7',
        strokeWidth: 2
    },
    targetDecorator: {
        style: {
            fill: '#6BA5D7',
            strokeColor: '#6BA5D7'
        }
    },
    sourcePoint: {
        x: 300,
        y: 100
    },
    targetPoint: {
        x: 400,
        y: 200,
    },
},

```

```

        maxSegmentThumb: 3,
        constraints: ej.diagrams.ConnectorConstraints.Default |
ej.diagrams.ConnectorConstraints.DragSegmentThumb
    }
]
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '600px',
    connectors: connectors,
}, '#element');
```

INDEX.HTML

```

  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: You need to mention the segment type as same as what you mentioned in connector type. There should be no contradiction between connector type and segment type.

Avoid overlapping

Orthogonal segments are automatically re-routed, in order to avoid overlapping with the source and target nodes. The following preview illustrates how orthogonal segments are re-routed.

INDEX.JS

```
var nodeport = {
  style: {
    strokeColor: '#366F8C',
    fill: '#366F8C'
  }
};
nodeport.shape = 'Circle';
nodeport.visibility = ej.diagrams.PortVisibility.Visible;
nodeport.id = 'port';
nodeport.offset = {
  x: 0,
  y: 0.5
};
var port2 = {
  style: {
    strokeColor: '#366F8C',
    fill: '#366F8C'
  }
}
port2.offset = {
  x: 0,
  y: 0.5
};
port2.id = 'port1';
port2.visibility = ej.diagrams.PortVisibility.Visible;
port2.shape = 'Circle';
var nodes = [{
  id: 'node',
  width: 100,
  height: 100,
  offsetX: 100,
  offsetY: 100,

How to customize Orthogonal Segment Thumb Shape

The orthogonal connector can have any number of segments in between the source and the target point. Segments are rendered with the rhombus shape by default. The [segmentThumbShape](#) property allows you to change the default shape of the segment thumb. The following predefined shapes are provided:

| Shape name | Shape |

|-----| -----|

| Rhombus |

|

| Square |

|

| Rectangle |

| Ellipse |

| Arrow |

| OpenArrow |

| Circle |

| Fletch |

| OpenFetch |

| IndentedArrow |

| OutdentedArrow |

|

| DoubleArrow |

|

You can customize the style of the thumb shape by overriding the class e-orthogonal-thumb.

INDEX.JS

```
ej.diagrams.Diagram.Inject(ej.diagrams.ConnectorEditing);
var connector1 = {
  id: 'connector1',
  type: 'Orthogonal',
  sourcePoint: {x: 250, y: 250},
  targetPoint: {x: 350, y: 350},
  segments: [
    {
      type: 'Orthogonal',
      direction: "Right",
      length: 70
    },
    {
      type: 'Orthogonal',
      direction: "Bottom",
      length: 20
    }
  ],
  constraints: ej.diagrams.ConnectorConstraints.Default |
ej.diagrams.ConnectorConstraints.DragSegmentThumb
};
var diagram = new ej.diagrams.Diagram({
  width: 1500, height: 1000,
  connectors: [connector1]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/fabric.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Use the following CSS to customize the segment thumb shape.

```
`scss
.e-orthogonal-thumb {
stroke:#24039e;
fill:rgb(126, 190, 219);
stroke-width: 3px;
}
`
```

Bezier

Bezier segments are used to create curve segments and the curves are configurable either with the control points or with vectors.

To create a bezier segment, the [segment.type](#) is set as `bezier` and need to specify [type](#) for the connector. The following code example illustrates how to create a default bezier segment.

INDEX.JS

```
var connectors = [
  {
    id: 'connector1',
    type: 'Bezier',
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {
```

```

        style: {
            fill: '#6BA5D7',
            strokeColor: '#6BA5D7'
        },
    },
    segments: [{
        type: 'Bezier',
    }],
    sourcePoint: {
        x: 50,
        y: 100
    },
    targetPoint: {
        x: 150,
        y: 200
    },
},
],
];
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '600px',
    connectors: connectors
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Diagram</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

navigations/styles/fabric.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
```

```
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

The [point1](#) and [point2](#) properties of bezier segment enable you to set the control points. The following code example illustrates how to configure the bezier segments with control points.

INDEX.JS

```
var connectors = [
    {
        id: 'connector3',
        type: 'Bezier',
        style: {
            strokeColor: '#6BA5D7',
            fill: '#6BA5D7',
            strokeWidth: 2
        },
        targetDecorator: {
            style: {
                fill: '#6BA5D7',
                strokeColor: '#6BA5D7'
            }
        },
        segments: [{
            type: 'Bezier',
            point1: {
                x: 100,
                y: 100
            },
            point2: {
                x: 200,
                y: 200
            }
        }],
        sourcePoint: {
            x: 100,
            y: 200
        },
        targetPoint: {
            x: 200,
            y: 100
        }
    },
];
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '600px',
    connectors: connectors
}, '#element');

```

The [vector1](#) and [vector2](#) properties of bezier segment enable you to define the vectors. The following code illustrates how to configure a bezier curve with vectors.

INDEX.JS

```
var connectors = [
  {
    id: 'connector2',
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
  },
];
```

```

    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    },
    type: 'Bezier',
    segments: [{
      type: 'Bezier',
      vector1: {
        distance: 100,
        angle: 90
      },
      vector2: {
        distance: 45,
        angle: 270
      }
    }],
    sourcePoint: {
      x: 100,
      y: 100
    },
    targetPoint: {
      x: 200,
      y: 200
    }
  },
];
var diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '600px',
  connectors: connectors
}, '#element');
```

Avoid overlapping with bezier

By default, when there are no segments defined for a bezier connector, the bezier segments will be created automatically and routed in such a way that avoids overlapping with the source and target nodes.

INDEX.JS

```

ej.diagrams.Diagram.Inject(ej.diagrams.ConnectorEditing);
var nodes = [{
    id: 'Start',
    offsetX: 250,
    offsetY: 150,
    annotations: [{ content: 'Start' }]
},
{
    id: 'End',
    offsetX: 450,
    offsetY: 200,
    annotations: [{ content: 'End' }]
}];
let connectors = [{
    id: "connector1",
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7',
        strokeWidth: 2
    },
    targetDecorator: { shape: 'None' },
    // ID of the source and target nodes
    sourceID: "Start",
    sourcePortID: "StartPort",
    targetID: "End",
    targetPortID: "EndPort",
    type: 'Bezier',
}];
var diagram = new ej.diagrams.Diagram({

```

```

width: '100%',
height: '600px',
nodes: nodes,
connectors: connectors,
// Defines the default properties for the node
getNodeDefaults: (node) => {
    node.height = 100;
    node.width = 100;
    node.shape = { type: 'Basic', shape: 'Rectangle' }
    node.style.fill = '#6BA5D7';
    node.style.strokeColor = 'white';
    return node;
},
getConnectorDefaults: (connector) => {
    connector.constraints = ej.diagrams.ConnectorConstraints.Default |
ej.diagrams.ConnectorConstraints.DragSegmentThumb;
    return connector;
}
});
diagram.appendTo('#element');

```

INDEX.HTML

</body></html>

```

Also, the intermediate point of two adjacent bezier segments can be edited interactively based on the `bezierSettings.segmentEditOrientation` property of the connector class.

How to interact with the bezier segments efficiently

While interacting with multiple bezier segments, maintain their control points at the same distance and angle by using the `bezierSettings.smoothness` property of the connector class.

| BezierSmoothness value | Description |

|-----|-----|

| SymmetricDistance | Both control points of adjacent segments will be at the same distance when any one of them is editing. |

| SymmetricAngle | Both control points of adjacent segments will be at the same angle when any one of them is editing. |

| Default | Both control points of adjacent segments will be at the same angle and same distance when any one of them is editing. |

| None | Segment's control points are interacted independently from each other. |

INDEX.JS

```

ej.diagrams.Diagram.Inject(ej.diagrams.ConnectorEditing);
var nodes = [{
    id: 'Start',
    offsetX: 250,
    offsetY: 150,

Decorator

- Starting and ending points of a connector can be decorated with some customizable shapes like arrows, circles, diamond, or path. The connection end points can be decorated with the [sourceDecorator](#) and [targetDecorator](#) properties of the connector.
- The [shape](#) property of [sourceDecorator](#) allows to define the shape of the decorators. Similarly, the [shape](#) property of [targetDecorator](#) allows to define the shape of the decorators.
- To create custom shape for source decorator, use [pathData](#) property. Similarly, to create custom shape for target decorator, use [pathData](#) property.
- The following code example illustrates how to create decorators of various shapes.

INDEX.JS

```

var connectors = {
    id: "connector1",
    type: 'Straight',
    // Decorator shape- circle
    sourceDecorator: {
        shape: 'Circle',
        // Defines the style for the sourceDecorator
        style: {
            // Defines the strokeWidth for the sourceDecorator
            strokeWidth: 3,
            // Defines the strokeColor for the sourceDecorator
            strokeColor: 'red'
        }
    },

```

```

    },
    // Decorator shape - Diamond
    targetDecorator: {
        // Defines the custom shape for the connector's target decorator
        shape: 'Custom',
        // Defines the path for the connector's target decorator
        pathData: 'M80.5,12.5 C80.5,19.127417 62.59139,24.5 40.5,24.5
C18.40861,24.5 0.5,19.127417 0.5,12.5' +
        'C0.5,5.872583 18.40861,0.5 40.5,0.5 C62.59139,0.5 80.5,5.872583
80.5,12.5 z',
        // defines the style for the target decorator
        style: {
            // Defines the strokeWidth for the targetDecorator
            strokeWidth: 3,
            // Defines the strokeColor for the sourceDecorator
            strokeColor: 'green',
            // Defines the opacity for the sourceDecorator
            opacity: .8
        },
    },
},
sourcePoint: {
    x: 100,
    y: 100
},
targetPoint: {
    x: 200,
    y: 200
}
};
var connectors2 = {
    id: "connectors2",
    type: 'Straight',
    // Decorator shape - IndentedArrow
    sourceDecorator: {
        shape: 'IndentedArrow',
        style: {
            strokeWidth: 3,
            strokeColor: 'blue'
        },
    },
},
// Decorator shape - OutdentedArrow
targetDecorator: {
    shape: 'OutdentedArrow',
    style: {
        strokeWidth: 3,

```

Padding

Padding is used to leave the space between the Connector's end point and the object to where it is connected.

- The [sourcePadding](#) property of connector defines space between the source point and the source node of the connector.

- The [targetPadding](#) property of connector defines space between the end point and the target node of the connector.
- The following code example illustrates how to leave space between the connection end points and source and target nodes.

INDEX.JS

```
var nodes = [{
  id: 'node',
  width: 100,
  height: 100,
  offsetX: 100,
  offsetY: 100,
},
{
  id: 'node1',
  width: 100,
  height: 100,
  offsetX: 300,
  offsetY: 100,
}
];
var connector = {
  id: "connector1",
  style: {

Hit padding

- The [hitPadding](#) property enables you to define the clickable area around the connector path. The default value for hitPadding is 10.
- The following code example illustrates how to specify hit padding for connector.

INDEX.JS

```

ej.diagrams.Diagram.Inject(ej.diagrams.ConnectorEditing);
var connectors = [{
  id: "connector1",
  type: "Orthogonal",
  hitPadding: 40,

```

```

    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    },
    targetDecorator: {
      style: {
        fill: '#6BA5D7',
        strokeColor: '#6BA5D7'
      }
    },
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 300, y: 300 },
    constraints: ej.diagrams.ConnectorConstraints.Default |
ej.diagrams.ConnectorConstraints.DragSegmentThumb
  }
]
var diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '600px',
  connectors: connectors,
}, '#element');
```

INDEX.HTML

  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Flip

The diagram Provides support to flip the connector. The [flip](#) is performed to give the mirrored image of the original element.

The flip types are as follows:

- HorizontalFlip

[Horizontal](#) is used to interchange the connector source and target x points.

- VerticalFlip

[Vertical](#) is used to interchange the connector source and target y points.

- Both

[Both](#) is used to interchange the source point as target point and target point as source point

.

INDEX.JS

```
var nodes = [{
  id: 'node',
  width: 100,
  height: 100,
  offsetX: 100,
  offsetY: 100,
},
{
  id: 'node1',
  width: 100,
  height: 100,
  offsetX: 300,
  offsetY: 100,
}
];
var connector = {
  id: "connector1",
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
    strokeWidth: 2
  },
  targetDecorator: {
```

```

        style: {
            fill: '#6BA5D7',
            strokeColor: '#6BA5D7'
        }
    },
    sourceID: 'node',
    targetID: 'node1',
    // Set Source Padding value
    sourcePadding:20,
    // Set Target Padding value
    targetPadding:20
};
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '350px',
    getNodeDefaults: function(node) {
        node.height = 100;
        node.width = 100;
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
        return node;
    },
    nodes: nodes,
    connectors: [connector]
}, '#element');
```

INDEX.HTML

```

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: The flip is not applicable when the connectors connect in nodes

Bridging

Line bridging creates a bridge for lines to smartly cross over the other lines, at points of intersection. By default, [bridgeDirection](#) is set to top. Depending upon the direction given bridging direction appears.

Bridging can be enabled/disabled either with the `connector.constraints` or `diagram.constraints`. The following code example illustrates how to enable line bridging.

INDEX.JS

```
var node1 = {
  id: 'Transaction',
  width: 150,
  height: 60,
  offsetX: 300,
  offsetY: 60,
  shape: {
    type: 'Flow',
    shape: 'Terminator'
  },
  annotations: [{
    id: 'label1',
    content: 'Start Transaction',
    offset: {
      x: 0.5,
      y: 0.5
    }
  }],
};
var node2 = {
  id: 'Verification',
  width: 150,
  height: 60,
  offsetX: 300,
  offsetY: 250,
  shape: {
    type: 'Flow',
    shape: 'Process'
  },
  annotations: [{
    id: 'label2',
    content: 'Verification',
    offset: {
```

```
        x: 0.5,
        y: 0.5
    }
    ]]
};
var connectors = {
    id: 'connector1',
    type: 'Straight',
    sourceID: 'Transaction',
    targetID: 'Verification'
};
var connectors2 = {
    id: 'connector2',
    type: 'Straight',
    sourcePoint: {
        x: 200,
        y: 130
    },
    targetPoint: {
        x: 400,
        y: 130
    }
};
var connector3 = {
    id: 'connector3',
    type: 'Straight',
    sourcePoint: {
        x: 200,
        y: 170
    },
    targetPoint: {
        x: 400,
        y: 170
    }
};
//Enables bridging for every connector added in the model
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    getConnectorDefaults: (obj) => {
        obj.style.strokeColor = '#6BA5D7';
        obj.style.fill = '#6BA5D7';
        obj.style.strokeWidth = 2;
        obj.targetDecorator.style.fill = '#6BA5D7';
        obj.targetDecorator.style.strokeColor = '#6BA5D7';
        return obj;
    },
    getNodeDefaults: (node) => {
        node.height = 100;
        node.width = 100;
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
        return node;
    },
    nodes: [node1, node2],
    height: '600px',
    //enables the bridging constraints for the connector
```

```
constraints: ej.diagrams.DiagramConstraints.Default |
ej.diagrams.DiagramConstraints.Bridging,
connectors: [connectors, connectors2, connector3]
}, '#element');
```

INDEX.HTML

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: You need to inject connector bridging module into the diagram.

The [bridgeSpace](#) property of connectors can be used to define the width for line bridging.

Limitation: Bezier segments do not support bridging.

Corner radius

Corner radius allows to create connectors with rounded corners. The radius of the rounded corner is set with the [cornerRadius](#) property.

INDEX.JS

```
var nodes = [{
    id: 'node1',
    width: 100,
    height: 100,
    offsetX: 100,
    offsetY: 100,
},
{
    id: 'node2',
    width: 100,

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Appearance

- The connector's [strokeWidth](#), [strokeColor](#), [strokeDashArray](#), and [opacity](#) properties are used to customize the appearance of the connector segments.
- The [visible](#) property of the connector enables or disables the visibility of connector.
- Default values for all the connectors can be set using the `getConnectorDefaults` properties. For example, if all connectors have the same type or having the same property then such properties can be moved into `getConnectorDefaults`.

Segment appearance

The following code example illustrates how to customize the segment appearance.

INDEX.JS

```
var connectors = [{
  id: "connector1",
  targetDecorator: {
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    }
  },
  style: {
    // Stroke color
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
    // Stroke width of the line
    strokeWidth: 2,
    // Line style
    strokeDashArray: '2,2'
  },
  sourcePoint: {
    x: 100,
    y: 100
  },
  targetPoint: {
    x: 200,
    y: 200
  },
  segments: [{
    type: 'Orthogonal',
    direction: 'Right',
    length: 50
  }],
},
{
  id: "connector2",
  // Set the visibility of the connector to false
  visible: false,
  targetDecorator: {
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7',
      strokeWidth: 2
    }
  },
  style: {
    // Stroke color
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
    // Stroke width of the line
    strokeWidth: 2,
    // Line style
    strokeDashArray: '2,2'
  },
},
]
```

```

        sourcePoint: {
            x: 300,
            y: 300
        },
        targetPoint: {
            x: 400,
            y: 400
        },
        segments: [{
            type: 'Orthogonal',
            direction: 'Right',
            length: 50
        }],
    }
};
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '600px',
    // Define the default values for all the connector. Similary we can add
    all the properties
    getConnectorDefaults: (obj) => {
        obj.type = 'Orthogonal'
        return obj;
    },
    connectors: connectors,
}, '#element');
```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Decorator appearance

- The source decorator's [strokeColor](#), [strokeWidth](#), and [strokeDashArray](#) properties are used to customize the color, width, and appearance of the decorator.
- To set the border stroke color, stroke width, and stroke dash array for the target decorator, use [strokeColor](#), [strokeWidth](#), and [strokeDashArray](#).
- To set the size for source and target decorator, use width and height property.

The following code example illustrates how to customize the appearance of the decorator.

INDEX.JS

```
var connectors = [{
  id: "connector1",
  type: 'Straight',
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7',
    strokeWidth: 2
  },
  bridgeSpace: 20,
  // Customize the target decorator
  targetDecorator: {
    style: {
      // Fill color of the decorator
      fill: '#6BA5D7',
      // Stroke color of the decorator
      strokeColor: '#6BA5D7'
    }
  },
  sourcePoint: {
    x: 100,
    y: 100
  },
  targetPoint: {
    x: 200,
    y: 200
  }
}];
var diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '600px',
```

```
connectors: connectors,
}, '#element');
diagram.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Interaction

- Diagram allows to edit the connectors at runtime. To edit the connector segments at runtime, refer to [Connection Editing](#).

Automatic line routing

Diagram provides additional flexibility to re-route the diagram connectors. A connector will frequently re-route itself when a shape moves next to it. The following screenshot illustrates how the connector automatically re-routes the segments.

- Dependency LineRouting module should be injected to the application as the following code snippet.

```
`javascript
```

```
/
```

- Injecting the automatic line routing module.

```
*/
```

```
ej.diagrams.Diagram.Inject(ej.diagrams.LineRouting);
```

```
,
```

- Now, the line routing constraints must be included to the default diagram constraints to enable automatic line routing support like below.

```
`javascript
```

```
/
```

- Initialize the Diagram

```
*/
```

```
var diagram = new ej.diagrams.Diagram({
```

```
//Add Line routing constraints to diagram.
```

```
constraints: ej.diagrams.DiagramConstraints.Default |
```

```
ej.diagrams.DiagramConstraints.LineRouting
```

```
});
```

```
diagram.appendTo('#diagram');
```

```
,
```

- The following code block shows how to create the diagram with specifying nodes, connectors, constraints, and necessary modules for line routing.

INDEX.JS

```
ej.diagrams.Diagram.Inject(ej.diagrams.LineRouting);  
var diagram;  
var nodes = [  
  { id: 'shape1', offsetX: 100, offsetY: 100, width: 120, height: 50 },
```

```

    { id: 'shape2', offsetX: 300, offsetY: 300, width: 120, height: 50 },
    { id: 'shape3', offsetX: 150, offsetY: 200, width: 120, height: 50 }
  ];
  var connectors = [
    { id: 'connector', sourceID: 'shape1', targetID: 'shape2', type:
    'Orthogonal' }
  ];

  var diagram = new ej.diagrams.Diagram({
    width: '100%', height: 900, nodes: nodes, connectors: connectors,

    constraints: ej.diagrams.DiagramConstraints.Default |
    ej.diagrams.DiagramConstraints.LineRouting,
    getNodeDefaults: function (node) {
      node = { style: { strokeColor: '#6BA5D7', fill: '#6BA5D7' } }
      return node;
    },
    snapSettings: {
      constraints: ej.diagrams.SnapConstraints.None,
    }
  });
  diagram.appendTo('#element');
```

INDEX.HTML

```

- In some situations, automatic line routing enabled diagram needs to ignore a specific connector from automatic line routing. So, in this case, auto routing feature can be disabled to the specific connector using the [constraints](#) property of the connector like the following code snippet.

INDEX.JS

```
ej.diagrams.Diagram.Inject(ej.diagrams.LineRouting);
var diagram;
var nodes = [
  { id: 'shape1', offsetX: 100, offsetY: 100, width: 120, height: 50 },
  { id: 'shape2', offsetX: 350, offsetY: 300, width: 120, height: 50 },
  { id: 'shape3', offsetX: 150, offsetY: 200, width: 120, height: 50 },
  { id: 'shape4', offsetX: 300, offsetY: 200, width: 120, height: 50 }
];
var connectors = [
  { id: 'connector', sourceID: 'shape1', targetID: 'shape2', type:
'Orthogonal', annotations: [{offset:.7, content: ' Routing \n
enabled', style:{fill:"white"}}]},
  { id: 'connector2', sourceID: 'shape1', targetID:
'shape2', annotations: [{offset:.6, content: ' Routing \n
disabled', style:{fill:"white"}}], type: 'Orthogonal', constraints:
ej.diagrams.ConnectorConstraints.Default
&~ej.diagrams.ConnectorConstraints.InheritLineRouting }
];
/**
 * Initialize the Diagram
 */
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: 900, nodes: nodes, connectors: connectors,
  //Add Line routing constraints to diagram.
  constraints: ej.diagrams.DiagramConstraints.Default |
ej.diagrams.DiagramConstraints.LineRouting,
  getNodeDefaults: function (node) {
    node = { style: { strokeColor: '#6BA5D7', fill: '#6BA5D7' } }
    return node;
  },
  snapSettings: {
    constraints: ej.diagrams.SnapConstraints.None,
  }
});
diagram.appendTo('#element');
```

INDEX.HTML
