

USER GUIDE

Essential Studio for WPF

Version - v19.3.0.43 | Release Date - September 30, 2021

SfRangeSlider	67
WPF Range Slider (SfRangeSlider) Overview	67
Getting Started with WPF Range Slider (SfRangeSlider)	67
Assembly deployment.....	67
Creating a simple application with SfRangeSlider	67
Theme	69
Visual Structure in WPF Range Slider (SfRangeSlider)	69
Minimum and Maximum in WPF Range Slider (SfRangeSlider)	70
Ticks in WPF Range Slider (SfRangeSlider)	70
Tick Frequency	70
MinorTickFrequency	71
Step Frequency	71
Snaps To	72
Tick Placement	72
Range in WPF Range Slider (SfRangeSlider)	75
ShowRange.....	76
RangeStart.....	76
RangeEnd	77
Drag Selected Range	78
Intermediate Values in WPF Range Slider (SfRangeSlider)	78
Thumb ToolTip in WPF Range Slider (SfRangeSlider)	79
Thumb ToolTip Precision.....	79
Thumb ToolTipFormat	79
Thumb ToolTip Position	80
ThumbInterval.....	82
Orientation in WPF Range Slider (SfRangeSlider)	83
Direction Reversed in WPF Range Slider (SfRangeSlider)	84
Gestures in WPF Range Slider (SfRangeSlider)	85
Label Support in WPF Range Slider (SfRangeSlider)	85
CustomLabels	86
ShowCustomLabels	87
LabelPlacement.....	88
ShowValueLabels	89
ValuePlacement	90
LabelOrientation	92

Touch Support in WPF Range Slider (SfRangeSlider)	93
Styling and Appearance in WPF Range Slider (SfRangeSlider).....	97
InactiveTrackStyle	97
ActiveTrackStyle.....	97
ThumbStyle	99
Tick Customization	100
Events in WPF RangeSlider(SfRangeSlider)	109
How to trigger LabelLoaded event?	109
How to trigger RangeChangedEvent?	109
How to trigger RangeStartChanged event?	110
How to trigger RangeEndChanged event?	111
SfRating	112
WPF Rating (SfRating) Overview	112
Key features	113
Getting Started with WPF Rating (SfRating)	113
Assembly deployment.....	113
Creating Application with SfRating control.....	113
Creating project	113
Adding control via designer	113
Adding control manually in XAML.....	113
Add control manually in C#.....	114
Customize number of rating items	115
Set value.....	115
Precision of selection	115
Theme	116
Precision in WPF Rating (SfRating).....	116
ToolTip in WPF Rating (SfRating)	118
Restrict User Selection in WPF Rating (SfRating).....	119
Appearance and Styling in WPF Rating (SfRating)	119
Set fill color	119
Set stroke color	120
Set stroke thickness	121
ReportViewer	123
WPF ReportViewer Overview	123
Getting Started with WPF Report Viewer	124

Creating ReportViewer through Visual Studio.....	124
Show RDLC Reports.....	127
Load SSRS Reports.....	130
ReportViewer API of Essential Studio WPF.....	132
Properties.....	132
Methods.....	134
Events.....	135
ReportViewer Theme support	135
Limitations in WPF ReportViewer control	145
RDL Specification support	145
Layout Process	145
Unsupported expression.....	145
HTML Formatted Data with Report	145
Supported HTML Tags.....	145
Limitations of Cascading Style Sheet Attributes	146
How to.....	146
Create RDLC Report In VS2010 and Show It in Report Viewer	146
SSRS shared/embedded datasource credential information in ReportViewer	163
Provide the Report Parameters in code behind	164
Provide the Data Source credential information in code behind	164
Can you use SharePoint Integrated Mode in ReportViewer?	164
Can you use Azure SSRS reports in ReportViewer?	165
ReportWriter.....	170
WPF ReportWriter Overview	170
Getting Started with WPF ReportWriter.....	170
Adding ReportWriter to an application	170
Export RDL Reports	173
Export RDLC Reports	175
Saving reports in WPF ReportWriter Control.....	178
Saving report as PDF	178
Saving report as Excel	179
Saving report as Word	180
Saving report as an HTML	181
ReportWriter API of Essential Studio WPF.....	182
Constructors.....	182

Properties.....	182
Methods.....	183
Events.....	183
How to.....	183
Save a report as stream	183
Ribbon	184
WPF Ribbon control Overview	184
Components of Ribbon controls	184
Key features	184
Getting Started with WPF Ribbon.....	185
Add ribbon	185
Set icon for RibbonWindow	186
Set visual styles	187
Add RibbonTab.....	188
Add RibbonBar	189
Add RibbonButton	190
Add DropDownButton	191
Add SplitButton.....	193
Add RibbonGallery	194
Add RibbonComboBox.....	196
Add QAT	197
Add BackStage.....	200
Add application menu	202
Adding custom controls to the title bar	206
Set simplified layout.....	213
Theme	213
BackStage in WPF Ribbon	214
BackStage settings in Ribbon	214
Add BackStageCommandButton.....	217
Setting image to BackStageCommandButton.....	219
Add BackStageTabItem	227
Add BackStage separator	229
BackStage items position	232
Different types of Animation	234
Animation duration.....	234

Placement Customization	236
Customize the BackStageButton visibility.....	266
Application Menu in WPF Ribbon	268
Adding MenuItems in ApplicationMenu.....	268
Adding ApplicationItems in ApplicationMenu	283
Ribbon Items	298
RibbonButton in WPF Ribbon	298
RibbonDropDownButton in WPF Ribbon.....	319
RibbonSplitButton in WPF Ribbon	337
RibbonComboBox in WPF Ribbon.....	355
RibbonGallery in WPF Ribbon	359
RibbonTextBox in WPF Ribbon	385
RibbonCheckBox in WPF Ribbon.....	387
RibbonRadioButton in WPF Ribbon	390
RibbonListBox in WPF Ribbon.....	393
RibbonStatusBar in WPF Ribbon	396
SimpleMenuButton in WPF Ribbon	398
RibbonMenuItem in WPF Ribbon	406
RibbonTabPanellItem in WPF Ribbon	412
RibbonSeparator in WPF Ribbon	413
RibbonItemHost in WPF Ribbon	416
Quick Access ToolBar in WPF Ribbon.....	422
Adding custom item to the ContextMenu	424
How to disable the RibbonContextMenu	425
Add items to QuickAccessToolBar (QAT)	427
Add default QAT items.....	427
Add items to QAT Menu items.....	428
Add items to QAT customize window	430
Add custom QAT items	433
Add items from Ribbon context menu.....	436
Add custom items using RibbonItemHost	437
Add custom RibbonTab and RibbonBar	440
Add items to the customized RibbonTab.....	450
How to disable the customization in Ribbon	454
Simplified Layout in WPF Ribbon	455

Switching between simplified and normal layouts	456
Visibility of the Ribbon items between normal and simplified layout.....	456
Setting image for Ribbon items	458
Customizing the Ribbon during runtime through the QAT window	459
Resizing Ribbon in simplified layout	460
Dealing with Ribbon in WPF Ribbon	460
Three types of RibbonState	460
How to change the RibbonState in run time	463
Resize Ribbon Window	464
RibbonBar Positioning.....	464
Resize based on collapse order.....	476
Setting collapse image for RibbonBar	500
Grouping RibbonTabs using ContextTabGroups.....	506
Creating ContextTabGroup	506
Add ContextTabGroup to the simplified layout.....	506
Multiple ContextTabs.....	508
ContextTabGroup heading.....	509
Changing the visibility at run time	510
Creating ContextTabGroup in MVVM	511
Detecting selection changes in RibbonTab	523
Dealing with Ribbon Items in WPF Ribbon	524
Adding items to ButtonPanel in XAML.....	524
Adding items to ButtonPanel in code behind	525
Changing size of ribbon items.....	526
List of controls which support SizeForm	526
Add command to RibbonLauncherButton	527
Set RibbonBar LauncherButton Command	527
Show HelpButton in RibbonWindow	528
Serialization and Deserialization in WPF Ribbon	530
Use case scenarios	530
Persist ribbon states any time while running the application	531
Saving ribbon states.....	531
Save and load many ribbon states	533
Persisting ribbon states by XML writer	535
Reset Ribbon States	537

Delete ribbon states.....	537
Ribbon Merge in WPF Ribbon.....	538
Creating MDI window and enabling menu merging	538
Merge Type	544
Merge Order	545
Merging and Unmerging in code	547
Ribbon ModelTab in WPF Ribbon	548
Use case scenarios	548
Adding modal tabs to an application	549
Add Modal Tab to the simplified layout	549
How to handle modal tabs in ribbon	551
ToolTip in WPF Ribbon.....	552
Adding tooltip for ribbon items	552
Setting the ToolTip for the upper and lower half of the split button	554
Options for inserting help text in ScreenTip	555
KeyBoard Support in WPF Ribbon	556
Adding KeyTip to the ribbon items	556
KeyTip for QAT items	557
How to access particular item in ribbon using KeyTip.....	558
How does BackStage can be accessed using KeyTip.....	560
Touch Support in WPF Ribbon	561
Styling and Templates in WPF Ribbon	562
Theme	562
Patterns and Practices in WPF Ribbon.....	563
Ribbon with MVVM.....	563
Practice with PRISM	570
How to.....	576
Handle Pop-Up Opening and Closing Event in ApplicationMenu	576
SfRichTextBoxAdv	577
WPF RichTextBox (SfRichTextBoxAdv) Overview.....	577
Features	577
Getting Started with WPF RichTextBox (SfRichTextBoxAdv)	578
Assembly Reference.....	578
Adding SfRichTextBoxAdv to an application	578
Using SfRichTextBoxAdv as a standard RichTextBox	579

Creating Document editor with Ribbon.....	581
Theme	584
Document Structure in WPF RichTextBox (SfRichTextBoxAdv)	585
Document Properties in WPF RichTextBox (SfRichTextBoxAdv)	587
Word Count.....	587
Paragraph Count	587
Page Count	587
Current Page number.....	588
Layout Types in WPF RichTextBox (SfRichTextBoxAdv).....	589
Pages	589
Continuous	590
Block.....	590
Commands in WPF RichTextBox (SfRichTextBoxAdv).....	591
UI Command to access character formatting	592
List of available Commands	592
Selection in WPF RichTextBox (SfRichTextBoxAdv)	603
Multi Selection	607
Apply Formatting for selection	607
Binding Selection format properties.....	608
Keyboard shortcuts to perform selection	609
How to show blinking cursor and selection highlight even when the control lost focus	611
How to determine the editing context type	611
How to delete the selected content	612
Find and Replace in WPF RichTextBox (SfRichTextBoxAdv)	612
Replacing existing text	614
Options Pane.....	615
Spell Check in WPF RichTextBox (SfRichTextBoxAdv).....	615
Adding Custom Dictionaries.....	616
Multilingual Spell Check Support	617
Clipboard in WPF RichTextBox (SfRichTextBoxAdv)	617
UI Command to access clipboard operations	617
Undo Redo in WPF RichTextBox (SfRichTextBoxAdv).....	618
UI Command to perform undo/redo operations.....	618
Enable/Disable Undo Redo	618
List in WPF RichTextBox (SfRichTextBoxAdv).....	619

Single Level List	620
Multilevel List.....	620
Adding List.....	621
Level overrides	624
Editing list.....	626
Hyperlink in WPF RichTextBox (SfRichTextBoxAdv).....	626
Hyperlink ScreenTip	628
Hyperlink Navigation.....	630
Image in WPF RichTextBox (SfRichTextBoxAdv)	631
Image Resizer	631
Text wrapping style	631
Positioning the image	632
Shapes in WPF RichTextBox (SfRichTextBoxAdv).....	632
Supported shapes	632
Text box Shape	632
Shape Resizer	632
Text wrapping style	633
Positioning the shape.....	633
Table in WPF RichTextBox (SfRichTextBoxAdv)	633
UI Commands for accessing table	635
Comment in WPF RichTextBox (SfRichTextBoxAdv)	637
UI Commands for accessing comment.....	638
Customizing comment visual style.....	639
Document Styles in WPF RichTextBox (SfRichTextBoxAdv).....	640
Default style	641
Style hierarchy	641
Create new style	642
Modify an existing style	643
Apply style.....	644
Clear formatting.....	645
Import and Export in WPF RichTextBox (SfRichTextBoxAdv)	645
UI Commands for importing/exporting documents	647
Asynchronous import settings	647
Events to notify document starts and completes loading and saving	648
Printing Contents in WPF RichTextBox (SfRichTextBoxAdv)	648

UI Command for printing	649
Mini Toolbar in WPF RichTextBox (SfRichTextBoxAdv)	649
Enable/Disable Mini Toolbar.....	650
Automatic Suggestion in WPF RichTextBox (SfRichTextBoxAdv).....	650
Dialogs in WPF RichTextBox (SfRichTextBoxAdv)	661
UI Commands for accessing dialogs.....	661
Customizing dialogs	662
Localization in WPF RichTextBox (SfRichTextBoxAdv)	666
Setting Current UI Culture	666
Adding Resource file	667
MVVM in WPF RichTextBox (SfRichTextBoxAdv).....	668
Creating a View Model.....	668
Implementing extension class for SfRichTextBoxAdv	672
Creating XAML View.....	676
Virtualization in WPF RichTextBox (SfRichTextBoxAdv)	677
Styles and Templates in WPF RichTextBox (SfRichTextBoxAdv).....	677
Styling the SfRichTextBoxAdv	695
Setting Background for WPF RichTextBox	697
Setting Background for Document Pages	700
FAQ Section.....	702
Opening large size documents in WPF SfRichTextBoxAdv control	702
SfScheduler	702
WPF Scheduler (SfScheduler) Overview	702
Key features	702
Getting Started with WPF Scheduler (SfScheduler).....	705
Assembly deployment.....	705
Create simple application with SfScheduler	705
Change different SfScheduler Views.....	706
Appointments	707
Change first day of week.....	712
Show busy indicator	713
Theme	713
Day and Week Views in WPF Scheduler (SfScheduler)	714
Change time interval.....	714
Change time interval height.....	715

Flexible working days and working hours	715
Special time regions	717
Full screen scheduler	722
Change time ruler size	723
Minimum appointment duration	724
Minimum display appointments count in all day panel	724
Time text formatting	725
View header	726
Timeline Views in WPF Scheduler (SfScheduler)	728
Change time interval	728
Change time interval width	729
Flexible working days and working hours	730
Change days count	731
Blackout dates	732
Special time regions	733
Full screen scheduler	736
Change time ruler size	737
Minimum appointment duration	738
Time text formatting	738
View header	739
Appointment height	742
Month View in WPF Scheduler (SfScheduler)	742
Month agenda view	742
Appointment display mode	744
Appointment display count	745
Month navigation direction	746
Date format	747
View header	748
Leading and Trailing days visibility	751
Blackout dates	752
Show week number	754
Customize week number template	755
Customize month cell appearance	756
Customize month view appointments	758
Customize more appointments indicator in month cell	761

Resource Grouping in WPF Scheduler (SfScheduler)	762
Grouping by Resources	762
Resource Grouping types	763
Assigning resources to appointments.....	764
Scheduler Resource Mapping	766
Create business object for Resource	766
Resource header size	769
Resource auto height	770
Resource minimum height.....	771
Visible resource count.....	771
Assign resources to special time regions	773
Appearance customization	775
Appointments in WPF Scheduler (SfScheduler).....	779
Scheduler item source and Mapping	781
Creating business objects	782
Spanned appointments.....	784
All day appointments	785
Recurrence Appointment.....	786
Recurrence pattern exceptions.....	791
Add an exception appointment to the recurrence pattern	797
Appearance customization	799
Load On Demand in WPF Scheduler (SfScheduler).....	800
QueryAppointments event	801
Load On Demand command	802
Load On Demand for recurring appointment	804
Appointment Editing in WPF Scheduler (SfScheduler)	804
Adding appointments	804
Editing appointment	805
Visible/Collapse the built-in editors in appointment editor window	806
Disable appointment editing.....	808
Delete appointments	808
Appointment Resizing	809
Reminder in WPF Scheduler (SfScheduler)	810
Enable reminder.....	810
Adding reminders.....	811

Creating business object for reminder.....	812
ReminderAlertOpening event.....	814
ReminderAlertActionChanged events	814
Appointment drag and drop in WPF Scheduler (SfScheduler).....	815
Disable drag and drop	815
Show/Hide the time indicator on appointment dragging.....	816
Appointment dragging time indicator text formatting	816
AppointmentDragOver event	817
AppointmentDragStarting event.....	817
AppointmentDropping event.....	818
Time Zone in WPF Scheduler (SfScheduler).....	818
Create appointments in different time zones.....	822
Display Appointments based on client's time zone	823
Display appointments based on Scheduler time zone.....	823
Display appointments at same time everywhere regardless of client's time zone	823
Updating StartTime and EndTime after drag and drop appointment based on time zone.....	823
Date Navigations in WPF Scheduler (SfScheduler)	824
Range for visible dates	824
Programmatic date navigation	824
Programmatic date selection	825
Programmatically change to adjacent dates	825
Allow view navigation	826
Show date picker.....	827
Allowed views	827
Header in WPF Scheduler (SfScheduler)	828
Header height	828
Header date format	828
Appearance customization	829
Events in WPF Scheduler (SfScheduler)	831
CellTapped	831
CellDoubleTapped.....	832
CellLongPressed	832
SelectionChanged	833
SelectionChanging.....	833
ViewHeaderCellTapped.....	834

HeaderTapped.....	834
WeekNumberTapped.....	835
AppointmentTapped.....	835
ContextMenu and Commands in WPF Scheduler (SfScheduler)	836
Cell context menu	836
Appointment context menu.....	837
SchedulerContextMenuOpening event	838
Calendar Types in WPF Scheduler (SfScheduler)	838
Types of Calendar.....	838
DateTime values in Calendar types.....	839
Localization in WPF Scheduler (SfScheduler).....	840
Set Current UI Culture to the Application.....	840
Localization using Resource file	841
Accessibility Support in WPF Scheduler (SfScheduler)	843
Screen reader support	843
Keyboard navigation	847
Migrating from SfSchedule to SfScheduler in WPF Scheduler.....	848
Adding Reference.....	848
Initialization.....	849
Major improvements of SfScheduler	849
SfSpellChecker.....	852
WPF SpellChecker (SfSpellChecker) Overview	852
Control structure.....	853
Features	853
Getting Started with WPF SpellChecker (SfSpellChecker)	853
Control Structure	853
Assembly deployment.....	853
Adding WPF SfSpellChecker to an application.....	854
Fix spelling mistakes using spell check dialog.....	855
Fix spelling mistakes using context menu.....	856
Disable spell checking	857
Get suggestions for misspelled word.....	858
Ignore SpellCheck for particular types of text	859
SpellCheck for any language(culture)	860
Add custom words to dictionary.....	861

Event to notify when spell check is completed.....	861
Theme	862
Custom Dictionary in WPF SpellChecker (SfSpellChecker)	863
Default SpellCheck Dictionary.....	863
Load your own dictionaries for any language.....	863
SpellCheck using Hunspell dictionary	863
SpellCheck using Ispell dictionary	866
SpellCheck using OpenOffice dictionary	868
Add custom words to dictionary.....	871
Switch language(Culture) at runtime.....	874
Appearance in WPF SpellChecker (SfSpellChecker).....	876
Theme	876
SplitButton	877
WPF Split Button Overview.....	877
Key features	877
Getting Started with WPF Split Button	877
Control structure.....	878
Assembly deployment.....	878
Creating simple application with SplitButton	878
Setting label	880
Setting size mode	881
Setting icon template.....	882
Setting icon template selector	885
Setting image	887
Setting icon width and height.....	888
IsDefault mode.....	889
Adding items to Split Button.....	889
Theme	891
Data Binding in WPF Split Button.....	892
Creating model.....	892
Creating view model	892
Bind data from view model.....	893
Bind command from view model.....	894
Command Binding in WPF Split Button	897
Dropdown Menu Items in WPF Split Button.....	901

Setting icon for dropdown menu items	901
Setting icon bar visibility	901
Setting scrollbar visibility	902
Checkable dropdown menu items	904
Resizing dropdown menu	905
Adding custom dropdown menu items	906
Setting icon bar visibility for custom dropdown menu items	907
Dropdown Direction in WPF Split Button	909
Multiline Text in WPF Split Button (SplitButtonAdv)	911
Events in WPF Split Button	912
DropDownOpening	912
DropDownOpened	912
DropDownClosing	913
DropDownClosed	913
Click	913
Events for dropdown menu items	914
Styles and Templates in WPF Split Button	914
Edit appearance in Expression Blend	914
Edit appearance in Visual Studio	916
Themes in WPF Split Button	919
SfSpreadsheet	919
WPF Spreadsheet (SfSpreadsheet) Overview	919
Key Features	919
Choose between SfSpreadsheet and Spreadsheet control	920
Getting Started with WPF Spreadsheet (SfSpreadsheet)	922
Assemblies Deployment	922
Create a Simple Application with Spreadsheet	923
Creating a new Excel Workbook	926
Opening an existing Excel Workbook	926
Saving the Excel Workbook	927
Displaying Charts and Sparklines	928
Working With Spreadsheet in WPF Spreadsheet (SfSpreadsheet)	928
Accessing the Worksheet	928
Accessing the Grid	929
Setting the ActiveSheet programmatically	930

Accessing the cell or range of cells	930
Accessing the value of a cell	931
Setting the value or formula to a cell.....	931
Clearing the value or formatting from a cell.....	931
Refreshing the view	931
Scrolling the Grid programmatically	932
Formula Bar.....	932
Identify whether the workbook is modified or not	932
Suppress message boxes in Spreadsheet	932
Suspend and resume formula calculation	933
Close the popup programmatically.....	933
Identify when the active sheet is changed	933
Selection in WPF Spreadsheet (SfSpreadsheet).....	933
Accessing the Current cell.....	934
Accessing the Selected ranges	934
Adding or Clearing the Selection.....	934
Move Current Cell	935
Converting GridRangeInfo into IRange	935
Properties, Methods and Events.....	935
Key Navigation	936
Editing in WPF Spreadsheet (SfSpreadsheet)	937
Editing	937
Data Validation.....	939
Hyperlink	940
Formatting in WPF Spreadsheet (SfSpreadsheet)	941
Cell Background	942
Font	942
Cell Borders	943
Cell Alignment.....	943
Wrap Text.....	943
Merge Cells	944
Number Format.....	944
Built-in Styles	945
Format as Table.....	945
Clear formatting	946

Conditional Formatting in WPF Spreadsheet (SfSpreadsheet)	946
Highlight Cell Rules.....	946
Data Bars	948
Color Scales	949
Icon Sets	950
Themes in WPF Spreadsheet (SfSpreadsheet).....	951
Sorting and Filtering in WPF Spreadsheet (SfSpreadsheet).....	952
Filtering	952
Programmatic Sorting and Filtering	952
Unsupported Features	953
Limitations.....	953
Formulas in WPF Spreadsheet (SfSpreadsheet)	954
Adding Formula into cell	954
Named Ranges	954
Supported functions	955
Rows and Columns in WPF Spreadsheet (SfSpreadsheet).....	974
Insert Rows and Columns.....	974
Delete Rows and Columns	975
Hide Rows and Columns	975
Unhide Rows and Columns	976
Row Height and Column Width	976
Freeze Rows and Columns	976
Unfreeze Rows and Columns	976
Auto Fit Rows and Columns	977
Worksheet Management in WPF Spreadsheet (SfSpreadsheet)	977
Insert and Delete worksheet.....	977
Hide and Unhide worksheets.....	978
Hide or unhide sheet tabs.....	978
Rename a worksheet	978
Worksheet Protection.....	978
Gridlines	979
Headings.....	979
Zooming	980
Events.....	980
Data Management in WPF Spreadsheet (SfSpreadsheet)	981

Import from DataTable	981
Export to DataTable	981
Interactive Features in WPF Spreadsheet (SfSpreadsheet)	982
Clipboard Operations	982
Undo/Redo	983
Context menu	983
Cell Comments	985
Find and Replace in WPF Spreadsheet (SfSpreadsheet)	985
Find	985
Replace All	988
Replace	988
Outline in WPF Spreadsheet (SfSpreadsheet)	989
Group rows and columns	989
Ungroup rows and columns	989
Collapse or Expand Group	989
Change Outline Settings	990
Clear Outlines	990
Shapes in WPF Spreadsheet (SfSpreadsheet)	990
Charts	990
Sparklines	991
Pictures	991
TextBoxes	992
Accessing the selected Shapes	992
Select a Shape Programmatically	992
Clear a Selection	993
Conversion in WPF Spreadsheet (SfSpreadsheet)	993
Convert to Image	993
Convert to PDF	993
Convert to HTML	994
Localization in WPF Spreadsheet (SfSpreadsheet)	994
Set Current UI Culture to the Application	994
Localization using Resource file	994
Modifying the localized strings in Resource file	996
Printing in WPF Spreadsheet (SfSpreadsheet)	997
Ribbon Customization in WPF Spreadsheet (SfSpreadsheet)	997

Using Control Template	997
Using Event	998
Custom Formula in WPF Spreadsheet (SfSpreadsheet)	1000
Cell Customization in WPF Spreadsheet (SfSpreadsheet)	1001
Limitations in WPF Spreadsheet (SfSpreadsheet)	1004
Release memory held by AutomationPeer	1004
TabControlExt	1004
WPF TabControl (TabControlExt) Overview.....	1004
Key features	1005
Getting Started with WPF TabControl (TabControlExt)	1005
Structure of TabControl	1005
Assembly deployment.....	1006
Adding WPF TabControl via designer.....	1006
Adding WPF TabControl via XAML	1006
Adding WPF TabControl via C#	1007
Adding TabItem.....	1007
Placement of TabItem.....	1008
Selecting TabItem.....	1009
Closing the tab item	1010
Add new TabItem using new button.....	1012
Tab list menu for switching tabs	1013
Enable or disable tab navigation bar	1015
Show or hide built-in context menu	1016
Localization support.....	1017
Theme	1017
DataBinding in WPF TabControl (TabControlExt)	1018
Adding tab items using data binding	1018
TabItem Header	1020
TabItem content	1021
Editing tab header.....	1021
Select tab in WPF TabControl (TabControlExt)	1022
Select tab item using mouse or keyboard	1022
Tab selection changed notification.....	1023
Load the previously selected tab item content	1023
Display mode of the selected tab item	1024

Customize selected tab item header	1025
Close tabs in WPF TabControl (TabControlExt)	1026
Closing tab item	1026
Show or hide close button	1027
Restrict or allow closing the tab item	1029
Hide or delete item when closing a tab	1030
Tab item closed notification	1031
TabControl Header in WPF TabControl (TabControlExt)	1031
Setting tab item header	1031
Edit tab item header at runtime	1032
Restrict header editing for specific tab item.....	1033
Custom UI for the edit tab item header.....	1033
Setting size and alignment of tab header	1034
Setting image for tab item header.....	1035
Setting tooltip	1036
Hide tab header when there is single tab item.....	1037
Customize tab item header.....	1037
Change tab item background.....	1037
Change tab item foreground.....	1038
Arrange tabs in WPF TabControl (TabControlExt)	1039
Rearrange position of tab items	1039
Tab item order changed notification	1041
Restrict tab item reordering	1042
Tab items alignment	1043
Arrange tab item on single or multiple lines.....	1044
Restrict size of a TabItem.....	1047
Navigate using mouse or keyboard	1047
Navigate using scroll button	1048
Navigate using tab list menu.....	1049
Scroll items using mouse wheel.....	1050
Pin and Unpin TabItems in WPF TabControl (TabControlExt)	1050
Enabling pin and unpin behaviors.....	1050
Functionality of PinButton	1051
Pin and Unpin tab items using PinButton	1051
Pin and Unpin the tab items programmatically	1051

Pin and Unpin tab items using ContextMenu	1052
Re-order pinned tabs	1053
NewButton Feature in WPF TabControl (TabControlExt)	1053
Adding New tab button and new tab item	1053
Select a new tab item while creating it by new button	1054
Auto hide new button when no child tab item.....	1055
Custom template for the new button.....	1056
Change background and border thickness of new button	1056
Context menu in WPF TabControl (TabControlExt)	1057
Default tab item context menu.....	1057
Custom context menu item for the tab items	1059
Hide default context menu items	1062
Custom template for default tab item context menu	1063
Tab list context menu for switching tabs.....	1063
Show hidden tab items in tab list context menu	1064
Show specific type tab items in tab list context menu	1065
Show multi-type tab items in tab list context menu	1066
Custom tab list context menu item	1067
CustomMenuItem as Separator.....	1070
Custom template for the tab list context menu	1072
Custom template for the tab list menu item	1072
Appearance in WPF TabControl (TabControlExt)	1073
Change flow direction	1073
Theme	1074
TabNavigation	1074
WPF Tab Navigation Overview.....	1074
Appearance and structure of the control	1075
Getting Started with WPF Tab Navigation	1076
Assembly deployment.....	1076
Creating simple application with TabNavigation	1076

Data binding in WPF Tab Navigation	1080
Binding IEnumerable.....	1080
Binding data from XML	1081
Appearance in WPF Tab Navigation.....	1085

Show/hide the Header	1085
Show/hide the NavigationButton	1086
Show/hide the TabStrip	1088
Animation in WPF Tab Navigation	1089
TabSplitter	1091
WPF Tab Splitter Overview	1091
Features	1091
Getting Started with WPF Tab Splitter	1091
Assembly deployment	1091
Adding the TabSplitter control via XAML	1091
Adding the TabSplitter control via C#	1092
Adding splitter item	1092
Tab orientation	1094
Collapsing bottom panel	1095
Theme	1096
Interactive Features in WPF Tab Splitter	1097
Adding TabSplitterItem to the TabSplitter Control	1097
Panel Items	1098
Splitter Page	1099
Collapsing Bottom Panel	1101
Setting BottomPanelHeight of TabSplitter	1102
Orientation in WPF Tab Splitter	1103
Selected Page in WPF Tab Splitter	1104
Layout Related Features in WPF Tab Splitter	1105
Customizing the Appearance of TabSplitter	1105
Hide TabSplitterItem header tab in TabSplitter	1106
TaskBar	1107
WPF TaskBar Overview	1107
Features	1107
Getting Started with WPF TaskBar	1107
Overview of Taskbar control	1108
Why to use our TaskBar control	1108
Creating the Taskbar and its children element using Docking Manager	1108
Theme	1110
Adding a TaskBar Item in WPF TaskBar control	1110

Adding Content to TaskBar Item	1111
Setting Header Image in WPF TaskBar	1112
Setting Group Padding in WPF TaskBar	1113
Changing the size of Expander Button in WPF TaskBar	1114
Collapsing the TaskBar in WPF TaskBar	1115
Setting Group Margin in WPF TaskBar	1116
Setting Group Width in WPF TaskBar	1117
Changing Orientation of Taskbar in WPF TaskBar	1119
GroupOrientationChanged Event	1120
Changing the flow directions in WPF TaskBar	1120
Setting the Animation Speed in WPF TaskBar	1121
Methods handled with Speed Property	1122
Appearance in WPF TaskBar	1122
Theme	1122
SfTextBoxExt	1123
WPF Autocomplete (SfTextBoxExt) Overview	1123
Getting Started with WPF Autocomplete (SfTextBoxExt)	1124
Assembly deployment	1124
Creating a simple application	1124
Populating AutoComplete with Data	1126
AutoComplete modes	1128
Selection	1129
Theme	1129
Autocomplete and filtering in WPF Autocomplete (SfTextBoxExt)	1130
AutoComplete source	1130
Custom data	1130
Customize using the ItemTemplate	1131
Filtering options	1132
Prefix characters constraint	1135
Working with case sensitivity	1136
Showing image in token and drop-down	1136
Display a message when suggestions are empty	1137
Restricting the maximum items filtered	1138
Single and multiple selection in WPF Autocomplete (SfTextBoxExt)	1138
Single selection	1138

Multi selection	1138
Multiple selection using tokens	1138
Multiple selection using delimiter	1141
Setting and retrieving SelectedItem	1142
Retrieving SelectedValue	1145
Displaying images.....	1146
Diacritic Sensitivity in WPF Autocomplete (SfTextBoxExt)	1146
Highlighting Matched Text in WPF Autocomplete (SfTextBoxExt)	1147
First occurrence	1147
Multiple occurrence.....	1148
Unmatched.....	1149
Textbox customization in WPF Autocomplete (SfTextBoxExt)	1149
Water mark	1150
Customizing the TextBox.....	1151
Setting the Dropdown Icon	1151
Setting the ClearButton	1152
Dropdown customization in WPF Autocomplete (SfTextBoxExt)	1153
Customize the background	1153
Drop-down placement.....	1153
Setting the maximum height	1155
Open the drop-down on focus.....	1155
Open drop-down with a delay	1156
Customizing the SelectedItem background	1156
How to.....	1157
Perform multi-path search in WPF Autocomplete	1157
SfTextInputLayout.....	1160
WPF TextInputLayout (SfTextInputLayout) Overview	1160
Key features	1161
Getting Started with WPF TextInputLayout (SfTextInputLayout).....	1161
Adding TextInputLayout reference	1161
Initialize TextInputLayout	1161
Adding hint.....	1162
Theme	1162
Supported Input Views in WPF TextInputLayout (SfTextInputLayout).....	1162
TextBox	1163

PasswordBox	1163
ComboBox	1163
ComboBoxAdv	1164
Autocomplete (SfTextBoxExt)	1165
Container Type in WPF TextInputLayout (SfTextInputLayout)	1165

Helper text	1168
Error message	1169
Character counter	1170
Custom Icons in WPF TextInputLayout (SfTextInputLayout)	1170
Leading view	1170
Trailing view	1171
Customization in WPF TextInputLayout (SfTextInputLayout)	1172
Focused color	1172
Unfocused color	1172
Error color	1173
Container color	1173
Outline corner radius	1174
Right to Left in WPF TextInputLayout (SfTextInputLayout)	1174
TileView	1175
WPF Tile View Overview	1175
Structure of the TileViewControl	1175
Key features	1176
Getting Started with WPF Tile View	1176
Structure of TileViewControl	1176
Assembly deployment	1176
Adding WPF TileViewControl via designer	1176
Adding WPF TileViewControl via XAML	1177

Adding WPF TileViewControl via C#	1177
Populating items using TileViewItem.....	1178
Populating items using collection binding	1179
Select a TileViewItem.....	1180
Selected item changed notification	1182
Arrange TileViewItem in rows and columns	1182
Minimize or maximize the TileViewItem	1183
Closing TileViewItem.....	1185
Custom UI of TileViewItem	1185
Theme	1186
Data Binding in WPF Tile View	1187
Data binding to Objects	1187
Data binding with XML.....	1188
Virtualization support	1190
TileViewItem header	1190
TileViewItem content.....	1192
Different UI for TileViewItem content	1193
Working with TileView in WPF Tile View	1194
Populating items using TileViewItem.....	1194
Populating items using binding.....	1195
Select a TileViewItem.....	1195
Selected item changed notification	1197
Display TileViewItem splitter	1197
Custom UI of TileViewItem header	1198
Custom UI of TileViewItem content.....	1200
Arrange TileViewItem in WPF Tile View.....	1201
Rearrange position of TileViewItem	1201
Restrict rearranging of TileViewItem	1202
Arrange TileViewItem in rows and columns	1202
Arrange TileViewItem in custom order.....	1203
Change row and column size	1205
Navigate to TileViewItem.....	1206
Navigate to hidden items using scroll bar.....	1206
Change built-in animation duration.....	1207
Disable built-in navigation animation	1208

Close TileViewItem in WPF Tile View	1209
Show close button.....	1209
Closing TileViewItem.....	1209
Closing TileViewItem programmatically	1210
Hide or delete TileViewItem when closing a item	1211
Custom UI of close button	1212
TileViewItem closing notification.....	1213
TileViewItem Header in WPF Tile View.....	1213
Setting TileViewItem header.....	1214
Change minimized and maximized header	1214
Hide the TileViewItem header	1215
Change TileViewItem header height.....	1216
Change TileViewItem header cursor.....	1217
Custom appearance of TileViewItem header	1217
Custom UI of TileViewItem header.....	1220
Custom UI of minimized TileViewItem header	1222
Custom UI of maximized TileViewItem header	1223
Minimize TileViewItem in WPF Tile View	1224
Minimize the TileViewItem	1224
Direction for minimized items	1225
Allocate size for minimized TileViewItem	1225
Change minimized TileViewItem content.....	1226
Custom UI of minimized TileViewItem content.....	1227
Change minimized TileViewItem header	1228
Minimized state changed notification	1228
Maximize TileViewItem in WPF Tile View	1228
Maximize the TileViewItem	1228
Maximize on click the header	1229
Show maximize button only on mouse hover	1230
Hide maximize button.....	1231
Custom UI of the maximize button.....	1231
Change maximized TileViewItem content	1232
Custom UI of maximized TileViewItem content	1233
Change maximized TileViewItem header	1234
Maximized state changed notification.....	1234

Appearance in WPF Tile View	1234
Setting the foreground.....	1235
Setting the background.....	1235
Setting the border	1236
Change flow direction	1237

SfTimePicker.....	1239
WPF TimePicker (SfTimePicker) Overview.....	1239
Getting Started with WPF TimePicker (SfTimePicker)	1240
Structure of SfTimePicker	1240
Assembly deployment.....	1240
Add control through designer.....	1241
Adding control manually in XAML.....	1241
Add control manually in C\#	1241
Setting the time	1242
Time changed notification	1242
Display the time using the FormatString	1243
Specifying format for the TimeSelector	1243
Set selected value on lost focus.....	1244
Localization support.....	1245
Theme	1245
Setting Time in WPF TimePicker (SfTimePicker).....	1246
Setting Time using property.....	1246
Setting Null Value.....	1246
Setting WaterMark text	1247
Set selected value on lost focus.....	1248
Setting the time using editing.....	1248
Setting the Input Scope for the On-Screen Keyboard.....	1249
Restrict selecting time limit	1249
Time changed notification	1250
Time Formatting in WPF TimePicker (SfTimePicker)	1250
Display the time using the FormatString	1251
Specifying format for the TimeSelector	1251
Customizing DropDown in WPF TimePicker (SfTimePicker)	1252
Change DropDown height.....	1252

Show or hide DropDown button	1252
Time Selector in WPF TimePicker (SfTimePicker)	1253
Change the Cell templates	1253
Change the HourCell Template	1253
Change the MinuteCell Template	1255
Change the MeridiemCell Template	1256
Change size of cells	1257
TimeSelector item spacing	1258
Appearance in WPF TimePicker (SfTimePicker)	1259
Setting the Foreground	1259
Setting the Background	1259
Change flow direction	1260
Theme	1261
TimeSpanEdit	1262
WPF TimeSpan Editor (TimeSpanEdit) Overview	1262
Key features	1262
Getting Started with WPF TimeSpan Editor (TimeSpanEdit)	1262
Control Structure	1262
Assembly deployment	1262
Adding WPF TimeSpanEdit via designer	1263
Adding WPF TimeSpanEdit via XAML	1263
Adding WPF TimeSpanEdit via C\#	1263
Set or change time span value	1264
Change display format of time span	1264
Value Changed Notification	1265
Restrict the time within minimum and maximum time span	1265
Localization support	1266
Theme	1266
Working with TimeSpanEdit in WPF TimeSpan Editor (TimeSpanEdit)	1266
Date, hour and minute field navigation	1267
Increase or decrease the time fields with specific interval	1267
Change the time value	1267
Setting null value	1269
Show watermark when value is null	1270
Change display format of time span	1270

Value Changed Notification	1271
ReadOnly support	1272
Restrict the time within minimum and maximum time span	1272
Appearance in WPF TimeSpan Editor (TimeSpanEdit).....	1272
Setting the background.....	1272
Setting the foreground.....	1273
Change flow direction	1273
Theme	1274
ToolBarAdv.....	1274
WPF ToolBar (ToolBarAdv) Overview	1274
Features	1274
Getting Started with WPF ToolBar (ToolBarAdv).....	1274
Adding ToolBarAdv to a WPF Application.....	1274
Appearance and Structure of the Control	1275
Setting icon template.....	1275
Properties.....	1278
Theme	1281
Dealing with ToolBarAdv control in WPF ToolBar (ToolBarAdv)	1281
Specifying the Position of ToolBarAdv's in a ToolBarTrayAdv	1281
ToolBarAdv with Overflow items	1282
Show or hide Gripper	1283
Orientation of ToolBarTrayAdv	1283
Add or Remove buttons	1284
Hiding the ToolBarItem	1285
ToolBarAdv State in WPF ToolBar (ToolBarAdv).....	1286
Specifying location for floating ToolBarAdv.....	1287
Restrict Docking of ToolBarAdv for a specific position	1287
ToolBarManager in WPF ToolBar (ToolBarAdv).....	1288
Customization in WPF ToolBar (ToolBarAdv)	1289
Customizing Floating ToolBarAdv	1289
Customize FrameworkElement's Style	1289

SfRangeSlider

WPF Range Slider (SfRangeSlider) Overview

[SfRangeSlider](#) control allows the value range to be selected within the defined minimum and maximum limit. The range can be selected by moving the Thumb control along a track. In terms of appearance, this control is highly customizable and offers many options such as orientation, selection range, custom label support, touch support, snap to tick, tick placement, tooltip support etc.

Key Features:

- **Orientation** — Set the orientation of the RangeSlider either horizontally or vertically.
- **SelectionRange** — Select the range of values using two thumbs.
- **Move the Thumb to the Tapped Position** — Allow the thumb of RangeSlider to tapped position of the track.
- **Styling and Appearance** — The control is completely customizable in terms of the UI. Change the appearance of the control as required.
- **ToolTip Support** — Shows the value of the RangeSlider. It is fully customizable.
- **Gestures** — Provides both KeyGesture and MouseGesture.

Getting Started with WPF Range Slider (SfRangeSlider)

This section describes how to design a [SfRangeSlider](#) control in a WPF application and overview of its basic functionalities.

Assembly deployment

Namespace: Syncfusion.Windows.Controls.Input

Assembly: Syncfusion.SfInput.WPF (in Syncfusion.SfInput.WPF.dll)

Dependent assembly: Syncfusion.SfShared.WPF.dll

Creating a simple application with SfRangeSlider

The [SfRangeSlider](#) control can be added to an application using Visual Studio.

Create the WPF application with [SfRangeSlider](#) control as follows:

1. [Creating project](#)
2. [Adding control via designer](#)
3. [Adding control manually in code](#)

Creating the project

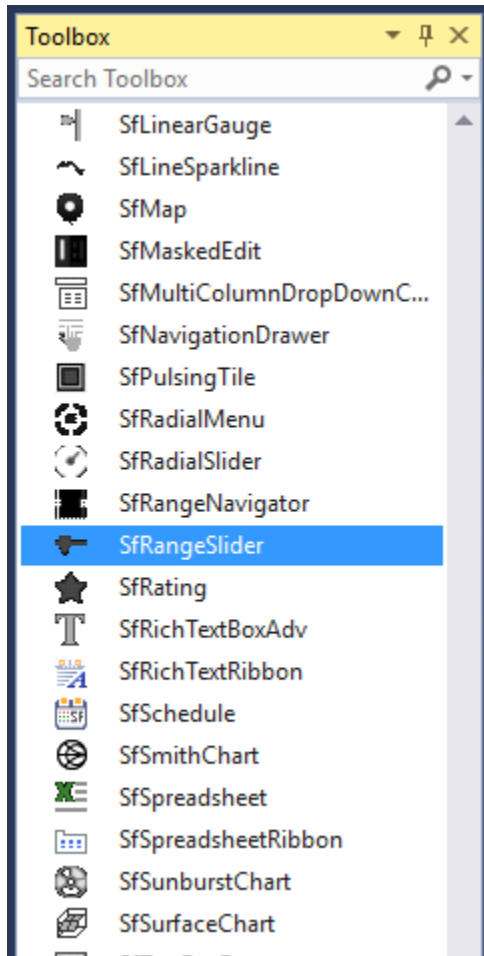

The steps to create a [SfRangeSlider](#) control by using Visual Studio in C# are as follows:

1. Open Visual Studio. 2. On the File menu, select New -> Project. This opens the New Project Dialog box.

Adding a control via designer

[SfRangeSlider](#) control can be added to the application by dragging it from the toolbox and dropping it in a designer view. The following required assembly references will be added automatically:

- Syncfusion.SfInput.WPF
- Syncfusion.SfShared.WPF

XML

```
<editors:SfRangeSlider
Width="500"
HorizontalAlignment="Center"
VerticalAlignment="Center"
Maximum="100"
Minimum="0"
Value="50" />
```

Adding a control manually in code

The following code sample shows how to create the [SfRangeSlider](#) from code-behind.

C#

```
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 500,
    HorizontalAlignment = HorizontalAlignment.Center,
    VerticalAlignment = VerticalAlignment.Center,
    Minimum = 0,
```

```
Maximum = 100,
Value = 60
};
```

Theme

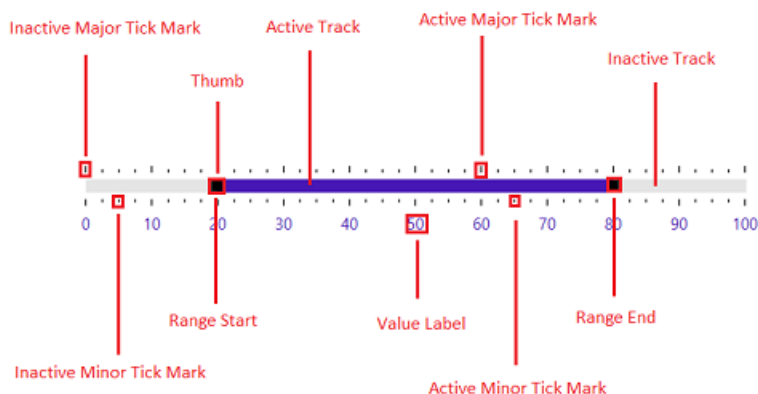

SfRangeSlider supports various built-in themes. Refer to the below links to apply themes for the SfRangeSlider,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Visual Structure in WPF Range Slider (SfRangeSlider)

This section describes the visual elements of the RangeSlider control and defines terms and concepts used in the RangeSlider.

- **Inactive Major Tick Mark** — Inactive major ticks to give the better indication between the Minimum to RangeStart and RangeEnd to Maximum.
- **Inactive Minor Tick Mark** — Inactive minor ticks to give the better indication between Major ticks in unselected part.
- **Active Minor Tick Mark** — Active minor ticks to give the better indication between Major ticks in selection part.
- **Active Major Tick Mark** — Active major ticks to give the better indication between the RangeStart and RangeEnd thumbs.
- **Thumb** — Thumb can be dragged along the track.
- **Active Track** — Selection range marked with RangeStart and RangeEnd thumbs.
- **Inactive Track** — The horizontal or vertical line is used to move the thumbs along it.
- **Range Start** — Thumb indicates the start of the selection range.
- **Range End** — Thumb indicates the end of the selection range.

- **Value Label** — indicates the value of the RangeSlider.

Minimum and Maximum in WPF Range Slider (SfRangeSlider)

Gets or sets the minimum and maximum possible value of the range.

XML

```
<editors:SfRangeSlider  
Width="500"  
Maximum="100"  
Minimum="0" />
```

C#

```
Grid parentGrid = new Grid();  
SfRangeSlider rangeSlider = new SfRangeSlider()  
{  
    Width = 500,  
    Maximum = 100,  
    Minimum = 0  
};  
parentGrid.Children.Add(rangeSlider);  
this.Content = parentGrid;
```

Ticks in WPF Range Slider (SfRangeSlider)

RangeSlider makes it possible to place tick marks along the track in a uniform manner and also to customize the position of the tick marks.

Tick Frequency

The [TickFrequency](#) property is used to define the number of ticks along the track, based on Minimum and Maximum values.

XML

```
<editors:SfRangeSlider  
Width="200"  
Maximum="100"  
Minimum="0"  
TickFrequency="20"  
Value="40" />
```

C#

```
Grid parentGrid = new Grid();  
SfRangeSlider rangeSlider = new SfRangeSlider()  
{  
    Width = 200,  
    Maximum = 100,  
    Minimum = 0,  
    TickFrequency = 20,  
    Value = 40  
};  
parentGrid.Children.Add(rangeSlider);  
this.Content = parentGrid;
```

Note: When the `SnapTo` property is set to `Ticks`, the `TickFrequency` is used to specify the interval between snap points.

MinorTickFrequency

The `MinorTickFrequency` property, determines the number of minor ticks on the track between the major ticks.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
MinorTickFrequency="3"
TickFrequency="10"
TickPlacement="BottomRight"
Value="40" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    MinorTickFrequency=3,
    TickFrequency = 10,
    TickPlacement=TickPlacement.BottomRight,
    Value = 40
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

Step Frequency

When the `SnapTo` property is set to `StepValues`, the `StepFrequency` property is used to specify the interval between snap points.

XML

```
<editors:SfRangeSlider
Width="200"
```

```
VerticalAlignment="Center"  
Maximum="100"  
Minimum="0"  
StepFrequency="20"  
Value="40" />
```

C#

```
Grid parentGrid = new Grid();  
SfRangeSlider rangeSlider = new SfRangeSlider()  
{  
    Width = 200,  
    Maximum = 100,  
    Minimum = 0,  
    StepFrequency = 20,  
    Value = 40  
};  
parentGrid.Children.Add(rangeSlider);  
this.Content = parentGrid;
```

Snaps To

The [SnapsTo](#) property determines whether the [SfRangeSlider](#) snaps to steps or ticks. Available options for this property are

1. StepValues
2. Ticks

Default option is StepValues and StepFrequency property is used to specify the interval between snap points in this case. When the SnapsTo property is set to Ticks, the TickFrequency property is used to specify the interval between snap points.

Tick Placement

The [TickPlacement](#) property is used to determine where to draw tick marks in relation to the track. Available options for this property are

1. BottomRight
2. Inline
3. None
4. Outside
5. TopLeft

The default option is Inline.

BottomRight

Tick marks are placed either below the track in horizontal orientation or right of the track in vertical orientation.

XML

```
<editors:SfRangeSlider  
    Width="300"  
    Maximum="100"
```

```

Minimum="0"
TickFrequency="20"
TickPlacement="BottomRight"
Value="40" />

```

C#

```

Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 200,
    Maximum = 100,
    Minimum = 0,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight,
    Value = 40
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;

```

Note: In Vertical Orientation, this option places the ticks to right side.

TopLeft

Tick marks are placed either above the track in horizontal orientation or left of the track in vertical orientation.

XML

```

<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
TickFrequency="20"
TickPlacement="TopLeft"
Value="40" />

```

C#

```

Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 200,
    Maximum = 100,
    Minimum = 0,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.TopLeft,
    Value = 40
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;

```

Note: In Vertical Orientation, this option places the ticks to left side.

Outside

Tick marks are placed on both sides of the track either in horizontal or vertical orientation.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
TickFrequency="20"
TickPlacement="Outside"
Value="40" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 200,
    Maximum = 100,
    Minimum = 0,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.Outside,
    Value = 40
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

Inline

Ticks are placed inside the track.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
TickFrequency="20"
TickPlacement="Inline"
Value="40" />
```

C#

```
Grid parentGrid = new Grid();
```

```
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 200,
    Maximum = 100,
    Minimum = 0,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.Inline,
    Value = 40
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

None

No Tick mark appears.

XML

```
<editors:SfRangeSlider
    Width="300"
    Maximum="100"
    Minimum="0"
    TickFrequency="20"
    TickPlacement="None"
    Value="40" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 200,
    Maximum = 100,
    Minimum = 0,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.None,
    Value = 40
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

Range in WPF Range Slider (SfRangeSlider)

The [SfRangeSlider](#) control provides support to select the range of value using two thumbs.

ShowRange

When ShowRange property is set to true, two thumbs are placed in the track. One thumb is used to update the start of the range selection and another thumb is used to update the end of the range selection.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
RangeEnd="70"
RangeStart="40"
ShowRange="True" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    ShowRange = true,
    RangeStart = 40,
    RangeEnd = 70
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

Note: When the ShowRange property is set to true, both ToolTip will display RangeStart and RangeEnd.

RangeStart

Gets or sets the start value of the range start.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
RangeEnd="70"
RangeStart="40"
ShowRange="True" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
```

```
{  
    Width = 300,  
    Maximum = 100,  
    Minimum = 0,  
    ShowRange = true,  
    RangeStart = 40,  
    RangeEnd = 70  
};  
parentGrid.Children.Add(rangeSlider);  
this.Content = parentGrid;
```

RangeEnd

Gets or sets the end value of the range end.

XML

```
<editors:SfRangeSlider  
    Width="300"  
    Maximum="100"  
    Minimum="0"  
    RangeEnd="70"  
    RangeStart="40"  
    ShowRange="True" />
```

C#

```
Grid parentGrid = new Grid();  
SfRangeSlider rangeSlider = new SfRangeSlider()  
{  
    Width = 300,  
    Maximum = 100,  
    Minimum = 0,  
    ShowRange = true,  
    RangeStart = 40,  
    RangeEnd = 70  
};  
parentGrid.Children.Add(rangeSlider);  
this.Content = parentGrid;
```

Drag Selected Range

The `AllowRangeDrag` API allows the range in the Range Slider to be adjusted and the range to be dragged without changing the start and end ranges individually. The default value of `AllowRangeDrag` is false.

XML

```
<editors:SfRangeSlider
Width="300"
AllowRangeDrag="True"
Maximum="100"
Minimum="0"
RangeEnd="20"
RangeStart="0"
ShowRange="True"
ShowValueLabels="True"
TickFrequency="20" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    ShowRange = true,
    RangeStart = 0,
    RangeEnd = 20,
    ShowValueLabels = true,
    TickFrequency = 20,
    AllowRangeDrag = true
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

Intermediate Values in WPF Range Slider (SfRangeSlider)

It is possible to get an intermediate value before either the tick value or the step value is snapped when interacting with `SfRangeSlider`.

IntermediateValue

Gets the intermediate value. This works when `ShowRange` is false.

IntermediateRangeStart

Gets the intermediate `RangeStart` value.

IntermediateRangeEnd

Gets the intermediate `RangeEnd` value.

Note: Above properties are read only properties and cannot set through XAML or code behind.

Thumb ToolTip in WPF Range Slider (SfRangeSlider)

The Thumb tooltip displays the current value where the Thumb stands.

Thumb ToolTip Precision

[ThumbToolTipPrecision](#) property is used to define the precision of the value displayed in the tooltip.

XML

```
<editors:SfRangeSlider
Width="300"
VerticalAlignment="Center"
Maximum="100"
Minimum="0"
ThumbToolTipPrecision="2"
Value="50" />
```

Note: ThumbToolTipPrecision property is only applicable, if ToolTipFormat value is N.

Thumb ToolTipFormat

The [ToolTipFormat](#) property, specifies the format specifier by which to format the ToolTip display value.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
ToolTipFormat="C0"
Value="50" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    ToolTipFormat= C0,
    Value = 50
};
```

```
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

Note: Default value of `ToolTipFormat` is N.

Thumb ToolTip Position

The position of the Thumb tooltip in relation to the Thumb can be controlled by the [ThumbToolTipPlacement](#) property. It has the following options.

1. BottomRight
2. TopLeft
3. None

BottomRight

Tooltip is placed either below the Thumb in horizontal orientation or right of the Thumb in vertical orientation.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
ThumbToolTipPlacement="BottomRight"
Value="50" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    ThumbToolTipPlacement = ThumbToolTipPlacement.BottomRight,
    Value = 50
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

Note: This option displays the tooltip to right in vertical orientation.

TopLeft

Tooltip is placed either above the Thumb in horizontal orientation or left of the Thumb in vertical orientation.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
ThumbToolTipPlacement="TopLeft"
Value="50" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    ThumbToolTipPlacement = ThumbToolTipPlacement.TopLeft,
    Value = 50
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

Note: This option displays the tooltip to left in vertical orientation.

None

No Tooltip appears.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
ThumbToolTipPlacement="None"
```

```
Value="50" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    ThumbToolTipPlacement = ThumbToolTipPlacement.None,
    Value = 50
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

**ThumbInterval**

[ThumbInterval](#) is an interval between the two thumbs, the thumbs cannot be moved within this range.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
RangeEnd="50"
RangeStart="20"
ShowRange="True"
ThumbInterval="10"
Value="50" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    ShowRange = true,
    RangeStart = 20,
    RangeEnd = 60,
    ThumbInterval = 10,
    Value = 50
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

Orientation in WPF Range Slider (SfRangeSlider)

The [Orientation](#) property has the following two options.

1. Horizontal
2. Vertical

The default option is Horizontal.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
Orientation="Horizontal"
Value="50" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    Value = 50,
    Orientation = Orientation.Horizontal
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

The following code sample illustrates how to set vertical orientation to [SfRangeSlider](#).

XML

```
<editors:SfRangeSlider
Height="300"
HorizontalAlignment="Center"
VerticalAlignment="Center"
Maximum="100"
Minimum="0"
Orientation="Vertical"
Value="50" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    Value = 50,
    Orientation = Orientation.Vertical
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

**Direction Reversed in WPF Range Slider (SfRangeSlider)**

The direction of increasing value can be changed using [IsDirectionReversed](#) property. When this property is set to True, the direction of increasing value is towards left in the horizontal orientation and down in the vertical orientation. The default is false.

XML

```
<editors:SfRangeSlider
Width="300"
IsDirectionReversed="True"
Maximum="100"
Minimum="0"
Value="30" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
```

```

Width = 300,
Maximum = 100,
Minimum = 0,
Value = 30,
IsDirectionReversed = true
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;

```

Gestures in WPF Range Slider (SfRangeSlider)

Keyboard

The focused Thumb moves a certain distance on every navigation key press.

Left Key

Thumb moves left and updates the corresponding value.

Right Key

Thumb moves right and updates the corresponding value.

Down Key

Thumb moves down and updates the corresponding value.

Up Key

Thumb moves up and updates the corresponding value.

Note: When the SnapsTo property is set to Ticks then the Thumb snaps to next tick based on the navigation key pressed.

Mouse

RangeSlider allows the mouse gesture to update the value of the SfRangeSlider either by dragging the thumb to a certain distance or by pressing the specified region in the track.

Note: When the thumb is released between two steps or when the pointer is pressed between two steps, then the value and thumb automatically snaps to nearest value.

Label Support in WPF Range Slider (SfRangeSlider)

This feature allows the display of labels for custom values given in the collection of CustomLabels when the ShowCustomLabels property is set to true. When ShowValueLabels is set to true, it also displays labels for all the tick values.

Property Table

Property	Description
CustomLabels	It describes an observable collection of items that contains the custom labels and the values for that the labels should be displayed.

ShowCustomLabels	This property allows the display of custom labels based on the CustomLabels collection for particular values.
ShowValueLabels	This property allows the tick labels to be displayed.
LabelPlacement	This property specifies the position of the custom label placement.
ValuePlacement	This property specifies the position of the label for all of the ticks.
LabelOrientation	LabelOrientation specifies the orientation of the labels as either horizontal or vertical.

CustomLabels

CustomLabels is an observable collection of items that contains the Label and Value properties. Create an observable collection of items by specifying the custom labels for corresponding values as illustrated in the following code example.

Create a ViewModel class with CustomCollection property.

C#

```
public class ViewModel
{
    private ObservableCollection<Items> customCollection = new
    ObservableCollection<Items>();
    public ObservableCollection<Items> CustomCollection
    {
        get { return customCollection; }
        set { customCollection = value; }
    }
    public ViewModel()
    {
        this.customCollection.Add(new Items() { label = "Min", value = 100 });
        this.customCollection.Add(new Items() { label = "Max", value = 200 });
    }
}
```

In the following code example, the CustomCollection property is bound to [CustomLabels](#) property in the SfRangeSlider control that populates the custom labels collection.

XML

```
<editors:SfRangeSlider
Width="300"
CustomLabels="{Binding CustomCollection}"
Maximum="200"
Minimum="100"
ShowCustomLabels="True"
TickFrequency="20"
TickPlacement="Outside"
ThumbToolTipPlacement="BottomRight"/>
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 200,
    Minimum = 100,
    ShowCustomLabels = true,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.Outside,
    ThumbToolTipPlacement = ThumbToolTipPlacement.BottomRight
};
Binding binding = new Binding("CustomCollection");
binding.Source = viewModel;
rangeSlider.SetBinding(SfRangeSlider.CustomLabelsProperty, binding);
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

RangeSlider with CustomLabels

ShowCustomLabels

The default value for [ShowCustomLabels](#) is false. When set to true, it displays the custom labels with the corresponding Tool tip for specific values based on the [CustomLabels](#) collection.

XML

```
<editors:SfRangeSlider
    Width="300"
    CustomLabels="{Binding CustomCollection}"
    Maximum="200"
    Minimum="100"
    ShowCustomLabels="True"
    TickFrequency="20"
    TickPlacement="Outside"
    ThumbToolTipPlacement="BottomRight"/>
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 200,
    Minimum = 100,
    ShowCustomLabels = true,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.Outside,
    ThumbToolTipPlacement = ThumbToolTipPlacement.BottomRight
};
Binding binding = new Binding("CustomCollection");
binding.Source = viewModel;
```

```
rangeSlider.SetBinding(SfRangeSlider.CustomLabelsProperty, binding);
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

RangeSlider with ShowCustomLabels

LabelPlacement

[LabelPlacement](#) property describes the position of the custom labels for particular values mentioned in the CustomLabels collection. Available options for this property are:

1. BottomRight
2. TopLeft

The following code example illustrates the usage of the LabelPlacement property. The output is displayed in the corresponding images.

XML

```
<editors:SfRangeSlider
Width="300"
CustomLabels="{Binding CustomCollection}"
Maximum="200"
Minimum="100"
ShowCustomLabels="True"
TickFrequency="20"
TickPlacement="Outside"
LabelPlacement="BottomRight"/>
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 200,
    Minimum = 100,
    ShowCustomLabels = true,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.Outside,
    LabelPlacement = LabelPlacement.BottomRight
};
Binding binding = new Binding("CustomCollection");
binding.Source = viewModel;
rangeSlider.SetBinding(SfRangeSlider.CustomLabelsProperty, binding);
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

LabelPlacement in BottomRight

XML

```
<editors:SfRangeSlider
Width="300"
CustomLabels="{Binding CustomCollection}"
Maximum="200"
Minimum="100"
ShowCustomLabels="True"
TickFrequency="20"
TickPlacement="Outside"
LabelPlacement="TopLeft"/>
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 200,
    Minimum = 100,
    ShowCustomLabels = true,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.Outside,
    LabelPlacement = LabelPlacement.TopLeft
};
Binding binding = new Binding("CustomCollection");
binding.Source = viewModel;
rangeSlider.SetBinding(SfRangeSlider.CustomLabelsProperty, binding);
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

LabelPlacement in TopLeft

ShowValueLabels

The default value of the [ShowValueLabels](#) property is false. When set to true, it displays the label for all the ticks based on the ValuePlacement property.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
ShowValueLabels="True"
TickFrequency="20"
TickPlacement="BottomRight"
Value="40" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    Value = 40,
    ShowValueLabels = true,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

ShowValueLabels property

ValuePlacement

The [ValuePlacement](#) property describes the position of the labels for all the ticks. Available options for this property are:

1. BottomRight
2. TopLeft

The following code example illustrates the usage of [ValuePlacement](#) property. The output is displayed in the corresponding images.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
ShowValueLabels="True"
TickFrequency="20"
TickPlacement="Outside"
ValuePlacement="TopLeft"
Value="40" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    Value = 40,
    ShowValueLabels = true,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight,
    ValuePlacement = ValuePlacement.TopLeft
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

ValuePlacement in TopLeft.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
ShowValueLabels="True"
TickFrequency="20"
TickPlacement="Outside"
ValuePlacement="BottomRight"
Value="40" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    Value = 40,
    ShowValueLabels = true,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight,
    ValuePlacement = ValuePlacement.BottomRight
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

ValuePlacement in BottomRight

LabelOrientation

The [LabelOrientation](#) property describes the orientation of the labels for both ticks and custom labels. Available options for this property are:

1. Horizontal
2. Vertical

The following code example illustrates the usage of [LabelOrientation](#) property. The output is displayed in the corresponding images.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="200"
Minimum="100"
ShowValueLabels="True"
TickFrequency="20"
TickPlacement="Outside"
ValuePlacement="BottomRight"
LabelOrientation="Horizontal"
Value="140" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 200,
    Minimum = 100,
    Value = 140,
    ShowValueLabels = true,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.Outside,
    ValuePlacement = ValuePlacement.BottomRight,
    LabelOrientation = Orientation.Horizontal
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

LabelOrientation as Horizontal

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="200"
Minimum="100"
ShowValueLabels="True"
TickFrequency="20"
TickPlacement="Outside"
ValuePlacement="BottomRight"
LabelOrientation="Vertical"
Value="140" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 200,
    Minimum = 100,
    Value = 140,
    ShowValueLabels = true,
    TickFrequency = 20,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.Outside,
    ValuePlacement = ValuePlacement.BottomRight,
    LabelOrientation = Orientation.Vertical
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

LabelOrientation as Vertical

Touch Support in WPF Range Slider (SfRangeSlider)

[MoveToPoint](#) API allows the [SfRangeSlider](#) to move the thumb by tapping or clicking the track of the [SfRangeSlider](#). This property provides the following options:

- MoveToTapPosition

- IncrementBySmallChange
- IncrementByLargeChange
- None

MoveToTapPosition

To move the thumb of [SfRangeSlider](#) to the tapped position, set the [MoveToPoint](#) property to `MoveToTapPosition`, and then tap or click the track of the [SfRangeSlider](#). This moves the thumb to the tapped position.

The following code example and screenshot illustrates the above.

XML

```
<editors:SfRangeSlider
Width="400"
LargeChange="10"
Maximum="100"
Minimum="0"
MoveToPoint="MoveToTapPosition"
SmallChange="5"
Value="50" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 400,
    Maximum = 100,
    Minimum = 0,
    SmallChange = 5,
    LargeChange = 10,
    MoveToPoint = MovePoint.MoveToTapPosition,
    Value = 50
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

IncrementBySmallChange

To move the [SfRangeSlider](#) thumb based on the `SmallChange` value, set the [MoveToPoint](#) property to `IncrementBySmallChange`, and then tap or click the track of the [SfRangeSlider](#). This increments the [SfRangeSlider](#) value by the `SmallChange` value.

The following code example and screenshot illustrates the above.

XML

```
<editors:SfRangeSlider
Width="400"
LargeChange="10"
Maximum="100"
Minimum="0"
MoveToPoint="IncrementBySmallChange"
SmallChange="5"
Value="50" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 400,
    Maximum = 100,
    Minimum = 0,
    SmallChange = 5,
    LargeChange = 10,
    MoveToPoint = MovePoint.IncrementBySmallChange,
    Value = 50
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

IncrementByLargeChange

To move the [SfRangeSlider](#) thumb based on the LargeChange value, set the [MoveToPoint](#) property to [IncrementByLargeChange](#), and then tap the track of the [SfRangeSlider](#). This increments the [SfRangeSlider](#) value by the LargeChange value.

The following code example and screenshot illustrates the above.

XML

```
<editors:SfRangeSlider
Width="400"
LargeChange="10"
Maximum="100"
Minimum="0"
MoveToPoint="IncrementByLargeChange"
SmallChange="5"
Value="50" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
```

```
Width = 400,
Maximum = 100,
Minimum = 0,
SmallChange = 5,
LargeChange = 10,
MoveToPoint = MovePoint.IncrementByLargeChange,
Value = 50
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

None

To fix the thumb movement of the [SfRangeSlider](#), set the `MoveToPoint` property to *None*. This does not allow thumb movement of the [SfRangeSlider](#).

The following code example and screenshot illustrates the above.

XML

```
<editors:SfRangeSlider
Width="400"
LargeChange="10"
Maximum="100"
Minimum="0"
MoveToPoint="None"
SmallChange="5"
Value="50" />
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
Width = 400,
Maximum = 100,
Minimum = 0,
SmallChange = 5,
LargeChange = 10,
MoveToPoint = MovePoint.None,
Value = 50
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

Styling and Appearance in WPF Range Slider (SfRangeSlider)

[SfRangeSlider](#) makes it possible to change the appearance by providing certain properties.

InactiveTrackStyle

Modify the appearance of the inactive track using the [InactiveTrackStyle](#) property.

XML

```
<Grid>
<Grid.Resources>
<ResourceDictionary>
<Style x:Key="InactiveTrackStyle" TargetType="Rectangle">
<Setter Property="Height" Value="3" />
<Setter Property="Fill" Value="#a8a8a8" />
<Setter Property="RadiusX" Value="2" />
<Setter Property="RadiusY" Value="2" />
</Style>
</ResourceDictionary>
</Grid.Resources>
<editors:SfRangeSlider
Width="300"
InactiveTrackStyle="{StaticResource InactiveTrackStyle}"
Maximum="100"
Minimum="0" />
</Grid>
```

C#

```
Grid parentGrid = new Grid();
Style inactiveTrackStyle = new Style(typeof(Rectangle));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.FillProperty, new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#a8a8a8"))));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.HeightProperty,
(double)3));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.RadiusXProperty,
(double)2));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.RadiusYProperty,
(double)2));
Resources.Add("inactiveTrackStyle", inactiveTrackStyle);
SfRangeSlider rangeSlider = new SfRangeSlider()
{
Width = 300,
Minimum = 0,
Maximum = 100,
InactiveTrackStyle = inactiveTrackStyle
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

ActiveTrackStyle

Modify the appearance of the active track by using the [ActiveTrackStyle](#) property.

XML

```

<Grid>
<Grid.Resources>
<ResourceDictionary>
<Style x:Key="InactiveTrackStyle" TargetType="Rectangle">
<Setter Property="Height" Value="3" />
<Setter Property="Fill" Value="#a8a8a8" />
<Setter Property="RadiusX" Value="2" />
<Setter Property="RadiusY" Value="2" />
</Style>
<Style x:Key="ActiveTrackStyle" TargetType="Rectangle">
<Setter Property="Height" Value="3" />
<Setter Property="Fill" Value="#505050" />
</Style>
</ResourceDictionary>
</Grid.Resources>
<editors:SfRangeSlider
Width="300"
ActiveTrackStyle="{StaticResource ActiveTrackStyle}"
InactiveTrackStyle="{StaticResource InactiveTrackStyle}"
Maximum="100"
Minimum="0"
RangeEnd="60"
RangeStart="20"
ShowRange="True" />
</Grid>

```

C#

```

Grid parentGrid = new Grid();
Style inactiveTrackStyle = new Style(typeof(Rectangle));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.FillProperty, new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#a8a8a8"))));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.HeightProperty,
(double)3));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.RadiusXProperty,
(double)2));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.RadiusYProperty,
(double)2));
Resources.Add("inactiveTrackStyle", inactiveTrackStyle);
Style activeTrackStyle = new Style(typeof(Rectangle));
activeTrackStyle.Setters.Add(new Setter(Rectangle.FillProperty, new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#505050"))));
activeTrackStyle.Setters.Add(new Setter(Rectangle.HeightProperty,
(double)3));
Resources.Add("activeTrackStyle", activeTrackStyle);
SfRangeSlider rangeSlider = new SfRangeSlider()
{
Width = 300,
Minimum = 0,
Maximum = 100,
ShowRange = true,
RangeStart = 20,
RangeEnd = 60,
ActiveTrackStyle = activeTrackStyle,

```

```

InactiveTrackStyle = inactiveTrackStyle
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;

```

ThumbStyle

Modify the appearance of the thumb by using the [ThumbStyle](#) property.

XML

```

<Grid>
<Grid.Resources>
<ResourceDictionary>
<Style x:Key="InactiveTrackStyle" TargetType="Rectangle">
<Setter Property="Height" Value="3" />
<Setter Property="Fill" Value="#a8a8a8" />
<Setter Property="RadiusX" Value="2" />
<Setter Property="RadiusY" Value="2" />
</Style>
<Style x:Key="ActiveTrackStyle" TargetType="Rectangle">
<Setter Property="Height" Value="3" />
<Setter Property="Fill" Value="#505050" />
</Style>
<Style x:Key="ThumbStyle" TargetType="Thumb">
<Setter Property="Width" Value="13" />
<Setter Property="Height" Value="13" />
<Setter Property="Background" Value="#0095ff" />
<Setter Property="Template">
<Setter.Value>
<ControlTemplate TargetType="Thumb">
<Border
x:Name="ThumbBorder"
Background="{TemplateBinding Background}"
BorderBrush="{TemplateBinding BorderBrush}"
CornerRadius="12" />
</ControlTemplate>
</Setter.Value>
</Setter>
</Style>
</ResourceDictionary>
</Grid.Resources>
<editors:SfRangeSlider
Width="300"
ActiveTrackStyle="{StaticResource ActiveTrackStyle}"
InactiveTrackStyle="{StaticResource InactiveTrackStyle}"
Maximum="100"
Minimum="0"
RangeEnd="60"
RangeStart="20"
ShowRange="True"
ThumbStyle="{StaticResource ThumbStyle}" />
</Grid>

```

C#

```

Grid parentGrid = new Grid();
Style inactiveTrackStyle = new Style(typeof(Rectangle));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.FillProperty, new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#a8a8a8"))));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.HeightProperty,
(double)3));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.RadiusXProperty,
(double)2));
inactiveTrackStyle.Setters.Add(new Setter(Rectangle.RadiusYProperty,
(double)2));
Resources.Add("inactiveTrackStyle", inactiveTrackStyle);
Style activeTrackStyle = new Style(typeof(Rectangle));
activeTrackStyle.Setters.Add(new Setter(Rectangle.FillProperty, new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#505050"))));
activeTrackStyle.Setters.Add(new Setter(Rectangle.HeightProperty,
(double)3));
Resources.Add("activeTrackStyle", activeTrackStyle);
ControlTemplate template = new ControlTemplate(typeof(Thumb));
FrameworkElementFactory elemFactory = new
FrameworkElementFactory(typeof(Border));
elemFactory.Name = "Border";
elemFactory.SetValue(Border.CornerRadiusProperty, new CornerRadius(12));
elemFactory.SetValue(Border.BackgroundProperty, new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#0095ff")));
elemFactory.SetValue(Border.BorderBrushProperty, new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#0095ff")));
template.VisualTree = elemFactory;
Style thumbStyle = new Style(typeof(Thumb));
thumbStyle.Setters.Add(new Setter(Thumb.BackgroundProperty, new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#0095ff"))));
thumbStyle.Setters.Add(new Setter(Thumb.HeightProperty, (double)13));
thumbStyle.Setters.Add(new Setter(Thumb.WidthProperty, (double)13));
thumbStyle.Setters.Add(new Setter(Thumb.TemplateProperty, template));
Resources.Add("thumbStyle", thumbStyle);
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Minimum = 0,
    Maximum = 100,
    ShowRange = true,
    RangeStart = 20,
    RangeEnd = 60,
    ActiveTrackStyle = activeTrackStyle,
    InactiveTrackStyle = inactiveTrackStyle,
    ThumbStyle = thumbStyle
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;

```

**Tick Customization**

Modify the appearance of the ticks by using the following properties:

- TickStroke
- ActiveTickStroke
- TickLength
- TickStrokeThickness
- MinorTickStroke
- ActiveMinorTickStroke
- MinorTickLength
- MinorTickStrokeThickness

TickStroke

Use the [TickStroke](#) property, to change the color of major ticks.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
RangeEnd="60"
RangeStart="20"
ShowRange="True"
TickFrequency="10"
TickPlacement="BottomRight"
TickStroke="#FF0000" />
</Grid>
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    RangeEnd = 60,
    RangeStart = 20,
    ShowRange = true,
    TickFrequency = 10,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight,
    TickStroke = new
    SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF0000"))
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

ActiveTickStroke

Use the [ActiveTickStroke](#) property, to change the active major ticks color.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
RangeEnd="60"
RangeStart="20"
ShowRange="True"
TickFrequency="10"
TickPlacement="BottomRight"
TickStroke="#FF0000"
ActiveTickStroke="#02C9F3"/>
</Grid>
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    RangeEnd = 60,
    RangeStart = 20,
    ShowRange = true,
    TickFrequency = 10,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight,
    TickStroke = new
    SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF0000")),
    ActiveTickStroke = new
    SolidColorBrush((Color)ColorConverter.ConvertFromString("#02C9F3"))
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

*TickLength*

Use the [TickLength](#) property, to change the height of the major ticks.

XML

```
<Grid>
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
RangeEnd="60"
RangeStart="20"
ShowRange="True"
TickLength="8"
TickStroke="#FF0000"
ActiveTickStroke="#02C9F3"/>
```

```

TickFrequency="10"
TickPlacement="BottomRight"
TickStroke="#FF0000" />
</Grid>

```

C#

```

Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    RangeEnd = 60,
    RangeStart = 20,
    ShowRange = true,
    TickFrequency = 10,
    TickLength = 8,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight,
    TickStroke = new
    SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF0000"))
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;

```

*TickStrokeThickness*

Use the [TickStrokeThickness](#) property, to change the thickness of the major ticks.

XML

```

<Grid>
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
RangeEnd="60"
RangeStart="20"
ShowRange="True"
TickFrequency="10"
TickLength="8"
TickPlacement="BottomRight"
TickStroke="#FF0000"
TickStrokeThickness="2" />
</Grid>

```

C#

```

Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()

```

```
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    RangeEnd = 60,
    RangeStart = 20,
    ShowRange = true,
    TickFrequency = 10,
    TickLength = 8,
    TickStrokeThickness = 2,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight,
    TickStroke = new
    SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF0000"))
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

MinorTickStroke

Use the [MinorTickStroke](#) property, to change the minor ticks color.

XML

```
<editors:SfRangeSlider
    Width="300"
    Maximum="100"
    Minimum="0"
    RangeEnd="60"
    RangeStart="20"
    ShowRange="True"
    TickFrequency="10"
    MinorTickFrequency="3"
    TickPlacement="BottomRight"
    MinorTickStroke="#FF0000" />
</Grid>
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    RangeEnd = 60,
    RangeStart = 20,
    ShowRange = true,
    TickFrequency = 10,
    MinorTickFrequency=3,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight,
```

```
MinorTickStroke = new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF0000"))
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

ActiveMinorTickStroke

Use the [ActiveMinorTickStroke](#) property, to change the color of the active minor ticks.

XML

```
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
RangeEnd="60"
RangeStart="20"
ShowRange="True"
TickFrequency="10"
MinorTickFrequency="3"
TickPlacement="BottomRight"
ActiveMinorTickStroke="#FF0000" />
</Grid>
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
Width = 300,
Maximum = 100,
Minimum = 0,
RangeEnd = 60,
RangeStart = 20,
ShowRange = true,
TickFrequency = 10,
MinorTickFrequency=3,
TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight,
ActiveMinorTickStroke = new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF0000"))
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

MinorTickLength

Use the [MinorTickLength](#) property, to change the height of the minor ticks.

XML

```
<Grid>
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
RangeEnd="60"
RangeStart="20"
ShowRange="True"
MinorTickLength="6"
TickLength="10"
TickFrequency="10"
MinorTickFrequency="2"
TickPlacement="BottomRight" />
</Grid>
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    RangeEnd = 60,
    RangeStart = 20,
    ShowRange = true,
    MinorTickLength = 6,
    TickLength = 10,
    TickFrequency = 10,
    MinorTickFrequency = 2,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

*MinorTickStrokeThickness*

Use the [MinorTickStrokeThickness](#) property, to change the thickness of the minor ticks.

XML

```
<Grid>
<editors:SfRangeSlider
Width="300"
Maximum="100"
```

```

Minimum="0"
RangeEnd="60"
RangeStart="20"
ShowRange="True"
TickFrequency="10"
MinorTickFrequency="2"
TickLength="8"
MinorTickLength="5"
TickPlacement="BottomRight"
TickStroke="#FF0000"
MinorTickStroke="#FF0000"
ActiveTickStroke="#02C9F3"
ActiveMinorTickStroke="#02C9F3"
MinorTickStrokeThickness="2" />
</Grid>

```

C#

```

Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    RangeEnd = 60,
    RangeStart = 20,
    ShowRange = true,
    TickFrequency = 10,
    MinorTickFrequency= 2,
    TickLength = 8,
    MinorTickStrokeThickness = 2,
    MinorTickLength= 5,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight,
    TickStroke = new
    SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF0000"))
    MinorTickStroke = new
    SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF0000"))
    ActiveMinorTickStroke = new
    SolidColorBrush((Color)ColorConverter.ConvertFromString("#02C9F3"))
    ActiveTickStroke = new
    SolidColorBrush((Color)ColorConverter.ConvertFromString("#02C9F3"))
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;

```

Value label customization

Customize the value label using the [TickBarItem](#) style.

XML

```
<Grid>
<Grid.Resources>
<ResourceDictionary>
<Style TargetType="editors:TickBarItem">
<Setter Property="FontSize" Value="12" />
<Setter Property="Foreground" Value="Red" />
</Style>
</ResourceDictionary>
</Grid.Resources>
<editors:SfRangeSlider
Width="300"
Maximum="100"
Minimum="0"
RangeEnd="60"
RangeStart="20"
ShowRange="True"
ShowValueLabels="True"
TickFrequency="10"
TickLength="4"
TickPlacement="BottomRight"
TickStroke="#505050"
TickStrokeThickness="1" />
</Grid>
```

C#

```
Grid parentGrid = new Grid();
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    RangeEnd = 60,
    ShowValueLabels = true,
    RangeStart = 20,
    ShowRange = true,
    TickFrequency = 10,
    TickLength = 4,
    TickStrokeThickness = 1,
    TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.BottomRight,
    TickStroke = new
    SolidColorBrush((Color) ColorConverter.ConvertFromString("#505050"))
};
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
```

Events in WPF RangeSlider(SfRangeSlider)

How to trigger LabelLoaded event?

The [LabelLoaded](#) event is triggered when the slider label is created. The argument contains the label content.

Content - Used to gets or sets the content of the label.

XML

```
<editors:SfRangeSlider
Width="300"
LabelLoaded="SfRangeSlider_LabelLoaded"
Maximum="200"
Minimum="100"
ShowValueLabels="True"
TickFrequency="20"
TickPlacement="Outside" />
```

C#

```
public MainWindow()
{
    InitializeComponent();
    Grid parentGrid = new Grid();
    SfRangeSlider rangeSlider = new SfRangeSlider()
    {
        Width = 300,
        Maximum = 200,
        Minimum = 100,
        Value = 140,
        ShowValueLabels = true,
        TickFrequency = 20,
        TickPlacement = Syncfusion.Windows.Controls.Input.TickPlacement.Outside
    };
    rangeSlider.LabelLoaded += SfRangeSlider_LabelLoaded;
    parentGrid.Children.Add(rangeSlider);
    this.Content = parentGrid;
}

private void SfRangeSlider_LabelLoaded(object sender, LabelLoadedEventArgs e)
{
    e.Content = e.Content + "%";
}
```

How to trigger RangeChangedEvent?

The [RangeChanged](#) event is triggered when either **RangeStart** or **RangeEnd** values are changed. The argument contains the following information.

NewEndValue – Gets or sets the new end value of range slider.

NewStartValue – Gets or sets the new start value of range slider.

OldStartValue – Gets or sets the old start value of range slider.

OldEndValue – Gets or set the old end value of range slider.

XML

```
<editors:SfRangeSlider
Width="300"
RangeChanged="SfRangeSlider_RangeChanged"
Maximum="100"
Minimum="0"
ShowRange="True"
RangeStart="30"
RangeEnd="60"/>
```

C#

```
public MainWindow()
{
    InitializeComponent();
    Grid parentGrid = new Grid();
    SfRangeSlider rangeSlider = new SfRangeSlider()
    {
        Width = 300,
        Maximum = 100,
        Minimum = 0,
        Value = 140,
        ShowRange = true,
        RangeStart = 30,
        RangeEnd = 60
    };
    rangeSlider.RangeChanged += SfRangeSlider_RangeChanged;
    parentGrid.Children.Add(rangeSlider);
    this.Content = parentGrid;
}

private void SfRangeSlider_RangeChanged(object sender, RangeChangedEventArgs e)
{
    var newStartValue = e.NewStartValue;
    var newEndValue = e.NewEndValue;
    var oldStartValue = e.OldStartValue;
    var oldEndValue = e.OldEndValue;
}
```

How to trigger RangeStartChanged event?

The [RangeStartChanged](#) event is triggered when **RangeStart** value is changed. The argument contains the following information.

OldStartValue – Gets or sets the old start value of range slider.

NewStartValue – Gets or sets the new start value of range slider.

XML

```
<editors:SfRangeSlider
Width="300"
RangeStartChanged="SfRangeSlider_RangeStartChanged"
Maximum="100"
Minimum="0"
ShowRange="True"
```

```
RangeStart="30"
RangeEnd="60"/>
```

C#

```
public MainWindow()
{
    InitializeComponent();
    Grid parentGrid = new Grid();
    SfRangeSlider rangeSlider = new SfRangeSlider()
    {
        Width = 300,
        Maximum = 100,
        Minimum = 0,
        Value = 140,
        ShowRange = true,
        RangeStart = 30,
        RangeEnd = 60
    };
    rangeSlider.RangeStartChanged += SfRangeSlider_RangeStartChanged;
    parentGrid.Children.Add(rangeSlider);
    this.Content = parentGrid;
}

private void SfRangeSlider_RangeStartChanged(object sender,
RangeStartChagedEventArgs e)
{
    var newStartValue = e.NewStartValue;
    var oldStartValue = e.OldStartValue;
}
```

How to trigger RangeEndChanged event?

The [RangeEndChanged](#) event is triggered when **RangeEnd** value is changed. The argument contains the following information.

OldEndValue – Gets or sets the old end value of range slider.

NewEndValue – Gets or sets the new end value of range slider.

XML

```
<editors:SfRangeSlider
Width="300"
RangeEndChanged="SfRangeSlider_RangeEndChanged"
Maximum="100"
Minimum="0"
ShowRange="True"
RangeStart="30"
RangeEnd="60"/>
```

C#

```
public MainWindow()
{
    InitializeComponent();
    Grid parentGrid = new Grid();
```

```
SfRangeSlider rangeSlider = new SfRangeSlider()
{
    Width = 300,
    Maximum = 100,
    Minimum = 0,
    Value = 140,
    ShowRange = true,
    RangeStart = 30,
    RangeEnd = 60
};
rangeSlider.RangeEndChanged += SfRangeSlider_RangeEndChanged;
parentGrid.Children.Add(rangeSlider);
this.Content = parentGrid;
}
private void SfRangeSlider_RangeEndChanged(object sender,
RangeEndChagedEventArgs e)
{
    var newEndValue = e.NewEndValue;
    var oldEndValue = e.OldEndValue;
}
```

SfRating

WPF Rating (SfRating) Overview

The SfRating control for WPF provides the number of stars that represent a rating. It is used to configure the item size, and the number of displayed items in the SfRating control. The SfRating control can be used in various scenarios such as rating movies, rating applications, etc.

Movie Rating

The Walk (2015)

PG | 2h 20min

In 1973, French street performer Philippe Petit is trying to make a living in Paris with juggling acts and wire walking, much to the chagrin of his father. During one performance, he eats a hard candy which was given to him by an audience member and injures his tooth.

Rate

Rating: 3/5

Key features

- **Precision:** Options to decide the accuracy level of rating.
- **Item count:** Supports to determine the number of rating items to be displayed.

Getting Started with WPF Rating (SfRating)

This section explains how to configure the [SfRating](#) control in a real-time scenario and also provides a walk-through on some of the customization features available in the SfRating control.

Assembly deployment

Refer to the [control dependencies](#) section to get the list of assemblies or NuGet package that needs to be added as a reference to use the [SfRating](#) control in any application.

You can find more details about installing the NuGet package in a WPF application in the following link:

[How to install nuget packages](#)

Creating Application with SfRating control

In this walk through, user will create a WPF application that contains [SfRating](#) control.

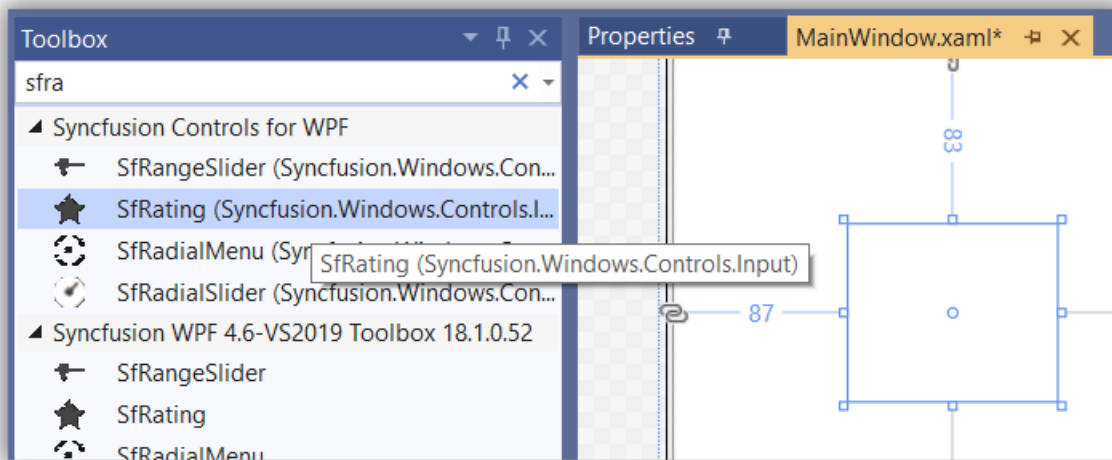

1. [Creating project](#)
2. [Adding control via designer](#)
3. [Adding control manually in XAML](#)
4. [Adding control manually in C#](#)

Creating project

Below section provides detailed information to create new project in Visual Studio to display [SfRating](#) control.

Adding control via designer

The [SfRating](#) control can be added to the application by dragging it from Toolbox and dropping it in designer. The required assembly will be added automatically.

Adding control manually in XAML

In order to add [SfRating](#) control manually in XAML, do the below steps,

1. Add the below required assembly references to the project,
 - Syncfusion.SfShared.WPF
 - Syncfusion.SfInput.WPF
2. Import Syncfusion WPF schema <http://schemas.syncfusion.com/wpf> in XAML page.
3. Declare [SfRating](#) in XAML page.

XML

```
<Window x:Class="SfRating_GettingStarted.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:SfRating_GettingStarted"
mc:Ignorable="d"
Title="SfRating Application" Height="450" Width="800"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf">
<Grid>
<syncfusion:SfRating ItemsCount="5" Width="150"/>
</Grid>
</Window>
```

Add control manually in C#

In order to add [SfRating](#) control manually in C#, do the below steps,

1. Add the below required assembly references to the project,
 - Syncfusion.SfShared.WPF
 - Syncfusion.SfInput.WPF
2. Import SfRating namespace **Syncfusion.Windows.Controls.Input**.
3. Create SfRating control instance and add it to window.

C#

```
using Syncfusion.Windows.Controls.Input;
namespace SfRating_GettingStarted
{
    /// <summary>
    /// Interaction logic for MainWindow.xaml
    /// </summary>
    public partial class MainWindow : Window
    {
        public MainWindow()
        {
            InitializeComponent();
            //Creating an instance of SfRating control.
            SfRating newrating = new SfRating()
            {
                ItemsCount = 5,
                Width = 150
            };
            //Adding SfRating as window content.
            this.Content = newrating;
        }
    }
}
```

```
}  
}
```

Customize number of rating items

The number of rating items to be displayed can be customized using [ItemCounts](#) property in [SfRating](#) control.

Note: The default value of ItemsCount is 0.

XML

```
<syncfusion:SfRating ItemsCount="5" Width="150"/>
```

C#

```
SfRating rating = new SfRating()  
{  
    ItemsCount = 5,  
    Width = 150  
};
```

Set value

The display value to be selected among the rating items can be set in the [SfRating](#) control using [Value](#) property.

Note: By default, value of this property is 0.

XML

```
<syncfusion:SfRating ItemsCount="5" Value="3" Width="150"/>
```

C#

```
SfRating rating = new SfRating()  
{  
    ItemsCount = 5,  
    Width = 150,  
    Value = 3  
};
```

Precision of selection

The [SfRating](#) control provides option to rate the items in full, half, and exact value using the [Precision](#) property.

Note: By default, the value of Precision property is Standard.

XML

```
<syncfusion:SfRating ItemsCount="5" Precision="Exact" Width="150"/>
```

C#

```
SfRating rating = new SfRating()
```

```
{
    ItemsCount = 5,
    Width = 150,
    Precision = Syncfusion.Windows.Primitives.Precision.Standard
};
```

Movie Rating

The Walk (2015)

PG | 2h 20min

In 1973, French street performer Philippe Petit is trying to make a living in Paris with juggling acts and wire walking, much to the chagrin of his father. During one performance, he eats a hard candy which was given to him by an audience member and injures his tooth.

Rating: 3/5

[View Sample in GitHub](#)

Theme

SfRating supports various built-in themes. Refer to the below links to apply themes for the SfRating,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Precision in WPF Rating (SfRating)

The precision mode defines the accuracy level of the SfRating control. It has Standard, Half, and Exact options. By default, the precision mode of the SfRating control is set to **Standard**.

Standard

When the precision mode of the SfRating control is set to **Standard**, the rating item will be filled completely based on the rating value.

XML

```
<rating:SfRating ItemsCount="5" Precision="Standard"></rating:SfRating>
```

C#

```
SfRating rating;  
public MainWindow()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    rating.ItemCount = 5;  
    rating.Precision = Precision.Standard;  
    Content = rating;  
}
```

*Half*

When the precision mode of the SfRating control is set to **Half**, the rating item will be filled partially based on the rating value.

XML

```
<rating:SfRating ItemCount="5" Precision="Half"></rating:SfRating>
```

C#

```
SfRating rating;  
public MainWindow()  
{  
    InitializeComponent();  
    rating = new SfRating();  
    ItemCount = 5;  
    rating.Precision = Precision.Half;  
    Content = rating;  
}
```

*Exact*

If the precision mode of SfRating is set to **Exact**, the rating item will be filled exactly based on the rating value.

XML

```
<rating:SfRating ItemCount="5" Precision="Exact"></rating:SfRating>
```

C#

```
SfRating rating;  
public MainWindow()  
{  
    InitializeComponent();  
    rating = new SfRating();  
}
```

```
rating.ItemsCount = 5;
rating.Precision = Precision.Exact;
Content = rating;
}
```

ToolTip in WPF Rating (SfRating)

ToolTip provides additional information about objects that are unfamiliar to users and are not directly displayed in UI. In the WPF SfRating control, tooltip shows the data of **Value** property. It will be displayed when the mouse is hovered over the rating items, and it will be disappeared when the mouse is moved from the rating items. The tooltip is enabled or disabled using the **ShowToolTip** property. The default value of this property is true.

XML

```
<rating:SfRating ItemsCount="5" ShowToolTip="True" >
</rating:SfRating>
```

C#

```
SfRating rating;
public MainWindow()
{
    InitializeComponent();
    rating = new SfRating();
    rating.ItemsCount = 5;
    rating.ShowToolTip = true;
    Content = rating;
}
```

Set tooltip precision

The **AutoToolTipPrecision** property sets the number precisions to be displayed after decimal point in tooltip. To set **AutoToolTipPrecision**, set the precision mode to **Exact**.

Note: The default value of this property is 1.

XML

```
<rating:SfRating ItemsCount="5" Precision="Exact" AutoToolTipPrecision="6" >
</rating:SfRating>
```

C#

```
SfRating rating;
public MainWindow()
```

```
{
  InitializeComponent();
  rating = new SfRating();
  rating.ItemsCount = 5;
  rating.Precision = Precision.Exact;
  rating.AutoToolTipPrecision = 6;
  Content = rating;
}
```

Restrict User Selection in WPF Rating (SfRating)

The SfRating control provides support to changeable or unchangeable values. This is achieved using the `IsReadOnly` property. When this property is set to true, the rating value becomes unchangeable. By default, value of this property is false.

XML

```
<rating:SfRating ItemsCount="5" IsReadOnly="True"/>
```

C#

```
SfRating rating;
public MainWindow()
{
  InitializeComponent();
  rating = new SfRating();
  rating.IsReadOnly = true;
  Content = rating;
}
```

Appearance and Styling in WPF Rating (SfRating)

When the default view is not needed, you can customize the view of WPF SfRating control. The SfRating control provides support to customize the size, item count, and space between rating items.

Note: These properties are available in SfRatingItem. To set this property, use the ItemContainerStyle property of the SfRating control.

Set fill color

The SfRating control supports to set the fill color to the selected and unselected items.

Selected items

The `RatedFill` property fills the rated area with the specified solid color in the SfRating control.

XML

```
<rating:SfRating ItemsCount="5" Value="2" >
```

```
<rating:SfRating.ItemContainerStyle>
<Style TargetType="rating:SfRatingItem">
<Setter Property="RatedFill" Value="Green"></Setter>
</Style>
</rating:SfRating.ItemContainerStyle>
</rating:SfRating>
```

Unselected items

The **UnRatedFill** property fills the unrated area with the specified solid color in the SfRating control.

XML

```
<rating:SfRating ItemsCount="5" Value="2" >
<rating:SfRating.ItemContainerStyle>
<Style TargetType="rating:SfRatingItem">
<Setter Property="UnratedFill" Value="Green">
</Setter>
</Style>
</rating:SfRating.ItemContainerStyle>
</rating:SfRating>
```

Set stroke color

The SfRating control supports to set the stroke color to the selected and unselected items.

Selected items

The **RatedStroke** property sets the stroke color to the rated area with the specified solid color to the selected items in the SfRating control.

XML

```
<rating:SfRating ItemsCount="5" Value="2" >
<rating:SfRating.ItemContainerStyle>
<Style TargetType="rating:SfRatingItem">
<Setter Property="RatedStroke" Value="Green">
</Setter>
</Style>
</rating:SfRating.ItemContainerStyle>
</rating:SfRating>
```

Unselected items

The **UnratedStroke** property sets the stroke color to the unrated area with the specified solid color in the SfRating control.

XML

```
<rating:SfRating ItemsCount="5" Value="2" >
```

```
<rating:SfRating.ItemContainerStyle>
<Style TargetType="rating:SfRatingItem">
<Setter Property="UnratedStroke" Value="Green">
</Setter>
</Style>
</rating:SfRating.ItemContainerStyle>
</rating:SfRating>
```

Set stroke thickness

The SfRating control supports to set the stroke thickness to the selected and unselected items.

Selected items

The **RatedStrokeThickness** property sets the stroke thickness to the rated area with the specified value in the SfRating control.

XML

```
<rating:SfRating ItemsCount="5" Value="2" >
<rating:SfRating.ItemContainerStyle>
<Style TargetType="rating:SfRatingItem">
<Setter Property="RatedStroke" Value="Green"></Setter>
<Setter Property="RatedStrokeThickness" Value="2"></Setter>
</Style>
</rating:SfRating.ItemContainerStyle>
</rating:SfRating>
```

Unselected items

The **UnratedStrokeThickness** property sets the stroke thickness to the unrated area with the specified value in the SfRating control.

XML

```
<rating:SfRating ItemsCount="5" Value="2" >
<rating:SfRating.ItemContainerStyle>
<Style TargetType="rating:SfRatingItem">
<Setter Property="UnratedStroke" Value="Green"></Setter>
<Setter Property="UnratedStrokeThickness" Value="2"></Setter>
</Style>
</rating:SfRating.ItemContainerStyle>
</rating:SfRating>
```

PointerOverFill

The **PointerOverFill** property fills the mouse over area with the specified solid color in the SfRating control.

XML

```
<rating:SfRating ItemsCount="5">
  <rating:SfRating.ItemContainerStyle>
    <Style TargetType="rating:SfRatingItem">
      <Setter Property="PointerOverFill" Value="Green"></Setter>
    </Style>
  </rating:SfRating.ItemContainerStyle>
</rating:SfRating>
```

*PointerOverStroke*

The **PointerOverStroke** property sets the stroke color to the mouse over area with the specified solid color in the SfRating control.

XML

```
<rating:SfRating ItemsCount="5">
  <rating:SfRating.ItemContainerStyle>
    <Style TargetType="rating:SfRatingItem">
      <Setter Property="PointerOverStroke" Value="Green"></Setter>
    </Style>
  </rating:SfRating.ItemContainerStyle>
</rating:SfRating>
```

*PointerOverStrokeThickness*

The **PointerOverStrokeThickness** property sets the stroke thickness to the mouse over area with the specified value in the SfRating control.

XML

```
<rating:SfRating ItemsCount="5">
  <rating:SfRating.ItemContainerStyle>
    <Style TargetType="rating:SfRatingItem">
      <Setter Property="PointerOverStroke" Value="Green"></Setter>
      <Setter Property="PointerOverStrokeThickness" Value="2"></Setter>
    </Style>
  </rating:SfRating.ItemContainerStyle>
</rating:SfRating>
```

*Height*

You can set the height of each SfRatingItem using the **Height** property.

XML

```
<rating:SfRating Value="3" >
```

```
<rating:SfRatingItem Height="20"/>
<rating:SfRatingItem Height="18"/>
<rating:SfRatingItem Height="16"/>
<rating:SfRatingItem Height="14"/>
<rating:SfRatingItem Height="12"/>
</rating:SfRating>
```

C#

```
SfRating rating;
public MainWindow()
{
    InitializeComponent();
    rating = new SfRating();
    rating.Value = 3;
    rating.Items.Add(new SfRatingItem() { Height = 20 });
    rating.Items.Add(new SfRatingItem() { Height = 18 });
    rating.Items.Add(new SfRatingItem() { Height = 16 });
    rating.Items.Add(new SfRatingItem() { Height = 14 });
    rating.Items.Add(new SfRatingItem() { Height = 12 });
    Content = rating;
}
```

SfRatingItems with variable sizes

To set same height to each SfRatingItem, use the `ItemContainerStyle` property.

XML

```
<rating:SfRating Value="4" ItemsCount="10" >
  <rating:SfRating.ItemContainerStyle>
    <Style TargetType="rating:SfRatingItem">
      <Setter Property="Height" Value="12"></Setter>
    </Style>
  </rating:SfRating.ItemContainerStyle>
</rating:SfRating>
```

SfRatingItems with similar sizes

ReportViewer

WPF ReportViewer Overview

Essential ReportViewer is a rendering component to display reports defined in the Microsoft's RDL format (2008 or 2008 R2) on both WPF and Silverlight applications. By using the ReportViewer, you can

display tabular, graphical or free-form reports that make use of relational, multi-dimensional, XML and object data source. It supports both Server and Client reports.

The important features of WPF ReportViewer are listed as follows:

- RDL Specification - Supports RDL Specification for SQL Server 2008 and RDL Specification for SQL Server 2008 R2 only. You can refer MSDN for list of available specifications - [msdn.microsoft.com/library/dd297486\(SQL.100\)](https://msdn.microsoft.com/library/dd297486(SQL.100)).
- Data sources - You can use advanced Database server data sources in the ReportViewer (SQL, Oracle and Azure).
- Charts - Show all basic types of Charts that are available in Microsoft RDL reports.
- Tablix - Shows the summaries and simple tables.
- Gauge - Shows measurement values by using expression values.
- Textbox - Shows textbox data with expression support.
- Report Parameter - View the report based on report parameter value.
- Expression - You can use expression to handle reports.
- Printing - Prints the assigned document.
- Customization - You can customize the ReportViewer appearance.

By using the ReportViewer, you can show variety of interactive Microsoft Report Definition Language (RDL) standard reports. The reports can be exported to PDF and displayed by using ReportViewer.

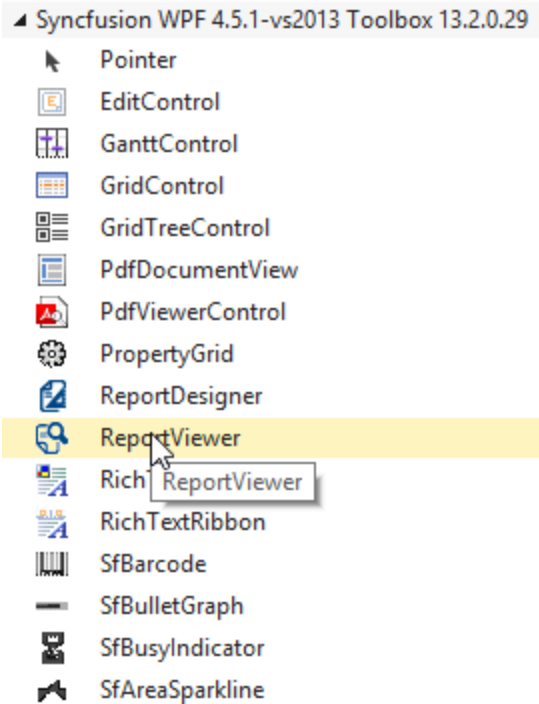

Getting Started with WPF Report Viewer

Creating ReportViewer through Visual Studio

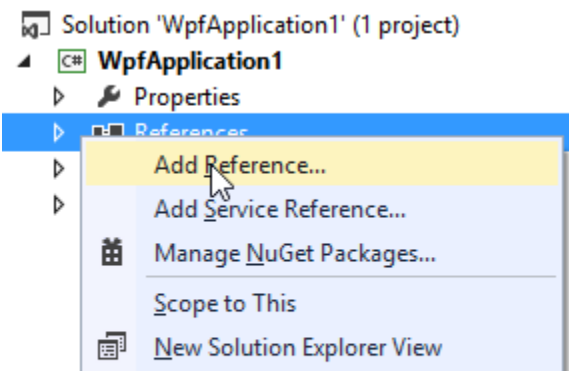

You can create a simple application through the Visual Studio Designer with the Syncfusion WPF ReportViewer control by using the following steps.

1. Create new WPF application in Visual Studio.
2. Add the ReportViewer from the Toolbox.

Drag and drop the ReportViewer control from the Toolbox to the XAML Page.

3. To add references, Right-click on References and select Add Reference.

4. Add the following assemblies.
 - Syncfusion.Chart.Wpf
 - Syncfusion.Compression.Base
 - Syncfusion.DocIO.Base
 - Syncfusion.Gauge.Wpf
 - Syncfusion.Grid.Wpf
 - Syncfusion.Linq.Base
 - Syncfusion.Pdf.Base
 - Syncfusion.PropertyGrid.Wpf
 - Syncfusion.ReportControls.Wpf

- Syncfusion.ReportDesigner.Wpf
- Syncfusion.ReportViewer.Wpf
- Syncfusion.SfMaps.Wpf
- Syncfusion.SfSkinManager.Wpf
- Syncfusion.Shared.Wpf
- Syncfusion.Tools.Wpf
- Syncfusion.XlsIO.Base

Note: Refer the above assemblies from the installed location, C:\Program Files (x86)\Syncfusion\Essential Studio\WPF\{{ site.releaseversion }}\Assemblies

5. Add the following code for creating ReportViewer using code.

XML

```
<sync:ChromelessWindow x:Class="Syncfusion.Samples.ReportView"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:sync="http://schemas.syncfusion.com/wpf"
xmlns:local="clr-namespace:Syncfusion.Samples.ViewModel"
xmlns:localUtil="clr-namespace:Syncfusion.Samples.Util"
Title="Product Catalog" WindowStartupLocation="CenterScreen"
SnapsToDevicePixels="True" WindowState="Maximized"
TitleTextAlignment="Center" ShowIcon="False" UseNativeChrome="True"
Icon="App.ico">
<Grid Name="gridSkeleton" localUtil:EventAttachUtil.AddWindowLoaded="True">
<Border Name="groupBoxReportViewer" BorderThickness="0" >
<Grid>
<sync:ReportViewer Name="viewer" />
</Grid>
</Border>
</Grid>
</sync:ChromelessWindow>
```

6. Set **ReportPath** and **ProcessingMode** to the ReportViewer.

XML

```
<sync:ReportViewer Name="viewer"
ReportPath="..\ReportTemplate\InvoiceTemplate.rdl" ProcessingMode="Remote"
/>
```

7. Set Visual Style to the ReportViewer.

CSHARP

```
SkinStorage.SetVisualStyle(this, "Metro");
```

- Run the sample application and you can see the ReportViewer as displayed in the following screenshot.

Invoice

Invoice ID: 10248 View Report

72	Mozzarella di Giovanni	5	\$34.80	0.00%	\$174.00
Total					\$440.00

Thank you for your Business

Show RDLC Reports

- Assign `ReportPath` and `ProcessingMode` to ReportViewer.

CSHARP

```
Syncfusion.Windows.Reports.Viewer.ReportViewer viewer= new
Syncfusion.Windows.Reports.Viewer.ReportViewer;
viewer.ReportPath=@"../ReportTemplate/RDLC/ProductCatalog.rdlc";
```

```
viewer.ProcessingMode = ProcessingMode.Local;
```

2. Set Datasource to the RDLC Report and invoke `RefreshReport` to render the report.

CSHARP

```
viewer.DataSources.Clear();  
viewer.DataSources.Add(new ReportDataSource { Name = "ProductCatalog", Value  
= ProductCatalog.GetData() });  
viewer.RefreshReport();
```

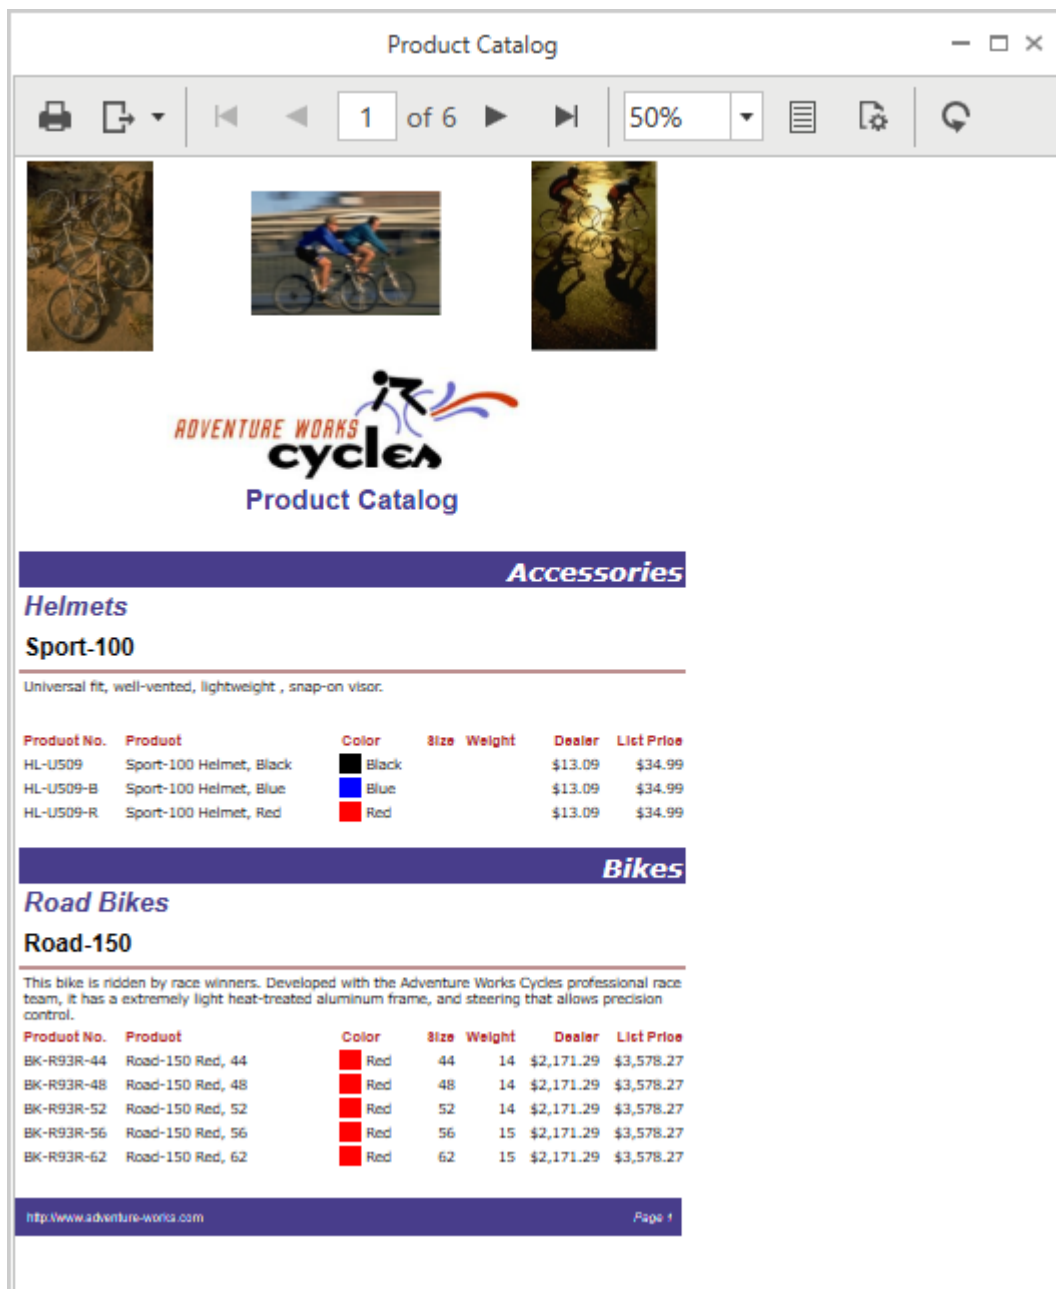

3. Assign values for the datasource in RDLC.

CSHARP

```
#region Product details  
public class ProductCatalog  
{  
    public string ProdSubCat { get; set; }  
    public string ProdModel { get; set; }  
    public string ProdCat { get; set; }  
    public string Description { get; set; }  
    public string ProdName { get; set; }  
    public string ProductNumber { get; set; }  
    public string Color { get; set; }  
    public string Size { get; set; }  
    public double? Weight { get; set; }  
    public double? StandardCost { get; set; }  
    public string Style { get; set; }  
    public string Class { get; set; }  
    public double? ListPrice { get; set; }  
    public static IList GetData()  
    {  
        List<ProductCatalog> datas = new List<ProductCatalog>();  
        ProductCatalog data = null;  
        data = new ProductCatalog()  
        {  
            ProdSubCat = "Road Frames",  
            ProdModel = "HL Road Frame",  
            ProdCat = "Components",  
            Description = "Our lightest and best quality aluminum frame made from the  
newest alloy; it is welded and heat-treated for strength. Our innovative  
design results in maximum comfort and performance.",  
            ProdName = "HL Road Frame - Black, 58",  
            ProductNumber = "FR-R92B-58",  
            Color = "Black",  
            Size = "58",  
            Weight = 2.24,  
            StandardCost = 1059.3100,  
            Style = "U",  
            Class = "H",  
            ListPrice = 1431.5000  
        };  
    }  
}
```

```
datas.Add(data);
data = new ProductCatalog()
{
    ProdSubCat = "Road Frames",
    ProdModel = "HL Road Frame",
    ProdCat = "Components",
    Description = "Our lightest and best quality aluminum frame made from the
newest alloy; it is welded and heat-treated for strength. Our innovative
design results in maximum comfort and performance.",
    ProdName = "HL Road Frame - Red, 58",
    ProductNumber = "FR-R92R-58",
    Color = "Red",
    Size = "58",
    Weight = 2.24,
    StandardCost = 1059.3100,
    Style = "U ",
    Class = "H ",
    ListPrice = 1431.5000
};
datas.Add(data);
data = new ProductCatalog()
{
    ProdSubCat = "Helmets",
    ProdModel = "Sport-100",
    ProdCat = "Accessories",
    Description = "Universal fit, well-vented, lightweight , snap-on visor.",
    ProdName = "Sport-100 Helmet, Red",
    ProductNumber = "HL-U509-R",
    Color = "Red",
    Size = "",
    Weight = null,
    StandardCost = 13.0863,
    Style = "",
    Class = "",
    ListPrice = 34.9900
};
datas.Add(data);
return datas;
}
}
#endregion
```

4. Run the application. The following output is displayed.

Load SSRS Reports

1. To load SSRS reports, initialize ReportViewer control and set the `ReportPath`, `ProcessingMode` and `ReportServerUrl`.

CSHARP

```
Syncfusion.Windows.Reports.Viewer.ReportViewer viewer = new
Syncfusion.Windows.Reports.Viewer.ReportViewer();
viewer.ReportPath = @"//SSRSSamples/Territory Sales";
viewer.ReportServerUrl = @"http://mvc.syncfusion.com/reportserver";
viewer.ProcessingMode = ProcessingMode.Remote;
```

```
viewer.ReportServerCredential = new System.Net.NetworkCredential("ssrs",  
"RDLReport1");
```

2. Add the credential information to the datasource.

CSHARP

```
List<DataSourceCredentials> credentials = new List<DataSourceCredentials>();  
foreach (var dataSource in viewer.GetDataSources())  
{  
    DataSourceCredentials credn = new DataSourceCredentials();  
    credn.Name = dataSource.Name;  
    credn.UserId = "ssrs1";  
    credn.Password = "RDLReport1";  
    credentials.Add(credn);  
}  
viewer.SetDataSourceCredentials(credentials);  
viewer.RefreshReport();
```

3. Run the application. The following output displays.

SSRS Report

1 of 5 50%

ReportViewer API of Essential Studio WPF

Properties

Property	Description	Type	Data Type
ReportPath	Gets or sets the file Reporting Server Report Path or local system path.	Dependency Property	string

DataSources	Get a collection of data sources used by the report.	-	ReportDataSourceCollection
CurrentPage	Gets or sets the current page	Dependency Property	Int
ProcessingMode	Gets or sets the processing mode namely Remote(from ReportingService or process DataSource from Database server) or Local	Dependency Property	Enum
ReportServerUrl	Gets or sets the ReportServerUrl of the Report Server	Dependency Property	String
ShowContextMenu	Gets or sets the ContextMenu visibility	Dependency Property	Boolean
ShowPrintButton	Gets or sets a value that indicates whether Print button is visible on the toolbar.	Dependency Property	Boolean
ShowRefreshButton	Gets or sets a value that indicates whether the Refresh button is visible.	Dependency Property	Boolean
ShowToolBar	Gets or sets a value that indicates whether the toolbar is visible on the control.	Dependency Property	Boolean
ShowZoomControl	Gets or sets a value that indicates whether the Zoom list box is visible.	Dependency Property	Boolean
ViewMode	Gets or sets a value that indicates whether it is Normal or Print View	Dependency Property	enum
ShowPdfExportButton	Gets or sets a value that indicates whether the PDF button is visible	Dependency Property	Boolean
ShowXPSEExportButton	Gets or sets a value that indicates whether the	Dependency Property	Boolean

	XPS Export Button is Visible		
ShowExportControls	Get or set a value that indicates whether the Export control is Visible	Dependency Property	Boolean
ShowPageNavigationControls	Get or set a value that indicates whether the page navigation controls is visible	Dependency Property	Boolean
ReportServerCredential	Credential access to Report Server	Dependency Property	ICredentials
ShowPageLayoutControl	Gets or sets a value that indicates whether the page layout control is visible	Dependency Property	Boolean
ShowParametersBlock	Gets or sets a value that indicates whether the parameter block control is visible	Dependency Property	Boolean

Methods

Method	Description	Parameters	Return Type
RefreshReport	Causes the local report to be rendered with new data.	-	Void
GetParameters	Get the necessary parameters for the report	-	ReportParameterInfoCollection
GetTotalPage	Gets the total pages of the report	-	Void
GetDataSetNames	Get the dataset names from the local report	-	ICollection<string>
LoadReport	Loads the Local report for processing	Stream	void
Print	Displays the Print dialog box.	-	Void
ShowNormalView	Displays the Normal view of the Report	-	Void
SetParameters	Set the necessary parameters for the report	ReportParameter[]	void

Events

Event	Description
ViewModeChanged	The event is triggered when the view is changed to normal and print view
ViewButtonClick	The event is triggered when the view button is clicked
SubreportProcessing	The event is triggered when the report is RDLC and contains with sub report.

ReportViewer Theme support

Theme support for ReportViewer is provided by modifying the UserControl as a ControlTemplate. You can now modify the ReportViewer in your own style, by writing a customized control template for ReportViewer.

To customize a ReportViewer, you have to modify the following control parts.

- PART_exportControl
- PART_comboBoxPageZoom
- PART_Zoom
- PART_ShowError
- PART_PageViewBody
- PART_PageFooterBorder
- PART_PageBodyBorder
- PART_PageHeaderBorder
- PART_scrollViewer
- PART_scrollIDSCredentialBlock
- PART_groupBoxExpandedExceptionScroll
- PART_scrollViewerParamBlock
- PART_canvasContentPage
- PART_CanvasFooter
- PART_CanvasHeader
- PART_treeItemArea
- PART_renderArea
- PARTgridReportParameterBlock
- PART_gridRenderingRegion
- PART_ExceptionGrid
- PART_gridException
- PART_gridLoadingIndicator
- PART_MainGrid
- PART_viewerSplitter
- PART_PageView
- PARTsPanel/Head
- PART_PageViewContainer
- PART_toolBar
- PART_DocumentMap
- PART_btnViewReport1
- PART_buttonNext
- PART_buttonParameters

- PART_buttonPrint
- PART_buttonFirst
- PART_buttonLast
- PART_buttonPrevious
- PART_buttonShowOrHideDocumentMap
- PART_buttonPrintLayout
- PART_buttonPageSetup
- PART_buttonRefresh
- PART_buttonViewReport
- PART_buttonFind
- PART_button back
- PART_toggleShowDetails
- PART_textBoxTotalPages
- PART_labelOf
- PART_textBlockException
- PART_textBoxFind
- PART_textBoxCurrentPage
- PART_textBlockStackTrace
- PART_gridExceptionRow
- PART_loadingIndicatorRow
- PART_toolBarGridRow
- PART_CredentialRow
- PART_parameterGridRow
- PART_viewerContentRow

The following code example illustrates a ReportViewer control template.

XML

```
<Style TargetType="local:ReportViewer">
  <Setter Property="Template">
    <Setter.Value>
      <ControlTemplate TargetType="local:ReportViewer">
        <Grid x:Name="PART_MainGrid" Height="Auto" Margin="0,0,0,0"
          Background="Transparent">
          <Grid.RowDefinitions>
            <RowDefinition Name="PART_toolBarGridRow" Height="28"/>
            <RowDefinition Name="PART_dsCredentialRow" Height="Auto"/>
            <RowDefinition Name="PART_parameterGridRow" Height="Auto"/>
            <RowDefinition Name="PART_viewerContentRow" Height="*" />
            <RowDefinition Name="PART_gridExceptionRow" Height="0"/>
            <RowDefinition Name="PART_loadingIndicatorRow" Height="0"/>
          </Grid.RowDefinitions>
          <!--Toolbar-->
          <StackPanel Name="PART_toolBar" Height="28" Orientation="Horizontal"
            Grid.ColumnSpan="2" Margin="0">
            <StackPanel.Background>
              <LinearGradientBrush EndPoint="0.5,1" StartPoint="0.5,0">
                <GradientStop Color="#FFFEFBF4" Offset="0.027"/>
                <GradientStop Color="#FFEAEDEF" Offset="0.029"/>
                <GradientStop Color="#FFDCE4F1" Offset="0.498"/>
                <GradientStop Color="#FFE6EAF3" Offset="0.966"/>
                <GradientStop Color="FloralWhite" Offset="0.968"/>
              </LinearGradientBrush>
            </StackPanel.Background>
          </StackPanel>
        </Grid>
      </ControlTemplate>

Limitations in WPF ReportViewer control

RDL Specification support

- ReportViewer control does not support RDL Specification for SQL Server 2000 and RDL Specification for SQL Server 2005.

Layout Process

- Syncfusion ReportViewer control has some limitations in Tablix Cell split Layout process in comparison with MS ReportViewer. When table cell width value exceeds the page width, the entire cell moves to the next page in order to display the complete cell items.

Unsupported expression

- Object function and VB function do not have complete support in ReportViewer.
- VB Code functions are not supported in Silverlight and WinRT ReportViewer.

HTML Formatted Data with Report

Report viewer supports showing the HTML formatted data with Textbox report items along with the inline CSS. This section provides the information about supported tags and limitations.

Supported HTML Tags

- Hyperlinks:
- Fonts:
- Header, style and block elements: `,

`,`

- ,
- ,
- ,`
- Text format: ,,,

Limitations of Cascading Style Sheet Attributes

The following is a list of attributes that are supported:

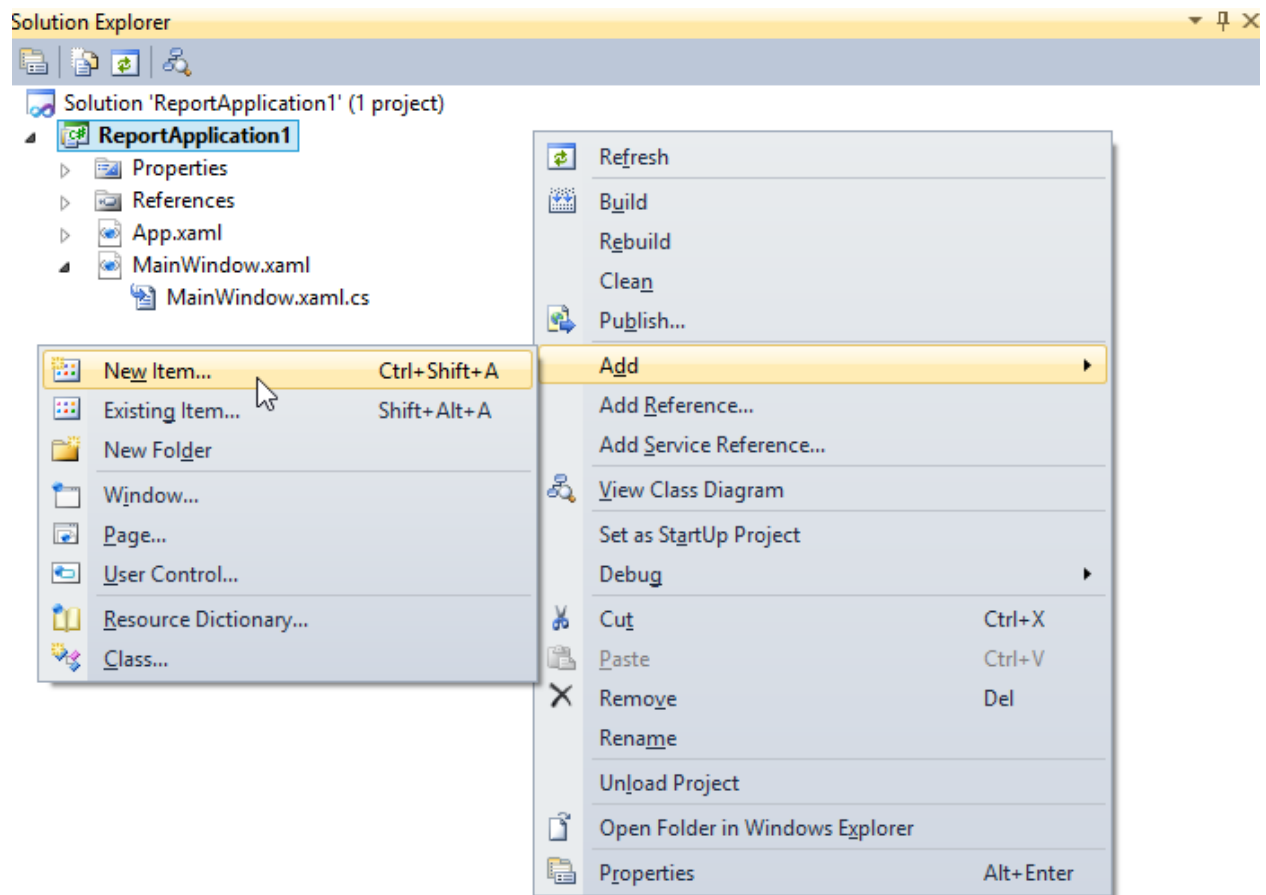

- text-align, text-indent
- font-family
- font-size
- Only valid RDL size values are supported in absolute CSS length units. Supported units are: in, cm, mm, pt, pc, px, ex, and em.
- Relative CSS length units are ignored and are not supported. Unsupported units include percentage (%), and rem.
- color
- padding, padding-bottom, padding-top, padding-right, and padding-left
- font-weight

How to

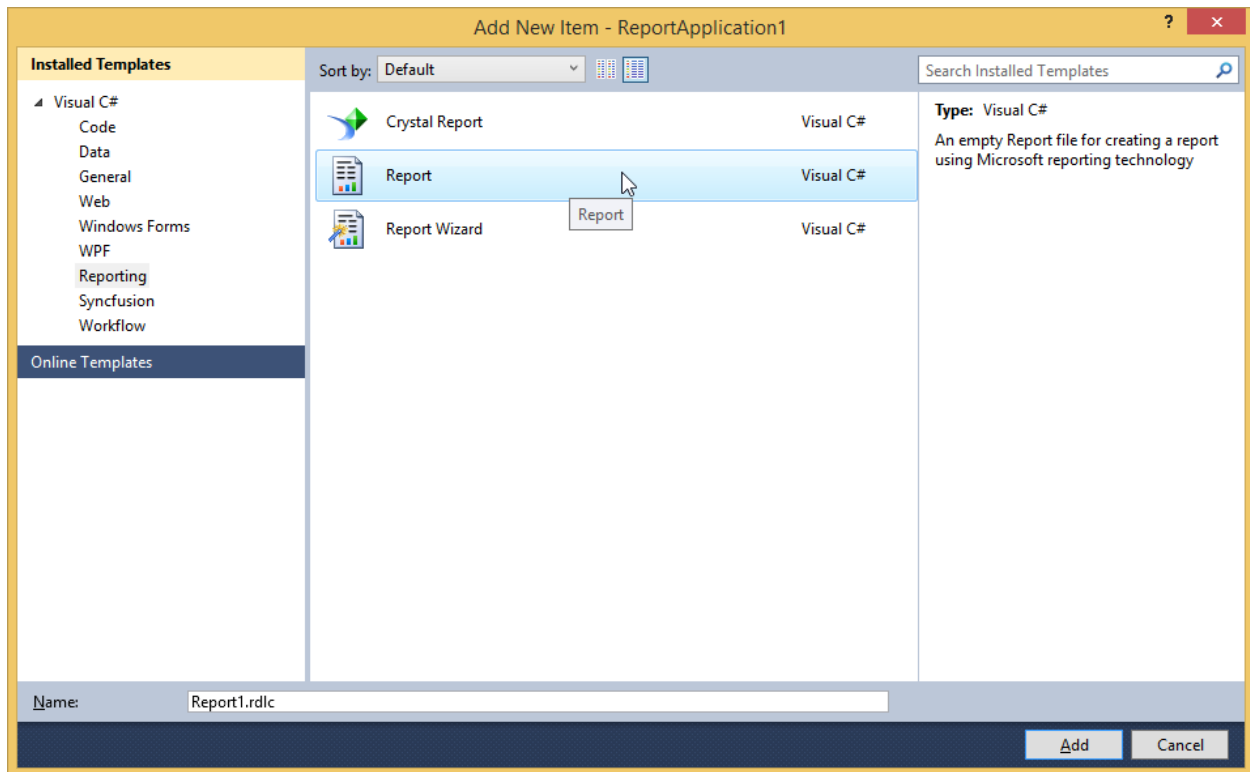

Create RDLC Report In VS2010 and Show It in Report Viewer

This section covers the steps to create RDLC report in VS2010 and shows the created RDLC report in the Report viewer.

1. Create a new WPF application with .NET Framework 4. The Solution Explorer dialog opens.
2. To add a new RDLC report in the WPF application, right-click on the newly added WPF application in the Solution Explorer.
3. Select Add, and then click New Item.

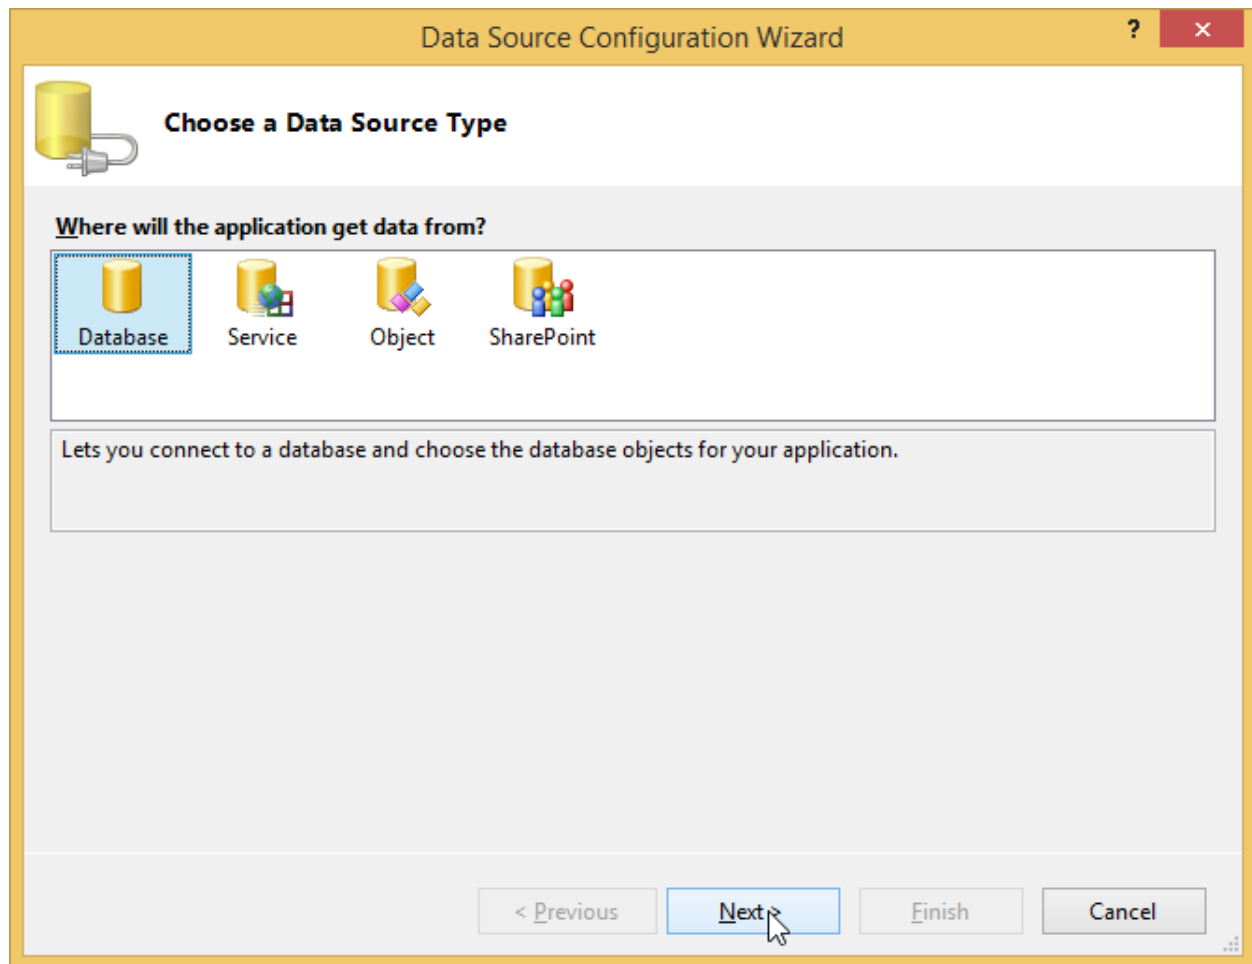

4. Then Add New Item dialog opens.
5. To create a dataset for the RDLC report, click Reporting under Visual C# Items.
6. Click Report, and then click Add.

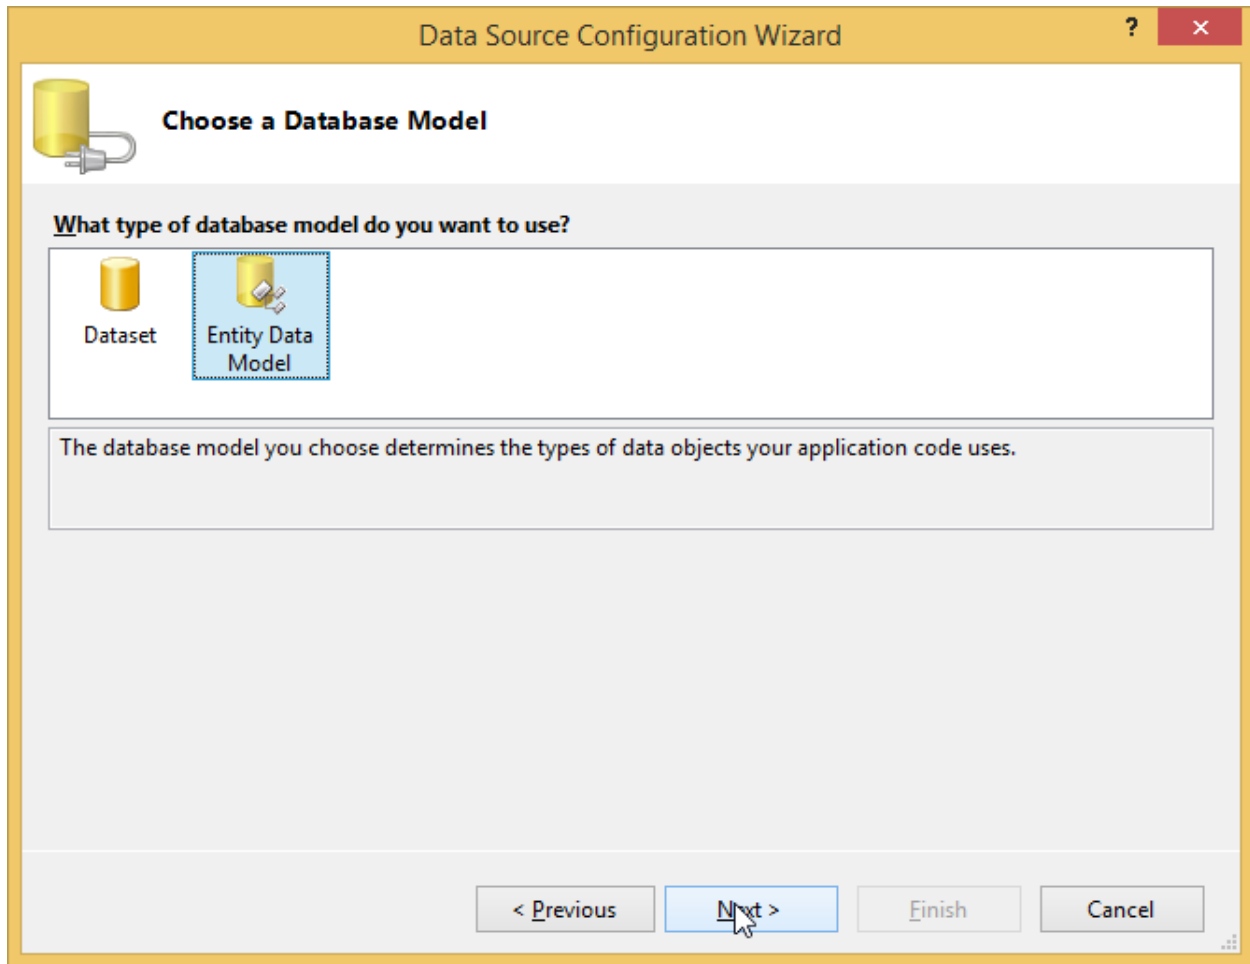

7. The Report Wizard opens.
8. Enter a dataset name in Name field. To choose a data source for the dataset, click New on the right of Data source drop-down combo box.

[illegible]

9. Then Data Source Configuration Wizard opens.
10. Click Database under Where will the application get data from? and then click Next.

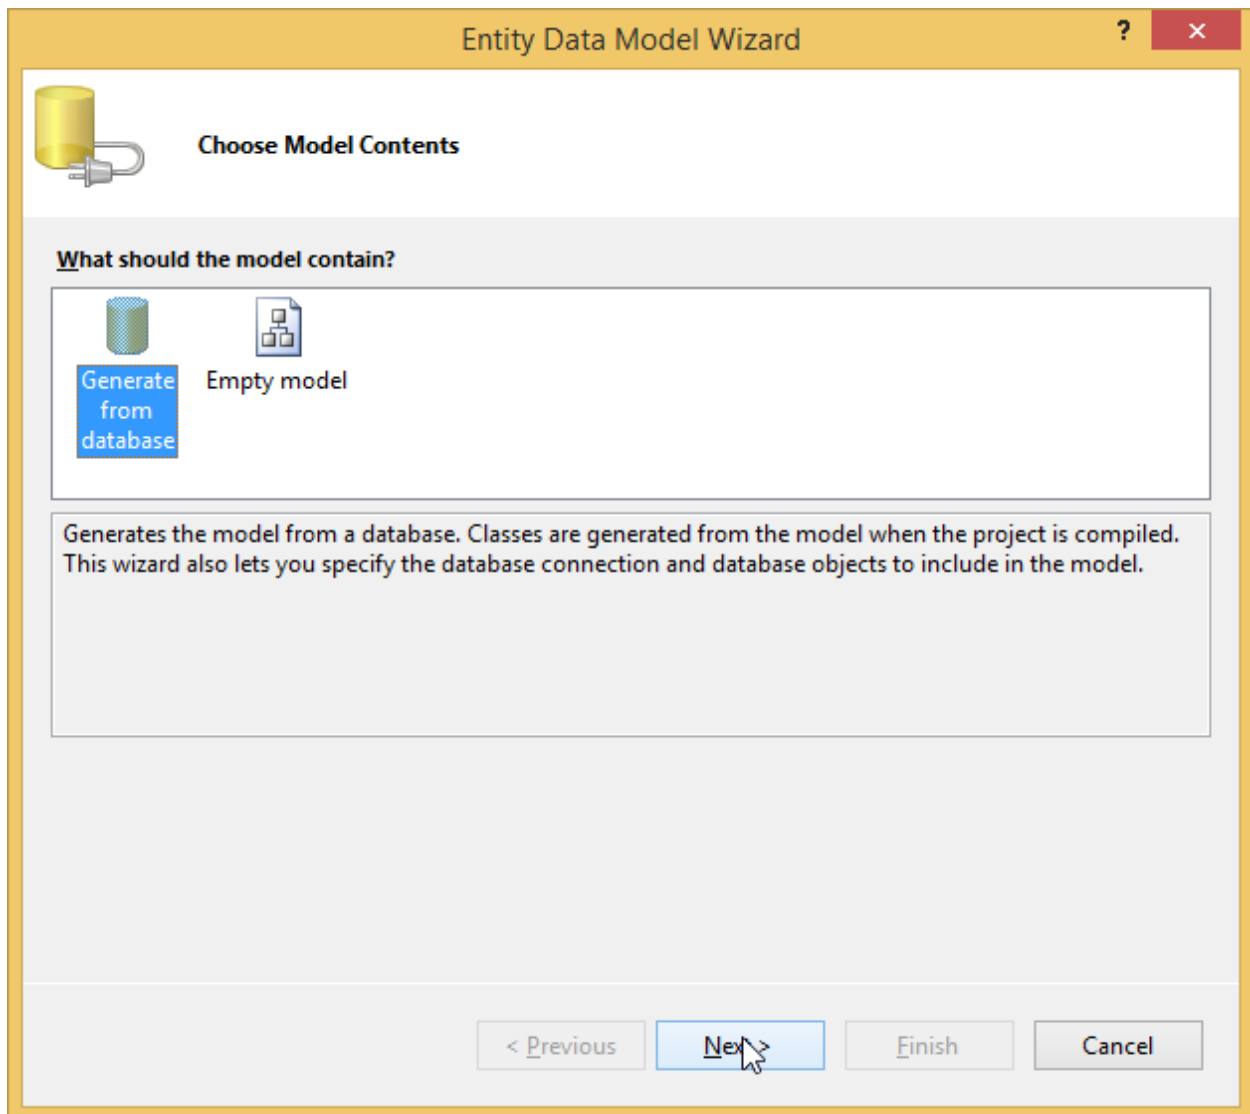

11. Click Entity Data Model under What type of database model do you want to use? and click Next.

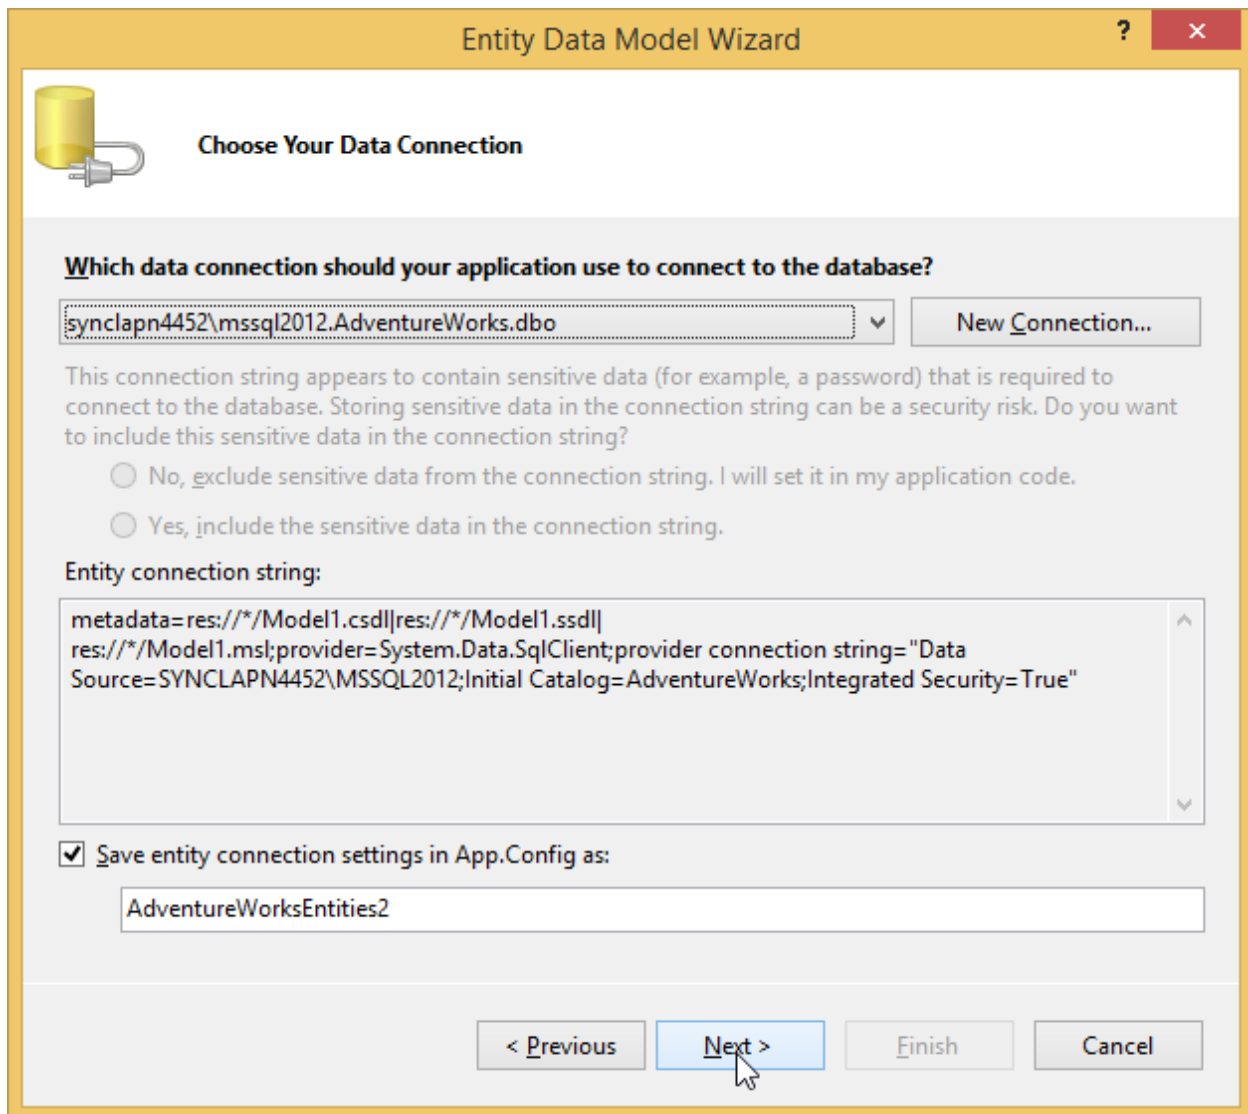

12. Then Entity Data Model Wizard opens.

13. Click Generate from database under what should the model contain? and click Next.

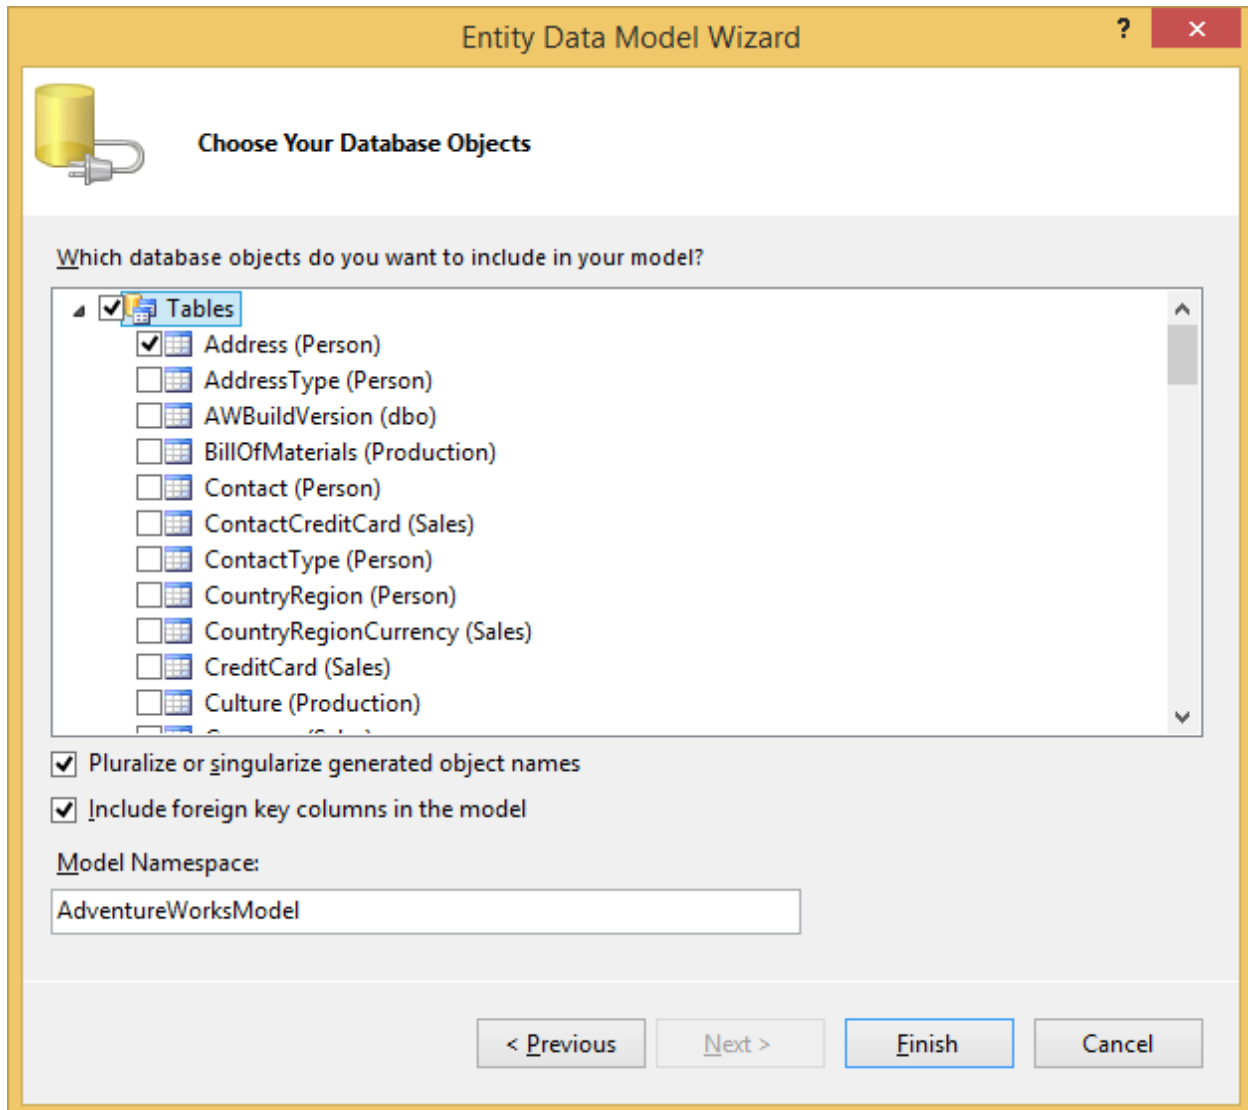

14. Select a data connection from Which data connection should your application use to connect to the database? drop-down combo box. Click Next.

The image shows a screenshot of the 'Entity Data Model Wizard' window, specifically the 'Choose Your Data Connection' step. The window has a yellow title bar with the text 'Entity Data Model Wizard' and standard window controls. Below the title bar is a yellow icon of a cylinder with a plug. The main content area is white and contains the following elements:

- Section Header:** 'Choose Your Data Connection' with a yellow icon.
- Question:** 'Which data connection should your application use to connect to the database?'
- Dropdown Menu:** A dropdown menu showing 'syncclapn4452\mssql2012.AdventureWorks.dbo' with a downward arrow.
- Button:** 'New Connection...'.
- Text:** 'This connection string appears to contain sensitive data (for example, a password) that is required to connect to the database. Storing sensitive data in the connection string can be a security risk. Do you want to include this sensitive data in the connection string?'
- Radio Buttons:** Two radio buttons: 'No, exclude sensitive data from the connection string. I will set it in my application code.' and 'Yes, include the sensitive data in the connection string.'.
- Text:** 'Entity connection string:'.
- Text Area:** A text area containing the connection string: 'metadata=res://*/Model1.csdl|res://*/Model1.ssdl|res://*/Model1.msl;provider=System.Data.SqlClient;provider connection string="Data Source=SYNCLAPN4452\MSSQL2012;Initial Catalog=AdventureWorks;Integrated Security=True"'. The text area has a vertical scrollbar on the right.
- Checkbox:** A checked checkbox labeled 'Save entity connection settings in App.Config as:'.
- Text Field:** A text field containing 'AdventureWorksEntities2'.
- Buttons:** Four buttons at the bottom: '< Previous', 'Next >', 'Finish', and 'Cancel'. The 'Next >' button is highlighted in blue and has a mouse cursor pointing to it.

15. Select the required object and click Next. The Data Source Configuration Wizard opens.

The screenshot shows the 'Entity Data Model Wizard' window, specifically the 'Choose Your Database Objects' step. The window has a yellow title bar with the text 'Entity Data Model Wizard' and standard window controls. Below the title bar is a yellow icon of a database cylinder with a plug. The main area is titled 'Choose Your Database Objects' and contains the question 'Which database objects do you want to include in your model?'. A tree view on the left shows 'Tables' selected. The right pane lists various tables with checkboxes: 'Address (Person)' is checked, while others like 'AddressType (Person)', 'AWBuildVersion (dbo)', 'BillOfMaterials (Production)', 'Contact (Person)', 'ContactCreditCard (Sales)', 'ContactType (Person)', 'CountryRegion (Person)', 'CountryRegionCurrency (Sales)', 'CreditCard (Sales)', and 'Culture (Production)' are unchecked. Below the list are two checked options: 'Pluralize or singularize generated object names' and 'Include foreign key columns in the model'. A text box for 'Model Namespace:' contains 'AdventureWorksModel'. At the bottom are four buttons: '< Previous', 'Next >', 'Finish' (highlighted with a blue border), and 'Cancel'.

Entity Data Model Wizard

Choose Your Database Objects

Which database objects do you want to include in your model?

☒ Tables

- ☒ Address (Person)
- ☐ AddressType (Person)
- ☐ AWBuildVersion (dbo)
- ☐ BillOfMaterials (Production)
- ☐ Contact (Person)
- ☐ ContactCreditCard (Sales)
- ☐ ContactType (Person)
- ☐ CountryRegion (Person)
- ☐ CountryRegionCurrency (Sales)
- ☐ CreditCard (Sales)
- ☐ Culture (Production)

☒ Pluralize or singularize generated object names

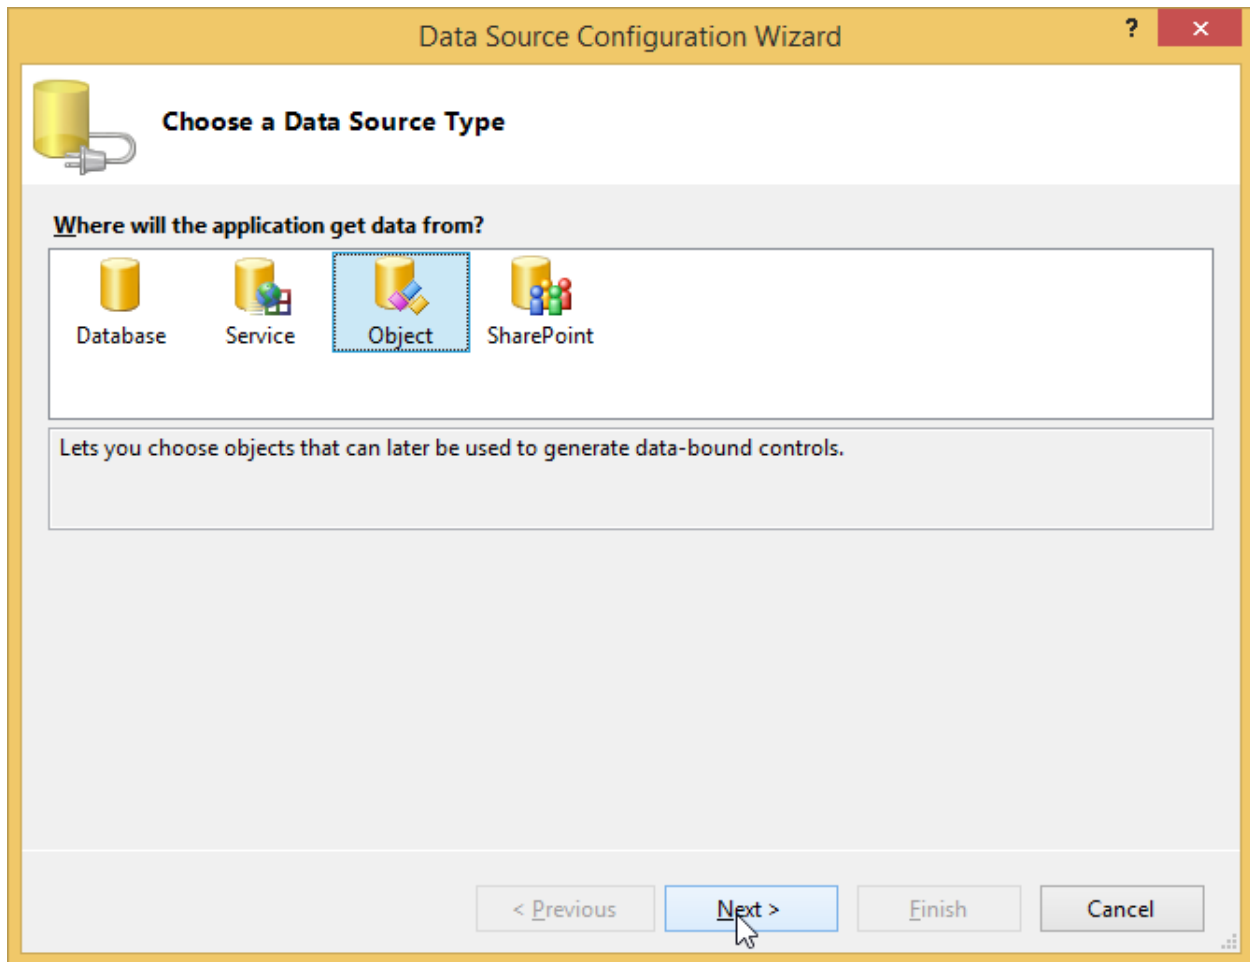

☒ Include foreign key columns in the model

Model Namespace:

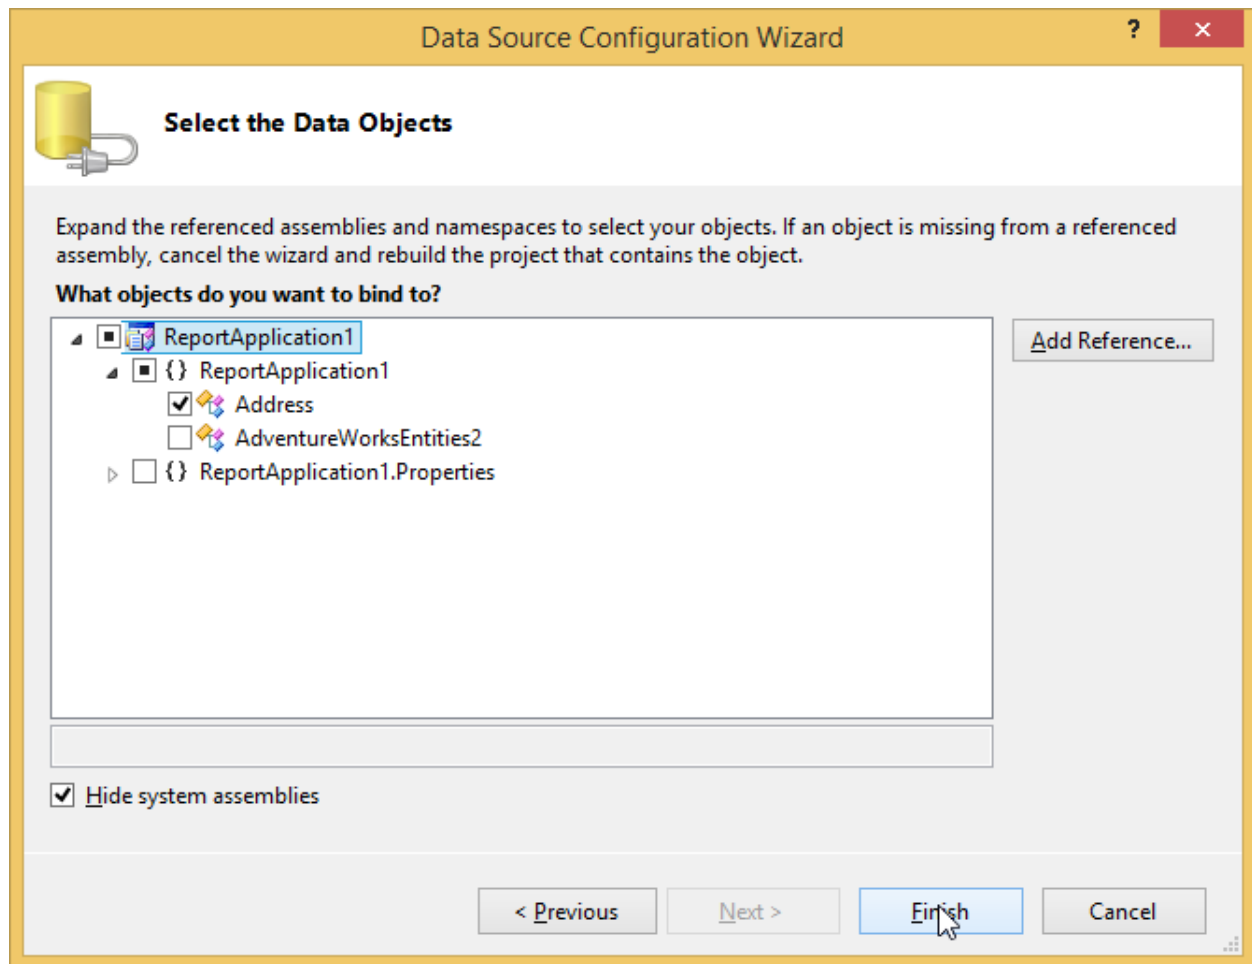

AdventureWorksModel

< Previous Next > Finish Cancel

16. Select Object under Where will the application get data from? and click Next.

17. Select the object under What objects do you want to bind to? and click Finish.

18. The Report Wizard shows the details of the dataset under Fields and Click Next.

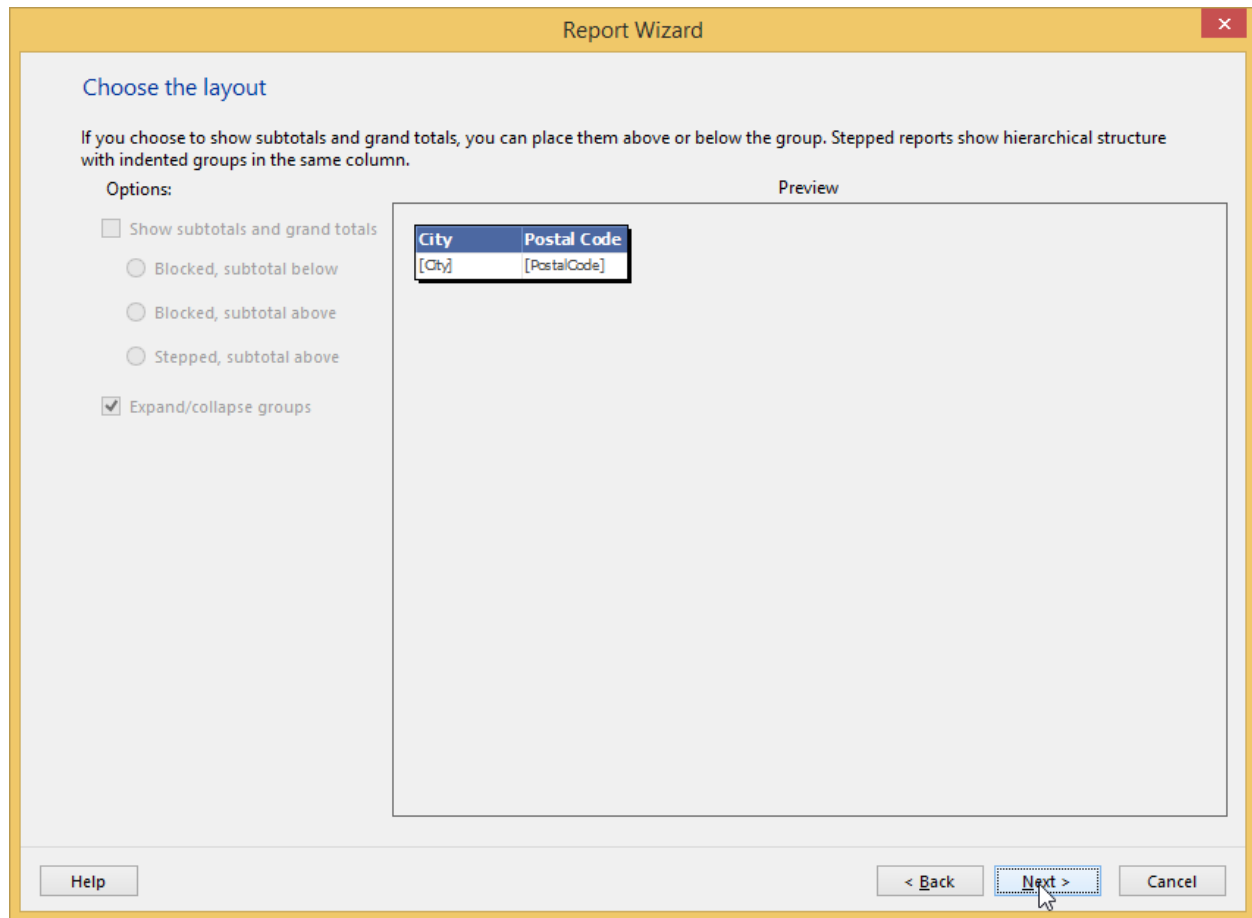

[illegible]

19. Arrange the available fields to row groups, column groups and values field. Click Next.

The screenshot shows the 'Report Wizard' window with the 'Arrange fields' step selected. The window has a yellow title bar and a red close button. The main area is light gray and contains the following elements:

- Available fields:** A list box on the left containing the following fields: AddressID, AddressLine1, AddressLine2, City, ModifiedDate, PostalCode, rowguid, and StateProvinceID.
- Row groups:** An empty box in the center with a grid icon and the label 'Row groups'.
- Column groups:** An empty box on the top right with a grid icon and the label 'Column groups'.
- Values:** A box on the bottom right with a summation symbol (Σ) and the label 'Values'. It contains two dropdown menus: 'City' and 'PostalCode'.
- Buttons:** At the bottom, there are three buttons: 'Help' (gray), '< Back' (blue with a dotted border), and 'Next >' (blue with a dotted border and a mouse cursor pointing to it). A 'Cancel' button is also present on the far right.

20. Choose the layout design in the next window and click Next.

The image shows a 'Report Wizard' dialog box with a yellow title bar. The main area is titled 'Choose the layout'. Below the title, there is a paragraph: 'If you choose to show subtotals and grand totals, you can place them above or below the group. Stepped reports show hierarchical structure with indented groups in the same column.' Under the heading 'Options:', there are four radio button options: 'Show subtotals and grand totals' (unchecked), 'Blocked, subtotal below' (unchecked), 'Blocked, subtotal above' (unchecked), and 'Stepped, subtotal above' (unchecked). There is also a checked checkbox for 'Expand/collapse groups'. To the right of the options is a 'Preview' section containing a table with two columns: 'City' and 'Postal Code'. The table has one data row with values '[City]' and '[PostalCode]'. At the bottom of the dialog, there are three buttons: 'Help', '< Back', and 'Next >', with a 'Cancel' button to the right of 'Next >'. A mouse cursor is pointing at the 'Next >' button.

Report Wizard

Choose the layout

If you choose to show subtotals and grand totals, you can place them above or below the group. Stepped reports show hierarchical structure with indented groups in the same column.

Options:

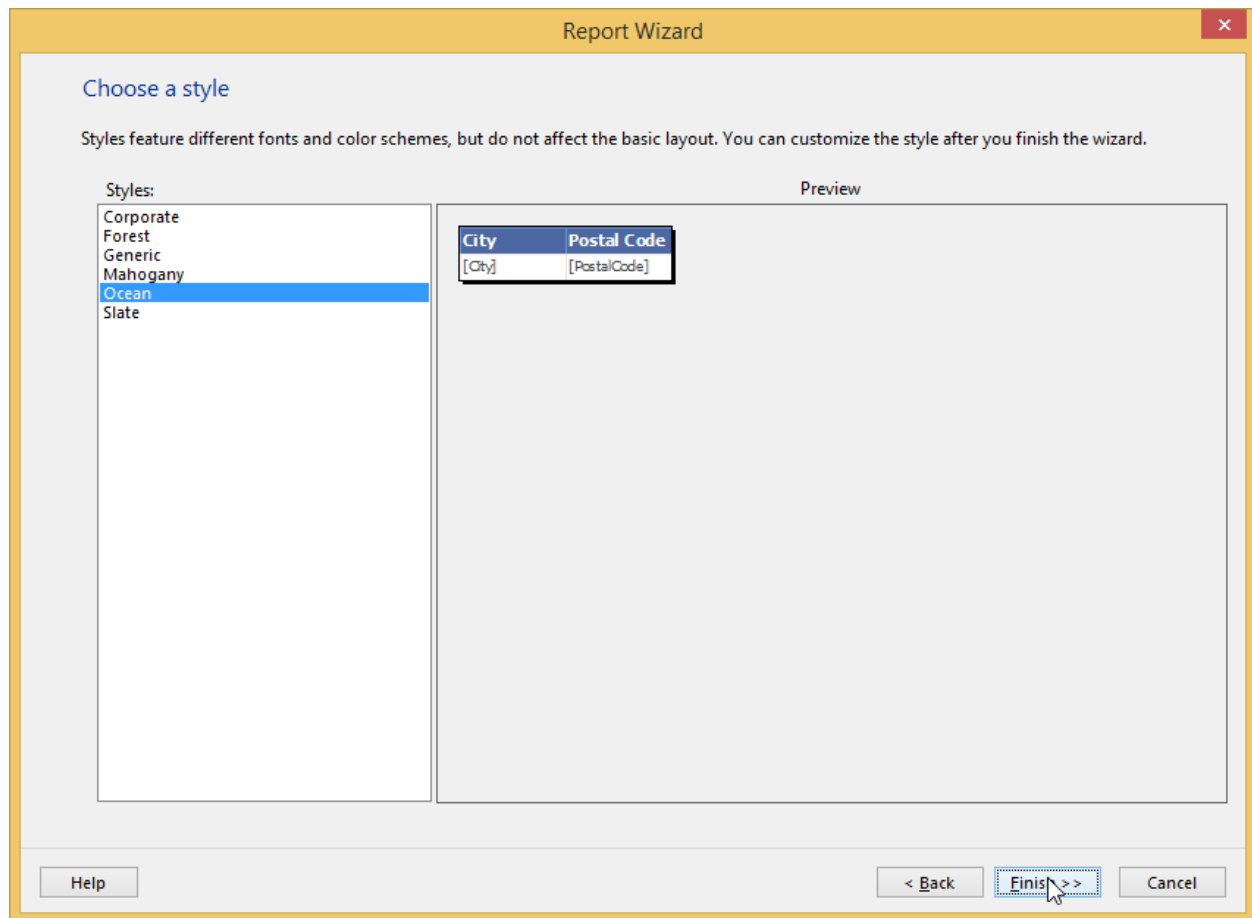

- ☐ Show subtotals and grand totals
- ☐ Blocked, subtotal below
- ☐ Blocked, subtotal above
- ☐ Stepped, subtotal above
- ☒ Expand/collapse groups

Preview

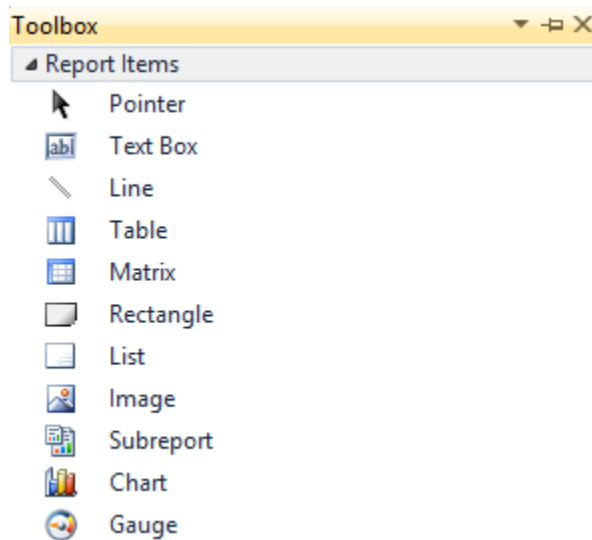

City	Postal Code
[City]	[PostalCode]

Help < Back Next > Cancel

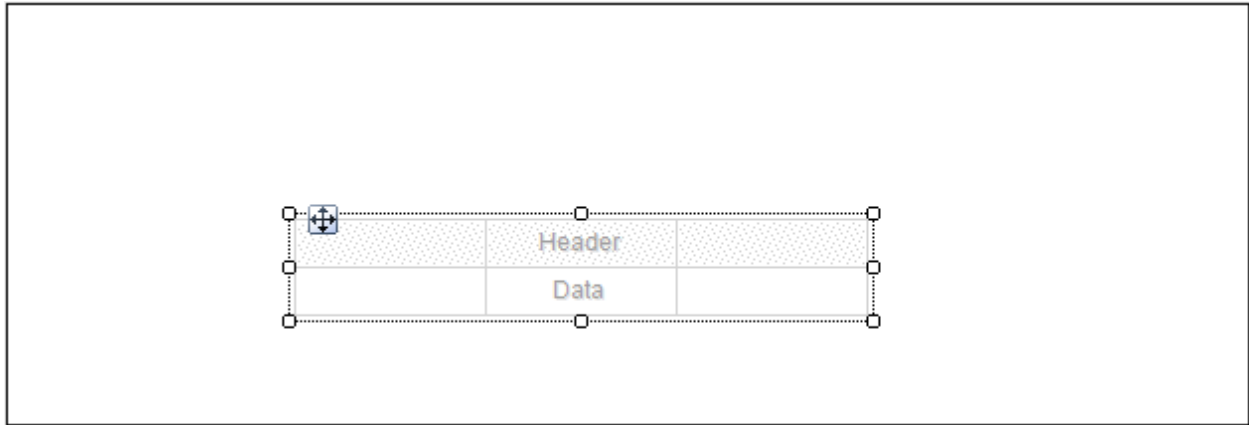

21. In the next window, choose the style and click Finish.

22. On Toolbox window, in Report Items, select Table.

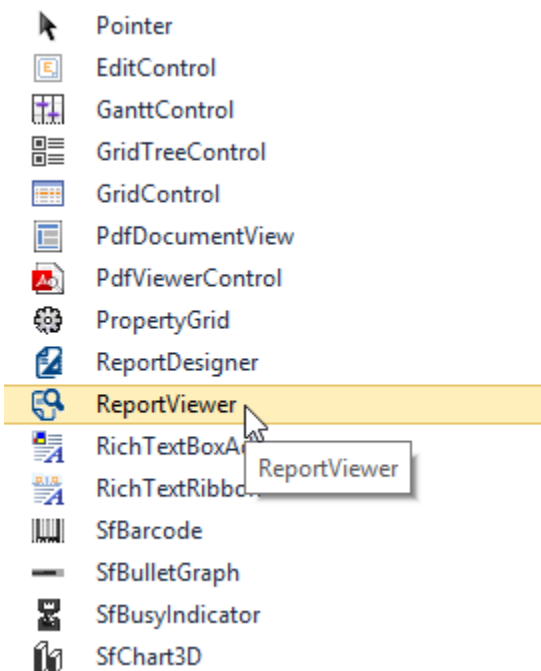

23. Draw a table on the WPF Designer window.

24. Drag the dataset field on the Table.

Address ID	Address Line1	City
[AddressID]	[AddressLine1]	[City]

25. To add Report Viewer in the WPF application, select ReportViewer under Reporting.

26. Set the ReportPath and the ProcessingMode as local in the Report Viewer.

XML

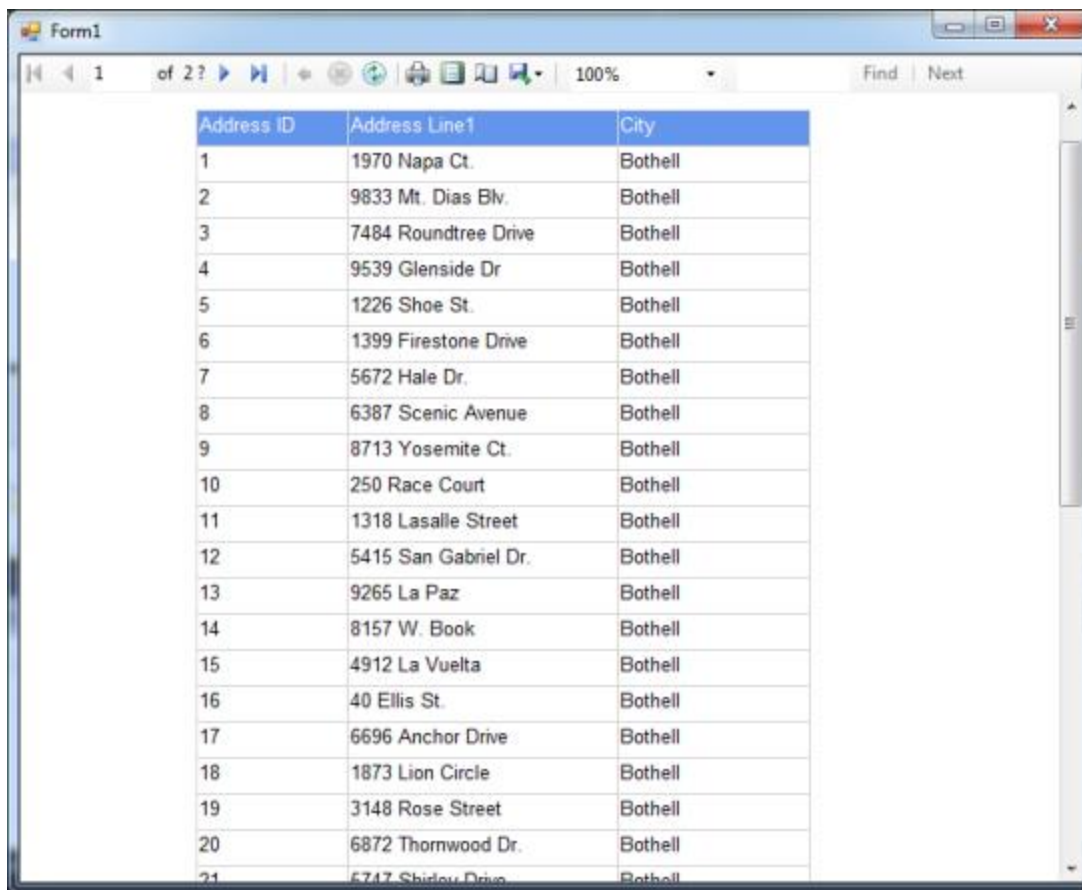

```
<Window x:Class="WpfApplication15.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
Title="MainWindow" Height="350" Width="525"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf">
<Grid>
<syncfusion:ReportViewer Name="viewer" ProcessingMode="Local"
ReportPath="..\..\ProductCatalog.rdlc" />
</Grid>
</Window>
```

27. Set the DataSource information in the code to view the report in the Report Viewer.

CSHARP

```
public MainWindow()
{
InitializeComponent();
this.Loaded += new RoutedEventHandler(MainWindow_Loaded);
}
void MainWindow_Loaded(object sender, RoutedEventArgs e)
{
this.viewer.DataSources.Clear();
this.viewer.DataSources.Add(new
Syncfusion.Windows.Reports.ReportDataSource()
{
Name = "Employee",
Value = new AdventureWorksEntities().Addresses.Take(100)
});
this.viewer.RefreshReport();
}
```

28. Run the application. The following output is displayed.

Address ID	Address Line1	City
1	1970 Napa Ct.	Bothell
2	9833 Mt. Dias Blv.	Bothell
3	7484 Roundtree Drive	Bothell
4	9539 Glenside Dr	Bothell

17	6696 Anchor Drive	Bothell
18	1873 Lion Circle	Bothell
19	3148 Rose Street	Bothell
20	6872 Thornwood Dr.	Bothell
21	5717 Shiloh Drive	Bothell

SSRS shared/embedded datasource credential information in ReportViewer

RDL reports have limitations for retrieving a password from the SQL Reporting Service (SSRS) for security reasons. Therefore, the credential information is provided when the data source credential is saved in the Reporting Server for shared or embedded data sources.

The following code provides SSRS shared/embedded data source credential information.

C#

```
void reportViewerControl_ReportLoaded(object sender, EventArgs e)
{
    var dataSources = this.reportViewerControl.GetDataSources();
    List<DataSourceCredentials> credentials=new List<DataSourceCredentials> ();
    foreach (var dataSource in dataSources)
    {
        DataSourceCredentials credential= new DataSourceCredentials ();
        credential.Name = dataSource.Name; // Sets the credential based on the data source.
        credential.UserId = "userName";
        credential.Password = "password";
        credentials.Add (credential);
    }
    this.reportViewerControl.SetDataSourceCredentials (credentials);
}
```

Provide the Report Parameters in code behind

Use the SetParameters method in the Report Viewer to provide the parameter values for rendering reports. Note that this method can also be used in a ReportLoaded event to avoid unexpected issues.

C#

```
this.reportViewerControl.ReportLoaded += new
Syncfusion.Windows.Reports.ReportLoadedEventHandler (reportViewerControl_Repo
rtLoaded);
void reportViewerControl_ReportLoaded(object sender, EventArgs e)
{
    //this.reportViewerControl.SetParameters
}
```

Provide the Data Source credential information in code behind

Use SetDataSourceCredentials to provide the data source credential for the Report Viewer. Use this method in a ReportLoaded event to avoid unexpected issues.

C#

```
this.reportViewerControl.ReportLoaded += new ReportLoadedEventHandler
(reportViewerControl_ReportLoaded);
void reportViewerControl_ReportLoaded(object sender, EventArgs e)
{
    var dataSources = this.reportViewerControl.GetDataSources();
    List<DataSourceCredentials> credentials=new List<DataSourceCredentials> ();
    foreach (var dataSource in dataSources)
    {
        DataSourceCredentials credential= new DataSourceCredentials ();
        credential.Name = dataSource.Name; // Sets the credential based on the data
        source.
        credential.UserId = "userName";
        credential.Password = "password";
        credentials.Add (credential);
    }
    this.reportViewerControl.SetDataSourceCredentials (credentials);
}
```

Can you use SharePoint Integrated Mode in ReportViewer?

Yes, Syncfusion Report Viewer supports viewing and exporting SharePoint Integrated Mode Reporting Service reports.

C#

```
this.reportViewer1.ReportLoaded += (sen, arg) =>
{
    IList < DataSourceCredentials > credentials = new List <
    DataSourceCredentials > ();
    foreach(var datasource in this.reportViewer1.GetDataSources())
    {
        DataSourceCredentials creden = new DataSourceCredentials();
        creden.Name = datasource.Name;
        creden.UserId = "username";
        creden.Password = "password";
        credentials.Add(creden);
    }
}
```

```
}  
this.reportViewer1.SetDataSourceCredentials(credentials);  
};  
this.reportViewer1.ReportPath = @" http://ServerName/testreport.rdl";  
this.reportViewer1.ReportServerUrl = @"http: //ServerName/ReportServer";  
this.reportViewer1.RefreshReport();
```

Can you use Azure SSRS reports in ReportViewer?

Yes, Syncfusion Report Viewer supports viewing and exporting Azure hosted reports. By default, Azure Reporting Service works with a Forms credential. So, provide your Forms credential in the ReportServerFormsCredential to view the report.

C#

```
this.reportViewer1.ReportLoaded += (sen, arg) =>  
{  
    IList < DataSourceCredentials > credentials = new List <  
        DataSourceCredentials > ();  
    foreach(var datasource in this.reportViewer1.GetDataSources())  
    {  
        DataSourceCredentials creden = new DataSourceCredentials();  
        creden.Name = datasource.Name;  
        creden.UserId = "username";  
        creden.Password = "password";  
        credentials.Add(creden);  
    }  
    this.reportViewer1.SetDataSourceCredentials(credentials);  
};  
this.reportViewer1.ReportPath = " / AzureReportProject / Reports";  
this.reportViewer1.ReportServerUrl = @"http://ServerName/ReportServer";  
this.reportViewer1.ReportServerFormsCredential = new  
    System.Net.NetworkCredential("userID", "Password");  
this.reportViewer1.RefreshReport();
```

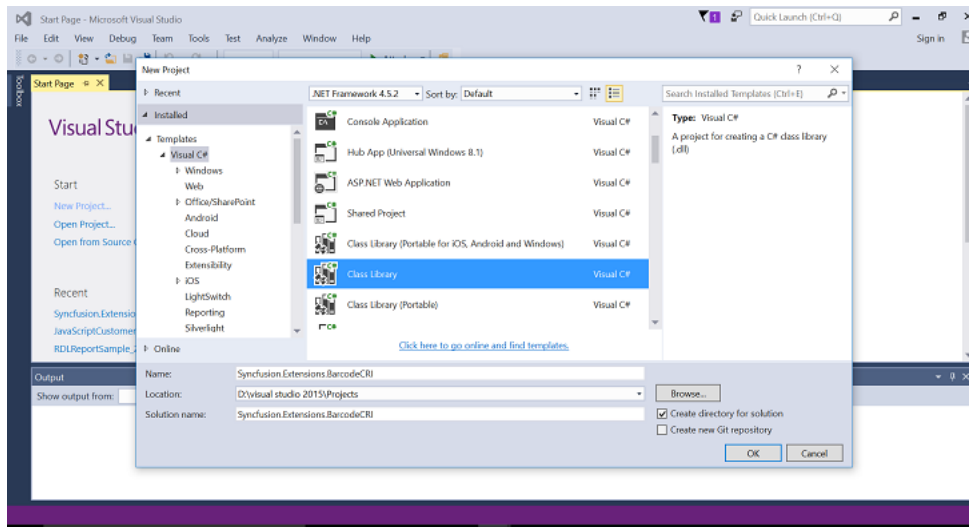

A custom report item allows you to add the functionality that is not natively supported in the RDL or extend the functionality of existing controls in the RDL standard. The run-time component allows to render the custom report item in report viewer.

Creating a custom report item run-time component

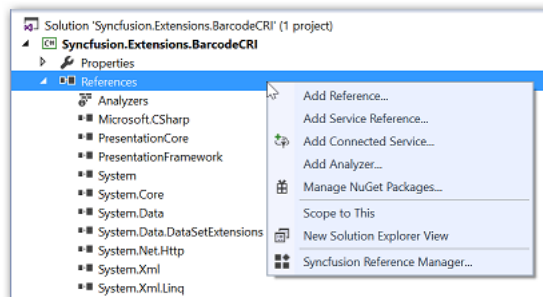

The run-time component of the custom report item is implemented by using CLS-compliant language, and is called by the report processor at run-time. The below section provides detail to create run-time component with the barcode custom report item in report viewer.

Create report item assembly

1. Open the Visual Studio and select the class library project type, then name the project as "Syncfusion.Extensions.BarcodeCRI" for the run-time component.

2. Add the reference "Syncfusion.ReportControls.Wpf", "Syncfusion.SfBarcode.WPF" and "Syncfusion.Shared.WPF" for the extension project.

Note: Refer the above assemblies from the below installed location. For Essential Studio: C:\Program Files (x86)\Syncfusion\Essential Studio\{ site.releaseversion }\Assemblies

3. Add a class "BarcodeCustomReportItem" by inheriting the `ICustomReportItem` interface.

Implementing the `ICustomReportItem` interface

To create a CustomReportItem run-time component, you should implement the `ICustomReportItem` interface, it generates the following two method stubs.

Interface methods	Definition
GenerateReportItemDefinition	Called first and is used for setting definition properties and creating the image object that contains both the definition and instance properties that are used for rendering the item.
EvaluateReportItemInstance	Called after the definition objects have been evaluated, and it provides the instance objects that will be used for rendering the item.

C#

```
namespace Syncfusion.Extensions.BarcodeCRI
{
```

```

public class BarcodeCustomReportItem : RDL.Data.ICustomReportItem
{
    #region ICustomReportItem Members
    public void GenerateReportItemDefinition(CustomReportItem cri)
    {
        //It will create the Image object
        cri.CreateCriImageDefinition();
    }
    public void EvaluateReportItemInstance(CustomReportItem cri)
    {
        Thread thread = new Thread(delegate ()
        {
            RDL.Data.Image imageReportItem = (RDL.Data.Image)cri.GeneratedReportItem;
            imageReportItem.ImageData = DrawImage(cri);
        }, (1024 * 1024 * 64));
        thread.SetApartmentState(ApartmentState.STA);
        thread.Start();
        thread.Join();
    }
    #endregion
    //To create image from custom report item control
    private byte[] DrawImage(CustomReportItem customReportItem)
    {
        try
        {
            byte[] imageData = null;
            SfBarcode barcodeControl = new SfBarcode();
            barcodeControl.Background = new SolidColorBrush(Colors.Transparent);
            barcodeControl.Height = customReportItem.Height.ToPixels();
            barcodeControl.Width = customReportItem.Width.ToPixels();
            barcodeControl.Text =
                (string)LookupCustomProperty(customReportItem.CustomProperties,
                "BarcodeValue");
            barcodeControl.InvalidateArrange();
            barcodeControl.UpdateLayout();
            MemoryStream stream = new ImageConversion().CovertToImage(barcodeControl);
            imageData = new byte[(int)stream.Length];
            stream.Seek(0, SeekOrigin.Begin);
            stream.Read(imageData, 0, (int)stream.Length);
            return imageData;
        }
        catch
        {
            return null;
        }
    }
}

```

Convert custom report item as image

The custom report item is rendered as image in report viewer, so that the run-time component need to be converted as an image. The following converter is used to generate the image for rendering.

C#

```

internal partial class ImageConversion : UserControl

```

```

{
    Canvas InnerCanvas;
    public MemoryStream CovertToImage(Control innerControl)
    {
        try
        {
            this.InnerCanvas = new Canvas();
            this.Content = this.InnerCanvas;
            innerControl.Margin = new Thickness(0);
            InnerCanvas.Children.Add(innerControl);
            InnerCanvas.Width = innerControl.Width;
            InnerCanvas.Height = innerControl.Height;
            Canvas canvas = this.InnerCanvas;
            canvas.Measure(new Size((int)canvas.Width, (int)canvas.Height));
            canvas.Arrange(new Rect(new Size((int)canvas.Width, (int)canvas.Height)));
            int Height = ((int)(InnerCanvas.ActualHeight));
            int Width = ((int)(InnerCanvas.ActualWidth));
            this.Height = InnerCanvas.Height;
            this.Width = InnerCanvas.Width;
            InnerCanvas.LayoutTransform = null;
            Size size = new Size(InnerCanvas.ActualWidth, InnerCanvas.ActualHeight);
            InnerCanvas.Background = Brushes.White;
            InnerCanvas.Arrange(new Rect(size));
            InnerCanvas.UpdateLayout();
            RenderTargetBitmap rtb = new RenderTargetBitmap(Width, Height, 300, 300,
                PixelFormats.Default);
            rtb.Render(InnerCanvas);
            var Source = new MemoryStream();
            BitmapEncoder encoder = new BmpBitmapEncoder();
            encoder.Frames.Add(BitmapFrame.Create(rtb));
            encoder.Save(Source);
            return Source;
        }
        catch
        {
            return null;
        }
    }
}

```

Build project

You can clean and build the extension project, it will generate the run-time component assembly "Syncfusion.Extensions.BarcodeCRI.dll" in the bin folder of the project.

Note: You can create a standalone report viewer application with the help of given [Getting Started Documentation](#).

You can download the extension project with barcode custom report item for report viewer from [here](#).

Deploy a custom report item

To deploy a custom report item, you must modify the application configuration files or create "ReportExtensions.config" file and copy the run-time component assembly (Syncfusion.Extensions.BarcodeCRI) and its dependent assemblies to the bin folder of your application. The deployment requires configuration to process the extensions, and the following describes about configuration settings.

Create a "ReportExtensions.config" file in your application. The following "configSections" section is mandatory to process the extension in the control, so add it as shown in the following code.

XML

```
<configSections>
<section name="ReportingExtensions" type="Syncfusion.Reporting.Extensions,
Syncfusion.ReportControls.WPF" allowLocation="true"
allowDefinition="Everywhere" />
</configSections>
```

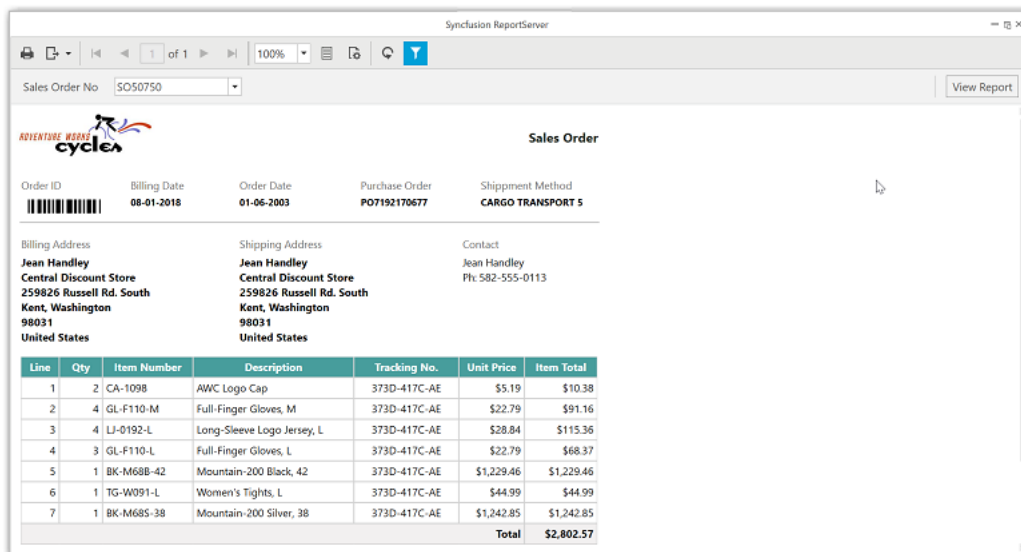

You must add the **ReportItem** tag for all newly added custom report item with the following attributes.

Attribute	Description
Name	Name of your report item that is going to be displayed in the list.
Assembly	Name of the newly created report item assembly.
Type	Report item class name with the namespace.

XML

```
<ReportingExtensions>
<ReportItems>
<ReportItem Name="Barcode" Assembly="Syncfusion.Extensions.BarcodeCRI"
Type="Syncfusion.Extensions.BarcodeCRI.BarcodeCustomReportItem" />
</ReportItems>
</ReportingExtensions>
```

After creating the config file, add it to the report viewer application. Run the application, output with the barcode custom report item is rendered as below.

Shows the invoice report rendered with the barcode custom report item.

ReportWriter

WPF ReportWriter Overview

Report Writer is a class library that enables the user to render reports defined in Microsoft's RDL format (2008 or 2008 R2) as PDF, Word, Excel or HTML documents.

The important features of WPF Report Writer are listed as follows:

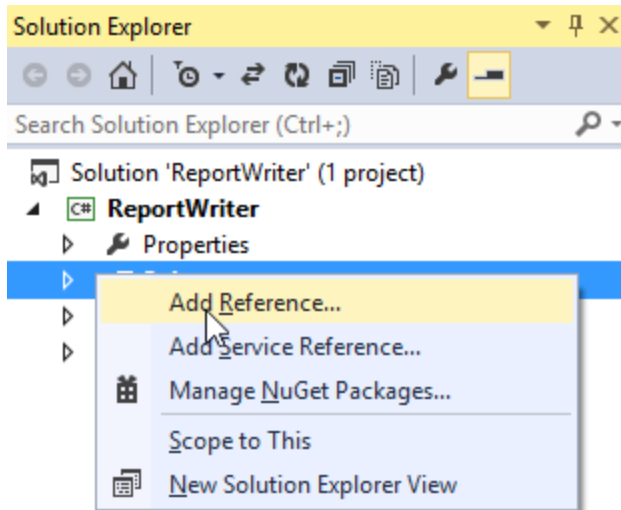

- RDL Specification - Supports RDL specification for the SQL Server 2008 and RDL specification for the SQL Server 2008 R2 only. List of available report definition formats: [msdn.microsoft.com/library/dd297486\(SQL.100\)](https://msdn.microsoft.com/library/dd297486(SQL.100)).
- Data sources - You can use advanced database servers Data Sources in Report Writer (SQL and Oracle).
- Charts - Show all basic types of charts that are available in Microsoft RDL reports.
- Tablix - Shows the summaries and simple tables.
- Gauge - Shows measurement values by using expression values.
- Textbox - Shows textbox data with expression support.
- Export - Export report as PDF, Word, Excel and HTML.
- Report Parameter - Views the report based on the report parameter value.

Getting Started with WPF ReportWriter

Adding ReportWriter to an application

This section illustrates how to add ReportWriter to the WPF application. It includes the following steps.

1. Create a new WPF application in Visual Studio.
2. In the Solution Explorer, Right-click the References folder and then click Add Reference.

3. Add the following references
 - Syncfusion.Chart.Wpf
 - Syncfusion.Compression.Base
 - Syncfusion.DocIO.Base
 - Syncfusion.Gauge.Wpf
 - Syncfusion.Linq.Base
 - Syncfusion.Pdf.Base
 - Syncfusion.ReportControls.Wpf
 - Syncfusion.ReportWriter.Base
 - Syncfusion.SfMaps.Wpf
 - Syncfusion.Shared.Wpf
 - Syncfusion.XlsIO.Base

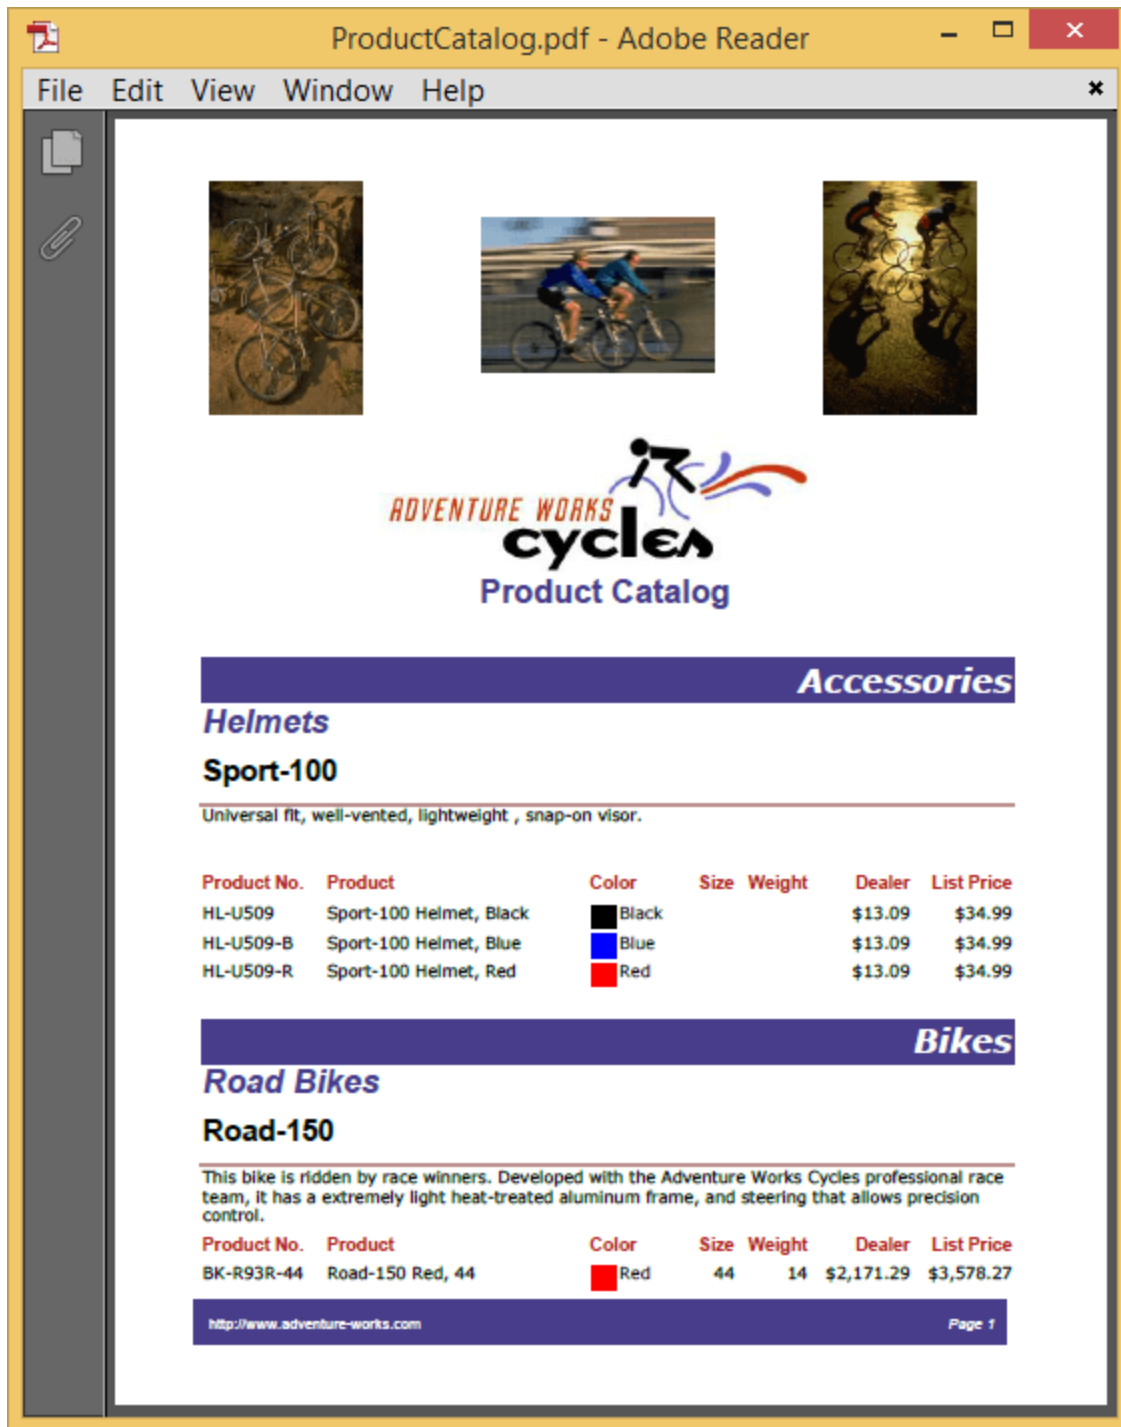

Note: Refer the above assemblies from the installed location, C:\Program Files (x86)\Syncfusion\Essential Studio\WPF\{{ site.releaseversion }}\Assemblies

4. Set the following properties of ReportWriter.
 - ReportPath - Set the local file system path of the report.
 - ReportProcessingMode - Set ProcessingMode as Remote for RDL report and Local for RDLC report.
 - Export format - Set Export format as PDF, Excel, Word or HTML.
5. Add the following code to export RDL report to the required export formats.

CSHARP

```
string fileName = null;
WriterFormat format;
string reportPath = @"..\ReportTemplate\Product Catalog.rdl";
//Step 1 : Instantiate the report writer with the parameter "ReportPath".
ReportWriter reportWriter = new ReportWriter(reportPath);
reportWriter.ReportProcessingMode = ProcessingMode.Remote;
//Step 2 : Save the report as Pdf or Word or Excel
if (pdf.IsChecked == true)
{
    fileName = "ProductCatalog.pdf";
    format = WriterFormat.PDF;
}
else if (word.IsChecked == true)
{
    fileName = "ProductCatalog.doc";
    format = WriterFormat.Word;
}
else if (excel.IsChecked == true)
{
    fileName = "ProductCatalog.xls";
    format = WriterFormat.Excel;
}
else
{
    fileName = "ProductCatalog.html";
    format = WriterFormat.HTML;
}
reportWriter.Save(fileName, format);
```

5. Run the application. The following output displays exported report in PDF format.

Export RDL Reports

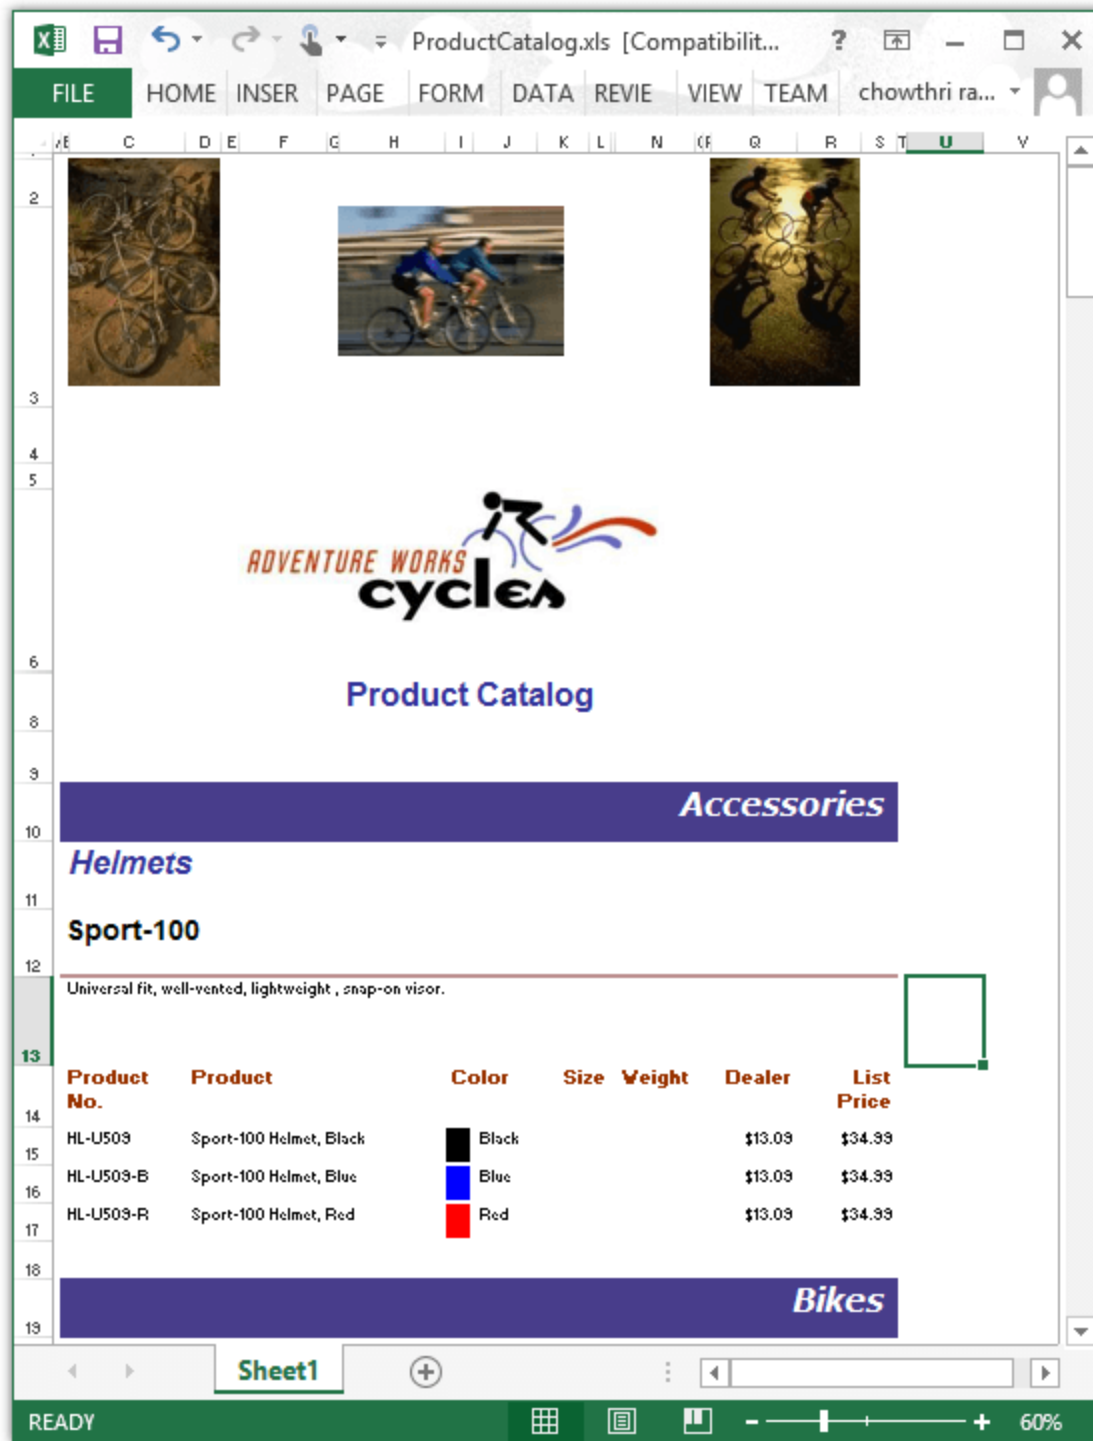

The ReportWriter allows you to export the RDL report to popular file formats PDF, WORD, EXCEL and HTML. The following code helps you to bind data to ReportWriter.

1. Assign `ReportPath`, `ReportProcessingMode` and `ExportFormat` to ReportWriter.

CSHARP

```
string reportPath = @"..\ReportTemplate\Product Catalog.rdl";  
ReportWriter reportWriter = new ReportWriter(reportPath);  
reportWriter.ReportProcessingMode = ProcessingMode.Remote;  
reportWriter.Save("ProductCatalog.xls", WriterFormat.Excel);
```

2. Run the application. The following output displays exported report in Excel format.

Export RDLC Reports

The ReportWriter allows you to export the RDLC report to popular file formats PDF, WORD, EXCEL and HTML. The following code helps you to bind data to ReportWriter.

1. Assign `ReportPath`, `ReportProcessingMode` and `ExportFormat` to ReportWriter.

CSHARP

```
string reportPath = @"..\ReportTemplate\RDLC\ProductCatalog.rdlc";
ReportWriter reportWriter = new ReportWriter(reportPath, dataSources);
reportWriter.ReportProcessingMode = ProcessingMode.Local;
reportWriter.Save("ProductCatalog.doc", WriterFormat.WORD);
```

2. Add data source to the RDLC report.

CSHARP

```
ReportDataSourceCollection dataSources = new ReportDataSourceCollection();
dataSources.Add(new ReportDataSource { Name = "ProductCatalog", Value =
ProductCatalogSource.GetData() });
```

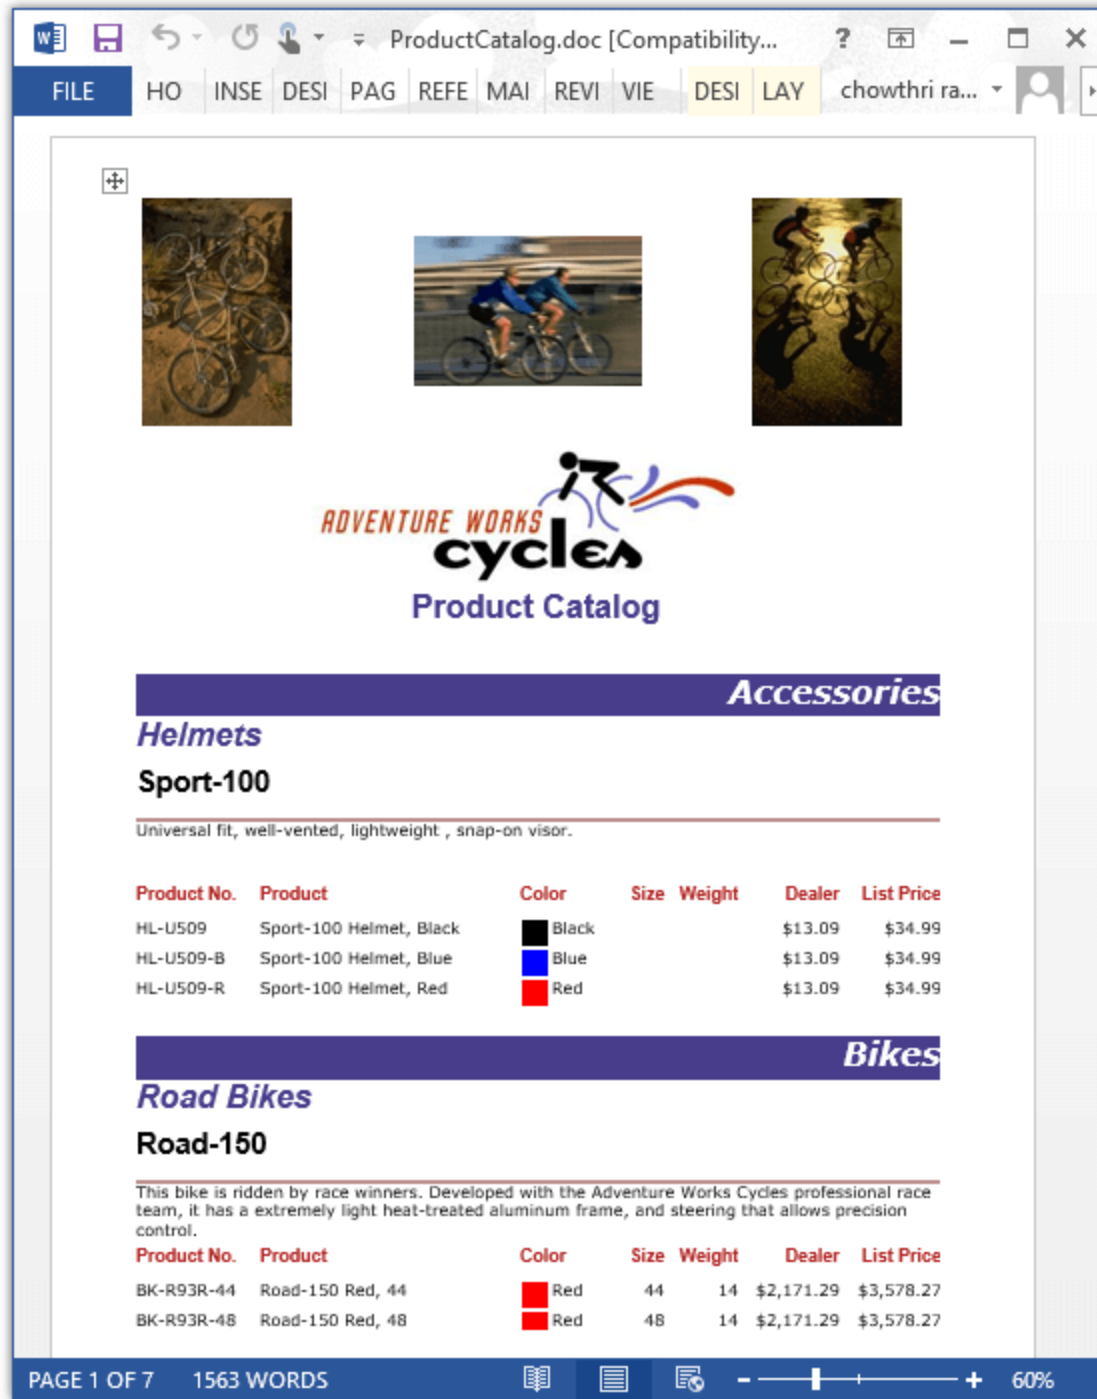

3. Assign values for the data source which is given in the RDLC.

CSHARP

```
#region ProductCatalog Details
public class ProductCatalogSource
{
    public string ProdSubCat { get; set; }
    public string ProdModel { get; set; }
    public string ProdCat { get; set; }
    public string Description { get; set; }
    public string ProdName { get; set; }
    public string ProductNumber { get; set; }
    public string Color { get; set; }
    public string Size { get; set; }
    public double? Weight { get; set; }
    public double? StandardCost { get; set; }
    public string Style { get; set; }
    public string Class { get; set; }
    public double? ListPrice { get; set; }
    public static IList GetData()
    {
        List<ProductCatalogSource> datas = new List<ProductCatalogSource>();
        ProductCatalogSource data = null;
        data = new ProductCatalogSource()
        {
            ProdSubCat = "Road Frames",
            ProdModel = "HL Road Frame",
            ProdCat = "Components",
            Description = "Our lightest and best quality aluminum frame made from the
newest alloy; it is welded and heat-treated for strength. Our innovative
design results in maximum comfort and performance.",
            ProdName = "HL Road Frame - Black, 58",
            ProductNumber = "FR-R92B-58",
            Color = "Black",
            Size = "58",
            Weight = 2.24,
            StandardCost = 1059.3100,
```

```
Style = "U ",
Class = "H ",
ListPrice = 1431.5000
};
datas.Add(data);
data = new ProductCatalogSource()
{
    ProdSubCat = "Road Frames",
    ProdModel = "HL Road Frame",
    ProdCat = "Components",
    Description = "Our lightest and best quality aluminum frame made from the
newest alloy; it is welded and heat-treated for strength. Our innovative
design results in maximum comfort and performance.",
    ProdName = "HL Road Frame - Red, 58",
    ProductNumber = "FR-R92R-58",
    Color = "Red",
    Size = "58",
    Weight = 2.24,
    StandardCost = 1059.3100,
    Style = "U ",
    Class = "H ",
    ListPrice = 1431.5000
};
datas.Add(data);
data = new ProductCatalogSource()
{
    ProdSubCat = "Helmets",
    ProdModel = "Sport-100",
    ProdCat = "Accessories",
    Description = "Universal fit, well-vented, lightweight , snap-on visor.",
    ProdName = "Sport-100 Helmet, Red",
    ProductNumber = "HL-U509-R",
    Color = "Red",
    Size = "",
    Weight = null,
    StandardCost = 13.0863,
    Style = "",
    Class = "",
    ListPrice = 34.9900
};
datas.Add(data);
return datas;
}
}
#endregion
```

4. Run the application. The following output displays exported report in Word format.

Saving reports in WPF ReportWriter Control

Essential ReportWriter provides support for saving a report as a PDF, Word, Excel and HTML documents with the help of the class ReportWriter. The report elements such as Tablix, matrices, charts, gauges, shapes, and text boxes are supported in this feature.

Saving report as PDF

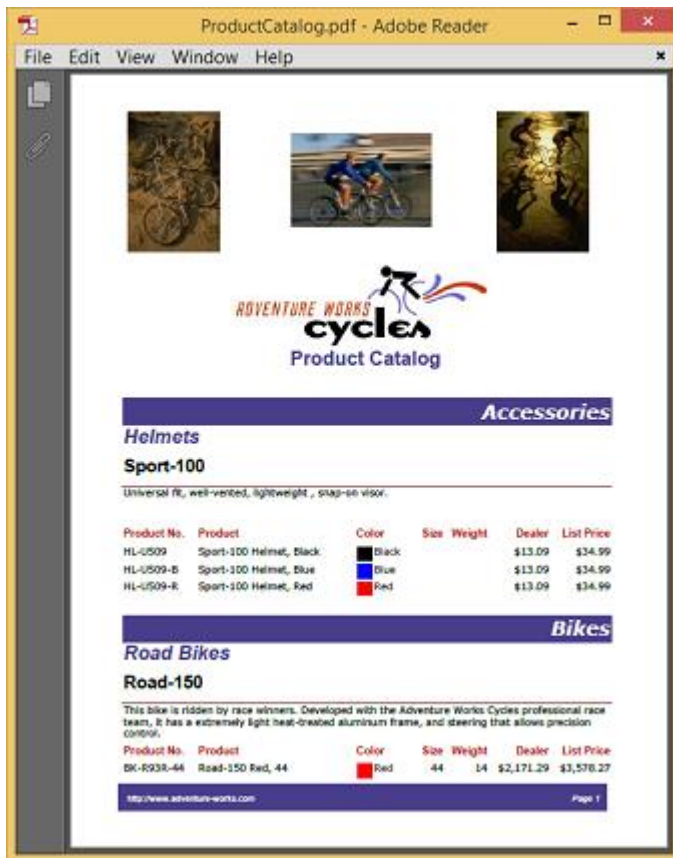

The report generated using the ReportDesigner can be exported as a PDF document using the following code.

C#

```
//Instantiate the report writer with the parameter "ReportPath" and
"ReportDataSourceCollection".
ReportWriter reportWriter = new ReportWriter(reportpath, dataSources);
reportWriter.Save("Sample.pdf", WriterFormat.PDF);
```

VB.NET

```
'Instantiate the report writer with the parameter "ReportPath" and
"ReportDataSourceCollection".
Dim reportWriter As New ReportWriter (reportpath, dataSources)
reportWriter.Save("Sample.pdf", WriterFormat.PDF)
```

Saving report as Excel

The report generated using the ReportDesigner can be exported as an Excel document using the following code example.

C#

```
//Instantiate the report writer with the parameter "ReportPath" and
"ReportDataSourceCollection".
ReportWriter reportWriter = new ReportWriter(reportPath, dataSources);
reportWriter.Save("Sample.xls", WriterFormat.Excel);
```

VB.NET

'Instantiate the report writer with the parameter "ReportPath" and "ReportDataSourceCollection".

```
Dim reportWriter As New ReportWriter (reportPath, dataSources)
reportWriter.Save("Sample.xls", WriterFormat.Excel)
```

Saving report as Word

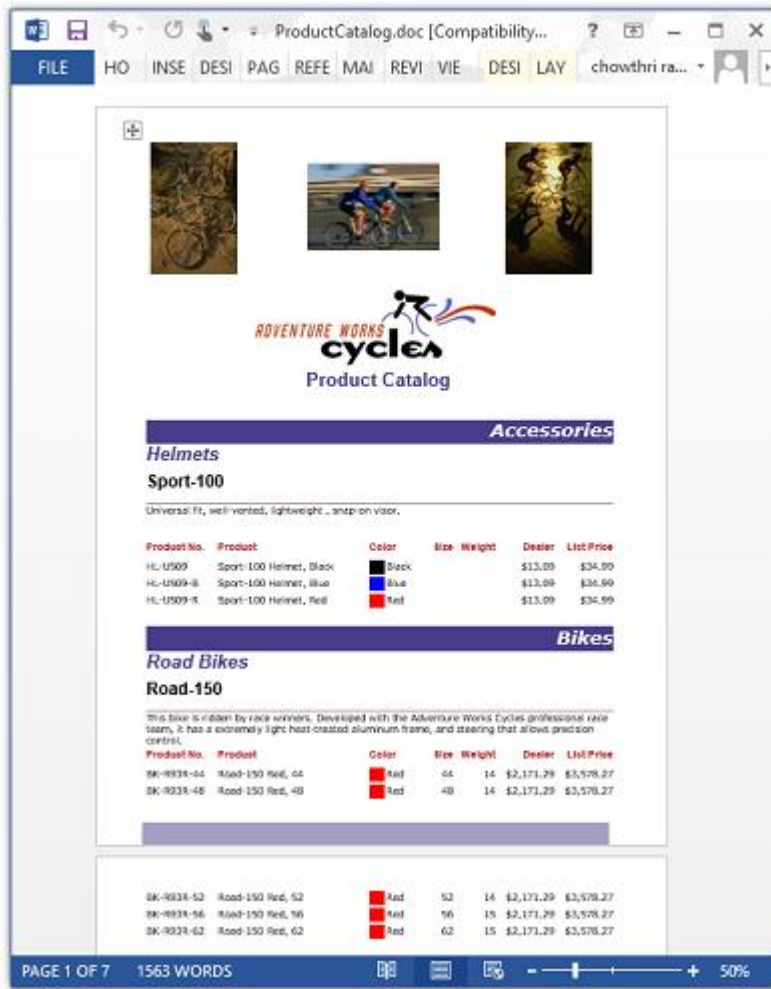

The report generated using the ReportDesigner can also be exported as a Word document using the following code example.

C#

```
// Instantiate the report writer with the parameter "ReportPath" and
// "ReportDataSourceCollection".
ReportWriter reportWriter = new ReportWriter (reportPath, dataSources);
reportWriter.Save("Sample.doc", WriterFormat.WORD);
```

VB.NET

```
'Instantiate the report writer with the parameter "ReportPath" and
'ReportDataSourceCollection".
Dim reportWriter As New ReportWriter (reportPath, dataSources)
reportWriter.Save("Sample.doc", WriterFormat.WORD)
```

Saving report as an HTML

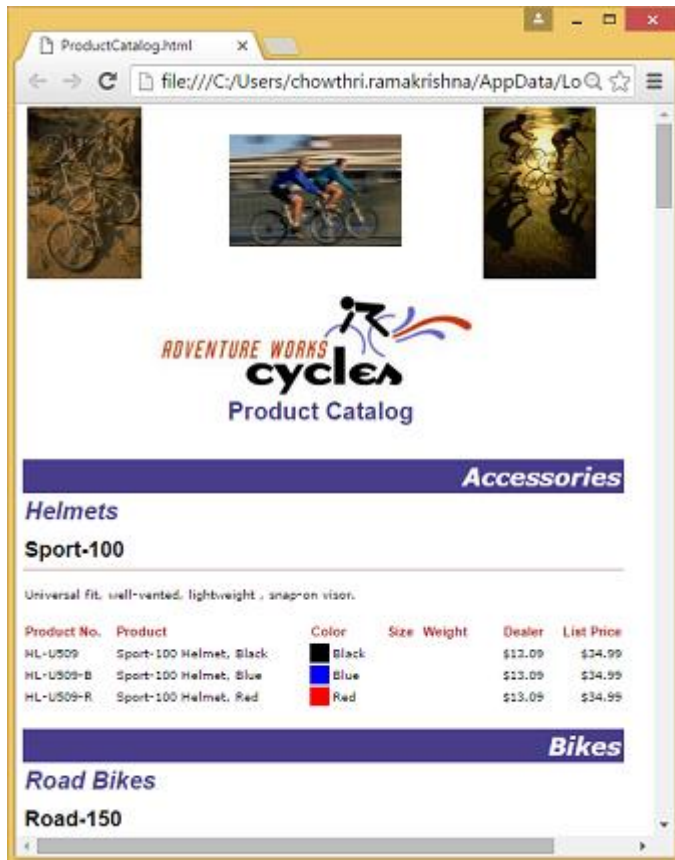

The report generated using the ReportDesigner can be exported as an HTML document using the following code example.

C#

```
//Instantiate the report writer with the parameter "ReportPath" and
"ReportDataSourceCollection".
ReportWriter reportWriter = new ReportWriter(reportPath, dataSources);
reportWriter.Save("Sample.html", WriterFormat.HTML);
```

VB.NET

```
'Instantiate the report writer with the parameter "ReportPath" and
"ReportDataSourceCollection".
Dim reportWriter As New ReportWriter (reportPath, dataSources)
reportWriter.Save("Sample.html", WriterFormat.HTML)
```

ReportWriter API of Essential Studio WPF

Constructors

Name	Description
ReportWriter()	Initializes a new instance of the ReportWriter.
ReportWriter(string)	Initializes a new instance of the ReportWriter with the specified path of the report.
ReportWriter(stream)	Initializes a new instance of the ReportWriter with the stream of the report.
ReportWriter(string, ReportDataSourceCollection)	Initializes a new instance of the ReportWriter with the specified path of the report and data source collection.
ReportWriter(stream, ReportDataSourceCollection)	Initializes a new instance of the ReportWriter with the stream of the report and data source collection.

Properties

Property Name	Description
DataSources	Gets or sets the data source collection.

ReportPath	Gets or sets the report path (file name of the report with its full path).
ReportProcessingMode	Gets or sets the processing mode (either local or remote).
ReportServerCredential	Gets or sets the Report Server credential.
ReportServerFormsCredential	Gets or sets the Report Server form credential. This is used to export SQL Azure RDL reports.
ReportServerUrl	Gets or sets the ReportServerURL.

Methods

Name	Description
GetDataSetNames()	Returns the names of the data set as IList <string>.
GetParameters()	Returns the parameters of the report as ReportParameterInfoCollection.
SetParameters(IEnumerable<ReportParameters>)	Sets the parameters of the report.
LoadReport(stream)	Loads the report with the specified stream that contains the RDL contents.
Save(string,writer type)	Saves the report as a PDF, Word, Excel and HTML documents in the mentioned path.
Save(stream)	Saves the report as a PDF, Word, Excel and HTML documents in the stream.

Events

Events	Description
ReportError	This event is triggered when Report throws Error.
ExportCompleted	This event is triggered when export is completed.
SubreportProcessing	This event is triggered when the report is RDLC and contains with subreport.

How to

Save a report as stream

You can save a report to stream using Save(Stream, WriterFormat) (overloaded method). This method is useful when generating the report on the server side and sending it to a client-side application. The following code explains how to save a report as a stream.

C#

```
//Step 1: create the report data source
ReportDataSourceCollection dataSources = new ReportDataSourceCollection();
```

```
dataSources.Add(new ReportDataSource() { Name = "Sales", Value =  
GetDataSource() });  
//Step 2: Instantiate the report writer with the parameter "ReportPath" and  
"ReportDataSourceCollection"  
ReportWriter reportWriter = new ReportWriter(reportPath, dataSources);  
MemoryStream stream = new MemoryStream();  
//Step 3: Save the report as PDF, Word or Excel document in the form of  
stream contents  
reportWriter.Save(stream, WriterFormat.PDF);
```

VB.NET

```
'Step 1: Create the report data source  
Dim dataSources As New ReportDataSourceCollection()  
dataSources.Add(New ReportDataSource() With {.Name = "Sales", .Value =  
GetDataSource()})  
'Step 2: Instantiate the report writer with the parameter "ReportPath" and  
"ReportDataSourceCollection"  
Dim reportWriter As New ReportWriter(reportPath, dataSources)  
Dim stream As New MemoryStream()  
'Step 3: Save the report as PDF, Word or Excel document in the form of  
stream contents  
reportWriter.Save(stream, WriterFormat.PDF)
```

Ribbon

WPF Ribbon control Overview

The [WPF Ribbon](#) illustrates the implementation of Office UI with Ribbon items and Backstage. Also RibbonWindow has been implemented for giving a themed Office UI look and feel for the traditional window. Functionality of keyboard navigation, Tooltips and Key tips are provided for access to items present in the ribbon.

Components of Ribbon controls

- Ribbon Tabs and Items
- Backstage Button
- Quick Access Toolbar (QAT)
- RibbonStatusBar

Key features

- Provides a ribbon window that overrides the default window and can set visual styles of ribbon window to different theme styles.
- The Ribbon control is available in both normal and simplified layout.
- QuickAccessToolbar provides placing of frequently used items.
- RibbonTab is available to add different Tabs like in Microsoft Outlook.
- RibbonBar is available to structure the layouts.
- Ribbon has a custom implementation of button control as RibbonButton.
- Can minimize / maximize the ribbon.
- Keyboard navigation made easy through KeyTips.

- RibbonStatusBar provides placing of StatusBar items.

Getting Started with WPF Ribbon

This section explains how to implement a similar UI as Microsoft Outlook using Ribbon.

Add ribbon

There are several ways to add Syncfusion control in to Visual Studio WPF project, the following steps will helps to add a Ribbon control through XAML Code.

- Create a WPF project in Visual Studio and refer the following assemblies.
 1. Syncfusion.Tools.Wpf
 2. Syncfusion.Shared.Wpf
- Include an XML namespace for the above assemblies to the Main window.

XML

```
<Window
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonControl.MainWindow">
</Window>
```

- Change the Window as **RibbonWindow**.

XML

```
<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonControl.MainWindow">
</syncfusion:RibbonWindow>
```

- Add following namespace and inherit MainWindow from **RibbonWindow** in code behind.

C#

```
using Syncfusion.Windows.Tools.Controls;
public partial class MainWindow : RibbonWindow
```

VB.NET

```
Imports Syncfusion.Windows.Tools.Controls
Public class As partial
```

- Now, Add the Ribbon control with a required optimal name, using the included namespace in XAML.

XML

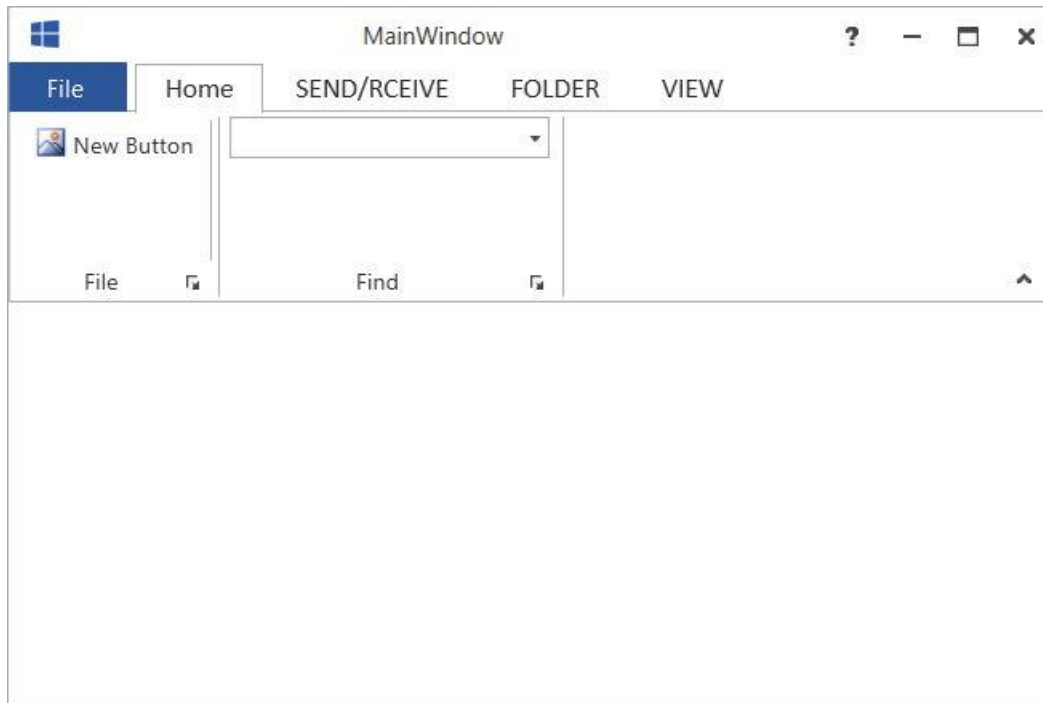

```
<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonControl.MainWindow">
<Grid>
<syncfusion:Ribbon x:Name="_ribbon"/>
</Grid>
</syncfusion:RibbonWindow>
```

Set icon for RibbonWindow

- Icon of the RibbonWindow can be set using the property named **Office2010Icon**. Please refer to the below code.

XML

```
<syncfusion:RibbonWindow
x:Class="WPF.Ribbon.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:local="clr-namespace:WPF.Ribbon"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:sfSkinManager="clr-namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
Title="MainWindow"
Office2010Icon="Assets/New Microsoft.png"
sfSkinManager:SfSkinManager.VisualStudio="Office2016White"
mc:Ignorable="d">
<Grid>
<syncfusion:Ribbon x:Name="_ribbon"/>
</Grid>
</syncfusion:RibbonWindow>
```

Set visual styles

Ribbon supports various visual styles by using the `SfSkinManager`. To apply Visual Studio style on the current layout, refer to the following steps.

- Refer the following assemblies with the project
 1. Syncfusion.SfSkinManager.Wpf
 2. Syncfusion.Themes.Office2013White.Wpf
- Include an XML namespace for the `SfSkinManager` assembly to the `MainWindow`.

XML

```
<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonControl.MainWindow"
xmlns:syncfusionskin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF" >
<Grid>
<syncfusion:Ribbon x:Name="_ribbon"/>
</Grid>
</syncfusion:RibbonWindow>
```

- Now apply the value as `Office2013White` to the `VisualStyle` property of the `SfSkinManager` for the `RibbonWindow`.

XML

```
<syncfusion:RibbonWindow
```

```

xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonControl.MainWindow"
xmlns:syncfusionskin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
syncfusionskin:SfSkinManager.VisualStudio="Office2013White" >
<Grid>
<syncfusion:Ribbon x:Name="_ribbon"/>
</Grid>
</syncfusion:RibbonWindow>

```

Add RibbonTab

Ribbon control accept **RibbonTab** as children, Here four **RibbonTab** are added and that can hold **RibbonItems** with **RibbonBar**.

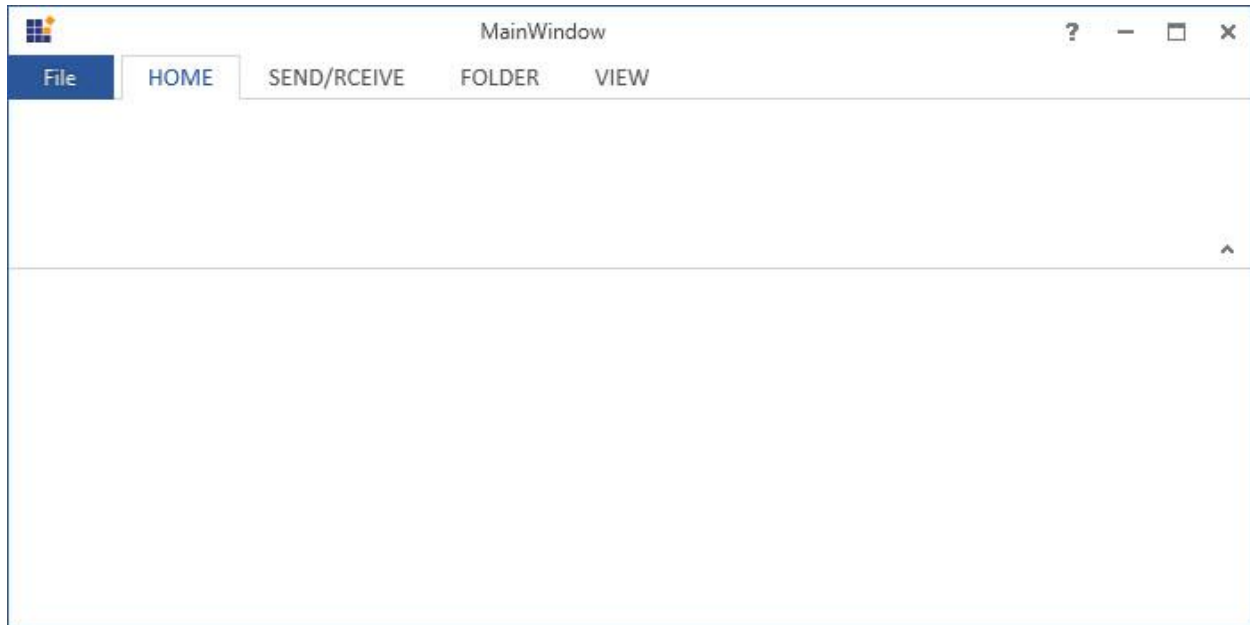

XML

```

<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonControl.MainWindow"
xmlns:syncfusionskin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
syncfusionskin:SfSkinManager.VisualStudio="Office2013White" >
<Grid>
<syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True"/>
<syncfusion:RibbonTab Caption="SEND/RCEIVE" IsChecked="False"/>
<syncfusion:RibbonTab Caption="FOLDER" IsChecked="False"/>
<syncfusion:RibbonTab Caption="VIEW" IsChecked="False"/>
</syncfusion:Ribbon>
</Grid>

```

```
</syncfusion:RibbonWindow>
```

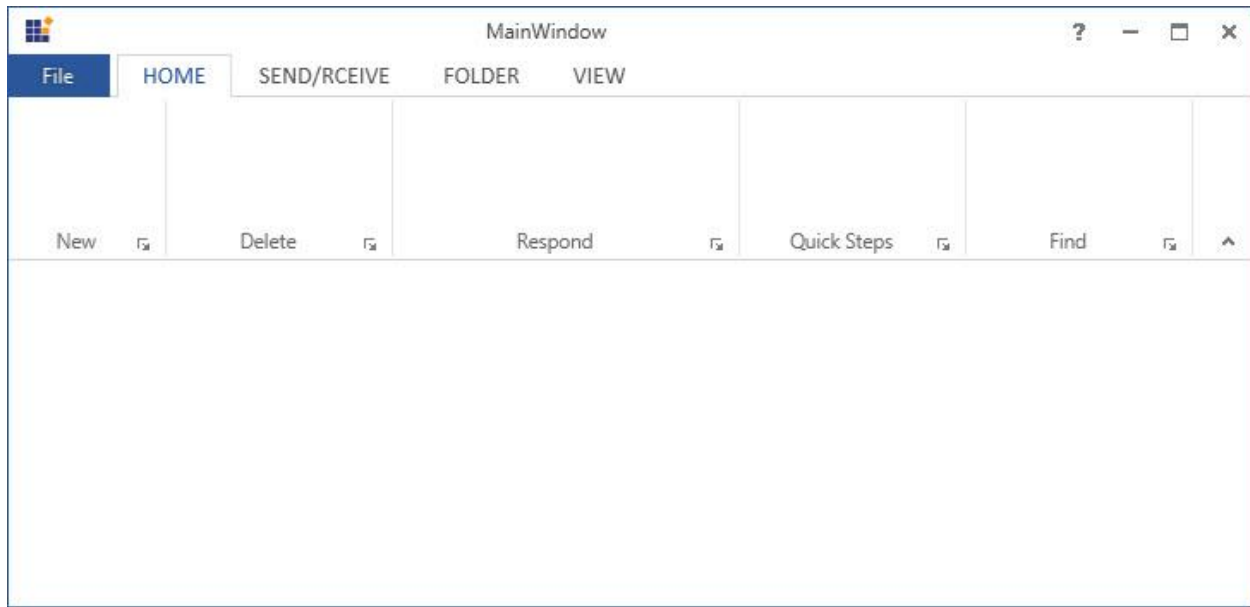

Add RibbonBar

RibbonTab accepts **RibbonBar** as children, here five **RibbonBar** Controls are added inside "HOME" RibbonTab. To set header for RibbonBar, use its **Header** property.

XML

```
<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonControl.MainWindow"
xmlns:syncfusionskin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
syncfusionskin:SfSkinManager.VisualStudio="Office2013White" >
<Grid>
<syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Name="New" Width="90" Header="New"/>
<syncfusion:RibbonBar Name="Delete" Width="150" Header="Delete"/>
<syncfusion:RibbonBar Name="Respond" Width="90" Header="Respond"/>
<syncfusion:RibbonBar Name="Quicksteps" Width="90" Header="Quick Steps"/>
<syncfusion:RibbonBar Name="Find" Width="90" Header="Find"/>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="SEND/RCEIVE" IsChecked="False"/>
<syncfusion:RibbonTab Caption="FOLDER" IsChecked="False"/>
<syncfusion:RibbonTab Caption="VIEW" IsChecked="False"/>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>
```

Add RibbonButton

RibbonButton provides functionalities like normal **Button**. It can place inside the **RibbonBar**. Here, "New" **RibbonBar** holds a **RibbonButton** with a caption as "New Email" using its **Label** property. It also provides **SizeForm** property for different sizes.

If the value of **SizeForm** is large, then image of 16 16 size *has been expanded to 32 32* automatically. Similarly, image of 32 32 *has been compressed to 16 16* if **SizeForm** is ExtraSmall.

XML

```
<syncfusion:RibbonBar Name="New" Width="90" Header="New">
  <syncfusion:RibbonButton SizeForm="Large" Label="New Email"/>
</syncfusion:RibbonBar>
```

Also add several other Ribbon Button as per the requirement

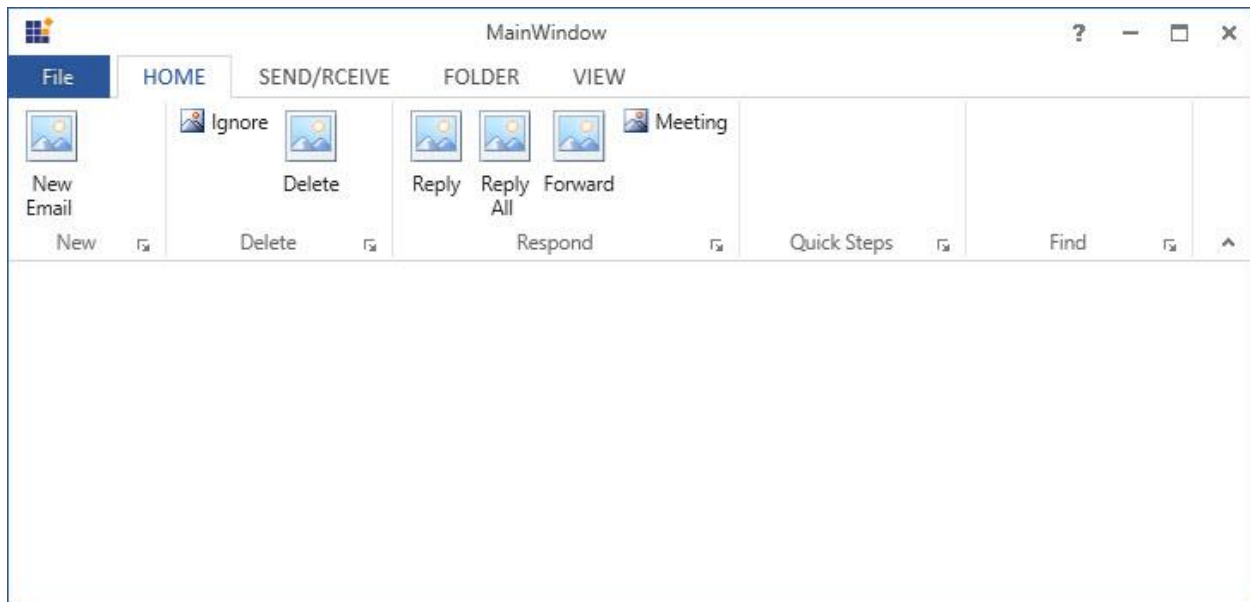

XML

```
<syncfusion:RibbonWindow
  xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
  xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
  xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
  x:Class="RibbonControl.MainWindow"
  xmlns:syncfusionskin="clr-
  namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
  syncfusionskin:SfSkinManager.VisualStyle="Office2013White" >
  <Grid>
    <syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top">
      <syncfusion:RibbonTab Caption="HOME" IsChecked="True">
        <syncfusion:RibbonBar Name="New" Width="90" Header="New">
          <syncfusion:RibbonButton SizeForm="Large" Label="New Email"/>
        </syncfusion:RibbonBar>
        <syncfusion:RibbonBar Name="Delete" Width="130" Header="Delete">
          <syncfusion:RibbonButton Label="Ignore"/>
          <syncfusion:RibbonButton Label="Delete" SizeForm="Large"/>
        </syncfusion:RibbonBar>
      </syncfusion:RibbonTab>
    </syncfusion:Ribbon>
  </Grid>
</syncfusion:RibbonWindow>
```

```

</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Respond" Width="200" Header="Respond">
<syncfusion:RibbonButton Label="Reply" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Reply All" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Forward" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Meeting"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Quicksteps" Width="90" Header="Quick Steps"/>
<syncfusion:RibbonBar Name="Find" Width="90" Header="Find"/>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="SEND/RCEIVE" IsChecked="False"/>
<syncfusion:RibbonTab Caption="FOLDER" IsChecked="False"/>
<syncfusion:RibbonTab Caption="VIEW" IsChecked="False"/>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

Note: Image of any size has been used for `RibbonButton` and also it supports image of all formats.

Add DropDownButton

`DropDownButton` appears like normal button that contains a drop arrow. It displays some items, while click on it. It accepts `DropDownMenuItem` as its children. Here, "New" RibbonBar holds a `DropDownButton` with a caption as "New Items" using its `Label` property also holding items like "E-mail Message", "Appointment", "Meeting", "Contact" and "Task". It also provides `SizeForm` property for different sizes.

XML

```

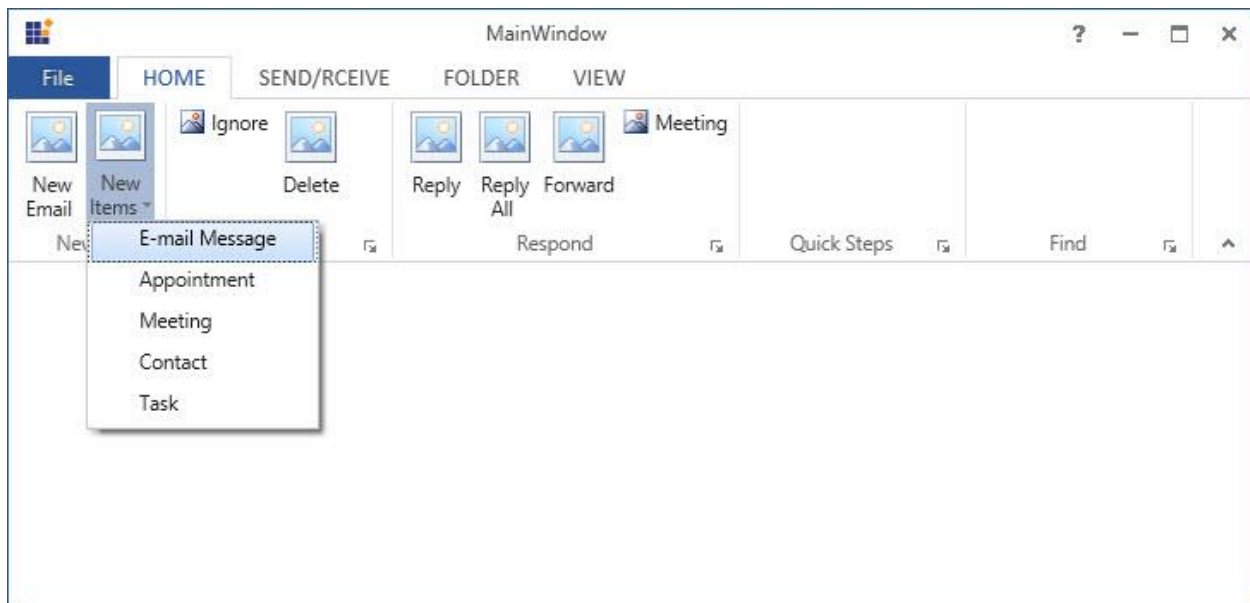

<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonControl.MainWindow"
xmlns:syncfusionskin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"

```

```

syncfusionskin:SfSkinManager.VisualStyle="Office2013White" >
<Grid>
<syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Name="New" Width="90" Header="New">
<syncfusion:RibbonButton SizeForm="Large" Label="New Email"/>
<syncfusion:DropDownButton SizeForm="Large" Label="New Items">
<syncfusion:DropDownMenuItem Header="E-mail Message"/>
<syncfusion:DropDownMenuItem Header="Appointment"/>
<syncfusion:DropDownMenuItem Header="Meeting"/>
<syncfusion:DropDownMenuItem Header="Contact"/>
<syncfusion:DropDownMenuItem Header="Task"/>
</syncfusion:DropDownButton>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Delete" Width="130" Header="Delete">
<syncfusion:RibbonButton Label="Ignore"/>
<syncfusion:RibbonButton Label="Delete" SizeForm="Large"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Respond" Width="200" Header="Respond">
<syncfusion:RibbonButton Label="Reply" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Reply All" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Forward" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Meeting"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Quicksteps" Width="90" Header="Quick Steps"/>
<syncfusion:RibbonBar Name="Find" Width="90" Header="Find"/>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="SEND/RCEIVE" IsChecked="False"/>
<syncfusion:RibbonTab Caption="FOLDER" IsChecked="False"/>
<syncfusion:RibbonTab Caption="VIEW" IsChecked="False"/>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

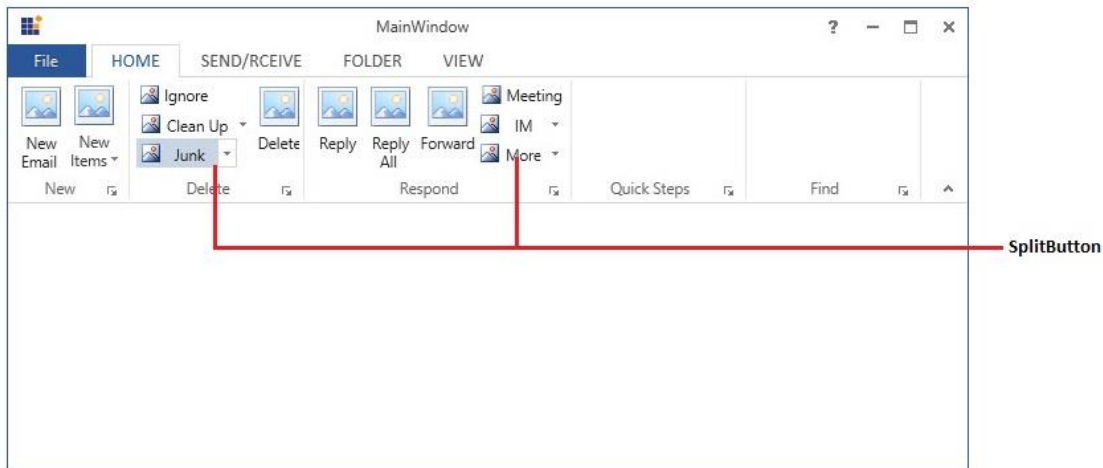

Add SplitButton

SplitButton also appears with a drop arrow. It displays some items while click on it. It accepts `DropDownMenuItem` as its children. Here, "Delete" RibbonBar holds a `SplitButton` with a caption as "Clean Up" using its `Label` property also holding items like "Clean Up Folder", "Clean Up Conversation" and "Clean Up Folder/SubFolder". It also provides `SizeForm` property for different sizes.

XML

```
<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonControl.MainWindow"
xmlns:syncfusionskin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
syncfusionskin:SfSkinManager.VisualStyle="Office2013White" >
<Grid>
<syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Name="New" Width="90" Header="New">
<syncfusion:RibbonButton SizeForm="Large" Label="New Email"/>
<syncfusion:DropDownButton SizeForm="Large" Label="New Items">
<syncfusion:DropDownMenuItem Header="E-mail Message"/>
<syncfusion:DropDownMenuItem Header="Appointment"/>
<syncfusion:DropDownMenuItem Header="Meeting"/>
<syncfusion:DropDownMenuItem Header="Contact"/>
<syncfusion:DropDownMenuItem Header="Task"/>
</syncfusion:DropDownButton>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Delete" Width="130" Header="Delete">
<syncfusion:RibbonButton Label="Ignore"/>
<syncfusion:SplitButton Label="Clean Up">
<syncfusion:DropDownMenuItem Header="Clean Up Folder"/>
<syncfusion:DropDownMenuItem Header="Clean Up Conversation"/>
<syncfusion:DropDownMenuItem Header="Clean Up Folder/SubFolder"/>
</syncfusion:SplitButton>
<syncfusion:SplitButton Label="Junk" Margin="0,0,12,0" Width="76"/>
<syncfusion:RibbonButton Label="Delete" SizeForm="Large"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Respond" Width="200" Header="Respond">
<syncfusion:RibbonButton Label="Reply" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Reply All" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Forward" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Meeting"/>
<syncfusion:SplitButton Label="IM" Margin="-2,0,6,0" Width="68"/>
<syncfusion:SplitButton Label="More" Margin="-2,0,6,0" Width="68"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Quicksteps" Width="90" Header="Quick Steps"/>
<syncfusion:RibbonBar Name="Find" Width="90" Header="Find"/>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="SEND/RCEIVE" IsChecked="False"/>
<syncfusion:RibbonTab Caption="FOLDER" IsChecked="False"/>
<syncfusion:RibbonTab Caption="VIEW" IsChecked="False"/>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>
```

Add RibbonGallery

RibbonGallery displays items with good look and feel and it also used to classify the items as groups for easy navigation. Here, "QuickSteps" RibbonBar holds a **RibbonGallery** with **InRibbon** visual mode to place gallery items with in Ribbon. Also **ItemHeight**, **ItemWidth** properties are used to set height and width respectively.

XML

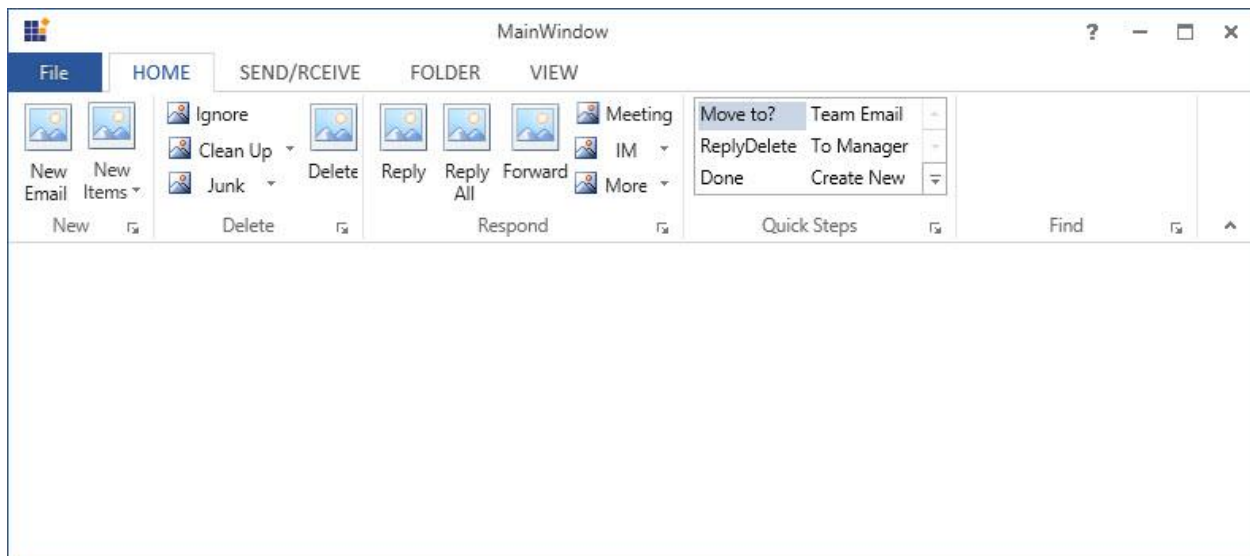

```
<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonControl.MainWindow"
xmlns:syncfusionskin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
syncfusionskin:SfSkinManager.VisualStyle="Office2013White" >
<Grid>
<syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Name="New" Width="90" Header="New">
<syncfusion:RibbonButton SizeForm="Large" Label="New Email"/>
<syncfusion:DropDownButton SizeForm="Large" Label="New Items">
<syncfusion:DropDownMenuItem Header="E-mail Message"/>
<syncfusion:DropDownMenuItem Header="Appointment"/>
<syncfusion:DropDownMenuItem Header="Meeting"/>
<syncfusion:DropDownMenuItem Header="Contact"/>
<syncfusion:DropDownMenuItem Header="Task"/>
</syncfusion:DropDownButton>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Delete" Width="130" Header="Delete">
<syncfusion:RibbonButton Label="Ignore"/>
<syncfusion:SplitButton Label="Clean Up">
<syncfusion:DropDownMenuItem Header="Clean Up Folder"/>
```

```

<syncfusion:DropDownMenuItem Header="Clean Up Conversation"/>
<syncfusion:DropDownMenuItem Header="Clean Up Folder/SubFolder"/>
</syncfusion:SplitButton>
<syncfusion:SplitButton Label="Junk" Margin="0,0,12,0" Width="76"/>
<syncfusion:RibbonButton Label="Delete" SizeForm="Large"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Respond" Width="200" Header="Respond">
<syncfusion:RibbonButton Label="Reply" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Reply All" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Forward" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Meeting"/>
<syncfusion:SplitButton Label="IM" Margin="-2,0,6,0" Width="68"/>
<syncfusion:SplitButton Label="More" Margin="-2,0,6,0" Width="68"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Width="170" Name="QuickSteps" Header="Quick Steps">
<syncfusion:RibbonGallery Width="160" VisualMode="InRibbon"
ItemHeight="20" ItemWidth="70">
<syncfusion:RibbonGalleryItem Content="Move to?"/>
<syncfusion:RibbonGalleryItem Content="Team Email"/>
<syncfusion:RibbonGalleryItem Content="ReplyDelete"/>
<syncfusion:RibbonGalleryItem Content="To Manager"/>
<syncfusion:RibbonGalleryItem Content="Done"/>
<syncfusion:RibbonGalleryItem Content="Create New"/>
</syncfusion:RibbonGallery>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Find" Width="90" Header="Find"/>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="SEND/RCEIVE" IsChecked="False"/>
<syncfusion:RibbonTab Caption="FOLDER" IsChecked="False"/>
<syncfusion:RibbonTab Caption="VIEW" IsChecked="False"/>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

Add RibbonComboBox

RibbonComboBox is used to display the list of items. It accepts **ComboBoxItems** as its children. Here, "Find" RibbonBar holds a **RibbonComboBox** with a caption as "Filter Email" using its **Label** property also holding items like "Person1@mail.com", "Person1@mail.com" and "Person1@mail.com".

XML

```
<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonControl.MainWindow"
xmlns:syncfusionskin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
syncfusionskin:SfSkinManager.VisualStyle="Office2013White" >
<Grid>
<syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Name="New" Width="90" Header="New">
<syncfusion:RibbonButton SizeForm="Large" Label="New Email"/>
<syncfusion:DropDownButton SizeForm="Large" Label="New Items">
<syncfusion:DropDownMenuItem Header="E-mail Message"/>
<syncfusion:DropDownMenuItem Header="Appointment"/>
<syncfusion:DropDownMenuItem Header="Meeting"/>
<syncfusion:DropDownMenuItem Header="Contact"/>
<syncfusion:DropDownMenuItem Header="Task"/>
</syncfusion:DropDownButton>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Delete" Width="130" Header="Delete">
<syncfusion:RibbonButton Label="Ignore"/>
<syncfusion:SplitButton Label="Clean Up">
<syncfusion:DropDownMenuItem Header="Clean Up Folder"/>
<syncfusion:DropDownMenuItem Header="Clean Up Conversation"/>
<syncfusion:DropDownMenuItem Header="Clean Up Folder/SubFolder"/>
</syncfusion:SplitButton>
<syncfusion:SplitButton Label="Junk" Margin="0,0,12,0" Width="76"/>
<syncfusion:RibbonButton Label="Delete" SizeForm="Large"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="Respond" Width="200" Header="Respond">
<syncfusion:RibbonButton Label="Reply" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Reply All" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Forward" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Meeting"/>
<syncfusion:SplitButton Label="IM" Margin="-2,0,6,0" Width="68"/>
<syncfusion:SplitButton Label="More" Margin="-2,0,6,0" Width="68"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Width="170" Name="QuickSteps" Header="Quick Steps">
<syncfusion:RibbonGallery Width="160" VisualMode="InRibbon"
ItemHeight="20" ItemWidth="70">
<syncfusion:RibbonGalleryItem Content="Move to?"/>
<syncfusion:RibbonGalleryItem Content="Team Email"/>
<syncfusion:RibbonGalleryItem Content="ReplyDelete"/>
<syncfusion:RibbonGalleryItem Content="To Manager"/>
<syncfusion:RibbonGalleryItem Content="Done"/>
<syncfusion:RibbonGalleryItem Content="Create New"/>
</syncfusion:RibbonGallery>
</syncfusion:RibbonBar>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>
```

```

</syncfusion:RibbonBar>
<syncfusion:RibbonBar Width="170" Header="Find" Name="Find" >
<syncfusion:RibbonComboBox Label="Filter Email" Width="160">
<ComboBoxItem>Person1@mail.com</ComboBoxItem>
<ComboBoxItem>Person2@mail.com</ComboBoxItem>
<ComboBoxItem>Person3@mail.com</ComboBoxItem>
</syncfusion:RibbonComboBox>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="SEND/RCEIVE" IsChecked="False"/>
<syncfusion:RibbonTab Caption="FOLDER" IsChecked="False"/>
<syncfusion:RibbonTab Caption="VIEW" IsChecked="False"/>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

Add QAT

QuickAccessToolBar (QAT) is used to group the frequently used commands and access the commands easily without having to search for the command in the menu bar. Also it can be placed above or below the ribbon.

XML

```

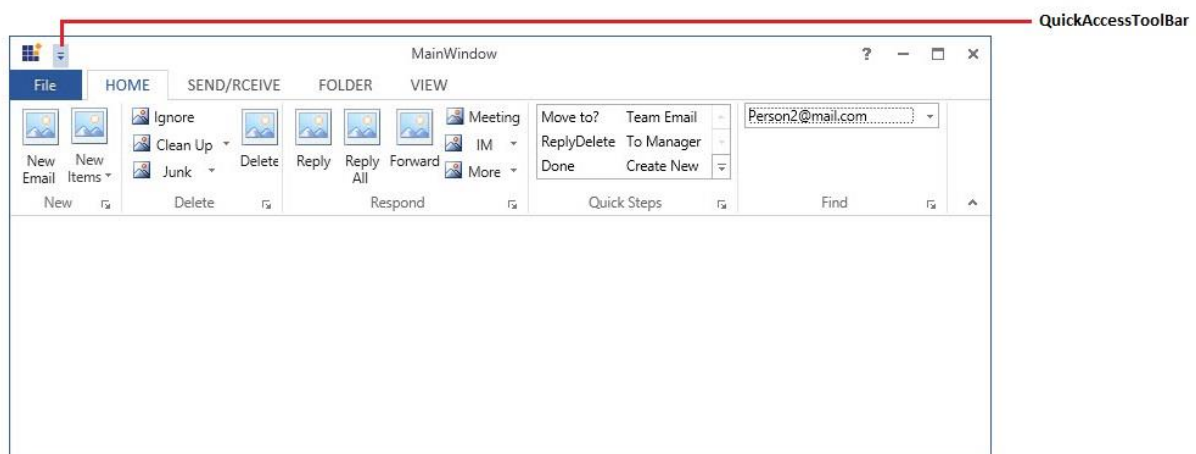

<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"

</syncfusion:RibbonWindow>

```

Add application menu

An Application Menu contains standard commands that are performed like in Microsoft Outlook 2003 UI. Using the `ApplicationMenu` property of the Ribbon, this Menu is viewed by added at the top-left corner of the window.

Note: Visual style is set to `Default` for RibbonWindow in SkinStorage. and BackStage is not applicable when `ApplicationMenu` is used in Ribbon.

XML

Note: [View sample in GitHub](#)

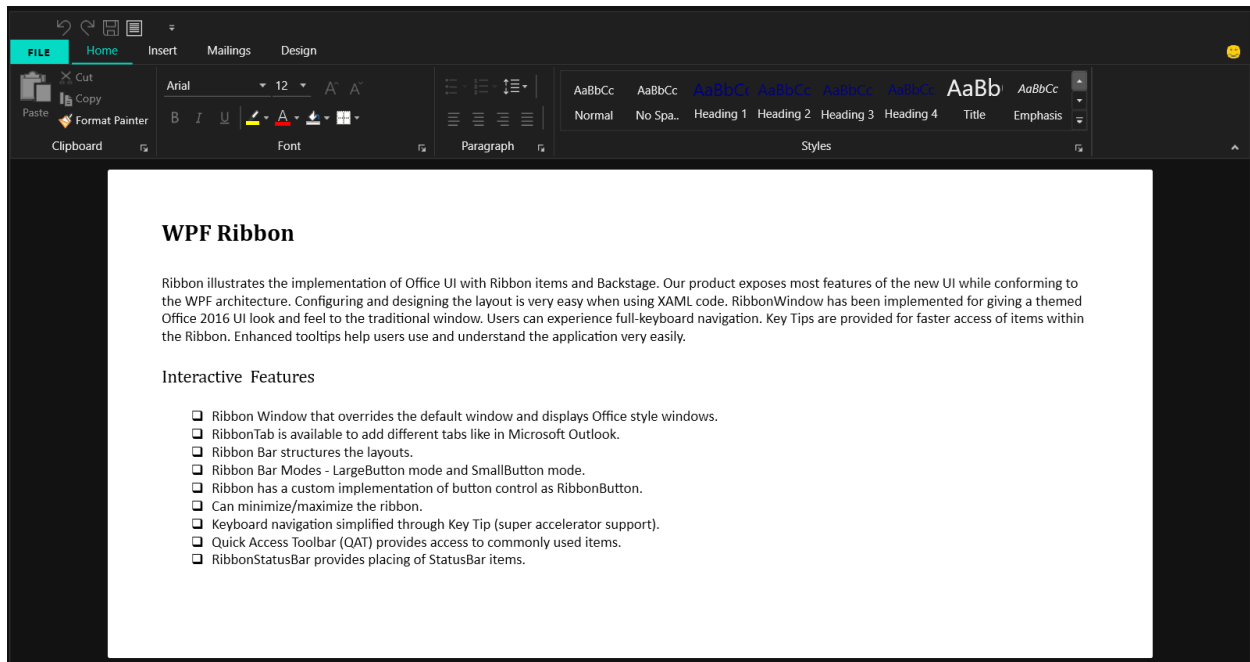

Set simplified layout

The simplified layout is designed to display the most commonly used Ribbon commands in a single line interface, allowing more screen space for compact content viewing, while other commands are placed inside the overflow menu. To know more about the simplified layout, refer [here](#).

Theme

Ribbon supports various built-in themes. Refer to the below links to apply themes for the Ribbon,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

BackStage in WPF Ribbon

Backstage is a separate view containing tabs and buttons that can show an application's information and basic settings. The backstage items can also be arranged at either the top or bottom. It provides different types of animations such as fade, scale, and zoom as well as support to customize the animation duration.

BackStage settings in Ribbon

The BackStage can be added by using [BackStage](#) property of Ribbon. To show the BackStage by, click the FILE Menu in Ribbon like in Microsoft Outlook.

XML

```
<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"

    <syncfusion:RibbonButton SizeForm="ExtraSmall" />
    <syncfusion:QuickAccessToolBar.QATMenuItems>
      <syncfusion:RibbonButton Label="Send" />
      <syncfusion:RibbonButton Label="Forward" />
      <syncfusion:RibbonButton Label="ReplyAll" />
      <syncfusion:RibbonButton Label="Delete" />
      <syncfusion:RibbonButton Label="Print" />
    </syncfusion:QuickAccessToolBar.QATMenuItems>
  </syncfusion:QuickAccessToolBar>
</syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:Ribbon.BackStage>
  <syncfusion:Backstage/>
</syncfusion:Ribbon.BackStage>
</syncfusion:Ribbon>

```

```
</Grid>
</syncfusion:RibbonWindow>
```

Customize the BackStage Visibility

The [IsBackStageVisible](#) property of Ribbon enables you to show/hide the BackStage. The following code example illustrates how to show or hide BackStage.

1) Through Property

XML

```
<syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top"
IsBackStageVisible ="True"/>
```

C#

```
_ribbon.IsBackStageVisible = true;
```

2) Through Methods

C#

```
private void ShowBackstage_Click(object sender, RoutedEventArgs e)
{
    //to show back stage
    _ribbon.ShowBackStage();
}
private void HideBackstage_Click(object sender, RoutedEventArgs e)
{
    //to hide the back stage
    _ribbon.HideBackStage();
}
```

VB.NET

```

Private Sub ShowBackstage_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
    'to show back stage
    _ribbon.ShowBackStage()
End Sub
Private Sub HideBackstage_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
    'to hide the back stage
    _ribbon.HideBackStage()
End Sub

```

3) Through Commands

Ribbon control provides the static command [OpenBackStage](#) to show/hide the BackStage based on the parameter passed to it.

XML

```

<syncfusion:RibbonButton x:Name="ribbonButton" Label="Open Backstage"
Command="{x:Static syncfusion:RibbonCommands.OpenBackStage}"
CommandTarget="{Binding ElementName=ribbon}">
<syncfusion:RibbonButton.CommandParameter>
<!--If we passes false it will hide the backstage otherwise it will show the
backstage-->
<sys:Boolean>true</sys:Boolean>
</syncfusion:RibbonButton.CommandParameter>
</syncfusion:RibbonButton>

```

Note: In order to bind the [OpenBackStage](#) command, CommandTarget and CommandParameter must be defined.

Add BackStageCommandButton

The `BackStageCommandButton` can be added to BackStage as BackStage Element. Here four BackStageCommandButtons are added with `Header` property value as "Save", "SaveAttachments", "Options" and "Exit".

XML

```

<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"

</syncfusion:QuickAccessToolBar.QATMenuItems>
</syncfusion:QuickAccessToolBar>

```

```
</syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:Ribbon.BackStage>
<syncfusion:Backstage>
<syncfusion:BackStageCommandButton Header="Save" />
<syncfusion:BackStageCommandButton Header="SaveAttachments" />
<syncfusion:BackStageCommandButton Header="Options" />
<syncfusion:BackStageCommandButton Header="Exit" />
</syncfusion:Backstage>
</syncfusion:Ribbon.BackStage>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>
```

Setting image to BackStageCommandButton

The [BackStageCommandButton](#) allows to display any type of image such as glyph, font or any custom content using the [IconTemplate](#) property, which is the preferred option. It also allows to display a normal image or vector image using the [IconType](#) enumeration property. The default value of the [IconType](#) property is [Icon](#). The [IconType](#) enumeration has the following values:

- **Icon** - Gets the details of the icon from the [Icon](#) property and sets it to the [BackStageCommandButton](#).
- **VectorImage** - Gets the details of the icon path from the [VectorImage](#) property and sets it to the [BackStageCommandButton](#).

Note: The [BackStageCommandButton](#) loads icon in the following priority order,

- [IconTemplate](#)
- [VectorImage](#)
- [Icon](#)

Setting icon template

The [IconTemplate](#) property provides support to set any type of image such as glyph, font or any custom content to the [BackStageCommandButton](#). The [BackStageCommandButton](#) displays the [IconTemplate](#) in 16 * 16 size.

//Setting backstage to ribbon
ribbon.BackStage = backstage;
ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);
```

Add BackStageTabItem

The `BackStageTabItem` can also be added inside the BackStage Element. Here four `BackStageCommandButtons` are added with `Header` property value as "Open", "Print" and "Office Account".

Note: [View sample in GitHub](#)

Different types of Animation

Backstage provides different types of animations such as fade, scale, and zoom by using the [AnimationType](#) enumeration property.

- None
- Slide
- Fade
- Zoom

Animation duration

The [AnimationDuration](#) property is used to set the duration for animation in milliseconds.

The following code example illustrates how to animate the BackStage using the [AnimationType](#) property.

XML

```
<syncfusion:Ribbon.BackStage>
<syncfusion:Backstage x:Name="ribbonBackStage"
AnimationDuration="00:00:00.250" syncfusion:Ribbon.KeyTip="B"
AnimationType="{Binding
```

```

ElementName=AnimationTypes,Path=SelectedItem,UpdateSourceTrigger=PropertyChanged}"/>
<syncfusion:BackstageTabItem syncfusion:Ribbon.KeyTip="I" Header="Info">
<Grid Background="{Binding ElementName=mainRibbon,Path=Background}">
<Grid.RowDefinitions>
<RowDefinition Height="auto" />
<RowDefinition Height="auto" />
</Grid.RowDefinitions>
<local:Information x:Name="informationView" />
</Grid>
</syncfusion:BackstageTabItem>
<syncfusion:BackstageTabItem syncfusion:Ribbon.KeyTip="R" Header="Recent">
<local:Recent x:Name="recentView" Background="{Binding
ElementName=mainRibbon,Path=Background}" />
</syncfusion:BackstageTabItem>
<syncfusion:BackstageTabItem syncfusion:Ribbon.KeyTip="N" Header="New">
<local:New x:Name="newView" Background="{Binding
ElementName=mainRibbon,Path=Background}" />
</syncfusion:BackstageTabItem>
<syncfusion:BackStageSeparator />
<syncfusion:BackStageCommandButton
syncfusion:Ribbon.KeyTip="A"

syncfusion:Ribbon.KeyTip="X"
Command="{Binding ExitCommand}"
CommandParameter="{Binding ElementName=mainWindow}"
Header="Exit" />
</syncfusion:Backstage>
</syncfusion:Ribbon.BackStage>

```

C#

```
ribbon.BackStage.AnimationDuration = TimeSpan.FromMilliseconds(250);
```

Note: View [sample](#) in GitHub.

Placement Customization

The Backstage can be opened or closed within any window or placement target specified using the [PlacementType](#) and [PlacementTarget](#) properties in BackStage. It allows us to open the Backstage under the Ribbon tab or occupies the window or placement target's entire client area.

The [PlacementTarget](#) property specifies the element relative to which the Backstage should be positioned while it is opened.

The [PlacementType](#) property provides the following options which allows to place the backstage either in full screen or below the RibbonTab.

- FullScreen
- BelowTab

Place the backstage in FullScreen

Backstage placed in RibbonWindow

When the [PlacementType](#) is set to [FullScreen](#) and the [PlacementTarget](#) is not set, the Backstage will occupy the entire RibbonWindow while it is opened.

Place the backstage in BelowTab

Backstage placed in RibbonWindow

When the [PlacementType](#) is set to [BelowTab](#) and the [PlacementTarget](#) is not set, the Backstage will appear below the ribbon tabs instead of occupying the entire Ribbon Window while it is opened.

```

C#

```
ribbonBackStage.PlacementTarget = backstageGrid;
```

Note: View [sample](#) in GitHub.

Customize the BackStageButton visibility

Ribbon control allows to show or hide the **BackStageButton** by using its **Visibility** property.

The following code example illustrates how to show or hide the **BackStageButton**.

XML

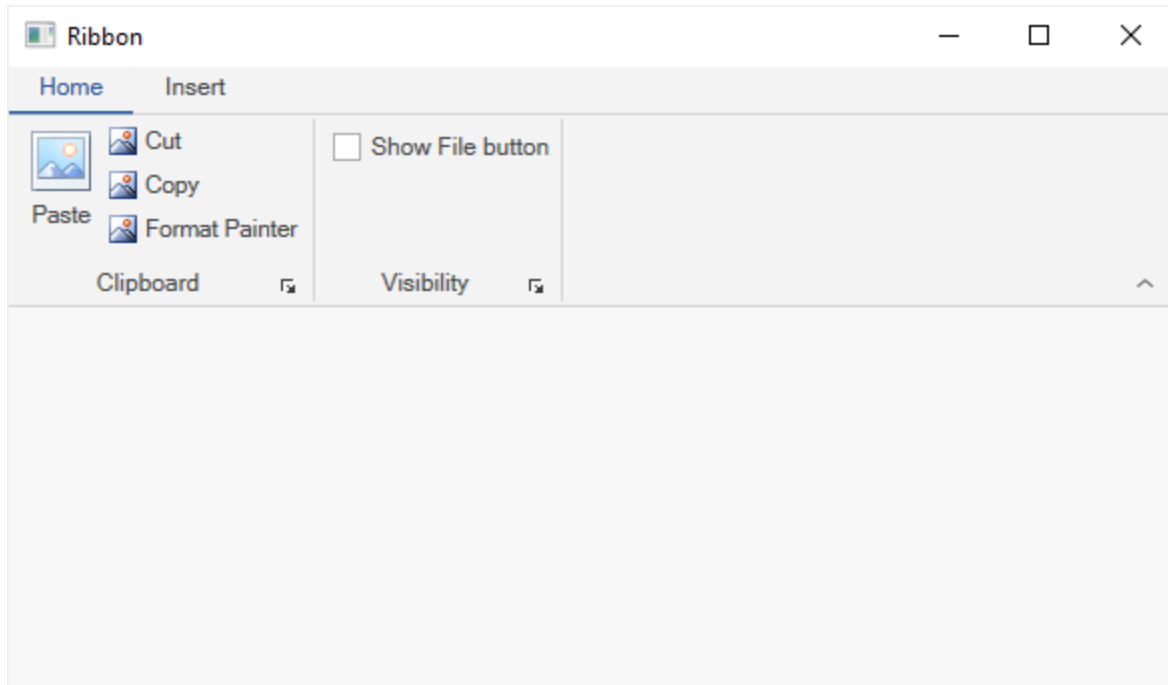

```
<Window
x:Class="BackStageButton.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:local="clr-namespace:BackStageButton"
xmlns:skinManager="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
Title="Ribbon"
Width="800"
Height="450"
skinManager:SfSkinManager.Theme="{skinManager:SkinManagerExtension
ThemeName=Office2019Colorful}">
<Grid>
```

```
<syncfusion:Ribbon Name="ribbon" BackStageHeader="File">
<syncfusion:Ribbon.BackStage>
<syncfusion:Backstage x:Name="ribbonBackStage">
<syncfusion:BackstageTabItem syncfusion:Ribbon.KeyTip="I" Header="Info" />
<syncfusion:BackstageTabItem syncfusion:Ribbon.KeyTip="R" Header="Recent" />
<syncfusion:BackstageTabItem syncfusion:Ribbon.KeyTip="N" Header="New" />
</syncfusion:Backstage>
</syncfusion:Ribbon.BackStage>
<syncfusion:RibbonTab Caption="Home">
<syncfusion:RibbonBar
Name="ribbonFormatBar"
syncfusion:Ribbon.KeyTip="FN"
Header="Clipboard">
<syncfusion:RibbonButton
Margin="1"
Label="Paste"
SizeForm="Large" />
<syncfusion:RibbonButton
HorizontalAlignment="Left"
Label="Cut"
SizeForm="Small" />
<syncfusion:RibbonButton
HorizontalAlignment="Left"
Label="Copy"
SizeForm="Small" />
<syncfusion:RibbonButton Label="Format Painter" SizeForm="Small" />
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Header="Visibility">
<syncfusion:RibbonCheckBox
Margin="3"
Content="Show File button"
IsChecked="True" />
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="Insert" />
</syncfusion:Ribbon>
</Grid>
</Window>
```

C#

```
public MainWindow()
{
InitializeComponent();
this.Loaded += MainWindow_Loaded;
}
private void MainWindow_Loaded(object sender, RoutedEventArgs e)
{
ribbon.BackStageButton.Visibility = Visibility.Collapsed;
}
```

Application Menu in WPF Ribbon

The [ApplicationMenu](#) can be added by using [ApplicationMenu](#) property of Ribbon. To show the [ApplicationMenu](#), click the **FILE** button in Ribbon like in Microsoft Outlook.

The [IsPopupOpen](#) boolean property is used to show the [ApplicationMenu](#) while launching itself.

Note: The [BackStage](#) is not applicable when the ApplicationMenu is needed.

Adding MenuItems in ApplicationMenu

[MenuItems](#) are displayed in right of the [ApplicationMenu](#). Different [MenuItems](#) are added to an application menu using its [MenuItems](#) property.

XML

```
<syncfusion:RibbonWindow
x:Class="ApplicationMenu.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"

Ribbon Items

RibbonButton in WPF Ribbon

RibbonButton provides functionality similar to a normal button. Additionally, it comes in different sizes and can be easily placed inside the **RibbonBar** in the Ribbon control.

Setting various size modes

RibbonButton supports three types of size modes and it can be set using the [SizeForm](#) property. The different [SizeForm](#) available are as follows:

- **ExtraSmall** - Displays only the image in 16 * 16 size.
- **Small** - Displays the label and the image in 16 * 16 size.
- **Large** - Displays the label and the image in 32 * 32 size.

grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);
```

Note: When **simplified** layout is set, [RibbonButton](#) displays the image in 20 * 20 size irrespective of the size form. Also, the text in the **Large** size form will appear to the right of the image.

Setting image to RibbonButton

The [RibbonButton](#) allows to display any type of image such as glyph, font or any custom content using the [IconTemplateSelector](#) and [IconTemplate](#) property, which are the preferred options. It also allows to display a normal image or vector image using the [IconType](#) enumeration property. The default value of the [IconType](#) property is **Icon**. The [IconType](#) enumeration has the following values:

- **Icon** - Gets the details of the icon from the [SmallIcon](#), [MediumIcon](#) or [LargeIcon](#) properties and sets it to the [RibbonButton](#).
- **VectorImage** - Gets the details of the icon path from the [VectorImage](#) property and sets it to the [RibbonButton](#).

Note: The [RibbonButton](#) loads icon in the following priority order,

- [IconTemplateSelector](#)
- [IconTemplate](#)
- [VectorImage](#)
- [LargeIcon](#)
- [MediumIcon](#)
- [SmallIcon](#)

Setting icon template selector

The [IconTemplateSelector](#) property provides support to specify a different data template based on the value of the [SizeForm](#) or [LayoutMode](#) properties. For simplified layout, the template content will be resized to 20 * 20 size which is the standard.

Note: [View sample in GitHub](#)

Setting image path

The [RibbonButton](#) allows to set the image according to the different [SizeForm](#) values. To set the image to [RibbonButton](#), the following properties are used:

- [SmallIcon](#) - 16 * 16 size image to be displayed in normal layout for “ExtraSmall” and “Small” size form.
- [MediumIcon](#) - 20 * 20 size image to be displayed in simplified layout.
- [LargeIcon](#) - 32 * 32 size image to be displayed in normal layout for “Large” size form.

Normal layout

Simplified layout

Setting vector image

The [VectorImage](#) property is of type `ObservableCollection<Path>` which allows the image to be set as path type. The [RibbonButton](#) will automatically resize the image according to its [SizeForm](#). For simplified layout, the image will be resized to 20 * 20 size which is the standard.

Note: The [IconTemplateSelector](#) and [IconTemplate](#) properties are the preferred options to set any type of image such as glyph, font or any custom content when compared to the [VectorImage](#) property.

SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);

```

Normal layout

Simplified layout

Add RibbonButton to the simplified layout

When the simplified layout is enabled, the [RibbonButton](#) can be added and displayed in a single line as shown below. To know more about the simplified layout, refer [here](#).

XML

```

<syncfusion:RibbonWindow x:Class="RibbonButton_IconTemp.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"

// Adding tabs to ribbon
ribbon.Items.Add(homeTab);
ribbon.Items.Add(sendTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);

```

When arranging in simplified layout alone, the **Margin**, **Width** and **Height** values of the **RibbonButton** can be ignored as it will be resized automatically to the standard width and height. If the **RibbonButton** is to be shown in both normal and simplified layout, the **Margin**, **Width** and **Height** properties can be set for normal layout alone using triggers.

XML

```

<syncfusion:RibbonButton Label="Copy"
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,Simplified"
SizeForm="Small" MediumIcon="/Resources/Copy_20.png"
SmallIcon="/Resources/Copy16.png" >
<syncfusion:RibbonButton.Style >
<Style TargetType="syncfusion:RibbonButton" BasedOn="{StaticResource
SyncfusionRibbonButtonStyle}">
<Style.Triggers>
<Trigger Property="syncfusion:SimplifiedLayoutSettings.LayoutMode"
Value="Normal">
<Setter Property="Height" Value="48"/>
<Setter Property="Width" Value="48"/>
<Setter Property="Margin" Value="2"/>
</Trigger>
</Style.Triggers>
</Style>
</syncfusion:RibbonButton.Style>
</syncfusion:RibbonButton>

```

RibbonDropDownButton in WPF Ribbon

DropDownButton appears like normal button that contains a drop arrow. It displays some items, while click on it. It accepts **DropDownMenuItem** as its children.

Add DropDownMenuItem

DropDownMenuItem are the items with **Header** property that is used to set header.

XML

```

<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
<syncfusion:RibbonTab Caption="HOME" >
<syncfusion:RibbonBar Name="_ribbonBar1">
<syncfusion:DropDownButton Label="View"/>
<syncfusion:DropDownButton Label="Layout"/>

```

```
<syncfusion:DropDownButton Name="_dropDownButton" SizeForm = "Large"
Width="100" Label="File" >
<syncfusion:DropDownMenuItem Header="New"></syncfusion:DropDownMenuItem>
<syncfusion:DropDownMenuItem Header="Open"></syncfusion:DropDownMenuItem>
</syncfusion:DropDownButton>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
```

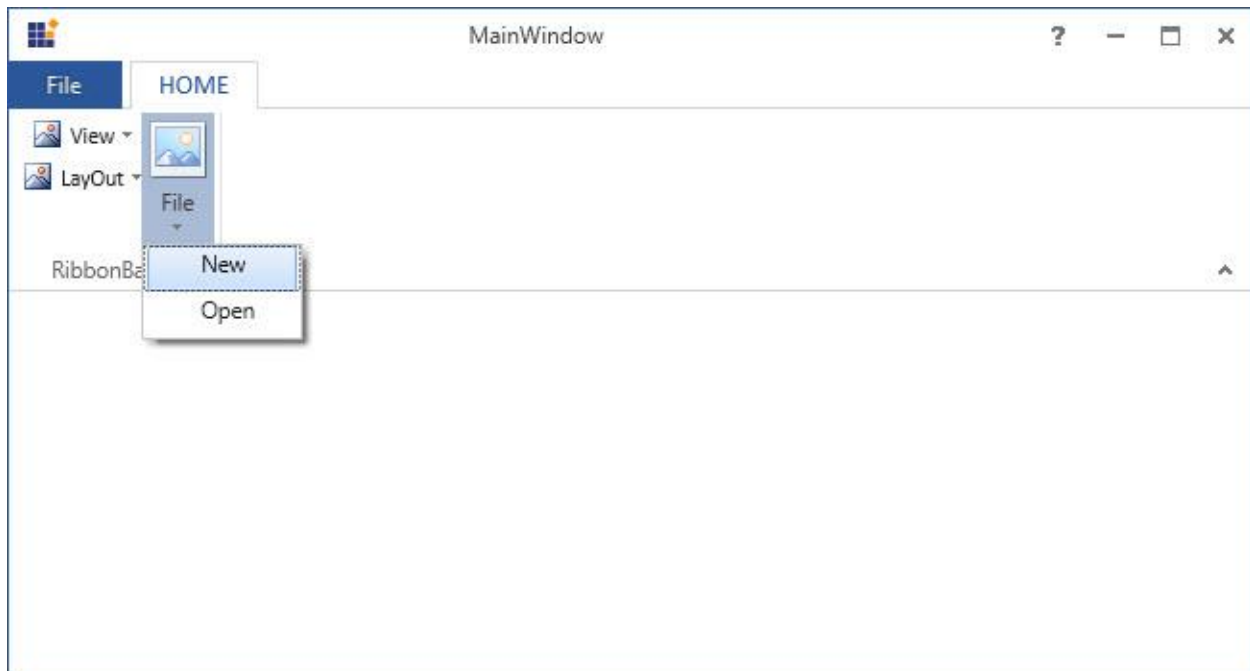

Create instance of `DropDownMenuItems` and add it to `DropDownButton` Items in code behind.

C#

```
DropDownMenuItem _dropDownMenuItem1 = new DropDownMenuItem() {Header="New"
};
DropDownMenuItem _dropDownMenuItem2 = new DropDownMenuItem() { Header =
"Open" };
_dropDownButton.Items.Add(_dropDownMenuItem1);
_dropDownButton.Items.Add(_dropDownMenuItem2);
```

VB.NET

```
Dim _dropDownMenuItem1 As New DropDownMenuItem() With {.Header="New"}
Dim _dropDownMenuItem2 As New DropDownMenuItem() With {.Header = "Open"}
_dropDownButton.Items.Add(_dropDownMenuItem1)
_dropDownButton.Items.Add(_dropDownMenuItem2)
```

Add DropDownMenuItem to DropDownMenuGroup

In `DropDownButton`, similar items can be grouped together and separated from other menu items using `DropDownMenuGroup`.

XML

```

<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Name="_ribbonBar">
<syncfusion:DropDownButton Label="View"/>
<syncfusion:DropDownButton Label="LayOut"/>
<syncfusion:DropDownButton Name="_dropDownButton" SizeForm = "Large"
Width="100" Label="File" >
<syncfusion:DropDownMenuGroup Name="_dropDownMenuGroup1" Header="Group1">
<syncfusion:DropDownMenuItem Header="New"/>
<syncfusion:DropDownMenuItem Header="Open"/>
</syncfusion:DropDownMenuGroup>
<syncfusion:DropDownMenuGroup Name="_dropDownMenuGroup2" Header="Group2">
<syncfusion:DropDownMenuItem Header="Cut"/>
<syncfusion:DropDownMenuItem Header="Copy"/>
</syncfusion:DropDownMenuGroup>
</syncfusion:DropDownButton>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab IsChecked="False" Caption="DESIGN"/>
</syncfusion:Ribbon>

```

Create instance of `DropDownMenuItem` and add it to `DropDownMenuGroup` Items.

C#

```

DropDownMenuItem _dropDownMenuItem1 = new DropDownMenuItem() { Header =
"New" };
DropDownMenuItem _dropDownMenuItem2 = new DropDownMenuItem() { Header =
"Open" };
DropDownMenuItem _dropDownMenuItem3 = new DropDownMenuItem() { Header =
"Cut" };
DropDownMenuItem _dropDownMenuItem4 = new DropDownMenuItem() { Header =
"Copy" };
_dropDownMenuGroup1.Items.Add(_dropDownMenuItem1);
_dropDownMenuGroup1.Items.Add(_dropDownMenuItem2);
_dropDownMenuGroup2.Items.Add(_dropDownMenuItem3);
_dropDownMenuGroup2.Items.Add(_dropDownMenuItem4);

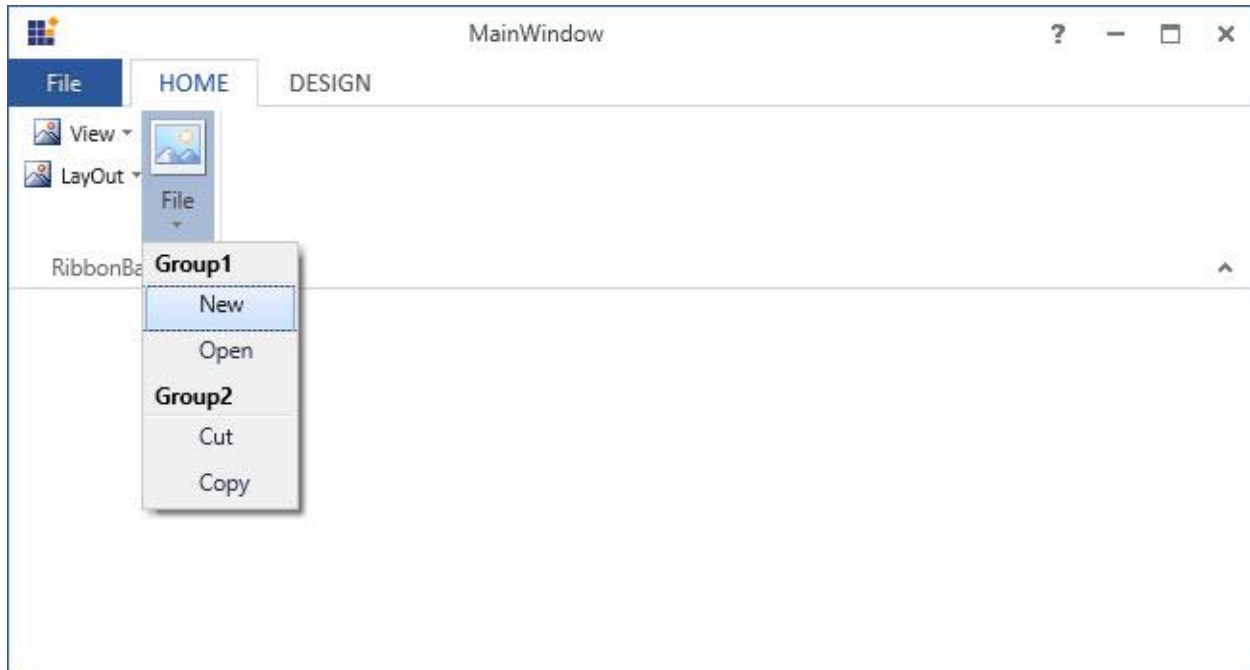

```

VB.NET

```

Dim _dropDownMenuItem1 As New DropDownMenuItem() With {.Header = "New"}
Dim _dropDownMenuItem2 As New DropDownMenuItem() With {.Header = "Open"}
Dim _dropDownMenuItem3 As New DropDownMenuItem() With {.Header = "Cut"}
Dim _dropDownMenuItem4 As New DropDownMenuItem() With {.Header = "Copy"}
_dropDownMenuGroup1.Items.Add(_dropDownMenuItem1)
_dropDownMenuGroup1.Items.Add(_dropDownMenuItem2)
_dropDownMenuGroup2.Items.Add(_dropDownMenuItem3)
_dropDownMenuGroup2.Items.Add(_dropDownMenuItem4)

```

Set various sizes for DropDownButton

[DropDownButton](#) supports three types of size modes and it can be set using the [SizeForm](#) property. The different [SizeForm](#) available are as follows:

- **ExtraSmall** - Displays only the image in 16 * 16 size.
- **Small** - Displays the label and the image in 16 * 16 size.
- **Large** - Displays the label and the image in 32 * 32 size.

XML

```
<syncfusion:RibbonBar Name="_ribbonBar2">
<syncfusion:DropDownButton SizeForm = "Large" Label="Large" />
<syncfusion:DropDownButton SizeForm = "Small" Label="Small" />
<syncfusion:DropDownButton SizeForm = "ExtraSmall" Label="ExtraSmall" />
</syncfusion:RibbonBar>
```

C#

```
DropDownButton _dropDownButton1 = new DropDownButton() { Label = "Large",
SizeForm = SizeForm.Large };
DropDownButton _dropDownButton2 = new DropDownButton() { Label = "Small",
SizeForm = SizeForm.Small };
DropDownButton _dropDownButton3 = new DropDownButton() { Label =
"ExtraSmall", SizeForm = SizeForm.ExtraSmall };
_ribbonBar2.Items.Add(_dropDownButton1);
_ribbonBar2.Items.Add(_dropDownButton2);
_ribbonBar2.Items.Add(_dropDownButton3);
```

VB.NET

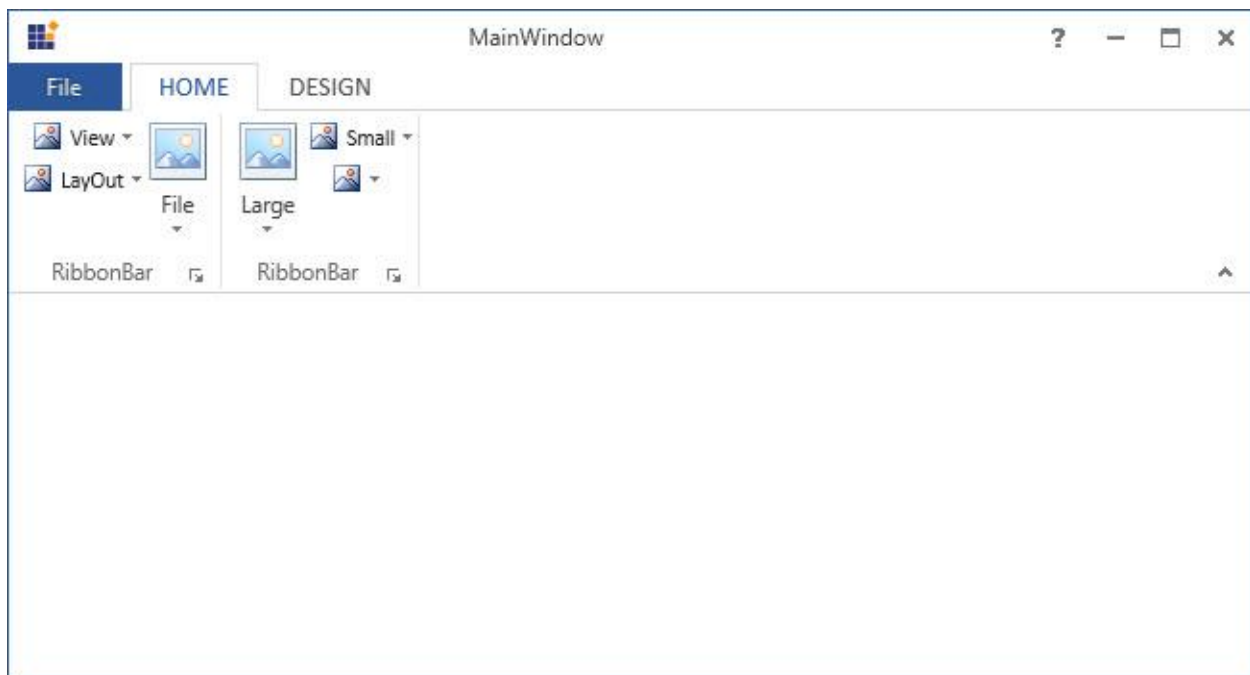

```
Dim _dropDownButton1 As New DropDownButton() With {
.Label = "Large",
```

```

.SizeForm = SizeForm.Large
}
Dim _dropDownButton2 As New DropDownButton() With {
.Label = "Small",
.SizeForm = SizeForm.Small
}
Dim _dropDownButton3 As New DropDownButton() With {
.Label = "ExtraSmall",
.SizeForm = SizeForm.ExtraSmall
}
_ribbonBar2.Items.Add(_dropDownButton1)
_ribbonBar2.Items.Add(_dropDownButton2)
_ribbonBar2.Items.Add(_dropDownButton3)

```

Note: When **simplified** layout is set, [DropDownButton](#) displays the image in 20 * 20 size irrespective of the size form. Also, the text in the **Large** size form will appear to the right of the image.

Setting image to DropDownButton

The [DropDownButton](#) allows to display any type of image such as glyph, font or any custom content using the [IconTemplateSelector](#) and [IconTemplate](#) property, which are the preferred options. It allows to display a normal image or vector image using the [IconType](#) enumeration property. The default value of the [IconType](#) property is "Icon". The [IconType](#) enumeration has the following values:

- **Icon** - Gets the detail of the icon path from the [SmallIcon](#), [MediumIcon](#) or [LargeIcon](#) properties and sets it to the DropDownButton.
- **VectorImage** - Gets the details of the icon's path data from the [VectorImage](#) property and sets it to the DropDownButton.

Note: The [DropDownButton](#) loads icon in the following priority order,

- [IconTemplateSelector](#)
- [IconTemplate](#)
- [VectorImage](#)
- [LargeIcon](#)
- [MediumIcon](#)
- [SmallIcon](#)

Setting icon template selector

The [IconTemplateSelector](#) property provides support to specify a different data template based on the value of the [SizeForm](#) or [LayoutMode](#) properties. For simplified layout, the template content will be resized to 20 * 20 size which is the standard.

```

Note: [View sample in GitHub](#)

Setting icon template

The [IconTemplate](#) property provides support to set any type of image such as glyph, font or any custom content to the [DropDownButton](#). The [DropDownButton](#) will automatically resize the template content according to its [SizeForm](#). For simplified layout, the template content will be resized to 20 * 20 size which is the standard.

Note: [View sample in GitHub](#)

Setting image path

The [DropDownButton](#) allows to set the image according to the different [SizeForm](#) values. To set the image to DropDownButton, the following properties are used:

- [SmallIcon](#) - 16 * 16 size image to be displayed in normal layout for “ExtraSmall” and “Small” size form.
- [MediumIcon](#) - 20 * 20 size image to be displayed in simplified layout.
- [LargeIcon](#) - 32 * 32 size image to be displayed in normal layout for “Large” size form.

Normal layout

Simplified layout

Setting vector image

The [VectorImage](#) property is of type `ObservableCollection<Path>` which allows the image to be set as path type. The `DropDownButton` will automatically resize the image according to its [SizeForm](#). For simplified layout, the image will be resized to 20 * 20 size which is the standard.

Note: The [IconTemplateSelector](#) and [IconTemplate](#) properties are the preferred options to set any type of image such as glyph, font or any custom content when compared to the [VectorImage](#) property.

Simplified layout

Add DropDownButton to the simplified layout

When the simplified layout is enabled, the [DropDownButton](#) can be added and displayed in a single line as shown below. To know more about the simplified layout, refer [here](#).

XML

```

<syncfusion:RibbonWindow x:Class="RibbonButton_IconTemp.Window1"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:RibbonButton_IconTemp"
xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
mc:Ignorable="d" xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
skin:SfSkinManager.VisualStyle="MaterialLight"
Title="Untitled 1 - Ribbon Control" Height="450" Width="800">
<Grid x:Name="grid">
<syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top"
EnableSimplifiedLayoutMode="True">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Header="Tables">
<syncfusion:DropDownButton
Label="Table"
LargeIcon="Resources/Table_32.png"
MediumIcon="Resources/Table20.png"
SizeForm="Large">
</syncfusion:DropDownButton>

```

```

<syncfusion:DropDownButton
Label="Shapes"
SmallIcon="Resources/Insert Shapes16.png"
MediumIcon="Resources/Insert Shapes20.png"
SizeForm="Small">
</syncfusion:DropDownButton>
<syncfusion:DropDownButton
Label="Chart"
SmallIcon="Resources/Base chart16.png"
MediumIcon="Resources/Base chart20.png"
SizeForm="Small">
</syncfusion:DropDownButton>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

C#

```

Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
ribbon.EnableSimplifiedLayoutMode = true;
// Creating new tabs
RibbonTab homeTab = new RibbonTab();
homeTab.Caption = "Home";
homeTab.IsChecked = true;
// Creating new bar
RibbonBar tablesBar = new RibbonBar();
tablesBar.Header = "Tables";
// Creating items
DropDownButton tableButton = new DropDownButton();
tableButton.Label = "Table";
tableButton.SizeForm = SizeForm.Large;
tableButton.MediumIcon = new BitmapImage(new Uri(@"Resources/Table20.png",
UriKind.RelativeOrAbsolute));
tableButton.LargeIcon = new BitmapImage(new Uri(@"Resources/Table_32.png",
UriKind.RelativeOrAbsolute));
DropDownButton shapesButton = new DropDownButton();
shapesButton.Label = "Shapes";
shapesButton.SizeForm = SizeForm.Small;
shapesButton.MediumIcon = new BitmapImage(new Uri(@"Resources/Insert
Shapes20.png", UriKind.RelativeOrAbsolute));
shapesButton.SmallIcon = new BitmapImage(new Uri(@"Resources/Insert
Shapes16.png", UriKind.RelativeOrAbsolute));
DropDownButton chartButton = new DropDownButton();
chartButton.Label = "Chart";
chartButton.SizeForm = SizeForm.Small;
chartButton.MediumIcon = new BitmapImage(new Uri(@"Resources/Base
chart20.png", UriKind.RelativeOrAbsolute));
chartButton.SmallIcon = new BitmapImage(new Uri(@"Resources/Base
chart16.png", UriKind.RelativeOrAbsolute));
// Adding items to bar
tablesBar.Items.Add(tableButton);
tablesBar.Items.Add(shapesButton);
tablesBar.Items.Add(chartButton);

```

```
// Adding bars to the tabs
homeTab.Items.Add(tablesBar);
// Adding tabs to ribbon
ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);
```

When arranging in simplified layout alone, the **Margin**, **Width** and **Height** values of the **DropDownButton** can be ignored as it will be resized automatically to the standard width and height. If the **DropDownButton** is to be shown in both normal and simplified layout, the **Margin**, **Width** and **Height** properties can be set for normal layout alone using triggers.

XML

```
<syncfusion:DropDownButton Label="Copy"
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,Simplified"
SizeForm="Small" MediumIcon="/Resources/Copy_20.png"
SmallIcon="/Resources/Copy16.png" >
<syncfusion:DropDownButton.Style>
<Style TargetType="syncfusion:DropDownButton" BasedOn="{StaticResource
SyncfusionRibbonDropDownButtonStyle}">
<Style.Triggers>
<Trigger Property="syncfusion:SimplifiedLayoutSettings.LayoutMode"
Value="Normal">
<Setter Property="Height" Value="48"/>
<Setter Property="Width" Value="48"/>
<Setter Property="Margin" Value="2"/>
</Trigger>
</Style.Triggers>
</Style>
</syncfusion:DropDownButton.Style>
</syncfusion:DropDownButton >
```

RibbonSplitButton in WPF Ribbon

SplitButton can perform like both normal **Button** as well as **DropDownButton**. It allow to click the button directly by clicking the upper part of the button and also it display list of items while click on the arrow.

Add DropDownMenuItem

DropDownMenuItem are the items with **Header** property that is used to set header.

XML

```
<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
<syncfusion:RibbonTab Name="_ribbonTab1" Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Name="_ribbonBar1" Header="RibbonBar1">
<syncfusion:RibbonButton Label="Cut"/>
<syncfusion:RibbonButton Label="Copy"/>
</syncfusion:RibbonBar>
```

```
<syncfusion:RibbonBar Name="_ribbonBar2" Header="RibbonBar2">
<syncfusion:SplitButton Label="Chart">
<syncfusion:DropDownMenuItem Header="PieChart"/>
<syncfusion:DropDownMenuItem Header="ColumnChart"/>
</syncfusion:SplitButton>
<syncfusion:SplitButton Label="Table"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="EDIT" IsChecked="False"/>
<syncfusion:RibbonTab Caption="VIEW" IsChecked="False"/>
</syncfusion:Ribbon>
```

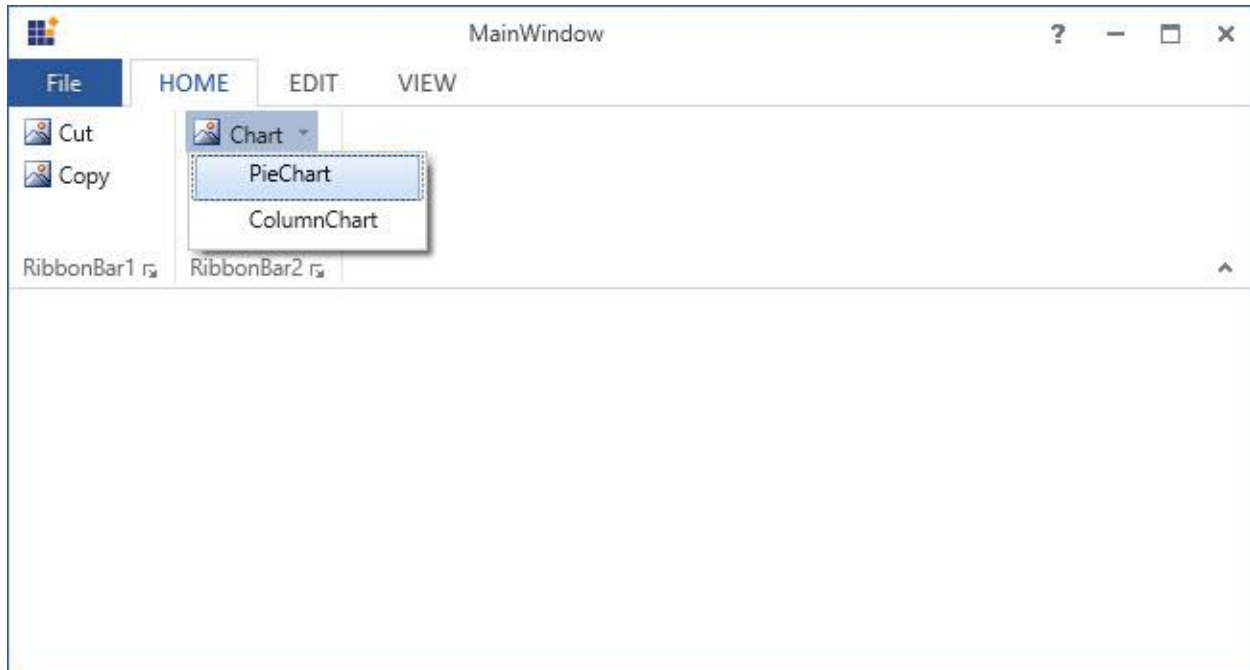

Create instance of `DropDownMenuItem` and add it to `SplitButton` in code behind.

C#

```
SplitButton _splitbutton = new SplitButton() { Label = "Chart" };
DropDownMenuItem _dropDownMenuItem1 = new DropDownMenuItem() { Header =
"PieChart" };
DropDownMenuItem _dropDownMenuItem2 = new DropDownMenuItem() { Header =
"ColumnChart" };
_splitbutton.Items.Add(_dropDownMenuItem1);
_splitbutton.Items.Add(_dropDownMenuItem2);
RibbonBar2.Items.Add( _splitbutton);
```

VB.NET

```
Dim _splitbutton As New SplitButton() With {.Label = "Chart"}
Dim _dropDownMenuItem1 As New DropDownMenuItem() With {.Header = "PieChart"}
Dim _dropDownMenuItem2 As New DropDownMenuItem() With {.Header =
"ColumnChart"}
_splitbutton.Items.Add(_dropDownMenuItem1)
_splitbutton.Items.Add(_dropDownMenuItem2)
RibbonBar2.Items.Add( _splitbutton)
```

Set various sizes for SplitButton

[SplitButton](#) supports three types of size modes and it can be set using the [SizeForm](#) property. The different [SizeForm](#) available are as follows:

- **ExtraSmall** - Displays only the image in 16 * 16 size.
- **Small** - Displays the label and the image in 16 * 16 size.
- **Large** - Displays the label and the image in 32 * 32 size.

XML

```
<syncfusion:SplitButton SizeForm="Large" Label="Large"/>
<syncfusion:SplitButton SizeForm="Small" Label="Small"/>
<syncfusion:SplitButton SizeForm="ExtraSmall" Label="ExtraSmall"/>
```

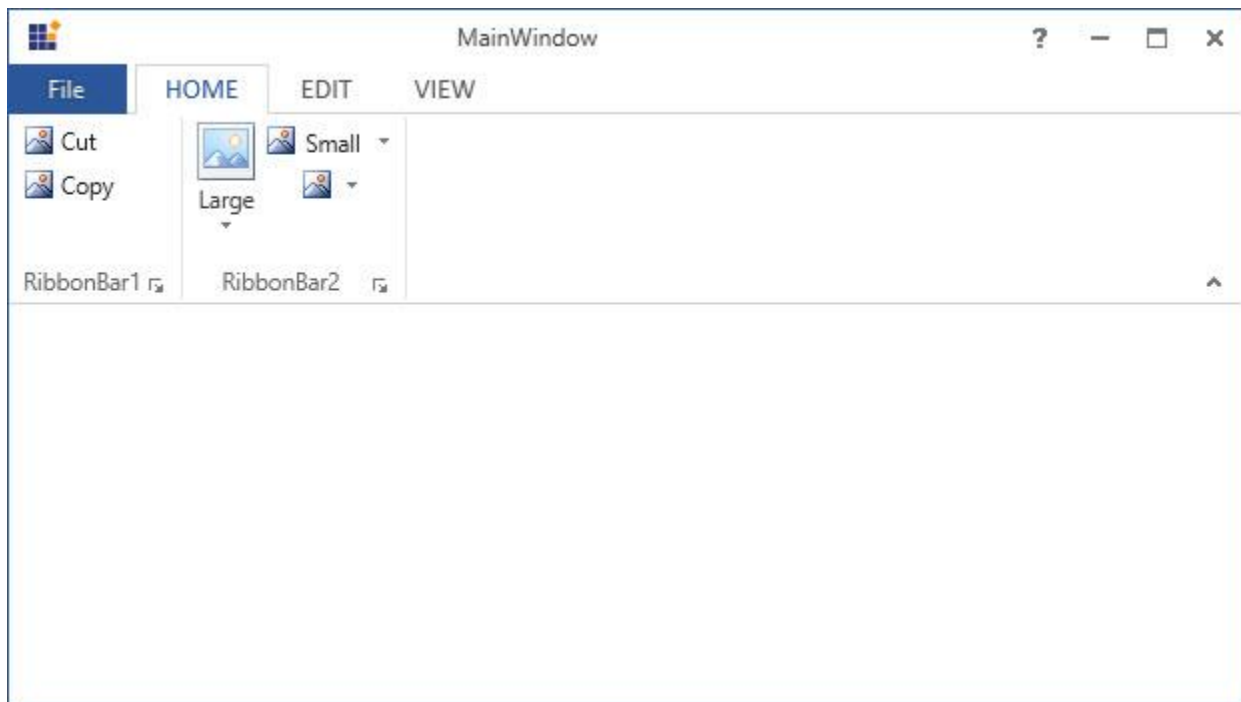

C#

```
SplitButton _splitbutton1 = new SplitButton() {Label = "Large", SizeForm=
SizeForm.Large};
SplitButton _splitbutton2 = new SplitButton() {Label = "Small", SizeForm=
SizeForm.Small};
SplitButton _splitbutton3 = new SplitButton() {Label = "ExtraSmall", SizeForm=
SizeForm.ExtraSmall};
_ribbonBar2.Items.Add(_splitbutton1);
_ribbonBar2.Items.Add(_splitbutton2);
_ribbonBar2.Items.Add(_splitbutton3);
```

VB.NET

```
Dim _splitbutton1 As New SplitButton() With {
.Label = "Large",
.SizeForm= SizeForm.Large
}
```

```
Dim _splitbutton2 As New SplitButton() With {  
    .Label = "Small",  
    .SizeForm= SizeForm.Small  
}  
Dim _splitbutton3 As New SplitButton() With {  
    .Label = "ExtraSmall",  
    .SizeForm= SizeForm.ExtraSmall  
}  
_ribbonBar2.Items.Add(_splitbutton1)  
_ribbonBar2.Items.Add(_splitbutton2)  
_ribbonBar2.Items.Add(_splitbutton3)
```

Note: When **simplified** layout is set, [SplitButton](#) displays the image in 20 * 20 size irrespective of the size form. Also, the text in the **Large** size form will appear to the right of the image.

Setting image to SplitButton

The [SplitButton](#) allows to display any type of image such as glyph, font or any custom content using the [IconTemplateSelector](#) and [IconTemplate](#) property, which are the preferred options. It allows to display a normal image or vector image using the [IconType](#) enumeration property. The default value of the [IconType](#) property is "Icon". The [IconType](#) enumeration has the following values:

- **Icon** - Gets the detail of the icon path from the [SmallIcon](#), [MediumIcon](#) or [LargeIcon](#) properties and sets it to the SplitButton.
- **VectorImage** - Gets the details of the icon path data from the [VectorImage](#) property and sets it to the SplitButton.

Note: The [SplitButton](#) loads icon in the following priority order,

- [IconTemplateSelector](#)

- [IconTemplate](#)
- [VectorImage](#)
- [LargeIcon](#)
- [MediumIcon](#)
- [SmallIcon](#)

Setting icon template selector

The [IconTemplateSelector](#) property provides support to specify a different data template based on the value of the [SizeForm](#) or [LayoutMode](#) properties. For simplified layout, the template content will be resized to 20 * 20 size which is the standard.

}
}
return LargeTemplate;
}
}

```

Note: [View sample in GitHub](#)

Setting icon template

The [IconTemplate](#) property provides support to set any type of image such as glyph, font or any custom content to the [SplitButton](#). The [SplitButton](#) will automatically resize the template content according to its [SizeForm](#). For simplified layout, the template content will be resized to 20 * 20 size which is the standard.

Note: [View sample in GitHub](#)

Setting image path

The [SplitButton](#) allows to set the image according to the different [SizeForm](#) values. To set the image to SplitButton, the following properties are used:

- [SmallIcon](#) - 16 * 16 size image to be displayed in normal layout for “ExtraSmall” and “Small” size form.
- [MediumIcon](#) - 20 * 20 size image to be displayed in simplified layout.
- [LargeIcon](#) - 32 * 32 size image to be displayed in normal layout for “Large” size form.

ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);
```

Normal layout

Simplified layout

Setting vector image

The [VectorImage](#) property is of type `ObservableCollection<Path>` which allows the image to be set as path type. The SplitButton will automatically resize the image according to its [SizeForm](#). For simplified layout, the image will be resized to 20 * 20 size which is the standard.

Note: The [IconTemplateSelector](#) and [IconTemplate](#) properties are the preferred options to set any type of image such as glyph, font or any custom content when compared to the [VectorImage](#) property.

SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);
```

When arranging in simplified layout alone, the **Margin**, **Width** and **Height** values of the SplitButton can be ignored as it will be resized automatically to the standard width and height. If the SplitButton is to be shown in both normal and simplified layout, **Margin**, **Width** and **Height** properties can be set for normal layout alone using triggers.

RibbonComboBox in WPF Ribbon

RibbonComboBox control is used to display the list of items, as ComboBox.

Add ComboBoxItems

ComboBoxItems are the items with **Header** property that is used to set header.

XML

```

<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
<syncfusion:RibbonTab Name="_ribbonTab1" Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Name="_ribbonBar1" Header="RibbonBar1">
<syncfusion:RibbonButton Label="Cut"/>
<syncfusion:RibbonButton Label="Copy"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="_ribbonBar2" Width="150" Header="RibbonBar2">
<syncfusion:ButtonPanel>
<syncfusion:RibbonComboBox SelectedItem="Arial" Width="80">
<syncfusion:RibbonComboBoxItem>Arial</syncfusion:RibbonComboBoxItem>
<syncfusion:RibbonComboBoxItem>Tahoma</syncfusion:RibbonComboBoxItem>
<syncfusion:RibbonComboBoxItem>Calibri</syncfusion:RibbonComboBoxItem>
</syncfusion:RibbonComboBox>
<syncfusion:RibbonComboBox SelectedItem="12" Width="50">
<syncfusion:RibbonComboBoxItem>11</syncfusion:RibbonComboBoxItem>
<syncfusion:RibbonComboBoxItem>12</syncfusion:RibbonComboBoxItem>
<syncfusion:RibbonComboBoxItem>13</syncfusion:RibbonComboBoxItem>
</syncfusion:RibbonComboBox>
</syncfusion:ButtonPanel>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="EDIT" IsChecked="False"/>
<syncfusion:RibbonTab Caption="VIEW" IsChecked="False"/>
</syncfusion:Ribbon>

```

Create instance for **RibbonComboBox** and add it to RibbonBar Items in Code behind

C#

```

ButtonPanel _buttonPanel = new ButtonPanel();
RibbonComboBox _ribbonComboBox1 = new RibbonComboBox() { Width=80};
RibbonComboBox _ribbonComboBox2 = new RibbonComboBox() { Width=50};
RibbonComboBoxItem comboBoxItem1 = new RibbonComboBoxItem() { Content =
"Arial" };
RibbonComboBoxItem comboBoxItem2 = new RibbonComboBoxItem() { Content =
"Calibri" };
RibbonComboBoxItem comboBoxItem3 = new RibbonComboBoxItem() { Content =
"Tahoma" };
RibbonComboBoxItem comboBoxItem4 = new RibbonComboBoxItem() { Content = "11"
};
RibbonComboBoxItem comboBoxItem5 = new RibbonComboBoxItem() { Content = "12"
};

```

```

RibbonComboBoxItem comboBoxItem6 = new RibbonComboBoxItem() { Content = "13"
};
_ribbonComboBox.Items.Add(comboBoxItem1);
_ribbonComboBox.Items.Add(comboBoxItem2);
_ribbonComboBox.Items.Add(comboBoxItem3);
_RibbonComboBox1.Items.Add(comboBoxItem4);
_ribbonComboBox1.Items.Add(comboBoxItem5);
_ribbonComboBox1.Items.Add(comboBoxItem6);
_buttonPanel.Children.Add(_ribbonComboBox1);
_buttonPanel.Children.Add(_ribbonComboBox2);
_ribbonBar2.Items.Add(_buttonPanel);

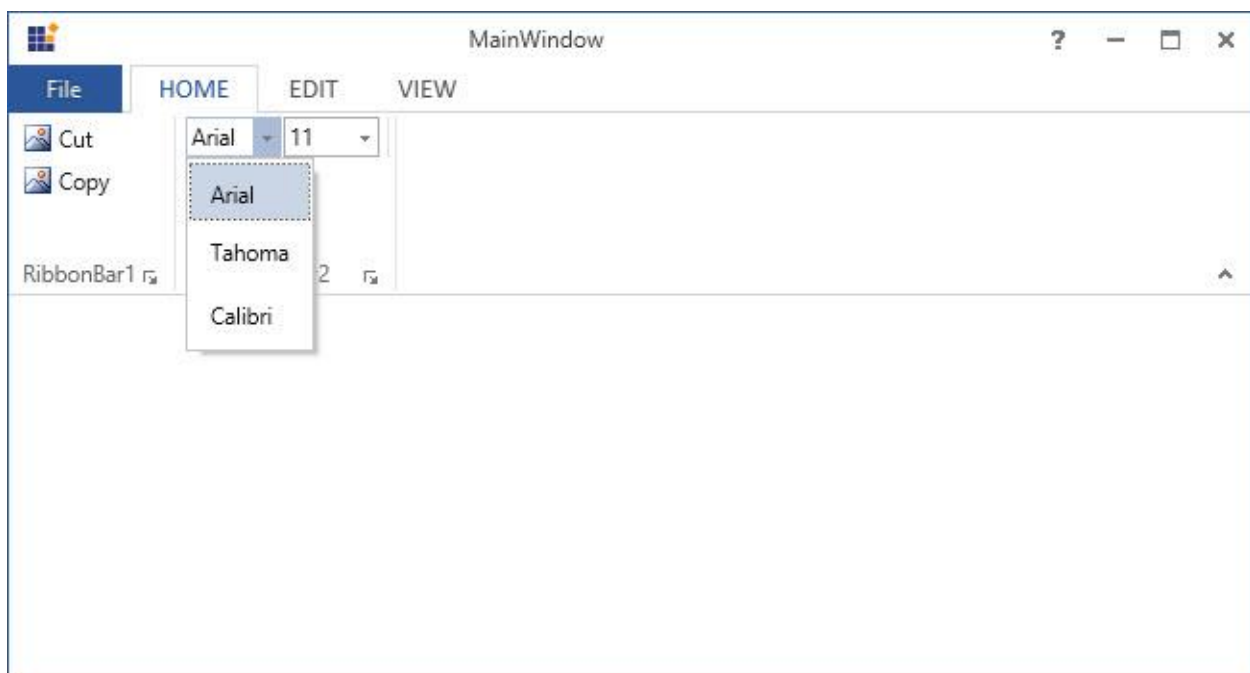

```

VB.NET

```

Dim _buttonPanel As New ButtonPanel()
Dim _ribbonComboBox1 As New RibbonComboBox() With {.Width=80}
Dim _ribbonComboBox2 As New RibbonComboBox() With {.Width=50}
Dim comboBoxItem1 As New RibbonComboBoxItem() With {.Content = "Arial"}
Dim comboBoxItem2 As New RibbonComboBoxItem() With {.Content = "Calibri"}
Dim comboBoxItem3 As New RibbonComboBoxItem() With {.Content = "Tahoma"}
Dim comboBoxItem4 As New RibbonComboBoxItem() With {.Content = "11"}
Dim comboBoxItem5 As New RibbonComboBoxItem() With {.Content = "12"}
Dim comboBoxItem6 As New RibbonComboBoxItem() With {.Content = "13"}
_ribbonComboBox.Items.Add(comboBoxItem1)
_ribbonComboBox.Items.Add(comboBoxItem2)
_ribbonComboBox.Items.Add(comboBoxItem3)
_RibbonComboBox1.Items.Add(comboBoxItem4)
_ribbonComboBox1.Items.Add(comboBoxItem5)
_ribbonComboBox1.Items.Add(comboBoxItem6)
_buttonPanel.Children.Add(_ribbonComboBox1)
_buttonPanel.Children.Add(_ribbonComboBox2)
_ribbonBar2.Items.Add(_buttonPanel)

```

Add ComboBox to the simplified layout

When the simplified layout is enabled, the RibbonComboBox can be added and displayed in a single line as shown below. To know more about the simplified layout, refer [here](#).

XML

```
<syncfusion:RibbonWindow x:Class="RibbonButton_IconTemp.Window1"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:RibbonButton_IconTemp" xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
mc:Ignorable="d" xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
skin:SfSkinManager.VisualStudio="MaterialLight"
Title="Untitled 1 - Ribbon Control" Height="450" Width="800">
<Grid x:Name="grid">
<syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top"
EnableSimplifiedLayoutMode="True" LayoutMode="Simplified">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Header="Font">
<syncfusion:RibbonComboBox Width="80">
<syncfusion:RibbonComboBoxItem>Arial</syncfusion:RibbonComboBoxItem>
<syncfusion:RibbonComboBoxItem
IsSelected="True">Tahoma</syncfusion:RibbonComboBoxItem>
<syncfusion:RibbonComboBoxItem>Calibri</syncfusion:RibbonComboBoxItem>
</syncfusion:RibbonComboBox>
<syncfusion:RibbonComboBox Width="50">
<syncfusion:RibbonComboBoxItem>11</syncfusion:RibbonComboBoxItem>
<syncfusion:RibbonComboBoxItem
IsSelected="True">12</syncfusion:RibbonComboBoxItem>
<syncfusion:RibbonComboBoxItem>13</syncfusion:RibbonComboBoxItem>
</syncfusion:RibbonComboBox>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>
```

C#

```
Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
ribbon.EnableSimplifiedLayoutMode = true;
ribbon.LayoutMode = LayoutMode.Simplified;
// Creating new tabs
RibbonTab homeTab = new RibbonTab();
homeTab.Caption = "Home";
homeTab.IsChecked = true;
// Creating new bar
RibbonBar fontBar = new RibbonBar();
fontBar.Header = "Font";
// Creating items
RibbonComboBox ribbonComboBox1 = new RibbonComboBox() { Width = 80 };
RibbonComboBox ribbonComboBox2 = new RibbonComboBox() { Width = 50 };
```

```

RibbonComboBoxItem comboBoxItem1 = new RibbonComboBoxItem() { Content =
"Arial" };
RibbonComboBoxItem comboBoxItem2 = new RibbonComboBoxItem() { Content =
"Calibri" };
RibbonComboBoxItem comboBoxItem3 = new RibbonComboBoxItem() { Content =
"Tahoma", IsSelected=true };
RibbonComboBoxItem comboBoxItem4 = new RibbonComboBoxItem() { Content = "11"
};
RibbonComboBoxItem comboBoxItem5 = new RibbonComboBoxItem() { Content =
"12", IsSelected = true };
RibbonComboBoxItem comboBoxItem6 = new RibbonComboBoxItem() { Content = "13"
};
ribbonComboBox1.Items.Add(comboBoxItem1);
ribbonComboBox1.Items.Add(comboBoxItem2);
ribbonComboBox1.Items.Add(comboBoxItem3);
ribbonComboBox2.Items.Add(comboBoxItem4);
ribbonComboBox2.Items.Add(comboBoxItem5);
ribbonComboBox2.Items.Add(comboBoxItem6);
// Adding items to bar
fontBar.Items.Add(ribbonComboBox1);
fontBar.Items.Add(ribbonComboBox2);
// Adding bars to the tabs
homeTab.Items.Add(fontBar);
// Adding tabs to ribbon
ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);

```

When arranging in simplified layout alone, the **Margin**, **Width** and **Height** values of the **RibbonComboBox** can be ignored as it will be resized automatically to the standard width and height. If the **RibbonComboBox** is to be shown in both normal and simplified layout, the **Margin**, **Width** and **Height** properties can be set for normal layout alone using triggers.

XML

```

<syncfusion:RibbonComboBox
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,Simplified" >
<syncfusion:RibbonComboBox.Style>
<Style TargetType="syncfusion:RibbonComboBox" BasedOn="{StaticResource
SyncfusionRibbonComboBoxStyle}">
<Style.Triggers>
<Trigger Property="syncfusion:SimplifiedLayoutSettings.LayoutMode"
Value="Normal">
<Setter Property="Height" Value="25"/>
<Setter Property="Width" Value="48"/>
<Setter Property="Margin" Value="2"/>
</Trigger>
</Style.Triggers>
</Style>

```

```
</syncfusion:RibbonComboBox.Style>
</syncfusion:RibbonComboBox >
```

Autosize width in RibbonComboBox

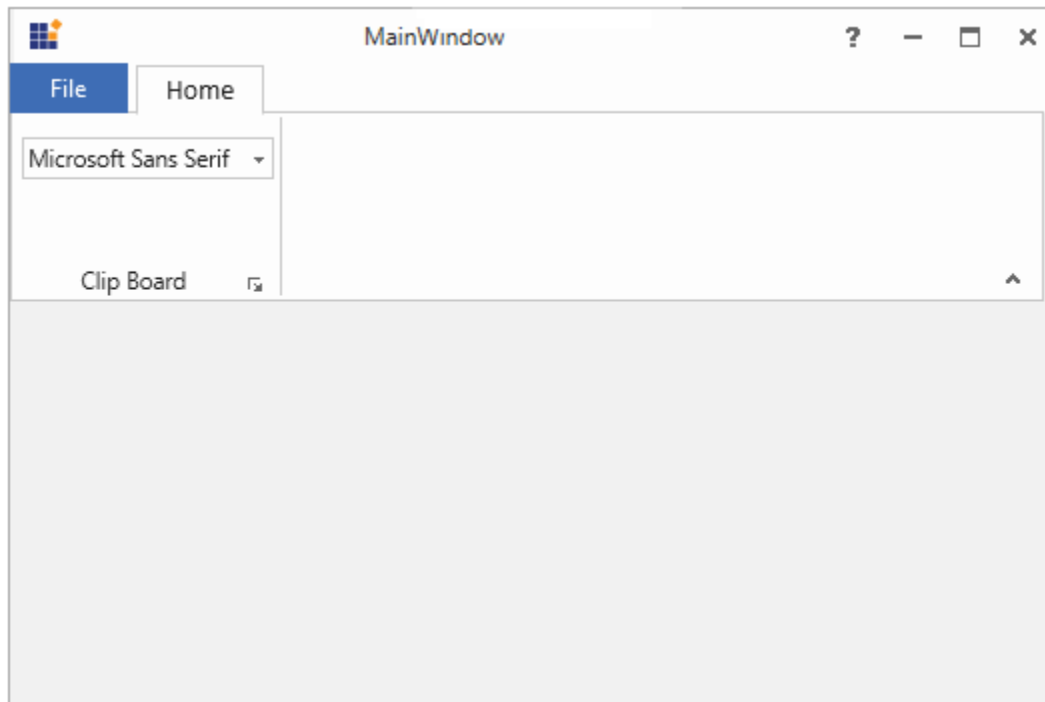

RibbonComboBox can be auto sized by not providing width to the RibbonComboBox and the width will be based on the selected item text.

If the width is given, then the width is set to the RibbonComboBox instead of the selected item text.

The following code example demonstrates how to set auto-width to the ComboBoxAdv control.

XML

```
<syncfusion:Ribbon x:Name="ribbon" HorizontalAlignment="Left" Height="94"
VerticalAlignment="Top" Width="517">
  <syncfusion:RibbonTab Background="Transparent" Caption="Home"
FocusVisualStyle="{x:Null}" Focusable="False" MinWidth="23">
    <syncfusion:RibbonBar Focusable="False" Header="Clip Board">
      <syncfusion:RibbonComboBox SelectedItem="Arial" Margin="0,10,0,0">
        <syncfusion:RibbonComboBoxItem>Arial</syncfusion:RibbonComboBoxItem>
        <syncfusion:RibbonComboBoxItem>Tahoma</syncfusion:RibbonComboBoxItem>
        <syncfusion:RibbonComboBoxItem>Microsoft Sans
Serif</syncfusion:RibbonComboBoxItem>
      </syncfusion:RibbonComboBox>
    </syncfusion:RibbonBar>
  </syncfusion:RibbonTab>
</syncfusion:Ribbon>
```

RibbonGallery in WPF Ribbon

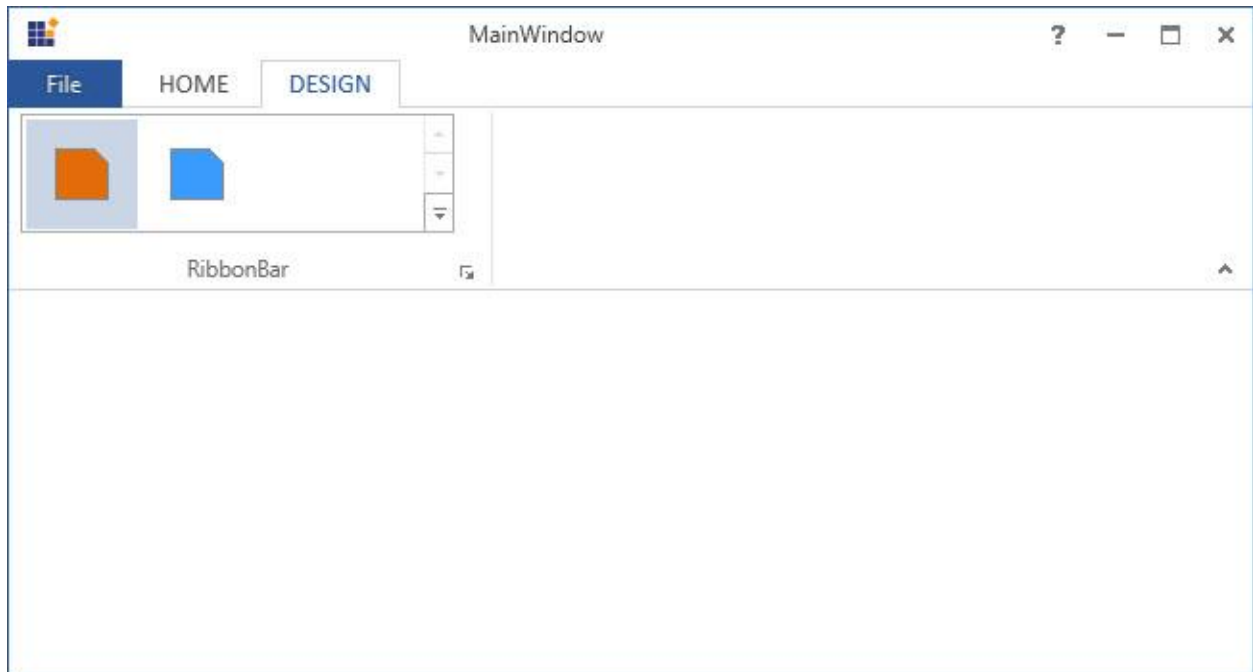

RibbonGallery provides `VisualMode` property, that helps to display items in two different ways.

Ribbon mode

To display items as a normal gallery control in the ribbon, set `VisualMode` property as `InRibbon mode`

XML

```
<syncfusion:RibbonGallery Width="230" VisualMode="InRibbon"  
Label="RibbonGallery" LargeIcon="Word.png"/>
```

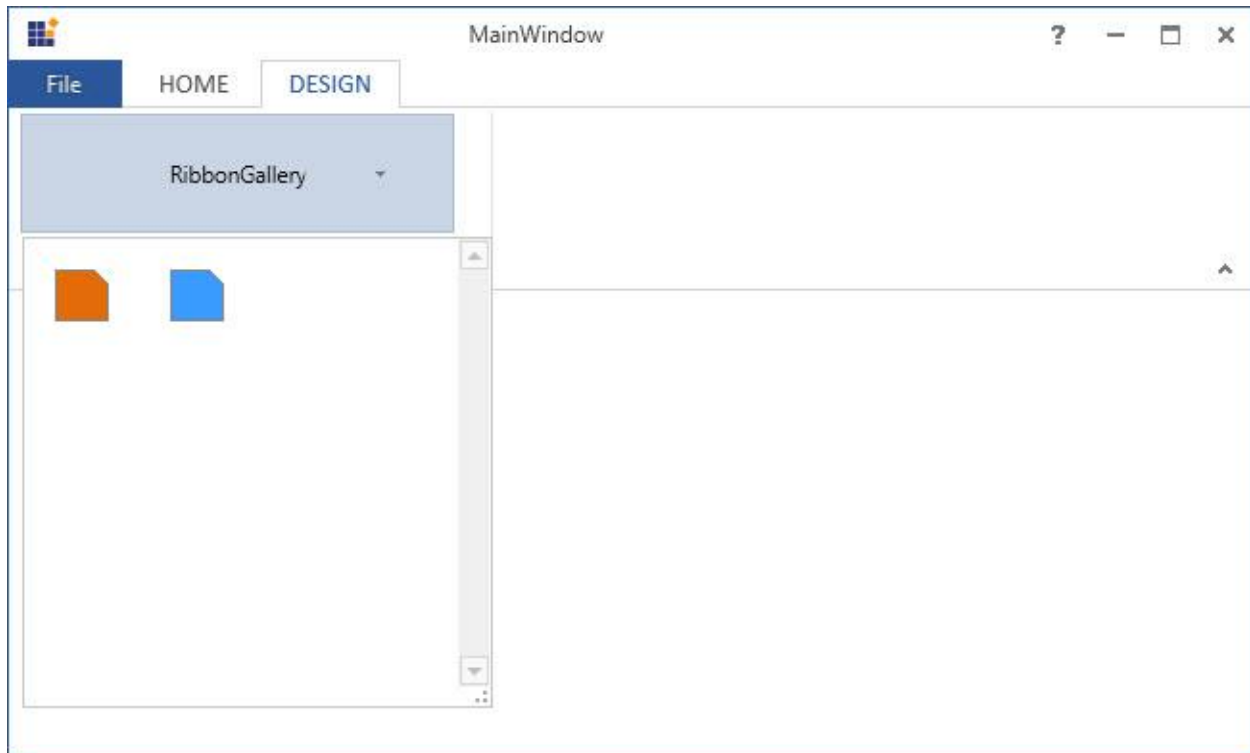

DropDown mode

To display items as DropDown in the ribbon, set `VisualMode` property as `DropDown mode`

XML

```
<syncfusion:RibbonGallery VisualMode="DropDown" Label="RibbonGallery"  
LargeIcon="Word.png" >
```

Ribbon gallery item

Ribbon control provides `RibbonGalleryItem` that add as items in RibbonGallery.

XML

```
<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
  <syncfusion:RibbonTab Caption="HOME" IsChecked="False"/>
  <syncfusion:RibbonTab IsChecked="True" Caption="DESIGN">
    <syncfusion:RibbonBar Header="RibbonBar">
      <syncfusion:RibbonGallery Name="_ribbonGallery" Width="230"
VisualMode="InRibbon" Label="RibbonGallery" LargeIcon="Word.png" >
        <syncfusion:RibbonGalleryItem>
          <Image Source="OrangeLarge.png"/>
        </syncfusion:RibbonGalleryItem>
        <syncfusion:RibbonGalleryItem >
          <Image Source="BlueLarge.png"/>
        </syncfusion:RibbonGalleryItem>
      </syncfusion:RibbonGallery>
    </syncfusion:RibbonBar>
  </syncfusion:RibbonTab>
</syncfusion:Ribbon>
```

Add `RibbonGalleryItem` in code behind.

C#

```
Image _image1 = new Image() { Source =new BitmapImage(new
Uri(@"OrangeLarge.png", UriKind.RelativeOrAbsolute)) };
Image _image2 = new Image() { Source = new BitmapImage(new
Uri(@"BlueLarge.png", UriKind.RelativeOrAbsolute)) };
```

```

RibbonGalleryItem _ribbonGalleryItem1 = new RibbonGalleryItem()
{Content=_image1};
RibbonGalleryItem _ribbonGalleryItem2 = new RibbonGalleryItem() { Content =
_image2 };
_ribbonGallery.Items.Add(_ribbonGalleryItem1);
_ribbonGallery.Items.Add(_ribbonGalleryItem2);

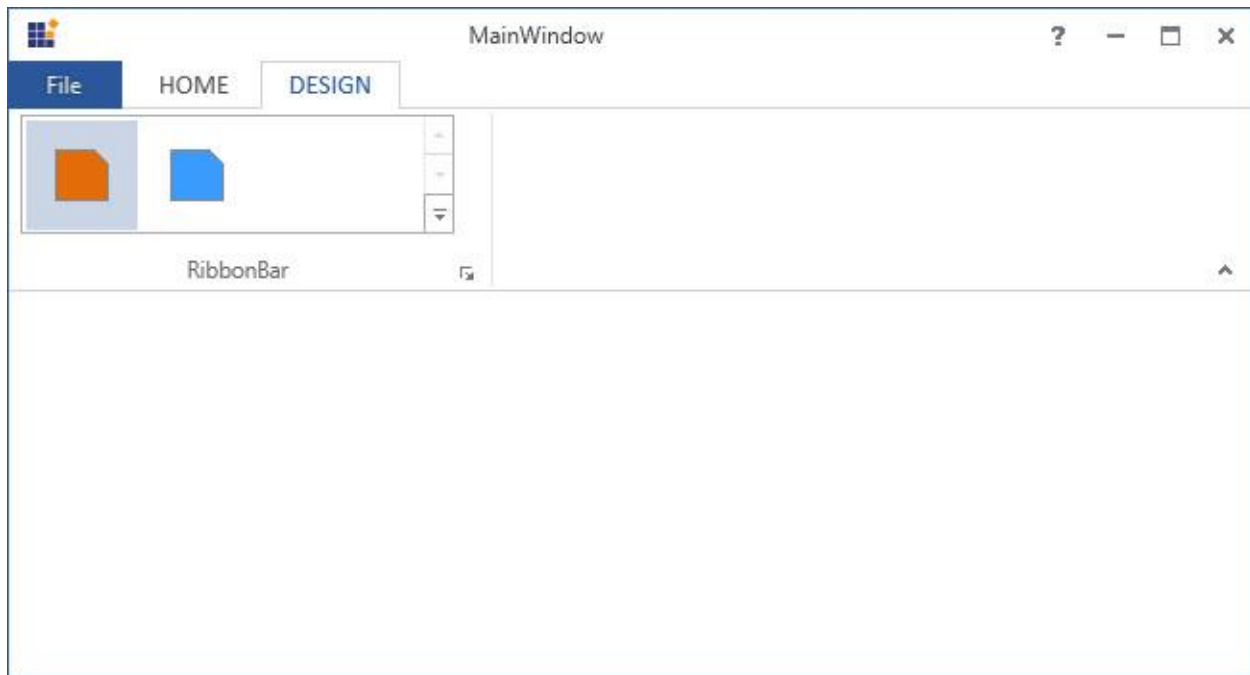

```

VB.NET

```

Dim _image1 As New Image() With {.Source = New BitmapImage(New
Uri("OrangeLarge.png", UriKind.RelativeOrAbsolute))}
Dim _image2 As New Image() With {.Source = New BitmapImage(New
Uri("BlueLarge.png", UriKind.RelativeOrAbsolute))}
Dim _ribbonGalleryItem1 As New RibbonGalleryItem() With {.Content=_image1}
Dim _ribbonGalleryItem2 As New RibbonGalleryItem() With {.Content = _image2}
_ribbonGallery.Items.Add(_ribbonGalleryItem1)
_ribbonGallery.Items.Add(_ribbonGalleryItem2)

```

Ribbon gallery group

Ribbon Gallery Group is a collection of Ribbon Gallery Items. The items are grouped in the Ribbon Gallery control based on some classifications.

Gallery filter

GalleryGroupFilters are used to view particular group. The `FilterIndexes` property is used to specify the indexes of the filters.

XML

```

<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
  <syncfusion:RibbonTab Caption="HOME" IsChecked="False"/>
  <syncfusion:RibbonTab Caption="DESIGN" IsChecked="True">
    <syncfusion:RibbonBar Width="250" Header="RibbonBar">

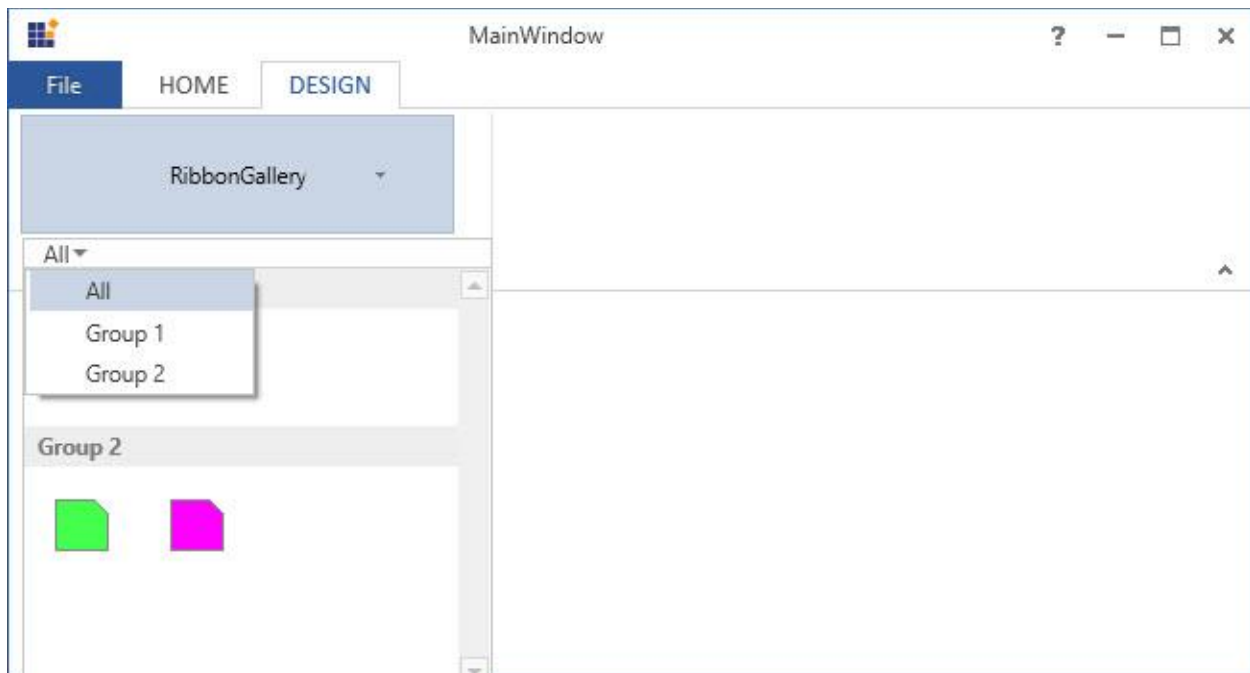

```

```

<syncfusion:RibbonGallery Name="_ribbonGallery" Width="230"
VisualMode="DropDown" Label="RibbonGallery">
<syncfusion:RibbonGallery.GalleryFilters>
<syncfusion:RibbonGalleryFilter Label="All"/>
<syncfusion:RibbonGalleryFilter Label="Group 1"/>
<syncfusion:RibbonGalleryFilter Label="Group 2"/>
</syncfusion:RibbonGallery.GalleryFilters>
<syncfusion:RibbonGallery.GalleryGroups>
<syncfusion:RibbonGalleryGroup Name="_ribbonGalleryGroup1" Label="Group 1"
syncfusion:RibbonGallery.FilterIndexes="0, 1">
<syncfusion:RibbonGalleryItem Name="_ribbonGalleryItem1" Margin="5">
<Image Source="OrangeLarge.png" Stretch="None" />
</syncfusion:RibbonGalleryItem>
<syncfusion:RibbonGalleryItem Name="_ribbonGalleryItem2" Margin="5" >
<Image Source="BlueLarge.png" Stretch="None"/>
</syncfusion:RibbonGalleryItem>
</syncfusion:RibbonGalleryGroup>
<syncfusion:RibbonGalleryGroup Name="_ribbonGalleryGroup2" Label="Group 2"
syncfusion:RibbonGallery.FilterIndexes="0, 2">
<syncfusion:RibbonGalleryItem Name="_RibbonGalleryItem3" Margin="5">
<Image Source="GreenLarge.png" Stretch="None"/>
</syncfusion:RibbonGalleryItem>
<syncfusion:RibbonGalleryItem Name="_RibbonGalleryItem4" Margin="5" >
<Image Source="PinkLarge.png" Stretch="None" />
</syncfusion:RibbonGalleryItem>
</syncfusion:RibbonGalleryGroup>
</syncfusion:RibbonGallery.GalleryGroups>
</syncfusion:RibbonGallery>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>

```

Add custom menu items

In the expanded Gallery items (in both the Visual Mode), can add custom menu items to the bottom of the Ribbon Gallery control, using the `MenuItem` property of `RibbonGallery`.

XML

```
<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
  <syncfusion:RibbonTab Caption="HOME" IsChecked="True"/>
  <syncfusion:RibbonTab IsChecked="False" Caption="DESIGN">
    <syncfusion:RibbonBar Width="250" Header="RibbonBar">
      <syncfusion:RibbonGallery Name="_ribbonGallery" Width="230"
VisualMode="InRibbon" Label="RibbonGallery" LargeIcon="Word.png" >
        <syncfusion:RibbonGalleryItem Margin="5">
          <Image Source="OrangeLarge.png"/>
        </syncfusion:RibbonGalleryItem>
        <syncfusion:RibbonGalleryItem Margin="5">
          <Image Source="PinkLarge.png"/>
        </syncfusion:RibbonGalleryItem>
        <syncfusion:RibbonGallery.MenuItems>
          <syncfusion:RibbonButton SizeForm = "Small" Label="Menu Item-1"/>
          <syncfusion:RibbonButton SizeForm = "Small" Label="Menu Item-2"/>
          <syncfusion:RibbonButton SizeForm = "Small" Label="Menu Item-3"/>
        </syncfusion:RibbonGallery.MenuItems>
      </syncfusion:RibbonGallery>
    </syncfusion:RibbonBar>
  </syncfusion:RibbonTab>
</syncfusion:Ribbon>
```

Custom Menu items of `RibbonGallery` added by creating instance of `RibbonButton` and add it to `MenuItems` property of `RibbonGallery` in code behind. `SplitButton` or `MenuButton` can also added instead of `RibbonButton`.

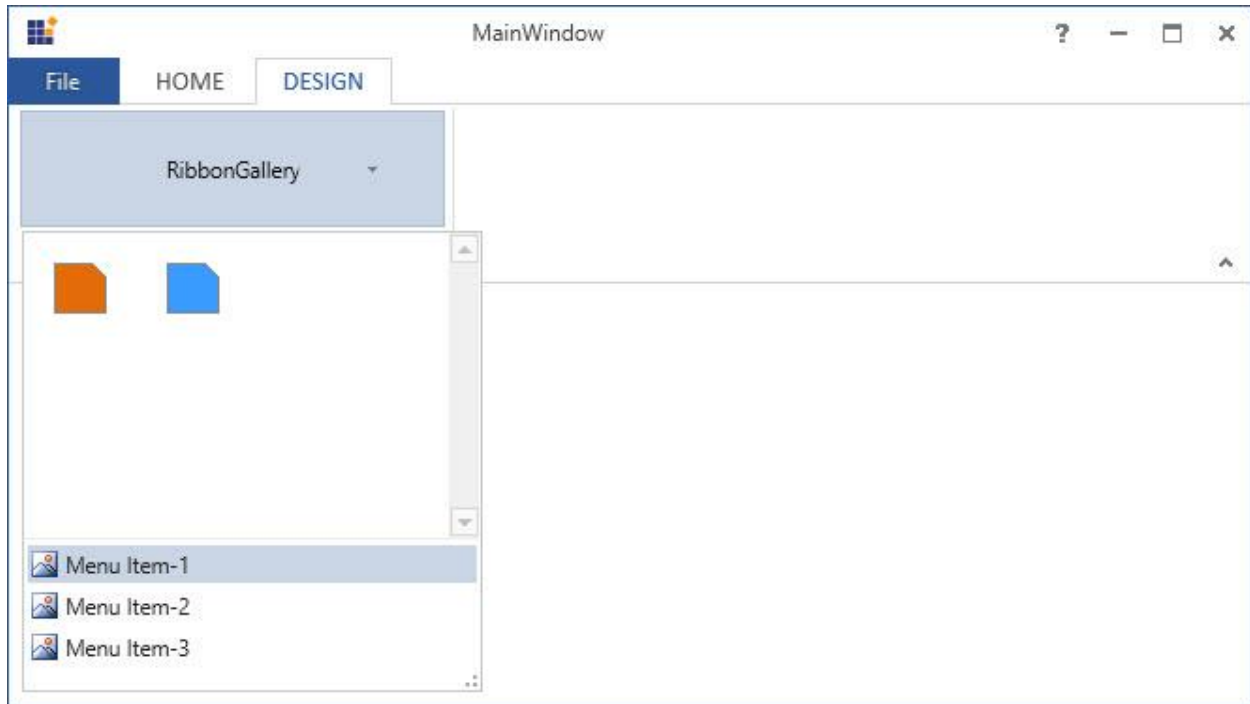

C#

```
RibbonButton _ribbonButton1 = new RibbonButton() { SizeForm =
SizeForm.Small, Label = "Menu Item-1" };
RibbonButton _ribbonButton2 = new RibbonButton() { SizeForm =
SizeForm.Small, Label = "Menu Item-2" };
RibbonButton _ribbonButton3 = new RibbonButton() { SizeForm =
SizeForm.Small, Label = "Menu Item-3" };
_ribbonGallery.MenuItems.Add(_ribbonButton1);
_ribbonGallery.MenuItems.Add(_ribbonButton2);
_ribbonGallery.MenuItems.Add(_ribbonButton3);
```

VB.NET

```
Dim _ribbonButton1 As New RibbonButton() With {
    .SizeForm = SizeForm.Small,
    .Label = "Menu Item-1"
}
Dim _ribbonButton2 As New RibbonButton() With {
    .SizeForm = SizeForm.Small,
    .Label = "Menu Item-2"
}
Dim _ribbonButton3 As New RibbonButton() With {
```

```
.SizeForm = SizeForm.Small,
.Label = "Menu Item-3"
}
_ribbonGallery.MenuItems.Add(_ribbonButton1)
_ribbonGallery.MenuItems.Add(_ribbonButton2)
_ribbonGallery.MenuItems.Add(_ribbonButton3)
```

Add custom context menu

The context menu is a type of menu that appears when a right-click operation is performed on the target. The ribbon gallery and its items allow to add a custom context menu with user-defined menu items set to the [ContextMenu](#) property. This will override the built-in context menu of the ribbon gallery and its items.

XML

```
<!-- A custom context menu with user-defined menu items -->
<syncfusion:RibbonWindow.Resources>
<syncfusion:RibbonContextMenu x:Key="galleryContextMenu"
ItemsSource="{Binding}">
<syncfusion:RibbonMenuItem Header="Apply Style" Command="{Binding
DataContext.ApplyStyleCommand}" IconBarEnabled="True"/>
<syncfusion:RibbonMenuItem Header="Remove from Style Gallery"
Command="{Binding DataContext.RemoveItemCommand}" IconBarEnabled="True"/>
<Separator />
<syncfusion:RibbonMenuItem Header="Minimize Ribbon" Command="{Binding
DataContext.MinimizeRibbonCommand}" IconBarEnabled="True" />
</syncfusion:RibbonContextMenu>
</syncfusion:RibbonWindow.Resources>
<!-- Replace the custom context menu with the built-in context menu of the
ribbon gallery -->
<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
```

```

<syncfusion:RibbonTab Caption="HOME" IsChecked="False"/>
<syncfusion:RibbonTab IsChecked="True" Caption="DESIGN">
<syncfusion:RibbonBar Header="RibbonBar">
<syncfusion:RibbonGallery x:Name="gallery" ContextMenu="{DynamicResource
galleryContextMenu}"
Width="380" SizeForm="Large" Height="67" ItemHeight="60" ItemWidth="60"

}
```

Set various sizes for RibbonGallery

The [RibbonGallery](#) supports three types of size modes in its DropDown [VisualMode](#) and it can be set using the [SizeForm](#) property. The different [SizeForm](#) available are as follows:

- **ExtraSmall** - Displays only the image in 16 * 16 size.
- **Small** - Displays the label and the image in 16 * 16 size.
- **Large** - Displays the label and the image in 32 * 32 size.

ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);
```

Note: When **simplified** layout is set, [RibbonGallery](#) displays the image in 20 * 20 size irrespective of the size form. Also, the text in the **Large** size form will appear to the right of the image.

Setting image to RibbonGallery

The [RibbonGallery](#) allows to display any type of image such as glyph, font or any custom content using the [IconTemplateSelector](#) and [IconTemplate](#) property, which are the preferred options. It allows to display a normal image or vector image using the [IconType](#) enumeration property. The default value of the [IconType](#) property is "Icon". The [IconType](#) enumeration has the following values:

- **Icon** - Gets the detail of the icon path from the [SmallIcon](#), [MediumIcon](#) or [LargeIcon](#) properties and sets it to the DropDownButton.
- **VectorImage** - Gets the details of the icon's path data from the [VectorImage](#) property and sets it to the DropDownButton.

Note: The [RibbonGallery](#) loads icon in the following priority order,

- [IconTemplateSelector](#)
- [IconTemplate](#)
- [VectorImage](#)
- [LargeIcon](#)
- [MediumIcon](#)
- [SmallIcon](#)

Setting icon template selector

The [IconTemplateSelector](#) property provides support to specify a different data template based on the value of the [SizeForm](#) or [LayoutMode](#) properties. For simplified layout, the template content will be resized to 20 * 20 size which is the standard.

Setting image path

The [RibbonGallery](#) allows to set the image according to the different [SizeForm](#) values. To set the image to [RibbonGallery](#), the following properties are used:

- [SmallIcon](#) - 16 * 16 size image to be displayed in normal layout for “ExtraSmall” and “Small” size form.
- [MediumIcon](#) - 20 * 20 size image to be displayed in simplified layout.
- [LargeIcon](#) - 32 * 32 size image to be displayed in normal layout for “Large” size form.

Normal layout

Simplified layout

Setting vector image

The [VectorImage](#) property is of the type `ObservableCollection<Path>` which allows the image to be set as path type. The [RibbonGallery](#) will automatically resize the image according to its [SizeForm](#). For simplified layout, the image will be resized to 20 * 20 size which is the standard.

Note: The [IconTemplateSelector](#) and [IconTemplate](#) properties are the preferred options to set any type of image such as glyph, font or any custom content when compared to the [VectorImage](#) property.

</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

Arranging between layouts

When arranging in simplified layout alone, the **Margin**, **Width** and **Height** values of the RibbonGallery can be ignored as it will be resized automatically to the standard width and height. If the RibbonGallery is to be shown in both normal and simplified layout, the **Margin**, **Width** and **Height** properties can be set for normal layout alone using triggers.

XML

```

<syncfusion:RibbonGallery
  syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,Simplified" >
  <syncfusion:RibbonGalleryItem Content="Item 1"/>
  <syncfusion:RibbonGalleryItem Content="Item 2"/>
  <syncfusion:RibbonGallery.Style>
    <Style TargetType="syncfusion:RibbonGallery" BasedOn="{StaticResource
      SyncfusionRibbonGalleryStyle}">
    <Style.Triggers>

```

```
<Trigger Property="syncfusion:SimplifiedLayoutSettings.LayoutMode"
Value="Normal">
<Setter Property="Height" Value="48"/>
<Setter Property="Width" Value="48"/>
<Setter Property="Margin" Value="2"/>
</Trigger>
</Style.Triggers>
</Style>
</syncfusion:RibbonGallery.Style>
</syncfusion:RibbonGallery >
```

RibbonTextBox in WPF Ribbon

RibbonTextBox control provide similar set of functionalities like normal TextBox control in Ribbon Instance.

Add TextBox to the RibbonBar

XML

```
<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
<syncfusion:RibbonTab Name="_ribbonTab1" Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Name="_ribbonBar2" Header="RibbonBar1">
<syncfusion:RibbonButton Label="Cut"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="_ribbonBar2" Width="150" Header="RibbonBar2">
<syncfusion:RibbonTextBox Width="140"
Text="RibbonTextBox"></syncfusion:RibbonTextBox>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="EDIT" IsChecked="False"/>
</syncfusion:Ribbon>
```

Create instance of RibbonTextBox and add it to RibbonBar through code behind.

C#

```
RibbonTextBox _ribbonTextBox = new RibbonTextBox() {Text = "RibbonTextBox"};
ribbonBar2.Items.Add( _ribbonTextBox);
```

VB.NET

```
Dim _ribbonTextBox As New RibbonTextBox() With {.Text = "RibbonTextBox"}
_ribbonBar2.Items.Add( _ribbonTextBox)
```

![Adding text box to the ribbon](RibbonTextBoximages/RibbonTextBoximg1.jpg)

Add TextBox to the simplified layout

When the simplified layout is enabled, the RibbonTextBox can be added and displayed in a single line as shown below. To know more about the simplified layout, refer [here](#).

XML

```
<syncfusion:RibbonWindow x:Class="RibbonButton_IconTemp.Window1"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml">
```

```

xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:RibbonButton_IconTemp" xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
mc:Ignorable="d" xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
skin:SfSkinManager.VisualStudio="MaterialLight"
Title="Untitled 1 - Ribbon Control" Height="450" Width="800">
<Grid x:Name="grid">
<syncfusion:Ribbon VerticalAlignment="Top" EnableSimplifiedLayoutMode="True"
LayoutMode="Simplified">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Header="Font">
<syncfusion:RibbonTextBox Width="140"
Text="RibbonTextBox"></syncfusion:RibbonTextBox>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

C#

```

Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
ribbon.EnableSimplifiedLayoutMode = true;
ribbon.LayoutMode = LayoutMode.Simplified;
// Creating new tabs
RibbonTab homeTab = new RibbonTab();
homeTab.Caption = "Home";
homeTab.IsChecked = true;
// Creating new bar
RibbonBar fontBar = new RibbonBar();
fontBar.Header = "Font";
// Creating items
RibbonTextBox ribbonTextBox = new RibbonTextBox() { Text = "RibbonTextBox"
};
// Adding items to bar
fontBar.Items.Add(ribbonTextBox);
// Adding bars to the tabs
homeTab.Items.Add(fontBar);
// Adding tabs to ribbon
ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);

```

![RibbonTextBox during simplified layout](RibbonTextBoximages/RibbonTextBoxSimplified.png)

When arranging in simplified layout alone, the **Margin**, **Width** and **Height** values of the RibbonTextBox can be ignored as it will be resized automatically to the standard width and height. If the RibbonTextBox is to be shown in both normal and simplified layout, the **Margin**, **Width** and **Height** properties can be set for normal layout alone using triggers.

XML

```

<syncfusion:RibbonTextBox Text="Enter text"
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,Simplified" >

```

```
<syncfusion:RibbonTextBox.Style>
<Style TargetType="syncfusion:RibbonTextBox" BasedOn="{StaticResource
SyncfusionRibbonTextBoxStyle}">
<Style.Triggers>
<Trigger Property="syncfusion:SimplifiedLayoutSettings.LayoutMode"
Value="Normal">
<Setter Property="Height" Value="25"/>
<Setter Property="Width" Value="48"/>
<Setter Property="Margin" Value="2"/>
</Trigger>
</Style.Triggers>
</Style>
</syncfusion:RibbonTextBox.Style>
</syncfusion:RibbonTextBox >
```

RibbonCheckBox in WPF Ribbon

[RibbonCheckBox](#) is used to select or unselect options. It provides similar set of functionalities like normal CheckBox control in [Ribbon](#).

The following code example illustrates how to use [RibbonCheckBox](#) control in [Ribbon](#) instance.

XML

```
<syncfusion:Ribbon Name="ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
<syncfusion:RibbonTab Name="ribbonTab1" Caption="HOME" >
<syncfusion:RibbonBar Name="ribbonBar1" Header="RibbonBar1">
<syncfusion:RibbonButton Label="Cut"/>
<syncfusion:RibbonButton Label="Copy"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="ribbonBar2" Width="150" Header="RibbonBar2">
<syncfusion:RibbonCheckBox Width="140" Content="SelectAll"
IsChecked="True"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="EDIT" IsChecked="False"/>
</syncfusion:Ribbon>
```

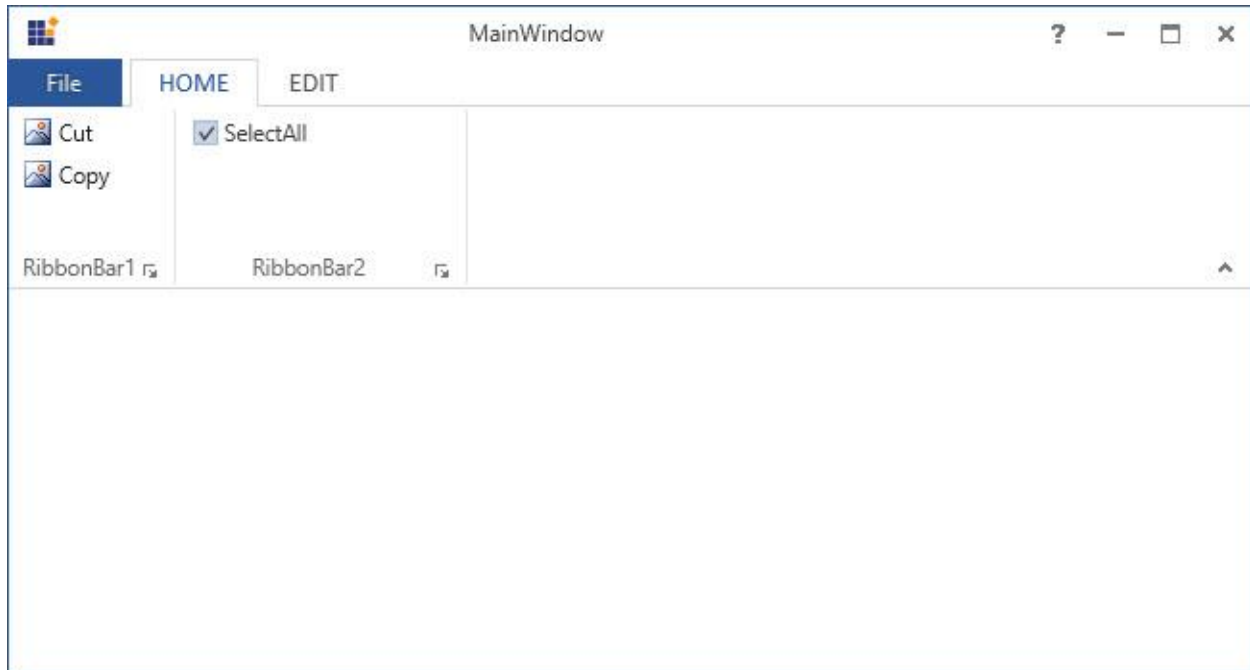

Create instance of [RibbonCheckBox](#) and add it to [RibbonBar](#) through code behind.

C#

```
RibbonCheckBox ribbonCheckBox = new RibbonCheckBox() { Content = "SelectAll",
IsChecked=true };
ribbonBar2.Items.Add(ribbonCheckBox);
```

VB.NET

```
Dim ribbonCheckBox As New RibbonCheckBox() With {
.Content = "SelectAll",
.IsChecked=True
}
ribbonBar2.Items.Add(ribbonCheckBox)
```

Add CheckBox to the simplified layout

When the simplified layout is enabled, the `RibbonCheckBox` can be added and displayed in a single line as shown below. To know more about the simplified layout, refer [here](#).

XML

```
<syncfusion:RibbonWindow x:Class="RibbonButton_IconTemp.Window1"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:RibbonButton_IconTemp" xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
mc:Ignorable="d" xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
skin:SfSkinManager.VisualStudio="MaterialLight"
Title="Untitled 1 - Ribbon Control" Height="450" Width="800">
<Grid x:Name="grid">
<syncfusion:Ribbon VerticalAlignment="Top" EnableSimplifiedLayoutMode="True"
LayoutMode="Simplified">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Header="Options">
<syncfusion:RibbonCheckBox Width="140" Content="SelectAll"
IsChecked="True"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>
```

C#

```
Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
ribbon.EnableSimplifiedLayoutMode = true;
```

```

ribbon.LayoutMode = LayoutMode.Simplified;
// Creating new tabs
RibbonTab homeTab = new RibbonTab();
homeTab.Caption = "Home";
homeTab.IsChecked = true;
// Creating new bar
RibbonBar optionsBar = new RibbonBar();
optionsBar.Header = "Options";
// Creating items
RibbonCheckBox ribbonCheckBox = new RibbonCheckBox() { Content =
"SelectAll", IsChecked = true };
// Adding items to bar
optionsBar.Items.Add(ribbonCheckBox);
// Adding bars to the tabs
homeTab.Items.Add(optionsBar);
// Adding tabs to ribbon
ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);

```

When arranging in simplified layout alone, the **Margin**, **Width** and **Height** values of the **RibbonCheckBox** can be ignored as it will be resized automatically to the standard width and height. If the **RibbonCheckBox** is to be shown in both normal and simplified layout, the **Margin**, **Width** and **Height** properties can be set for normal layout alone using triggers.

XML

```

<syncfusion:RibbonCheckBox Content="SelectAll"
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,Simplified" >
<syncfusion:RibbonCheckBox.Style>
<Style TargetType="syncfusion:RibbonCheckBox" BasedOn="{StaticResource
SyncfusionRibbonCheckBoxStyle}">
<Style.Triggers>
<Trigger Property="syncfusion:SimplifiedLayoutSettings.LayoutMode"
Value="Normal">
<Setter Property="Height" Value="25"/>
<Setter Property="Width" Value="48"/>
<Setter Property="Margin" Value="2"/>
</Trigger>
</Style.Triggers>
</Style>
</syncfusion:RibbonCheckBox.Style>
</syncfusion:RibbonCheckBox >

```

See Also

[How to bind the RibbonCheckBox in WPF Ribbon control with MVVM pattern?](#).

RibbonRadioButton in WPF Ribbon

RibbonRadioButton control is used to select a option like normal RadioButton .

Add RadioButton to the RibbonBar

XML

```
<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
<syncfusion:RibbonTab Name="_ribbonTab1" Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Name="_ribbonBar1" Header="RibbonBar1">
<syncfusion:RibbonButton Label="Cut"/>
<syncfusion:RibbonButton Label="Copy"/>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Name="_ribbonBar2" Width="150" Header="RibbonBar2">
<syncfusion:RibbonRadioButton GroupName="Group1" Width="140"
Content="ReadOnly" IsChecked="True"></syncfusion:RibbonRadioButton>
<syncfusion:RibbonRadioButton GroupName="Group1" Width="140"
Content="WriteOnly" ></syncfusion:RibbonRadioButton>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="EDIT" IsChecked="False"/>
</syncfusion:Ribbon>
```

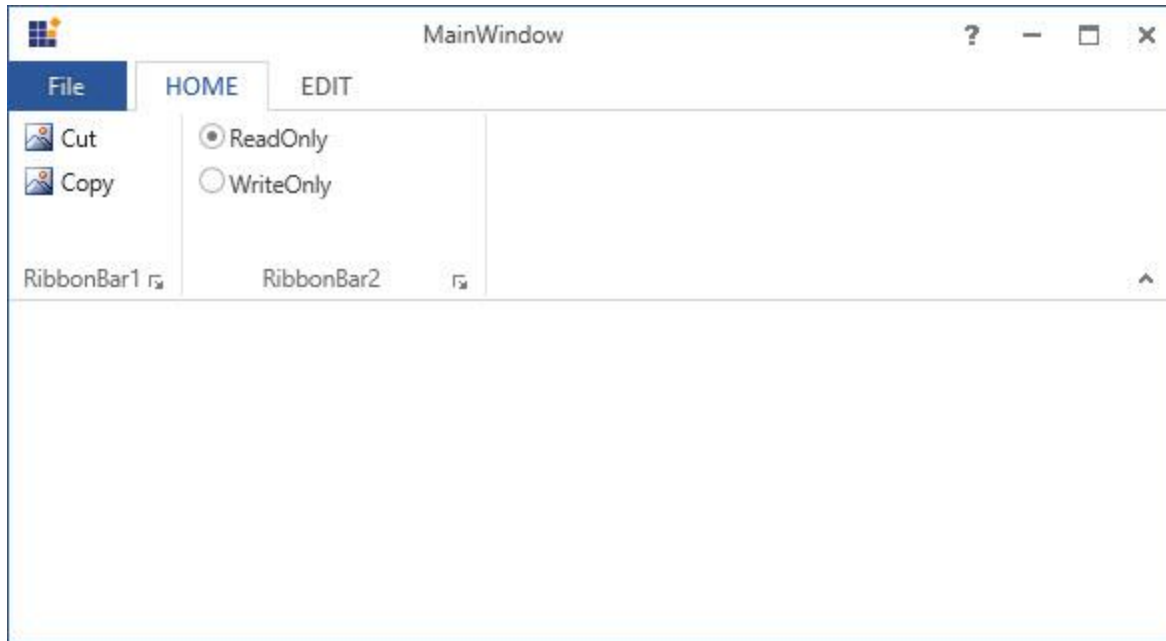

Create instance of RibbonRadioButton and add it to RibbonBar through code behind.

C#

```
RibbonRadioButton _ribbonRadioButton1 = new RibbonRadioButton() {Content =
"ReadOnly", IsChecked = true , GroupName = "Group1"};
RibbonRadioButton _ribbonRadioButton2 = new RibbonRadioButton() {Content =
"WriteOnly", GroupName = "Group1"};
_ribbonBar2.Items.Add(_ribbonRadioButton1);
_ribbonBar2.Items.Add(_ribbonRadioButton2);
```

VB.NET

```
Dim _ribbonRadioButton1 As New RibbonRadioButton() With {
.Content = "ReadOnly",
.IsChecked = True,
.GroupName = "Group1"
}
Dim _ribbonRadioButton2 As New RibbonRadioButton() With {
.Content = "WriteOnly",
.GroupName = "Group1"
}
_ribbonBar2.Items.Add(_ribbonRadioButton1)
_ribbonBar2.Items.Add(_ribbonRadioButton2)
```

Add RadioButton to the simplified layout

When the simplified layout is enabled, the RibbonRadioButton can be added and displayed in a single line as shown below. To know more about the simplified layout, refer [here](#).

XML

```
<syncfusion:RibbonWindow x:Class="RibbonButton_IconTemp.Window1"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:RibbonButton_IconTemp" xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
mc:Ignorable="d" xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
skin:SfSkinManager.VisualStudio="MaterialLight"
Title="Untitled 1 - Ribbon Control" Height="450" Width="800">
<Grid x:Name="grid">
<syncfusion:Ribbon VerticalAlignment="Top" EnableSimplifiedLayoutMode="True"
LayoutMode="Simplified">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Header="Options">
<syncfusion:RibbonRadioButton GroupName="Mode" Content="Read only"
IsChecked="True"></syncfusion:RibbonRadioButton>
<syncfusion:RibbonRadioButton GroupName="Mode" Content="Write only"
></syncfusion:RibbonRadioButton>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>
```

C#

```
Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
```

```

ribbon.EnableSimplifiedLayoutMode = true;
ribbon.LayoutMode = LayoutMode.Simplified;
// Creating new tabs
RibbonTab homeTab = new RibbonTab();
homeTab.Caption = "Home";
homeTab.IsChecked = true;
// Creating new bar
RibbonBar optionsBar = new RibbonBar();
optionsBar.Header = "Options";
// Creating items
RibbonRadioButton ribbonRadioButton = new RibbonRadioButton() { Content =
"Read only", IsChecked = true, GroupName="Mode" };
RibbonRadioButton ribbonRadioButton2 = new RibbonRadioButton() { Content =
"Write only", GroupName="Mode" };
// Adding items to bar
optionsBar.Items.Add(ribbonRadioButton);
optionsBar.Items.Add(ribbonRadioButton2);
// Adding bars to the tabs
homeTab.Items.Add(optionsBar);
// Adding tabs to ribbon
ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);

```

When arranging in simplified layout alone, the **Margin**, **Width** and **Height** values of the **RibbonRadioButton** can be ignored as it will be resized automatically to the standard width and height. If the **RibbonRadioButton** is to be shown in both normal and simplified layout, the **Margin**, **Width** and **Height** properties can be set for normal layout alone using triggers.

XML

```

<syncfusion:RibbonRadioButton Content="SelectAll"
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,Simplified" >
<syncfusion:RibbonRadioButton.Style >
<Style TargetType="syncfusion:RibbonRadioButton" BasedOn="{StaticResource
SyncfusionRibbonRadioButtonStyle}">
<Style.Triggers>
<Trigger Property="syncfusion:SimplifiedLayoutSettings.LayoutMode"
Value="Normal">
<Setter Property="Height" Value="25"/>
<Setter Property="Width" Value="48"/>
<Setter Property="Margin" Value="2"/>
</Trigger>
</Style.Triggers>
</Style>
</syncfusion:RibbonRadioButton.Style>
</syncfusion:RibbonRadioButton >

```

RibbonListBox in WPF Ribbon

RibbonListBox control is used to display a list of items in a Ribbon. It accepts any type of content as RibbonListBox items but **ListBoxItem** by default.

Add ListBox to the RibbonBar

XML

```
<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
  <syncfusion:RibbonTab Name="_ribbonTab1" Caption="HOME" IsChecked="True">
    <syncfusion:RibbonBar Name="_ribbonBar1" Header="RibbonBar1">
      <syncfusion:RibbonButton Label="Cut"/>
      <syncfusion:RibbonButton Label="Copy"/>
    </syncfusion:RibbonBar>
    <syncfusion:RibbonBar Name="_ribbonBar2" Width="150" Header="RibbonBar2">
      <syncfusion:RibbonListBox Width="140" >
        <ListBoxItem Content="Office2003Theme"/>
        <ListBoxItem Content="Office2007Theme"/>
        <ListBoxItem Content="Office2010Theme"/>
      </syncfusion:RibbonListBox>
    </syncfusion:RibbonBar>
  </syncfusion:RibbonTab>
  <syncfusion:RibbonTab Caption="EDIT" IsChecked="False"/>
</syncfusion:Ribbon>
```

Create instance of RibbonListBox and add it to RibbonBar through code behind.

C#

```
RibbonListBox _ribbonListBox = new RibbonListBox();
ListBoxItem item1 = new ListBoxItem() {Content = "Office2003Theme"};
ListBoxItem item2 = new ListBoxItem() {Content = "Office2007Theme"};
ListBoxItem item3 = new ListBoxItem() {Content = "Office2010Theme"};
_ribbonListBox.Items.Add(item1);
_ribbonListBox.Items.Add(item2);
_ribbonListBox.Items.Add(item3);
ribbonBar2.Items.Add( ribbonListBox);
```

VB.NET

```
Dim _ribbonListBox As New RibbonListBox()
Dim item1 As New ListBoxItem() With {.Content = "Office2003Theme"}
Dim item2 As New ListBoxItem() With {.Content = "Office2007Theme"}
Dim item3 As New ListBoxItem() With {.Content = "Office2010Theme"}
_ribbonListBox.Items.Add(item1)
_ribbonListBox.Items.Add(item2)
_ribbonListBox.Items.Add(item3)
ribbonBar2.Items.Add( ribbonListBox)
```

Add ListBox to the simplified layout

When the simplified layout is enabled, the RibbonListBox can be added and displayed in a single line as shown below. To know more about the simplified layout, refer [here](#).

XML

```
<syncfusion:RibbonWindow x:Class="RibbonButton_IconTemp.Window1"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:RibbonButton_IconTemp" xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
mc:Ignorable="d" xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
skin:SfSkinManager.VisualStyle="MaterialLight"
Title="Untitled 1 - Ribbon Control" Height="450" Width="800">
<Grid x:Name="grid">
<syncfusion:Ribbon VerticalAlignment="Top" EnableSimplifiedLayoutMode="True"
LayoutMode="Simplified">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True">
<syncfusion:RibbonBar Header="Options">
<syncfusion:RibbonListBox Width="100" >
<ListBoxItem Content="Create New"/>
<ListBoxItem Content="Modify"/>
<ListBoxItem Content="Delete"/>
</syncfusion:RibbonListBox>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>
```

C#

```
Ribbon ribbon = new Ribbon();
```

```

ribbon.VerticalAlignment = VerticalAlignment.Top;
ribbon.EnableSimplifiedLayoutMode = true;
ribbon.LayoutMode = LayoutMode.Simplified;
// Creating new tabs
RibbonTab homeTab = new RibbonTab();
homeTab.Caption = "Home";
homeTab.IsChecked = true;
// Creating new bar
RibbonBar optionsBar = new RibbonBar();
optionsBar.Header = "Options";
// Creating items
RibbonListBox ribbonListBox = new RibbonListBox();
ListBoxItem item1 = new ListBoxItem() { Content = "Create New" };
ListBoxItem item2 = new ListBoxItem() { Content = "Modify" };
ListBoxItem item3 = new ListBoxItem() { Content = "Delete" };
ribbonListBox.Items.Add(item1);
ribbonListBox.Items.Add(item2);
ribbonListBox.Items.Add(item3);
// Adding items to bar
optionsBar.Items.Add(ribbonListBox);
// Adding bars to the tabs
homeTab.Items.Add(optionsBar);
// Adding tabs to ribbon
ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);

```

When arranging in simplified layout alone, the **Margin**, **Width** and **Height** values of the **RibbonListBox** can be ignored as it will be resized automatically to the standard width and height. If the **RibbonListBox** is to be shown in both normal and simplified layout, the **Margin**, **Width** and **Height** properties can be set for normal layout alone using triggers.

XML

```

<syncfusion:RibbonListBox
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,Simplified" >

<Setter Property="Height" Value="48"/>
<Setter Property="Width" Value="48"/>
<Setter Property="Margin" Value="2"/>
</Trigger>
</Style.Triggers>

```

```

</Style>
</syncfusion:RibbonListBox.Style>
</syncfusion:RibbonListBox>

```

RibbonStatusBar in WPF Ribbon

The [RibbonStatusBar](#) control is added to [RibbonWindow](#) to display the current status of the application or document similar in Microsoft Office.

XML

```

<syncfusion:RibbonWindow x:Class="Ribbonstatusbar_sample.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:Ribbonstatusbar_sample"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
skin:SfSkinManager.VisualStudio="Office2016Colorful"
mc:Ignorable="d"
Title="MainWindow" Height="450" Width="800">
<syncfusion:RibbonWindow.StatusBar>
<syncfusion:RibbonStatusBar Background="DarkBlue">
<WrapPanel>
<TextBlock Text="Ready" Margin="10,0,0,0" Foreground="AntiqueWhite" />
<TextBlock Text="Page No 1" Margin="20,0,0,0" Foreground="AntiqueWhite" />
</WrapPanel>
</syncfusion:RibbonStatusBar>
</syncfusion:RibbonWindow.StatusBar>
<Grid>
<syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True"/>
<syncfusion:RibbonTab Caption="VIEW" IsChecked="False"/>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

Create an instance of the StatusBar and assign it to [RibbonStatusBar](#) property of [RibbonWindow](#) through code behind.

C#

```

//Initialize the Ribbon control.
Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
//Creating new tabs.
RibbonTab ribbonTab = new RibbonTab();
ribbonTab.Caption = "Home";
ribbonTab.IsChecked = true;
RibbonTab viewTab = new RibbonTab();
viewTab.Caption = "View";
viewTab.IsChecked = false;
//Adding tabs to the Ribbon.
ribbon.Items.Add(ribbonTab);

```

```

ribbon.Items.Add(viewTab);
grid.Children.Add(ribbon);
//Initialize the ribbon status bar.
RibbonStatusBar ribbonStatusBar = new RibbonStatusBar();
ribbonStatusBar.Background = Brushes.DarkBlue;
//Initializing wrap panel.
WrapPanel wrapPanel = new WrapPanel();
double left = 10, top = 0, right = 0, bottom = 0;
double left1 = 20, top1 = 0, right1 = 0, bottom1 = 0;
//Initialize the TextBlock and add the values.
TextBlock textBlock1 = new TextBlock { Text = "Ready", Foreground =
Brushes.AntiqueWhite };
TextBlock textBlock2 = new TextBlock { Text = "Page No 1", Foreground =
Brushes.AntiqueWhite };
textBlock1.Margin = new Thickness(left, top, right, bottom);
textBlock2.Margin = new Thickness(left1, top1, right1, bottom1);
//Add textblock to the wrappanel.
wrapPanel.Children.Add(textBlock1);
wrapPanel.Children.Add(textBlock2);
//Add the wrappanel to the statusbar.
ribbonStatusBar.Items.Add(wrapPanel);
//Add statusbar to the ribbonwindow.
this.StatusBar = ribbonStatusBar;

```

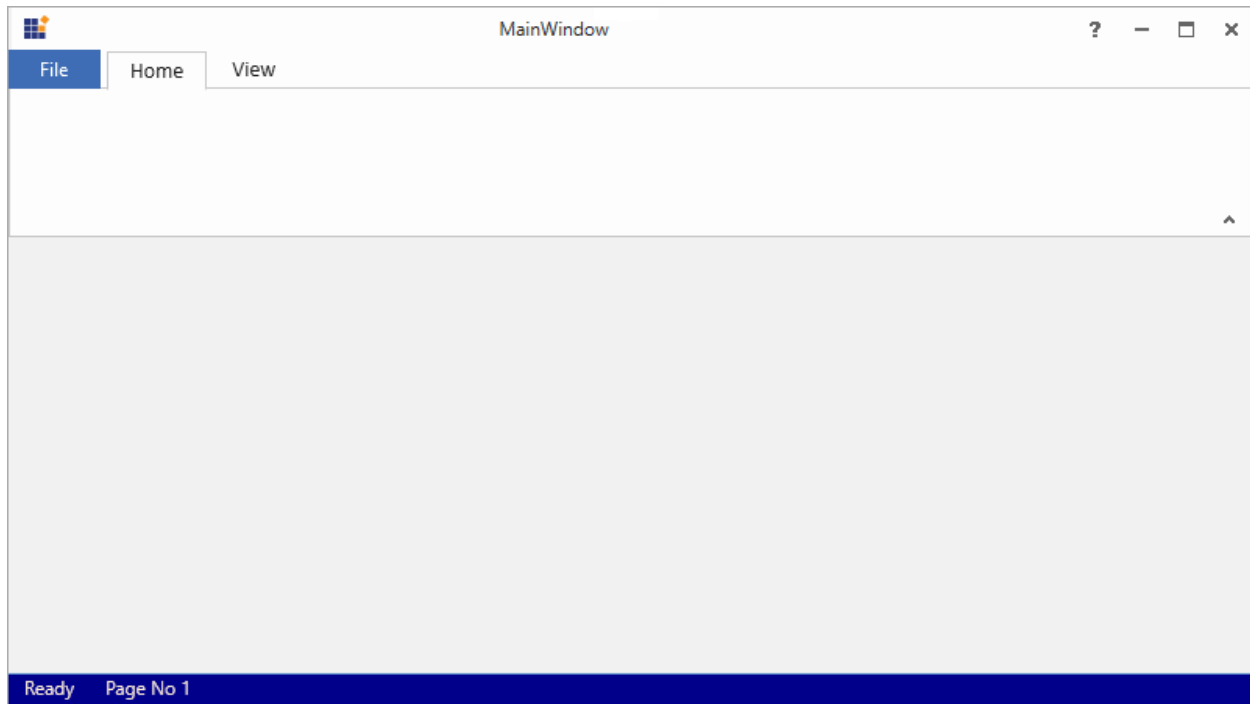

VB.NET

```

'Initialize the Ribbon control.
Dim ribbon As New Ribbon()
ribbon.VerticalAlignment = VerticalAlignment.Top
'Creating new tabs.
Dim ribbonTab As New RibbonTab()
ribbonTab.Caption = "Home"
ribbonTab.IsChecked = True
Dim viewTab As New RibbonTab()
viewTab.Caption = "View"
viewTab.IsChecked = False
'Adding tabs to the Ribbon.
ribbon.Items.Add(ribbonTab)
ribbon.Items.Add(viewTab)
grid.Children.Add(ribbon)
'Initialize the ribbon status bar.
Dim ribbonStatusBar As New RibbonStatusBar()
ribbonStatusBar.Background = Brushes.DarkBlue
'Initializing wrap panel.
Dim wrapPanel As New WrapPanel()
Dim left As Double = 10, top As Double = 0, right As Double = 0, bottom As
Double = 0
Dim left1 As Double = 20, top1 As Double = 0, right1 As Double = 0, bottom1
As Double = 0
'Initialize the TextBlock and add the values.
Dim textBlock1 As TextBlock = New TextBlock With {.Text = "Ready",
.Foreground = Brushes.AntiqueWhite}
Dim textBlock2 As TextBlock = New TextBlock With {.Text = "Page No 1",
.Foreground = Brushes.AntiqueWhite}
textBlock1.Margin = New Thickness(left, top, right, bottom)
textBlock2.Margin = New Thickness(left1, top1, right1, bottom1)

```

```
'Add textblock to the wrappanel.
wrapPanel.Children.Add(textBlock1)
wrapPanel.Children.Add(textBlock2)
'Add the wrappanel to the statusbar.
ribbonStatusBar.Items.Add(wrapPanel)
'Add statusbar to the ribbonwindow.
Me.StatusBar = ribbonStatusBar
```

SimpleMenuButton in WPF Ribbon

SimpleMenuButton provides functionality similar to other menu button and it doesn't carries a sub menu. It can be used with **ApplicationMenu** and it can also be placed inside the **RibbonBar** in Ribbon control.

XML

```
<syncfusion:RibbonWindow x:Class="TemplateSupport.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:TemplateSupport"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
xmlns:skinManager="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
mc:Ignorable="d"
skinManager:SfSkinManager.VisualStyle="MaterialLight"
Height="450" Width="800">
<Grid>
<syncfusion:Ribbon Name="_Ribbon1" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
<syncfusion:RibbonTab Name="_RibbonTab1" Caption="HOME" IsChecked="False">
<syncfusion:RibbonBar Name="_RibbonBar1" Header="RibbonBar1">
```

```

<syncfusion:SimpleMenuButton Icon="/Resources/Copy16.png" Label="Open"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="EDIT" IsChecked="False"/>
<syncfusion:Ribbon.ApplicationMenu>
<syncfusion:ApplicationMenu Name="_ApplicationMenu" Width="38" Height="38"
syncfusion:Ribbon.KeyTip="F" IsPopupOpen="False"
ApplicationButtonImage="/Resources/App.ico">
<syncfusion:SimpleMenuButton Label="File"/>
<syncfusion:SimpleMenuButton Label="Open"/>
</syncfusion:ApplicationMenu>
</syncfusion:Ribbon.ApplicationMenu>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

Create an instance of SimpleMenuButton and add it to ApplicationMenu through code behind.

C#

```

using Syncfusion.SfSkinManager;
using Syncfusion.Windows.Tools.Controls;
using System;
using System.Windows;
using System.Windows.Media.Imaging;
namespace TemplateSupport
{
    /// <summary>
    /// Interaction logic for MainWindow.xaml
    /// </summary>
    public partial class MainWindow : RibbonWindow
    {
        public MainWindow()
        {
            InitializeComponent();
            Ribbon ribbon = new Ribbon();
            ribbon.VerticalAlignment = VerticalAlignment.Top;
            // Creating new tabs
            RibbonTab homeTab = new RibbonTab();
            homeTab.Caption = "Home";
            homeTab.IsChecked = true;
            RibbonTab editTab = new RibbonTab();
            editTab.Caption = "Edit";
            // Creating new bar
            RibbonBar ribbonBar = new RibbonBar();
            ribbonBar.Header = "Clipboard";
            // Creating items
            ApplicationMenu _ApplicationMenu = new ApplicationMenu();
            ribbon.ApplicationMenu = _ApplicationMenu;
            SimpleMenuButton _SimpleMenuButton = new SimpleMenuButton() { Label =
            "File", Width = 100 };
            SimpleMenuButton _SimpleMenuButton1 = new SimpleMenuButton() { Label =
            "Open", Width = 100 };
            SimpleMenuButton _SimpleMenuButton2 = new SimpleMenuButton() { Label =
            "Menu", Width = 100 };
            _ApplicationMenu.Items.Add( _SimpleMenuButton);

```

```

_ApplicationMenu.Items.Add(_SimpleMenuButton1);
ribbonBar.Items.Add(_SimpleMenuButton2);
homeTab.Items.Add(ribbonBar);
ribbon.Items.Add(homeTab);
ribbon.Items.Add(editTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);
}
}
}

```

VB.NET

```

Dim _SimpleMenuButton As New SimpleMenuButton() With {
    .Label = "File",
    .Width = 100
}
Dim _SimpleMenuButton1 As New SimpleMenuButton() With {
    .Label = "Open",
    .Width = 100
}
_ApplicationMenu.Items.Add(_SimpleMenuButton)
_ApplicationMenu.Items.Add(_SimpleMenuButton1)

```

Setting image to SimpleMenuButton

The [SimpleMenuButton](#) allows to display any type of image such as glyph, font or any custom content using [IconTemplate](#) property. It also allows to display a normal image using [Icon](#) property.

Note: The [SimpleMenuButton](#) loads icon in the following priority order,

- [IconTemplate](#)
- [Icon](#)

Setting icon template

The [IconTemplate](#) property provides support to set any type of image such as glyph, font or any custom content to the [SimpleMenuButton](#). The [SimpleMenuButton](#) will automatically resize the template content.

```

RibbonMenuItem in WPF Ribbon

RibbonMenuItem used as entity in menus like ApplicationMenu, DropDownButton, SplitButton, context menu, and so on.

RibbonMenuItem header

The header property used to set the name of the MenuItem. The same has been explained below:

XML

```

<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
<syncfusion:RibbonTab Name="_ribbonTab1" Caption="HOME" >

```

```
<syncfusion:RibbonBar Name="_ribbonBar1">
<syncfusion:RibbonMenuItem Header="NEW"
Width="100"></syncfusion:RibbonMenuItem>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
```

Create instance of RibbonMenuItem and add it to RibbonBar through code behind.

C#

```
RibbonMenuItem _ribbonMenuItem = new RibbonMenuItem() {Header = "NEW", Width
= 100};
ribbonBar1.Items.Add( _ribbonMenuItem);
```

VB.NET

```
Dim _ribbonMenuItem As New RibbonMenuItem() With {
.Header = "NEW",
.Width = 100
}
ribbonBar1.Items.Add( _ribbonMenuItem)
```

RibbonMenuItem icon

The Icon property used to set the Icon for that RibbonMenuItem. The same has been explained in the below code example:

XML

```
<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
<syncfusion:RibbonTab Name="_ribbonTab1" Caption="HOME" >
```

```

<syncfusion:RibbonBar Name="_ribbonBar1">
<syncfusion:RibbonMenuItem Header="NEW">
<syncfusion:RibbonMenuItem.Icon>
<Image Source="SampleImages\options.png"/>
</syncfusion:RibbonMenuItem.Icon>
</syncfusion:RibbonMenuItem>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Name="_ribbonTab2" Caption="View">
<syncfusion:RibbonBar Name="_ribbonBar2">
<syncfusion:RibbonMenuItem Header="View" IconBarEnabled="True">
<syncfusion:RibbonMenuItem.Icon>
<Image Source="SampleImages\sharing.png"/>
</syncfusion:RibbonMenuItem.Icon>
</syncfusion:RibbonMenuItem>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>

```

Create instance of RibbonMenuItem and add the icon for RibbonBar through code behind.

C#

```

RibbonMenuItem _ribbonMenuItem = new RibbonMenuItem() { Header = "NEW1",
Width = 100, Icon = new Image { Source = new BitmapImage(new
Uri(@"SampleImages\sharing.png", UriKind.RelativeOrAbsolute)) } };

```

VB.NET

```

RibbonMenuItem _ribbonMenuItem = new RibbonMenuItem() { Header = "NEW1",
Width = 100, Icon = new Image { Source = new BitmapImage(new
Uri(@"SampleImages\sharing.png", UriKind.RelativeOrAbsolute)) } };

```

Add MenuItem to the simplified layout

When the simplified layout is enabled, the RibbonMenuItem can be added and displayed in a single line as shown below. To know more about the simplified layout, refer [here](#).

XML

```
<syncfusion:RibbonWindow x:Class="RibbonButton_IconTemp.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:RibbonButton_IconTemp"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
mc:Ignorable="d"
syncfusion:SkinStorage.VisualStudio="Office2013"
Title="Untitled 1 - Ribbon Control" Height="450" Width="800">
<Grid x:Name="grid">
<syncfusion:Ribbon VerticalAlignment="Top" EnableSimplifiedLayoutMode="True"
LayoutMode="Simplified">
<syncfusion:RibbonTab Caption="Home" IsChecked="True">
<syncfusion:RibbonBar Header="Clipboard">
<syncfusion:RibbonMenuItem Header="Cut" IconBarEnabled="True">
<syncfusion:RibbonMenuItem.Icon>
<Image Source="/Resources/Cut16.png"/>
</syncfusion:RibbonMenuItem.Icon>
</syncfusion:RibbonMenuItem>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>
```

C#

```
Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
ribbon.EnableSimplifiedLayoutMode = true;
ribbon.LayoutMode = LayoutMode.Simplified;
// Creating new tabs
RibbonTab homeTab = new RibbonTab();
homeTab.Caption = "Home";
homeTab.IsChecked = true;
// Creating new bar
RibbonBar clipboardBar = new RibbonBar();
clipboardBar.Header = "Clipboard";
// Creating items
RibbonMenuItem ribbonMenuItem = new RibbonMenuItem();
ribbonMenuItem.Header = "Cut";
ribbonMenuItem.IconBarEnabled = true;
ribbonMenuItem.Icon = new Image { Source = new BitmapImage(new
Uri(@"Resources\Cut16.png", UriKind.RelativeOrAbsolute)) };
// Adding items to the bar
clipboardBar.Items.Add(ribbonMenuItem);
homeTab.Items.Add(clipboardBar);
ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
```

```
SkinStorage.SetVisualStyle(this, "Office2013");
```

When arranging in simplified layout alone, the **Margin**, **Width** and **Height** values of the RibbonMenuItem can be ignored as it will be resized automatically to the standard width and height. If the RibbonMenuItem is to be shown in both normal and simplified layout, the **Margin**, **Width** and **Height** properties can be set for normal layout alone using triggers.

XML

```
<syncfusion:RibbonMenuItem Header="Menu item"
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,Simplified" >
<syncfusion:RibbonMenuItem.Style>
<Style TargetType="syncfusion:RibbonMenuItem" BasedOn="{StaticResource
Office2013RibbonMenuItemStyle}">
<Style.Triggers>
<Trigger Property="syncfusion:SimplifiedLayoutSettings.LayoutMode"
Value="Normal">
<Setter Property="Height" Value="48"/>
<Setter Property="Width" Value="100"/>
<Setter Property="Margin" Value="2"/>
</Trigger>
</Style.Triggers>
</Style>
</syncfusion:RibbonMenuItem.Style>
</syncfusion:RibbonMenuItem >
```

IconSizeChanged event

The event occurs when the IconSize property of the RibbonMenuItem get changed.

XML

```
<syncfusion:RibbonMenuItem Header="View" IconBarEnabled="True"
IconSizeChanged="RibbonMenuItem_IconSizeChanged"/>
```

C#

```
RibbonMenuItem menuItem = new RibbonMenuItem();
menuItem.IconSizeChanged += RibbonMenuItem_IconSizeChanged;
```

VB.NET

```
Private menuItem As RibbonMenuItem = New RibbonMenuItem()
menuItem.IconSizeChanged += RibbonMenuItem_IconSizeChanged
```

To handle the IconSizeChanged event, refer the following code:

C#

```
private void RibbonMenuItem_IconSizeChanged(DependencyObject d,
DependencyPropertyChangedEventArgs e)
{
    // Insert code to do some operations when the IconSize property is changed
}
```

VB.NET

```
Private Sub RibbonMenuItem_IconSizeChanged(ByVal d As DependencyObject,
ByVal e As DependencyPropertyChangedEventArgs)
    'Insert code to do some operations when the IconSize property is changed
End Sub
```

FlowDirectionChanged event

The event occurs when the FlowDirection property of the RibbonMenuItem get changed.

XML

```
<syncfusion:RibbonMenuItem Header="View"
FlowDirectionChanged="RibbonMenuItem_FlowDirectionChanged"/>
```

C#

```
RibbonMenuItem menuItem = new RibbonMenuItem();
menuItem.FlowDirectionChanged += RibbonMenuItem_FlowDirectionChanged;
```

VB.NET

```
Private menuItem As RibbonMenuItem = New RibbonMenuItem()
menuItem.FlowDirectionChanged += RibbonMenuItem_FlowDirectionChanged
```

To handle the FlowDirectionChanged event, refer the following code:

C#

```
private void RibbonMenuItem_FlowDirectionChanged(DependencyObject d,
DependencyPropertyChangedEventArgs e)
{
    // Insert code to do some operations when the FlowDirection property is
    changed
}
```

VB.NET

```
Private Sub RibbonMenuItem_IconSizeChanged(ByVal d As DependencyObject,
ByVal e As DependencyPropertyChangedEventArgs)
    'Insert code to do some operations when the IconSize property is changed
End Sub
```

RibbonTabPanelItem in WPF Ribbon

RibbonTabPanelItem is used to display items below application Close button and above the **RibbonBar** content area. It is usually aligned in the right side of the Ribbon and we can place desire items like emoji's, help button etc., in this Tab panel.

XML

```
<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
  <syncfusion:RibbonTab Name="_ribbonTab" Caption="HOME" IsChecked="True">
    <syncfusion:RibbonBar Name="_ribbonBar">
      <syncfusion:RibbonMenuItem Header="NEW"
Width="100"></syncfusion:RibbonMenuItem>
    </syncfusion:RibbonBar>
  </syncfusion:RibbonTab>
  <syncfusion:Ribbon.TabPanelItem>
    <syncfusion:RibbonButton SizeForm="Small" Label="Help"/>
  </syncfusion:Ribbon.TabPanelItem>
</syncfusion:Ribbon>
```

Create instance of **RibbonButton** and assign it to **TabPanelItem** property of **Ribbon** through code behind.

C#

```
RibbonButton _ribbonButton = new RibbonButton() { Label="Help"};
ribbon.TabPanelItem = _ribbonButton;
```

VB.NET

```
Dim _ribbonButton As New RibbonButton() With {.Label="Help"}
ribbon.TabPanelItem = _ribbonButton
```

Note:

Ribbon control supports TabPanelItem for both normal and simplified layout, where the simplified layout is designed to display the most commonly used Ribbon commands in a single line interface, allowing more screen space for compact viewing of the content. To know more about the simplified layout, refer [here](#).

RibbonSeparator in WPF Ribbon

RibbonSeparator used to separate the similar set of Ribbon elements in Ribbon. It can separate RibbonButtons according to their purpose.

*Add Separator to the RibbonBar***XML**

```
<syncfusion:Ribbon Name="_ribbon" HorizontalAlignment="Stretch"
VerticalAlignment="Top">
  <syncfusion:RibbonTab Caption="HOME" IsChecked="True">
    <syncfusion:RibbonBar>
      <syncfusion:RibbonButton Label="New"/>
      <syncfusion:RibbonButton Label="Open"/>
      <syncfusion:RibbonButton Label="Save"/>
      <syncfusion:RibbonSeparator/>
      <syncfusion:RibbonButton Label="Cut"/>
      <syncfusion:RibbonButton Label="Copy"/>
      <syncfusion:RibbonButton Label="Paste"/>
    </syncfusion:RibbonBar>
  </syncfusion:RibbonTab>
  <syncfusion:RibbonTab IsChecked="False"
Caption="DESIGN"></syncfusion:RibbonTab>
</syncfusion:Ribbon>
```

RibbonSeparator instance can be added as item to the group of other items through code behind.

C#

```
RibbonSeparator _ribbonSeparator = new RibbonSeparator();
RibbonButton _ribbonButton1 = new RibbonButton() { Label = "New" };
RibbonButton _ribbonButton2 = new RibbonButton() { Label = "Open" };
RibbonButton _ribbonButton3 = new RibbonButton() { Label = "Save" };
RibbonButton _ribbonButton4 = new RibbonButton() { Label = "Cut" };
RibbonButton _ribbonButton5 = new RibbonButton() { Label = "Copy" };
RibbonButton _ribbonButton6 = new RibbonButton() { Label = "Paste" };
_ribbonBar.Items.Add(_ribbonButton1);
_ribbonBar.Items.Add(_ribbonButton2);
_ribbonBar.Items.Add(_ribbonButton3);
_ribbonBar.Items.Add(_ribbonSeparator);
_ribbonBar.Items.Add(_ribbonButton4);
_ribbonBar.Items.Add(_ribbonButton5);
_ribbonBar.Items.Add(_ribbonButton6);
```

VB.NET

```
Dim _ribbonSeparator As New RibbonSeparator()
Dim _ribbonButton1 As New RibbonButton() With {.Label = "New"}
Dim _ribbonButton2 As New RibbonButton() With {.Label = "Open"}
Dim _ribbonButton3 As New RibbonButton() With {.Label = "Save"}
```

```

Dim _ribbonButton4 As New RibbonButton() With {.Label = "Cut"}
Dim _ribbonButton5 As New RibbonButton() With {.Label = "Copy"}
Dim _ribbonButton6 As New RibbonButton() With {.Label = "Paste"}
_ribbonBar.Items.Add(_ribbonButton1)
_ribbonBar.Items.Add(_ribbonButton2)
_ribbonBar.Items.Add(_ribbonButton3)
_ribbonBar.Items.Add(_ribbonSeparator)
_ribbonBar.Items.Add(_ribbonButton4)
_ribbonBar.Items.Add(_ribbonButton5)
_ribbonBar.Items.Add(_ribbonButton6)

```

Add Separator to the simplified layout

When the simplified layout is enabled, the RibbonSeparator can be added and displayed in a single line as shown below. To know more about the simplified layout, refer [here](#).

XML

```

<syncfusion:RibbonWindow x:Class="RibbonButton_IconTemp.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"

MediumIcon="/Resources/Cut_20.png" />
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>
```

C#

```
Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
ribbon.EnableSimplifiedLayoutMode = true;
ribbon.LayoutMode = LayoutMode.Simplified;
// Creating new tabs
RibbonTab homeTab = new RibbonTab();
homeTab.Caption = "Home";
homeTab.IsChecked = true;
// Creating new bar
RibbonBar clipboardBar = new RibbonBar();
clipboardBar.Header = "Clipboard";
// Creating items
RibbonButton pasteButton = new RibbonButton();
pasteButton.Label = "Paste";
pasteButton.SizeForm = SizeForm.Large;
pasteButton.MediumIcon = new BitmapImage(new Uri(@"Resources/Paste20.png",
UriKind.RelativeOrAbsolute));
RibbonSeparator ribbonSeparator = new RibbonSeparator();
RibbonButton cutButton = new RibbonButton();
cutButton.Label = "Cut";
cutButton.SizeForm = SizeForm.Small;
cutButton.MediumIcon = new BitmapImage(new Uri(@"Resources/Cut_20.png",
UriKind.RelativeOrAbsolute));
// Adding items to the bar
clipboardBar.Items.Add(pasteButton);
clipboardBar.Items.Add(ribbonSeparator);
clipboardBar.Items.Add(cutButton);
// Adding bar to the tab
homeTab.Items.Add(clipboardBar);
ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);
```

When arranging in simplified layout alone, the **Margin**, **Width** and **Height** values of the **RibbonSeparator** can be ignored as it will be resized automatically to the standard width and height. If the

RibbonSeparator is to be shown in both normal and simplified layout, the **Margin, Width and Height** properties can be set for normal layout alone using triggers.

XML

```
<syncfusion:RibbonSeparator
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,Simplified" >
<syncfusion:RibbonSeparator.Style>
<Style TargetType="syncfusion:RibbonSeparator" BasedOn="{StaticResource
SyncfusionRibbonSeparatorStyle}">
<Style.Triggers>
<Trigger Property="syncfusion:SimplifiedLayoutSettings.LayoutMode"
Value="Normal">
<Setter Property="Height" Value="48"/>
<Setter Property="Width" Value="1"/>
<Setter Property="Margin" Value="2"/>
</Trigger>
</Style.Triggers>
</Style>
</syncfusion:RibbonSeparator.Style>
</syncfusion:RibbonSeparator >
```

RibbonItemHost in WPF Ribbon

WPF Ribbon allows adding any control within the RibbonBar but it does not provide support to add that control in QAT or customize using QAT customization dialog. However, the [RibbonItemHost](#) allows hosting any control, such as Combobox, Textbox, Radio button, Checkbox, and more to be displayed on the [RibbonBar](#) and also allows to add in [QuickAccessToolBar](#) or customize using QAT customization dialog.

Adding custom items to the Ribbon

The [RibbonItemHost ContentTemplate](#) property can be used to host any control.

In the below example, MS CheckBox is set to the [ContentTemplate](#) property of the [RibbonItemHost](#) within the [RibbonBar](#).

XML

```
<syncfusion:RibbonWindow x:Class="Ribbon.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:Ribbon"
mc:Ignorable="d"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
skin:SfSkinManager.Theme="{skin:SkinManagerExtension ThemeName=FluentLight}"
WindowStartupLocation="CenterScreen"
Title="Custom items demo" Height="450" Width="650">
<syncfusion:RibbonWindow.DataContext>
<local:ViewModel />
</syncfusion:RibbonWindow.DataContext>

Adding the custom item to the QAT

The control hosted in [RibbonItemHost](#) can be added to the [QuickAccessToolBar](#) using ribbon context menu or through QAT customization dialog. In the QAT customization dialog, all the ribbon items are displayed using its [Label](#) and [IconTemplate](#) properties. Similarly, the [RibbonItemHost](#) also allows us to set the label and icon using its [Label](#) and [IconTemplate](#) properties respectively.

- [Label](#) - Used to display the text of [RibbonItemHost](#) inside the QAT customization dialog.
- [IconTemplate](#) - Gets or sets the template that is used to display the icon of [RibbonItemHost](#) inside the QAT customization dialog.

In the below example, the [Label](#) and [IconTemplate](#) are set for the [RibbonItemHost](#) controls which will be used when the items are displayed in the QAT customization dialog.

Quick Access ToolBar in WPF Ribbon

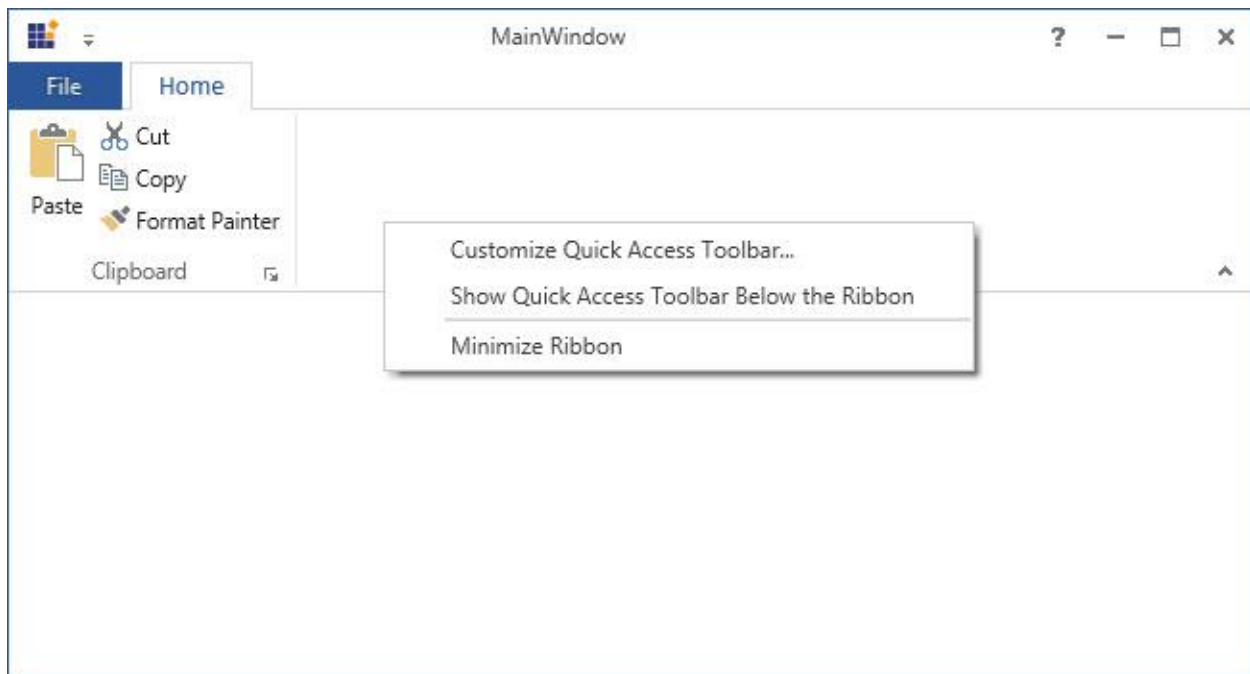

RibbonContextMenu allows to customize the Ribbon with the Right Click and it displays different functions for Ribbon and RibbonItems.

XML

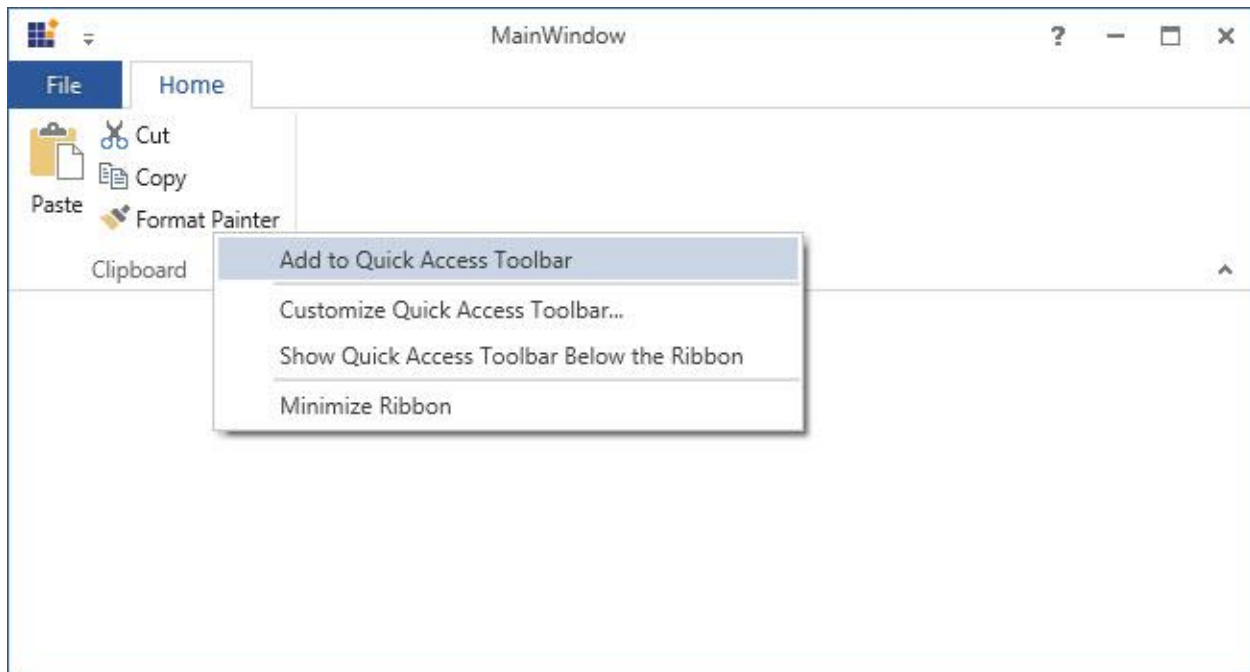

```
<syncfusion:Ribbon x:Name="Ribbon" VerticalAlignment="Top">
  <syncfusion:Ribbon.QuickAccessToolBar>
    <syncfusion:QuickAccessToolBar
      syncfusion:WindowChrome.IsHitTestVisibleInChrome="True"/>
  </syncfusion:QuickAccessToolBar>
</syncfusion:Ribbon>
```

```
</syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:RibbonTab Caption="Home" >
  <syncfusion:RibbonBar Header="Clipboard" >
    <syncfusion:RibbonButton Label="Paste" SizeForm="Large"
    LargeIcon="/Resources/Paste32.png" />
    <syncfusion:RibbonButton Label="Cut" SizeForm="Small"
    SmallIcon="/Resources/Cut16.png" />
    <syncfusion:RibbonButton Label="Copy" SizeForm="Small"
    SmallIcon="/Resources/Copy16.png" />
    <syncfusion:RibbonButton Label="Format Painter" SizeForm="Small"
    SmallIcon="/Resources/FormatPainter16.png" />
  </syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
```

The below RibbonContextMenu gets generated when the user right click on the ribbon

It displays along with "Add to Quick Access Toolbar" function while clicking at the RibbonItem as like in the below screenshot

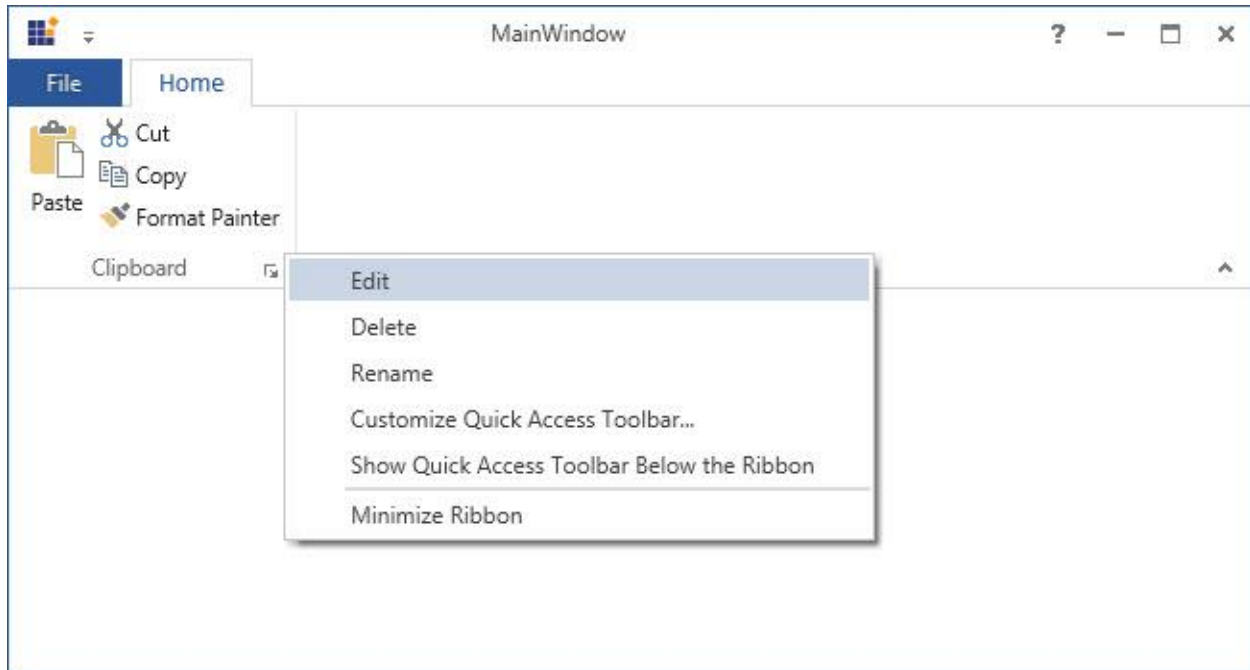

Adding custom item to the ContextMenu

Ribbon Context Menu supports display of custom items. To add the custom item, set an attached property called `CustomContextMenuItems` of the `RibbonContextMenu`

XML

```
<syncfusion:Ribbon x:Name="Ribbon" VerticalAlignment="Top"
syncfusion:RibbonContextMenu.IsCustomContextMenuItemsOnTop="True" >
  <syncfusion:RibbonContextMenu.CustomContextMenuItems >
    <syncfusion:RibbonMenuItem Header="Edit" IsCheckable="True" />
    <syncfusion:RibbonMenuItem Header="Delete" IsCheckable="True" />
    <syncfusion:RibbonMenuItem Header="Rename" IsCheckable="True" />
  </syncfusion:RibbonContextMenu.CustomContextMenuItems>
</syncfusion:Ribbon>
```

How to disable the RibbonContextMenu

In order to disable the ContextMenu handle the `RibbonContextMenuOpening` event

XML

```
<syncfusion:Ribbon x:Name="Ribbon" VerticalAlignment="Top"
RibbonContextMenuOpening="Ribbon_ContextMenuOpening">
<syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:QuickAccessToolBar
syncfusion:WindowChrome.IsHitTestVisibleInChrome="True"/>
</syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:RibbonTab Caption="Home" >
<syncfusion:RibbonBar Header="Clipboard" >
<syncfusion:RibbonButton Label="Paste" SizeForm="Large"
LargeIcon="/Resources/Paste32.png" />
<syncfusion:RibbonButton Label="Cut" SizeForm="Small"
SmallIcon="/Resources/Cut16.png" />
<syncfusion:RibbonButton Label="Copy" SizeForm="Small"
SmallIcon="/Resources/Copy16.png" />
<syncfusion:RibbonButton Label="Format Painter" SizeForm="Small"
SmallIcon="/Resources/FormatPainter16.png" />
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
```

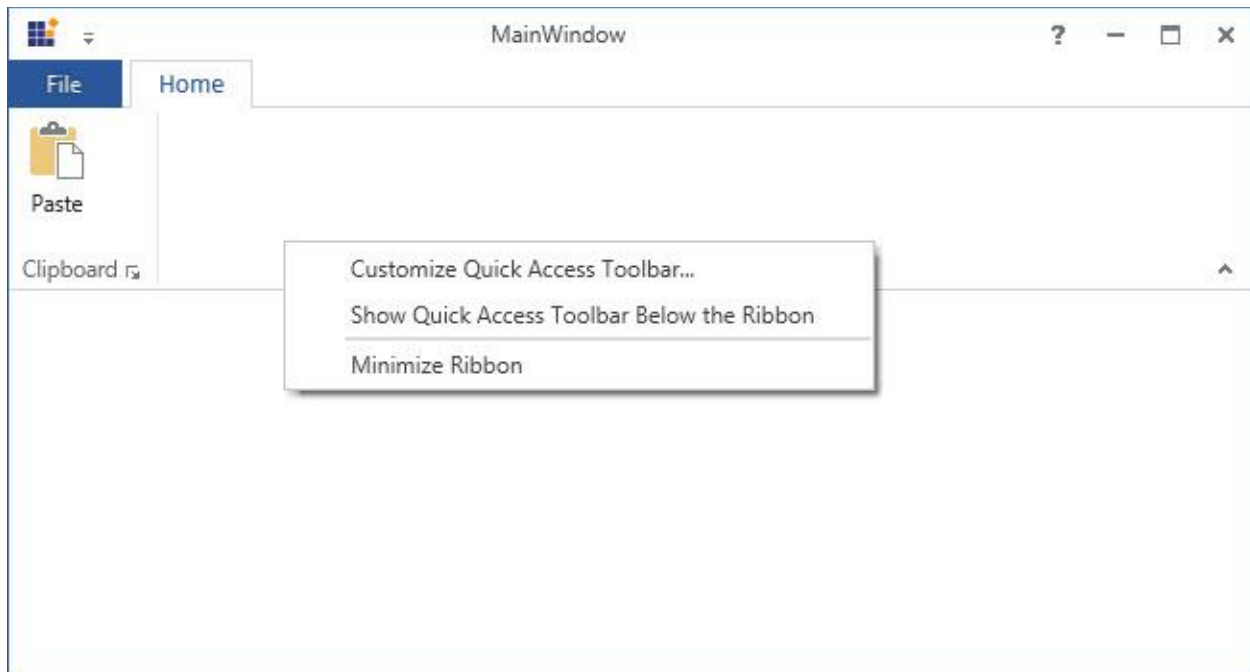

C#

```
private void Ribbon_ContextMenuOpening(object sender, ContextMenuEventArgs
e)
{
e.Handled = true;
}
```

VB.NET

```
Private Sub Ribbon_ContextMenuOpening(ByVal sender As Object, ByVal e As ContextMenuEventArgs)  
    e.Handled = True  
End Sub
```

The following snapshot gets generated before handling the RibbonContextMenu event

After the event is handled, the output gets display as follows

Add items to QuickAccessToolBar (QAT)

Quick Access Toolbar is used to group the frequently used commands above or under the Ribbon, and it allows to add or remove commands to it. It is placed next to the ApplicationMenu to provide end users with the easy accessibility.

Add default QAT items

Use the following code to add items to the QuickAccessToolBar

XML

```
<syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:QuickAccessToolBar>
<syncfusion:RibbonButton Label="Undo" SmallIcon="/Resources/Undo16.png"
SizeForm="ExtraSmall"
ToolTip="Undo" syncfusion:RibbonCommandManager.SynchronizedItem="Undo" />
<syncfusion:RibbonButton Label="Redo" SmallIcon="/Resources/Redo16.png"
SizeForm="ExtraSmall"
ToolTip="Redo" syncfusion:RibbonCommandManager.SynchronizedItem="Redo"/>
</syncfusion:QuickAccessToolBar>
</syncfusion:Ribbon.QuickAccessToolBar>
```

C#

```
RibbonButton RibbonButton = new RibbonButton();
RibbonButton.SmallIcon = new BitmapImage(new Uri("/Resources/Redo16.png",
UriKind.Relative));
RibbonButton.SizeForm = SizeForm.ExtraSmall;
QuickAccessToolBar QAT=new QuickAccessToolBar();
QAT.Items.Add(RibbonButton);
Ribbon.QuickAccessToolBar = QAT;
```

VB.NET

```
Dim RibbonButton As New RibbonButton()
RibbonButton.SmallIcon = New BitmapImage(New Uri("/Resources/Redo16.png",
UriKind.Relative))
RibbonButton.SizeForm = SizeForm.ExtraSmall
Dim QAT As New QuickAccessToolBar()
QAT.Items.Add(RibbonButton)
Ribbon.QuickAccessToolBar = QAT
```

Add items to QAT Menu items

Ribbon also supports to add the items to QAT Menu items. To add the items to the Drop Down Menu of the QuickAccessToolBar, use the attached property, `QATMenuItems` of the Quick Access ToolBar . `QATMenuItems` can be added to the QAT by making the Selection.

XML

```
<syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:QuickAccessToolBar>
<syncfusion:QuickAccessToolBar.QATMenuItems>
<syncfusion:RibbonButton Label="Save"
syncfusion:RibbonCommandManager.SynchronizedItem="Save" />
<syncfusion:RibbonButton Label="Quick Print"
syncfusion:RibbonCommandManager.SynchronizedItem="Quick Print"/>
<syncfusion:RibbonButton Label="Print Preview"
syncfusion:RibbonCommandManager.SynchronizedItem="Print Preview"/>
<syncfusion:RibbonButton Label="Undo"
syncfusion:RibbonCommandManager.SynchronizedItem="Undo" />
<syncfusion:RibbonButton Label="Redo"
syncfusion:RibbonCommandManager.SynchronizedItem="Redo" />
<syncfusion:RibbonButton Label="Paste"
syncfusion:RibbonCommandManager.SynchronizedItem="Paste"/>
</syncfusion:QuickAccessToolBar.QATMenuItems>
<syncfusion:RibbonButton Label="Undo" SmallIcon="/Resources/Undo16.png"
SizeForm="ExtraSmall"
ToolTip="Undo" syncfusion:RibbonCommandManager.SynchronizedItem="Undo" />
<syncfusion:RibbonButton Label="Redo" SmallIcon="/Resources/Redo16.png"
SizeForm="ExtraSmall"
ToolTip="Redo" syncfusion:RibbonCommandManager.SynchronizedItem="Redo"/>
</syncfusion:QuickAccessToolBar>
</syncfusion:Ribbon.QuickAccessToolBar>
```

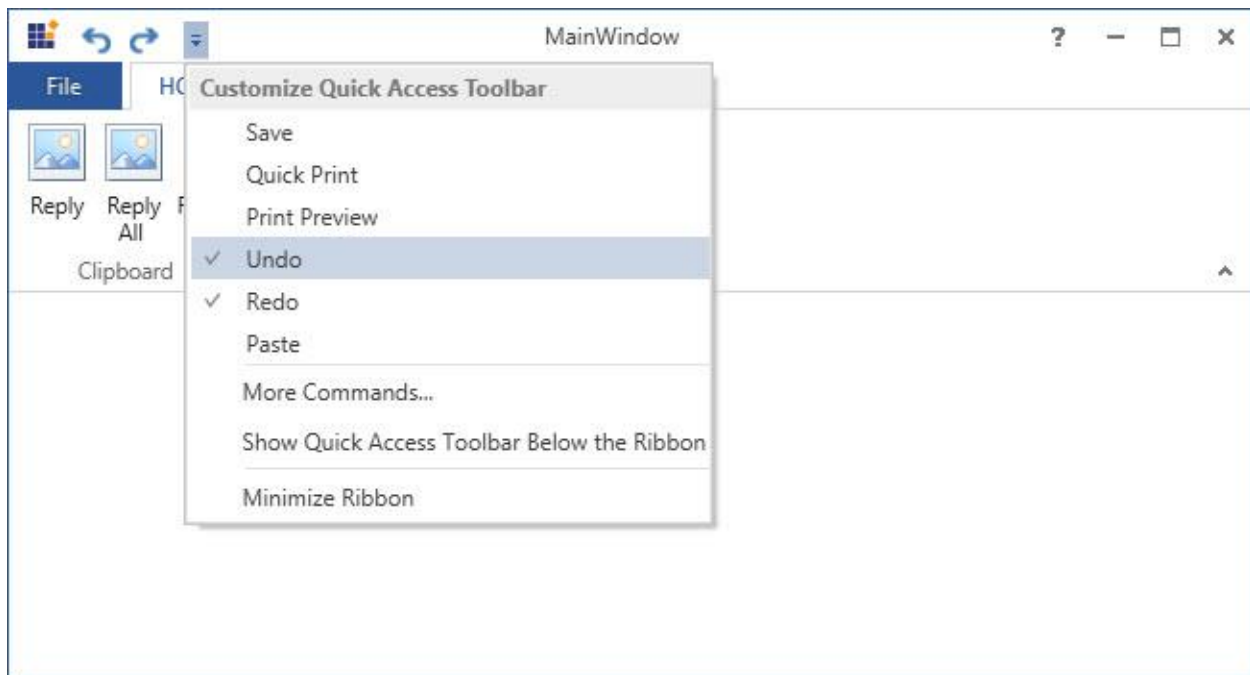

C#

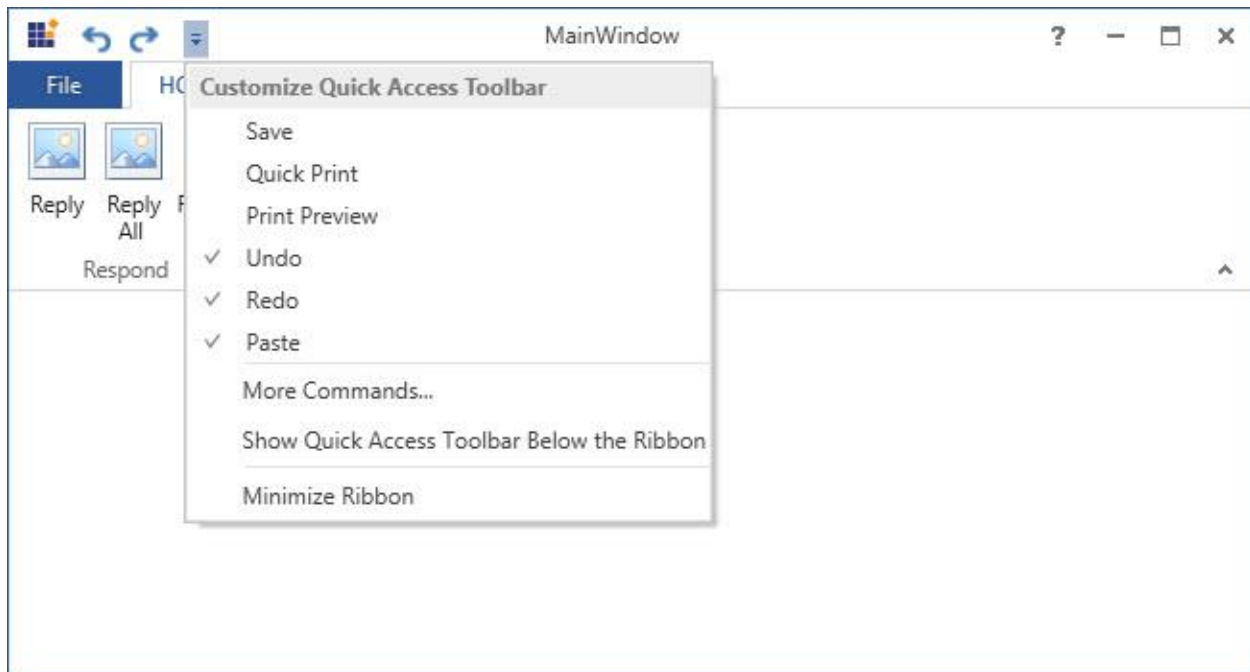

```
RibbonButton pasteRibbonButton = new RibbonButton() { Label = "Paste",  
SmallIcon = new BitmapImage(new Uri("/Resources/Paste32.png",  
UriKind.Relative)) };  
this.Ribbon.QuickAccessToolBar.QATMenuItems.Add(pasteRibbonButton);
```

VB.NET

```
Dim pasteRibbonButton As New RibbonButton() With {  
.Label = "Paste",  
.SmallIcon = New BitmapImage(New Uri("/Resources/Paste32.png",  
UriKind.Relative))  
}  
Me.Ribbon.QuickAccessToolBar.QATMenuItems.Add(pasteRibbonButton)
```

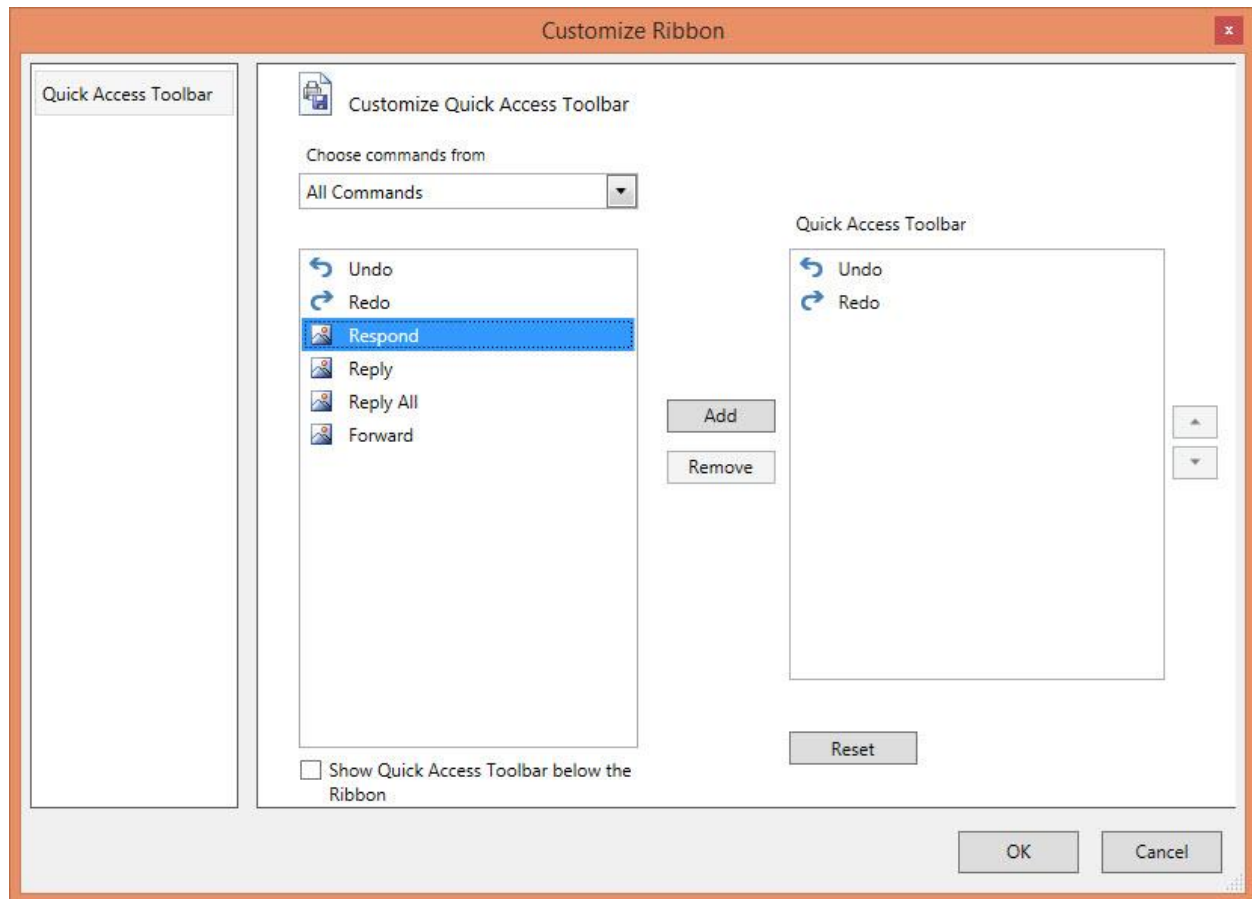

The “Paste” QATMenuItem has been selected and it is displayed as one of the items in the QAT.

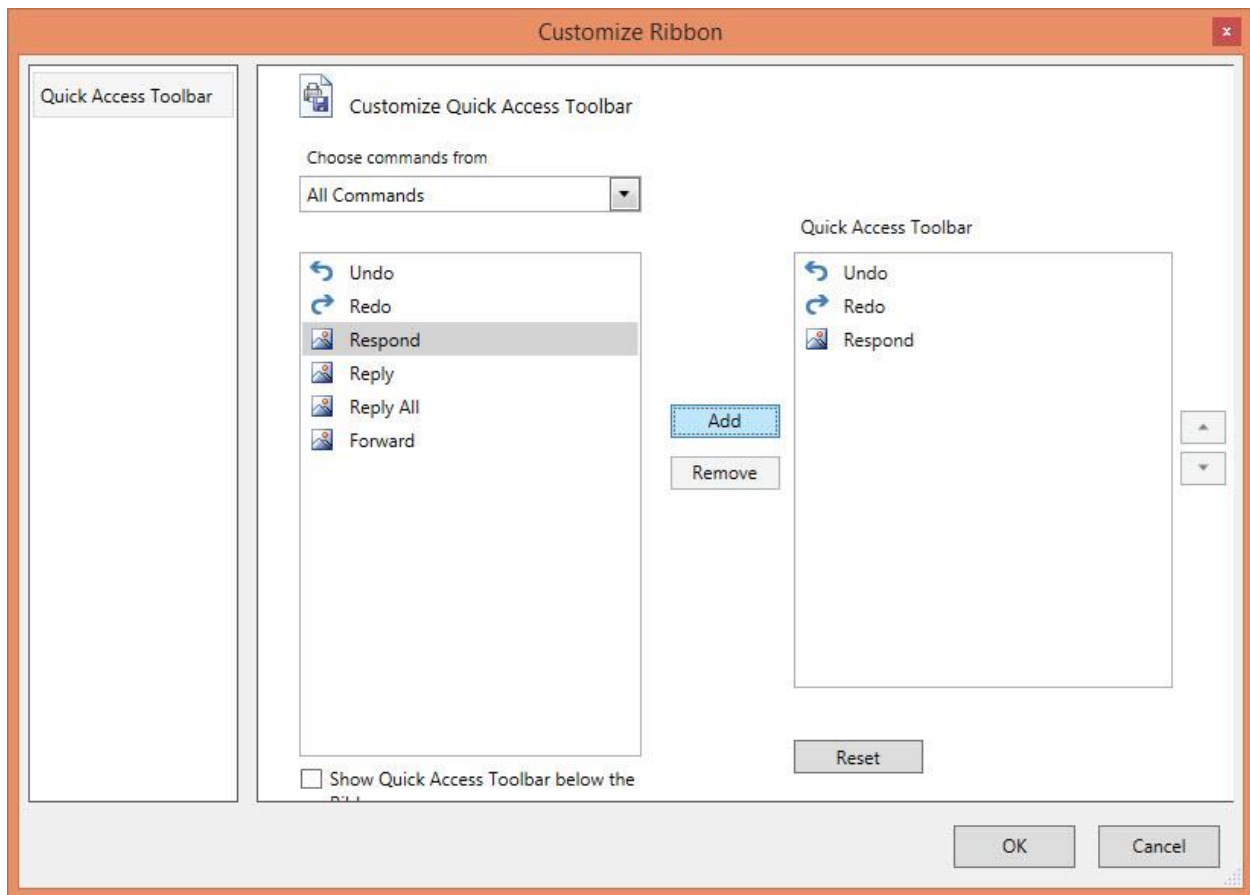

Add items to QAT customize window

To open QAT Customize Window, select **MoreCommands** option from the ContextMenu of the QAT. In the QAT Customized Window, the list of Commands is available. The Commands can be filtered only from the Particular tab by using **Choose commands from** option. Then, select the Command to add to the QuickAccessToolBar and add commands to the right Pane of the Quick Access ToolBar Dialog by clicking Add Button. Finally click OK.

Finally, the Items gets displayed in the QAT

Add custom QAT items

Ribbon control provides an option to add items to the QAT that will not be present in the Ribbon. These items can be defined in the [CustomQATItems](#) collection of the **QuickAccessToolBar** and can be accessed from the QAT Window in the “**Commands Not in the Ribbon**” and “**All Commands**” section.

XML

```
<syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:QuickAccessToolBar QATDropDownVisiblity="Visible">
<syncfusion:QuickAccessToolBar.CustomQATItems>
<syncfusion:RibbonButton Label="Undo" SmallIcon="/Resources/Undo_01.png" />
<syncfusion:RibbonButton Label="Redo" SmallIcon="/Resources/Redo_01.png" />
<syncfusion:RibbonButton Label="New" Command="ApplicationCommands.Open"
SmallIcon="/Resources/Document-01.png"/>
</syncfusion:QuickAccessToolBar.CustomQATItems>
</syncfusion:QuickAccessToolBar>
</syncfusion:Ribbon.QuickAccessToolBar>
```

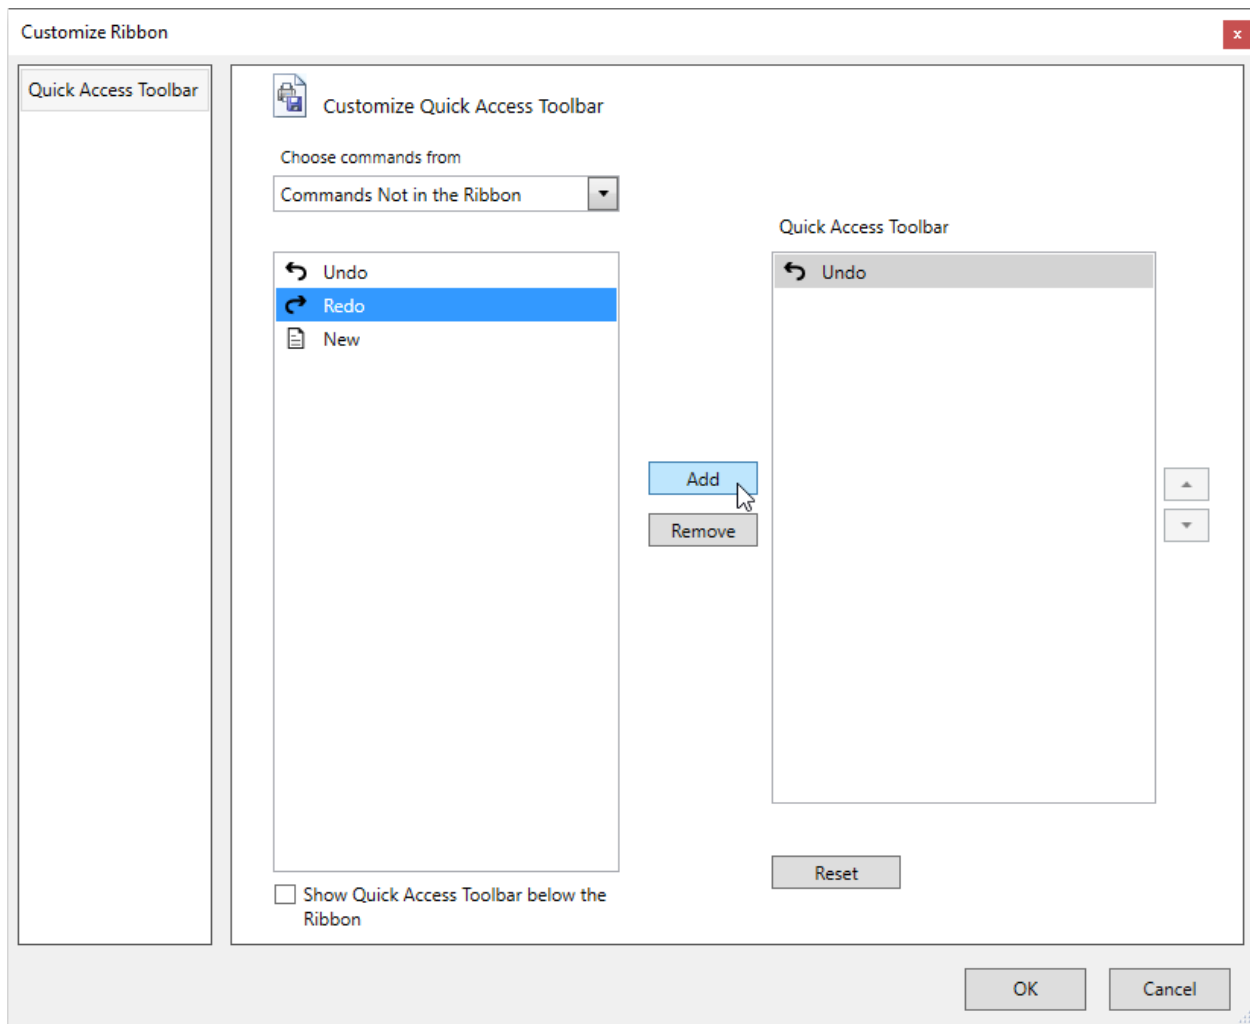

C#

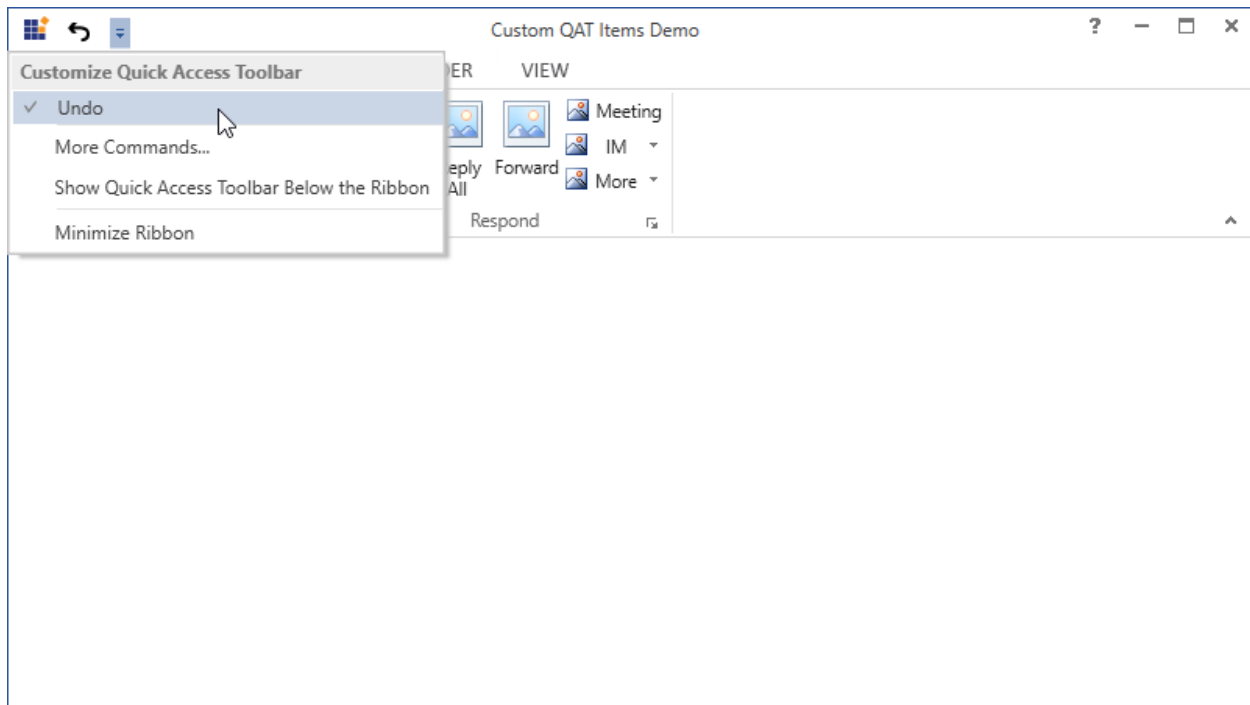

```
RibbonButton undoRibbonButton = new RibbonButton() { Label = "Undo",
SmallIcon = new BitmapImage(new Uri("/Resources/Undo_01.png",
UriKind.Relative))};
RibbonButton redoRibbonButton = new RibbonButton() { Label = "Redo",
SmallIcon = new BitmapImage(new Uri("/Resources/Redo_01.png",
UriKind.Relative))};
RibbonButton newRibbonButton = new RibbonButton() { Label = "New", SmallIcon
= new BitmapImage(new Uri("/Resources/Document-01.png", UriKind.Relative))};
this.Ribbon.QuickAccessToolBar.CustomQATItems.Add(undoRibbonButton);
this.Ribbon.QuickAccessToolBar.CustomQATItems.Add(redoRibbonButton);
this.Ribbon.QuickAccessToolBar.CustomQATItems.Add(newRibbonButton);
```

VB.NET

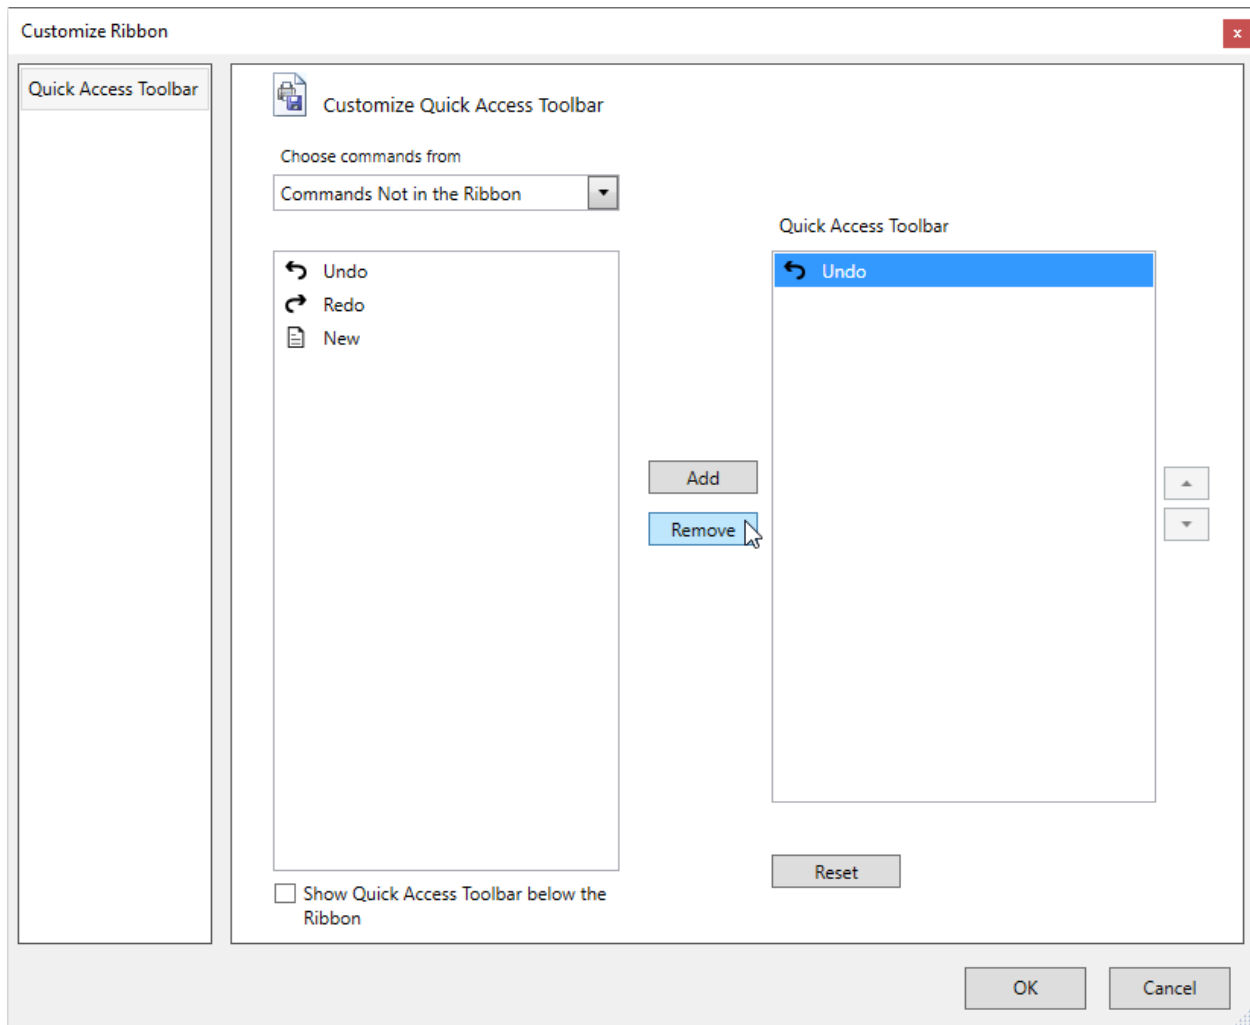

```
Dim undoRibbonButton As New RibbonButton() With {
.Label = "Undo",
.SmallIcon = New BitmapImage(New Uri("/Resources/Undo_01.png",
UriKind.Relative))
}
Dim redoRibbonButton As New RibbonButton() With {
.Label = "Redo",
.SmallIcon = New BitmapImage(New Uri("/Resources/Redo_01.png",
UriKind.Relative))
}
Dim newRibbonButton As New RibbonButton() With {
.Label = "New",
.SmallIcon = New BitmapImage(New Uri("/Resources/Document-01.png",
UriKind.Relative))
}
Me.Ribbon.QuickAccessToolBar.CustomQATItems.Add(undoRibbonButton)
Me.Ribbon.QuickAccessToolBar.CustomQATItems.Add(redoRibbonButton)
Me.Ribbon.QuickAccessToolBar.CustomQATItems.Add(newRibbonButton)
```

Once the [CustomQATItems](#) are added to the Quick Access Toolbar using the **Add** button, it will be visible in the Ribbon QAT and in the QAT Dropdown menu. The visibility of this item in the Ribbon QAT can be toggled by checking/unchecking from the QAT Dropdown menu.

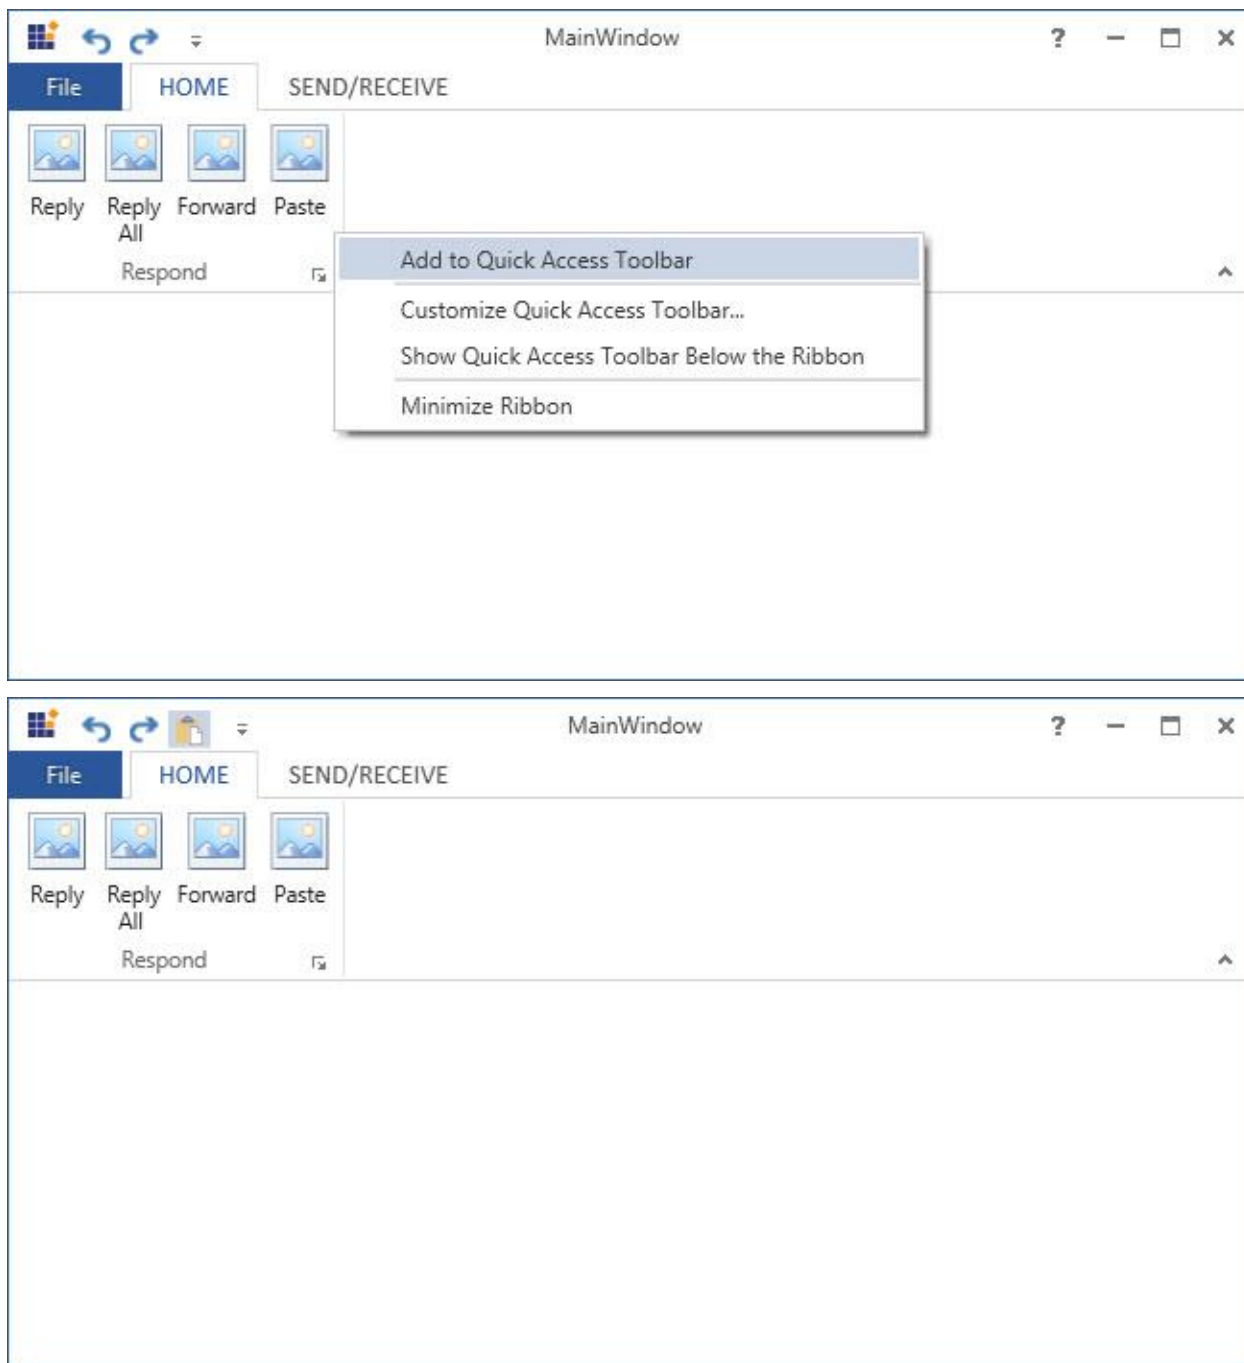

The added [CustomQATItems](#) in the QAT Dropdown menu can be removed through the QAT Window using the **Remove** button.

Add items from Ribbon context menu

QAT can also be customized by adding the items from the Ribbon ContextMenu. Select Add to Quick Access Toolbar by right-clicking the Ribbon item required to add to the QAT. Then, the respective item gets added as one of the items in the QAT.

Add custom items using RibbonItemHost

The control hosted in [RibbonItemHost](#) can be added to the [QuickAccessToolBar](#) using ribbon context menu or through QAT customization dialog. In the QAT customization dialog, all the ribbon items are displayed using its [Label](#) and [IconTemplate](#) properties. Similarly, the [RibbonItemHost](#) also allows us to set the label and icon using its [Label](#) and [IconTemplate](#) properties respectively.

- [Label](#) - Used to display the text of [RibbonItemHost](#) inside the QAT customization dialog.
- [IconTemplate](#) - Gets or sets the template that is used to display the icon of [RibbonItemHost](#) inside the QAT customization dialog.

In the below example, the [Label](#) and [IconTemplate](#) are set for the [RibbonItemHost](#) controls which will be used when the items are displayed in the QAT customization dialog.

XML

![WPF Ribbon Custom Items in MoreCommands Window](RibbonCustomItem_images/wpff-ribbon-custom-items-in-morecommands.png)

![Adding WPF Ribbon Custom Items in RibbonBar](RibbonCustomItem_images/wpff-ribbon-custom-items-with-ribbonbar.png)

To know more about the [RibbonItemHost](#), refer [here](#).

Add custom RibbonTab and RibbonBar

The following section illustrates how to customize Ribbon at the run time

QAT customized window

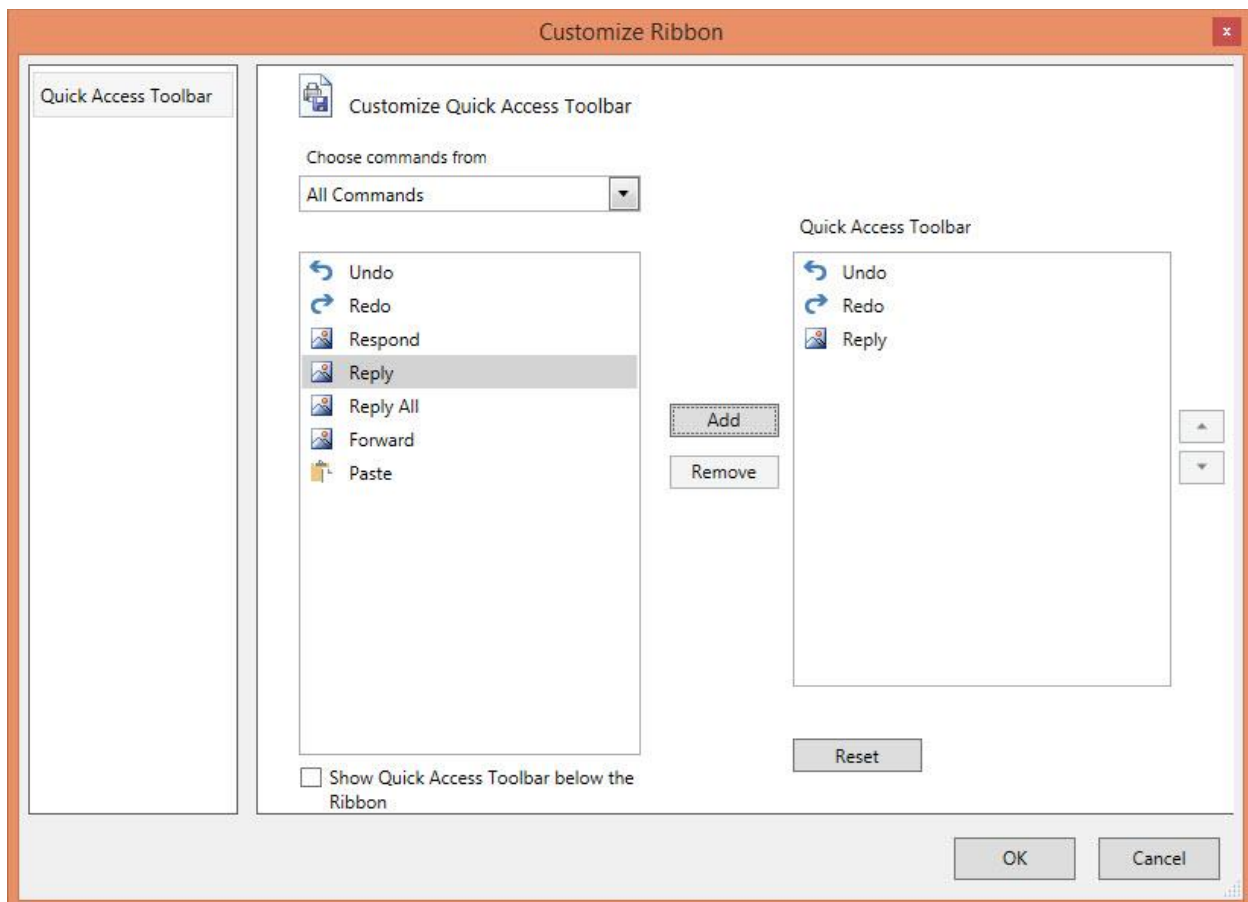

This topic illustrates in detail about the QAT topic.

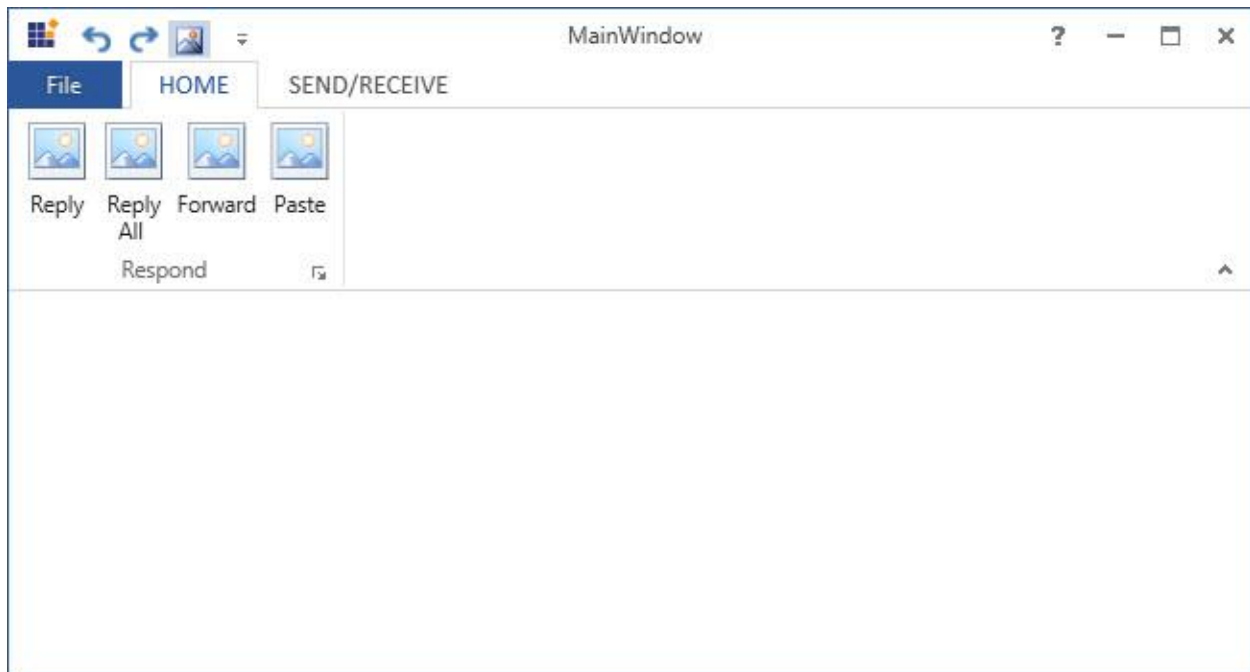

First, select MoreCommands option from the QAT to open the QAT Customized Window.

QAT can be Customized further by using the following options

1. Add

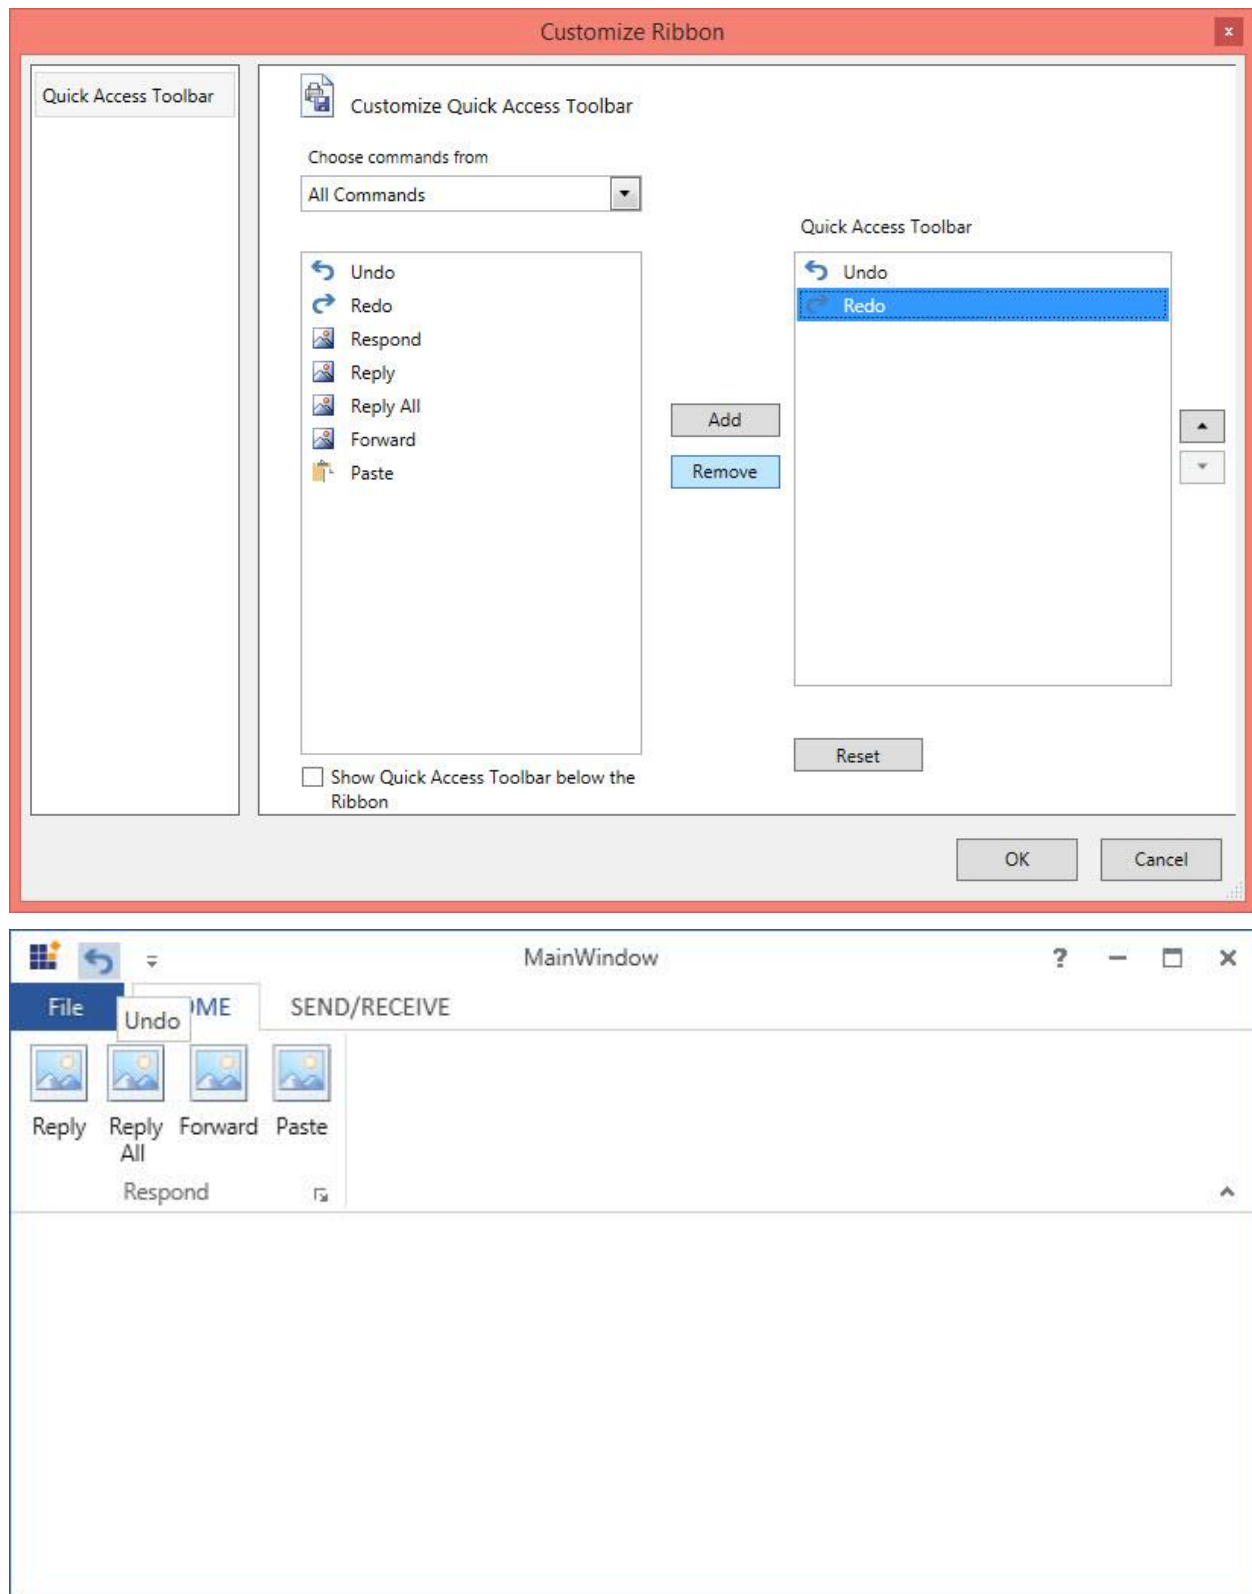

In the QAT Customized window, the list of Commands is available. The Commands can be filtered only from the Particular tab by using **Choose commands from** option. Then, select the commands to be added to the QAT and add the command to Right Pane of the QAT Dialog by clicking **Add** Button. Finally, Click OK. Now, the selected command gets added in the QAT.

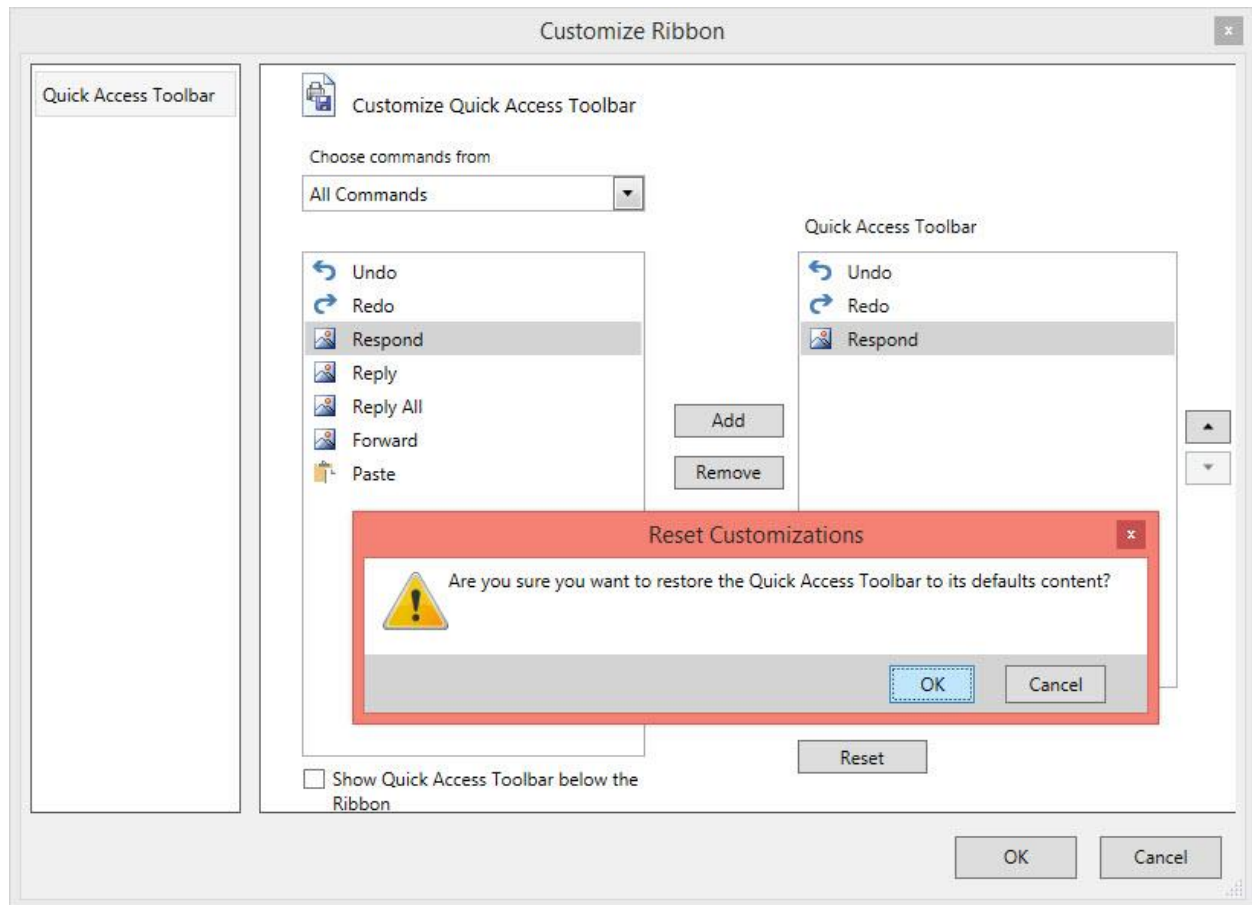

2. Remove

QAT items can be removed at the Run time. In the QAT Customize window, select the Command to be deleted from the QAT Dialog, and then click Remove Button. In the following screenshot, Redo command gets deleted and the output is changed according to it.

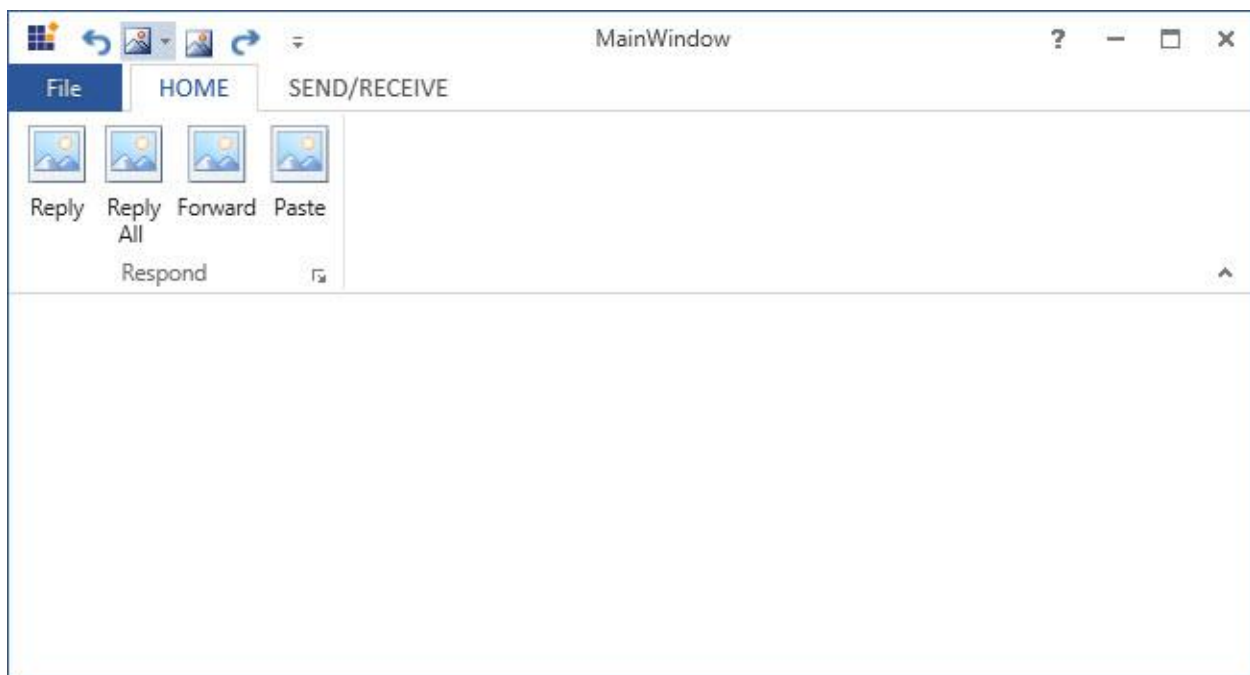

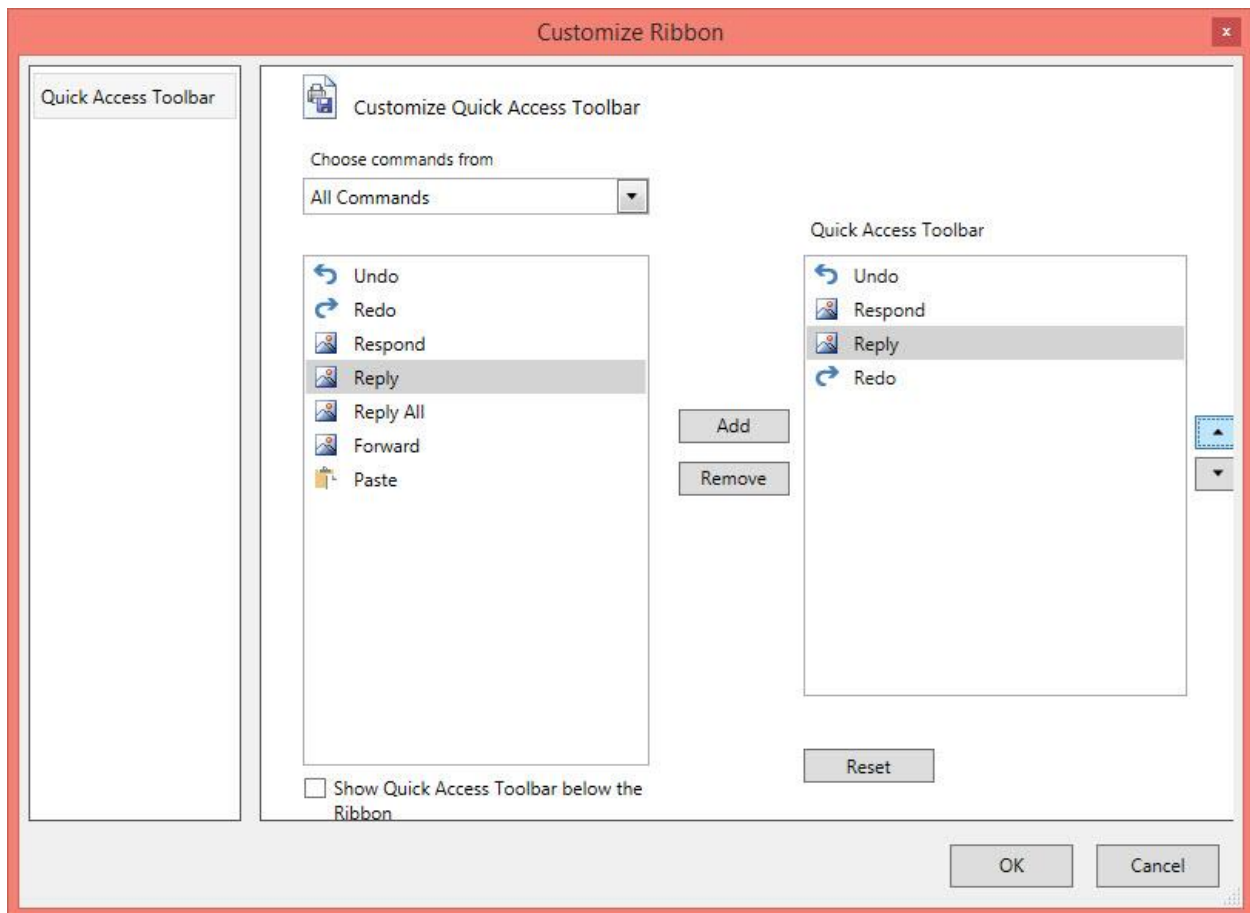

3. Reset

To restore the QAT to its default content, use this **Reset** option.

4. Reorder

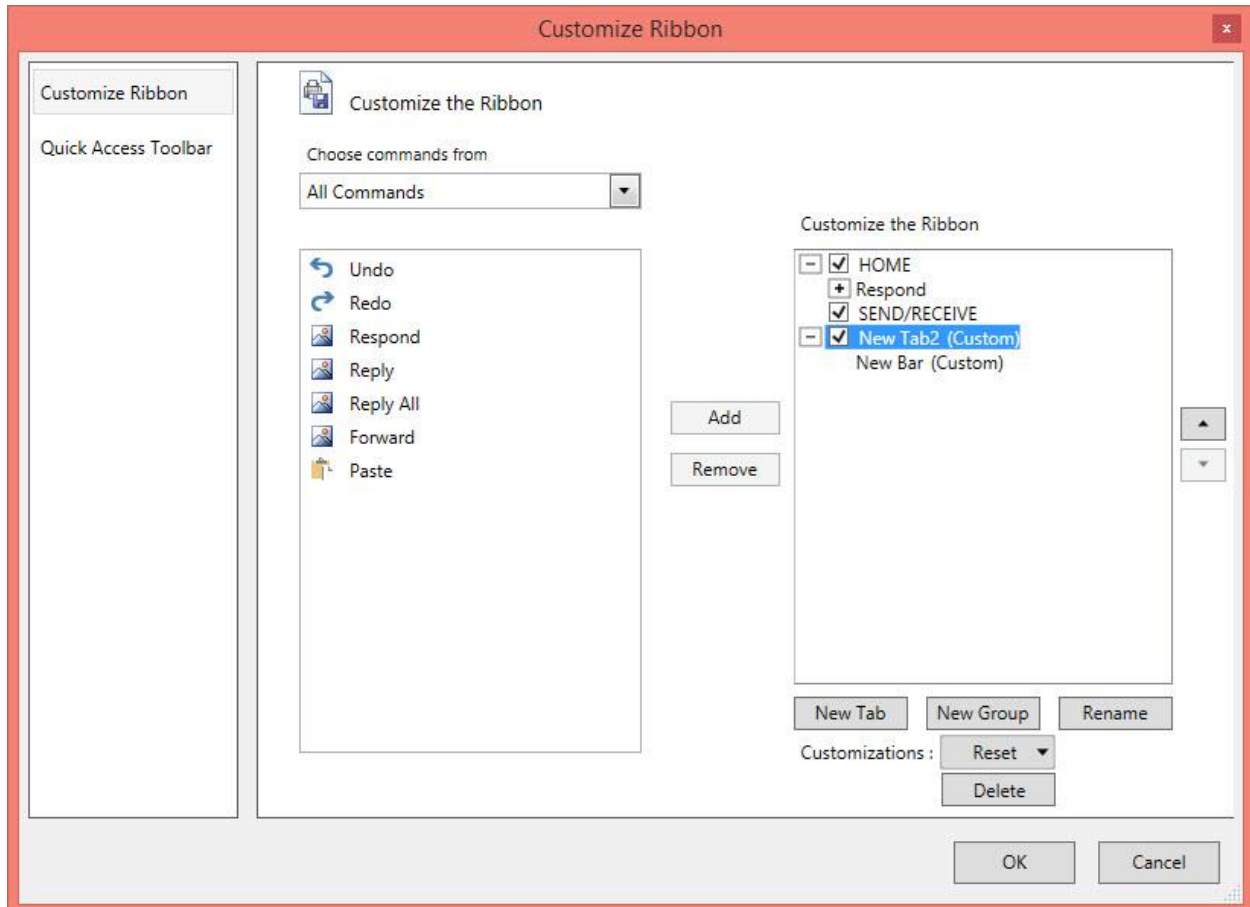

QAT also supports to reorder the items by clicking the Up and down arrow at the left of the QAT Dialog.

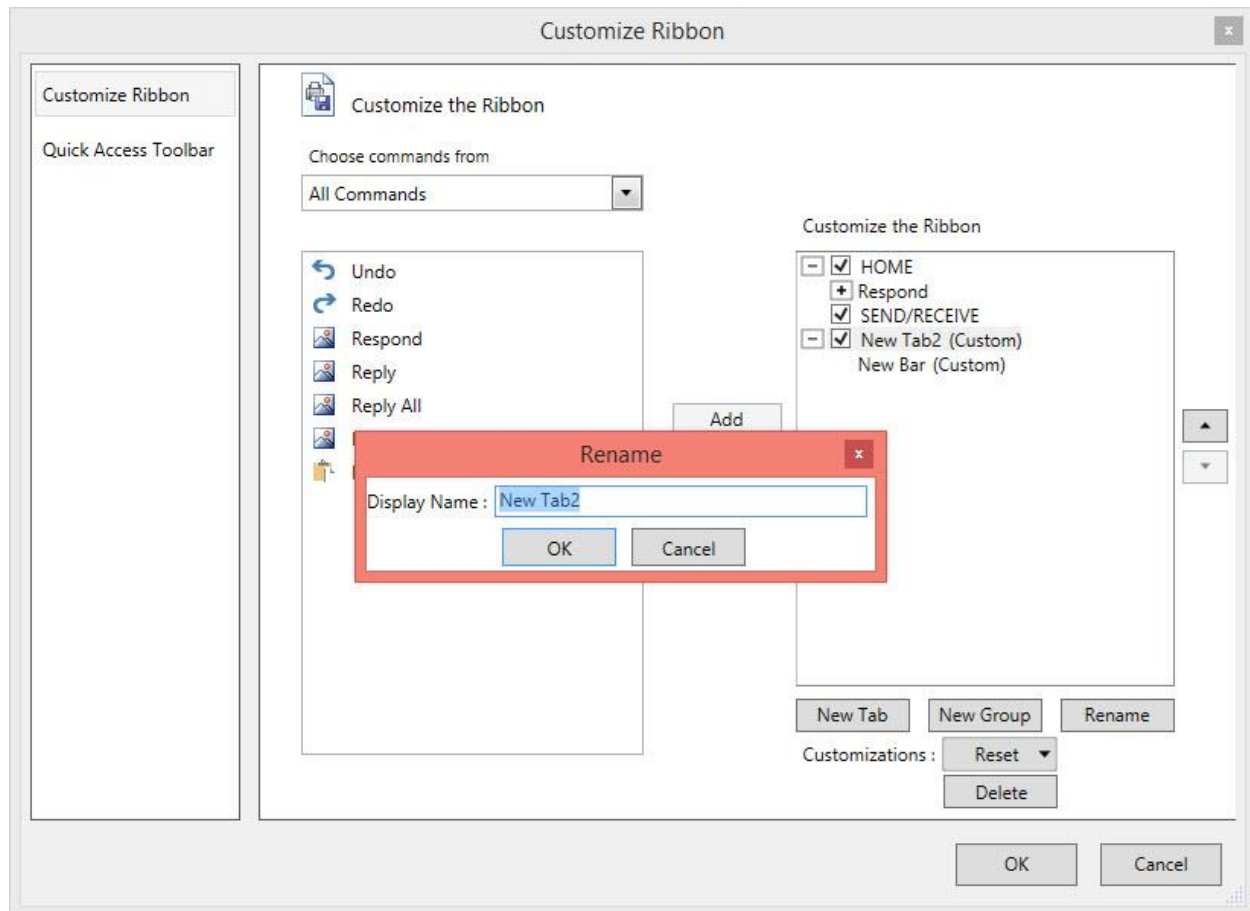

Customize Ribbon with RibbonTab and RibbonBar

QAT can also support to customize Ribbon Tab and RibbonBar while running. To customize the Ribbon, enable the `ShowCustomizeRibbon` property of the Ribbon to `true` and follow the steps.

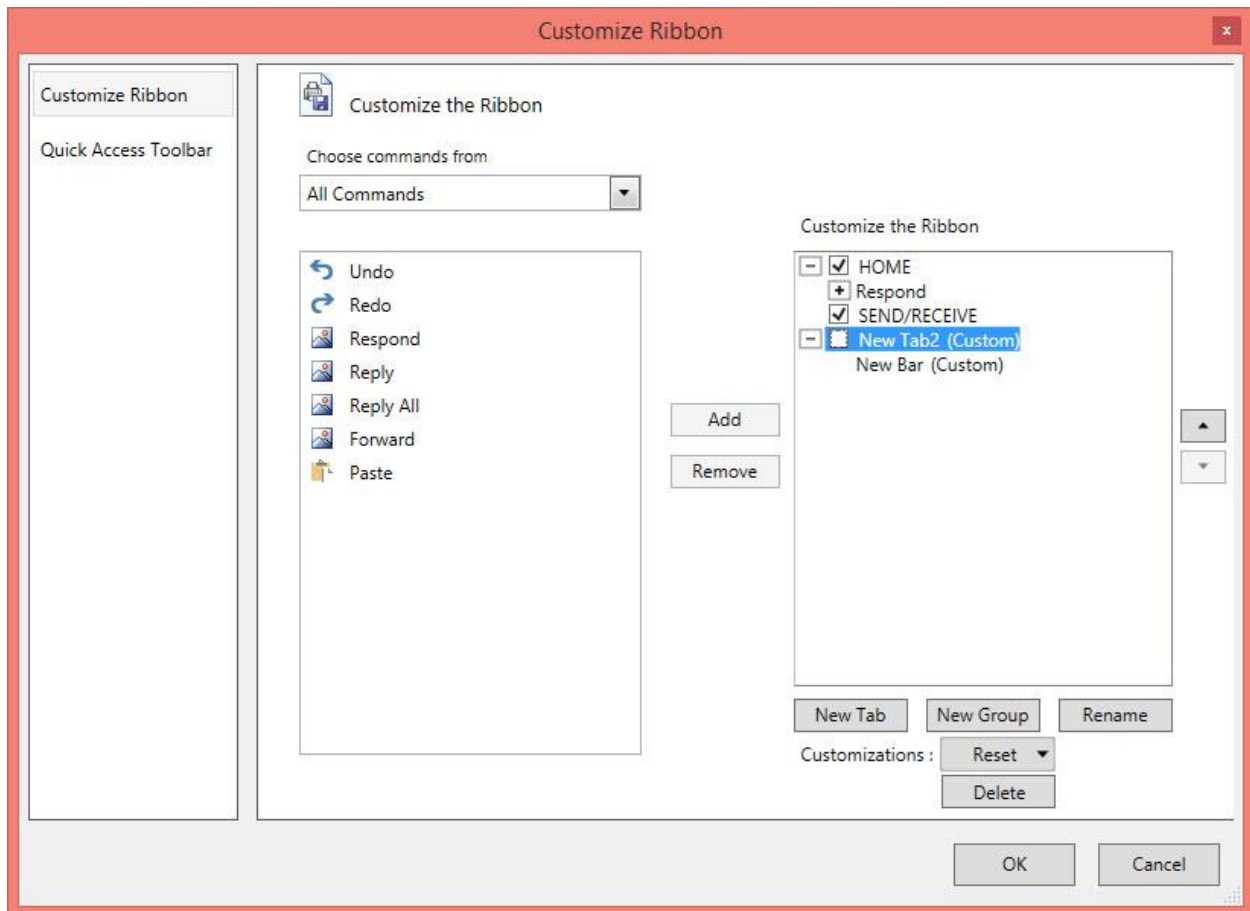

1. Click the Quick Access Toolbar drop-down button and click the **MoreCommands** menu.
2. Then, select the **Customize Ribbon** options from the left-side column.
3. You can add **RibbonTab** and **RibbonBar** by selecting New Tab and New Group Options Respectively.

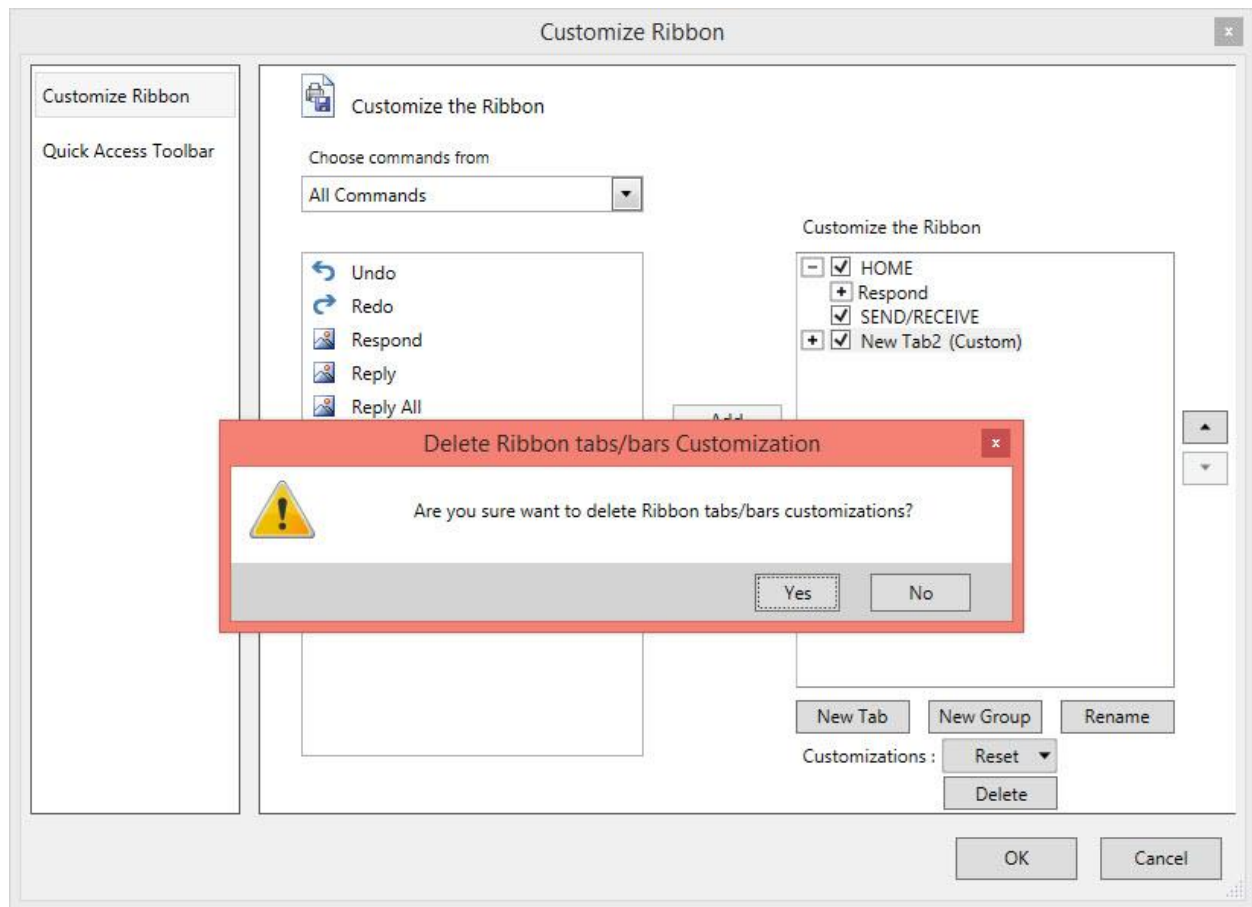

4. To move the tab up and down, select the tab to be moved and click the button at the right-side corner accordingly. Similarly, the group can be moved within the tab.
5. By using the **Rename** option, rename any particular Tab/Group present in the Ribbon by selecting it.

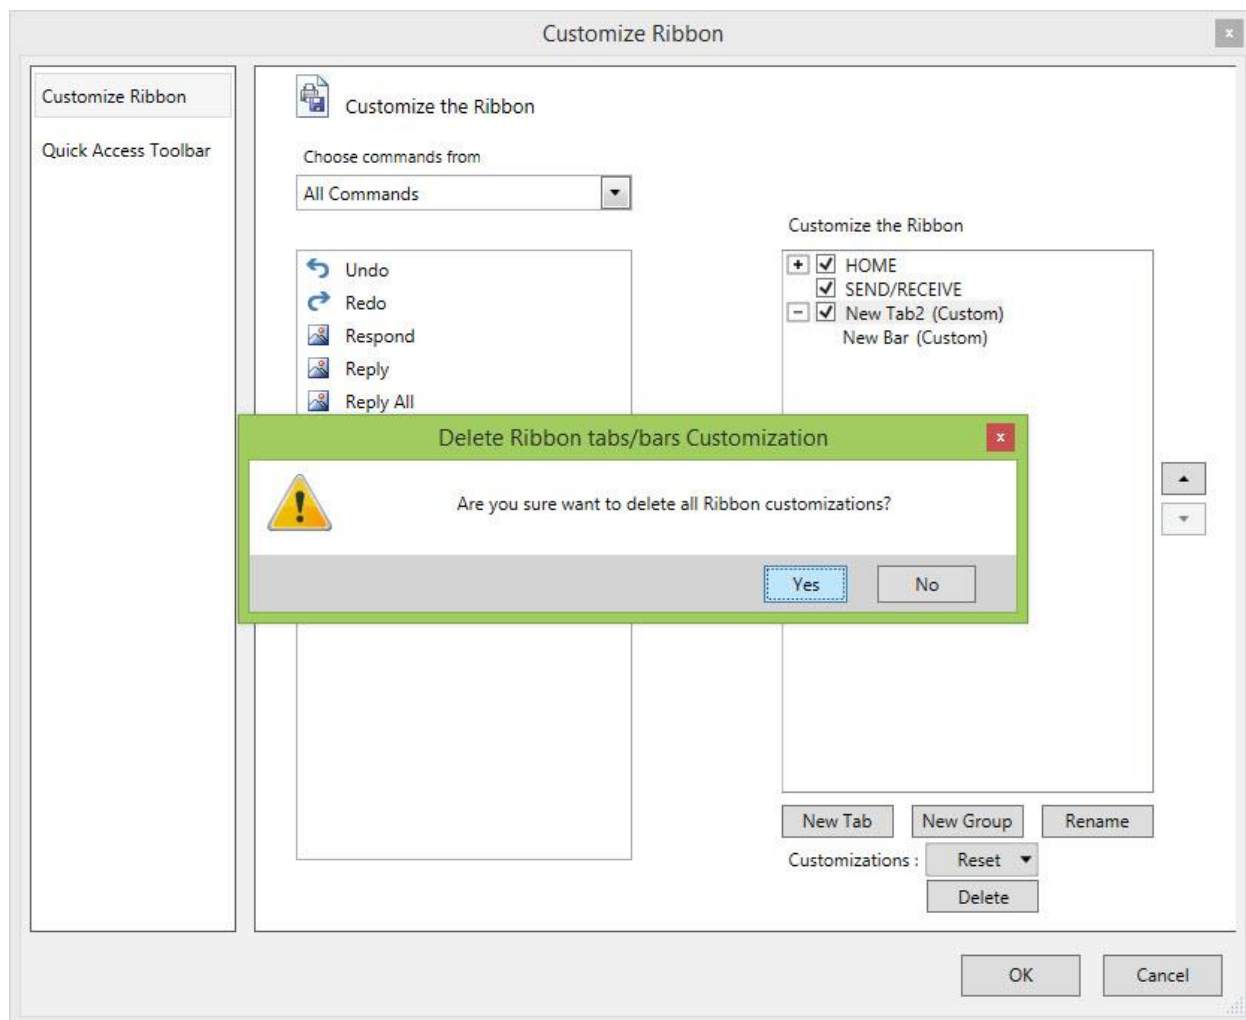

6. The visibility of any particular Tab can be changed by enabling the checkbox of the corresponding selection.

7. By using **Delete** option, the Custom RibbonBar and RibbonTab can be deleted. But, this option does not work in the case of original content.

8. To delete all the Ribbon Customization, use **Reset All Customization** from the Reset Drop Down Menu.

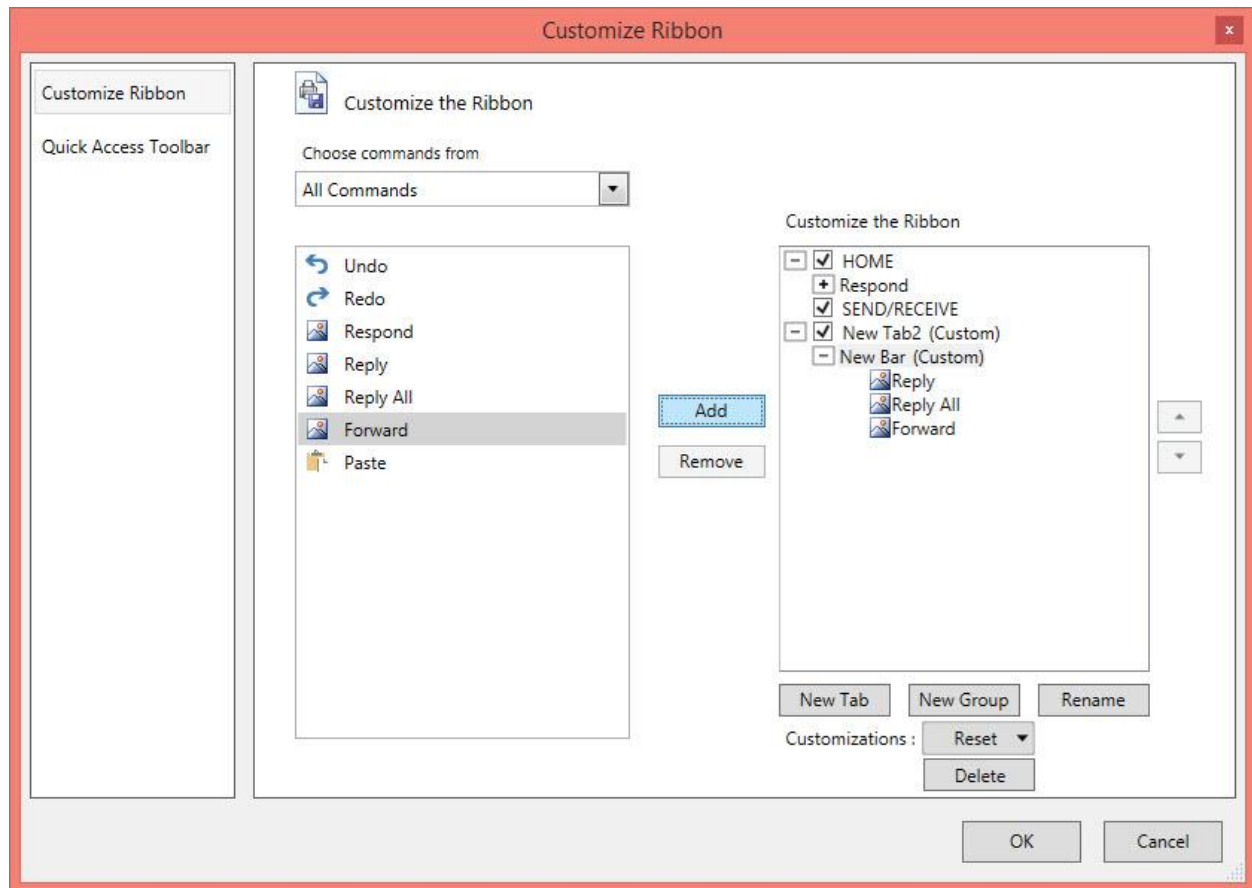

After customizing the RibbonTab and RibbonBar, RibbonItems can be customized. Customizing Ribbon Item concepts are explained as follows.

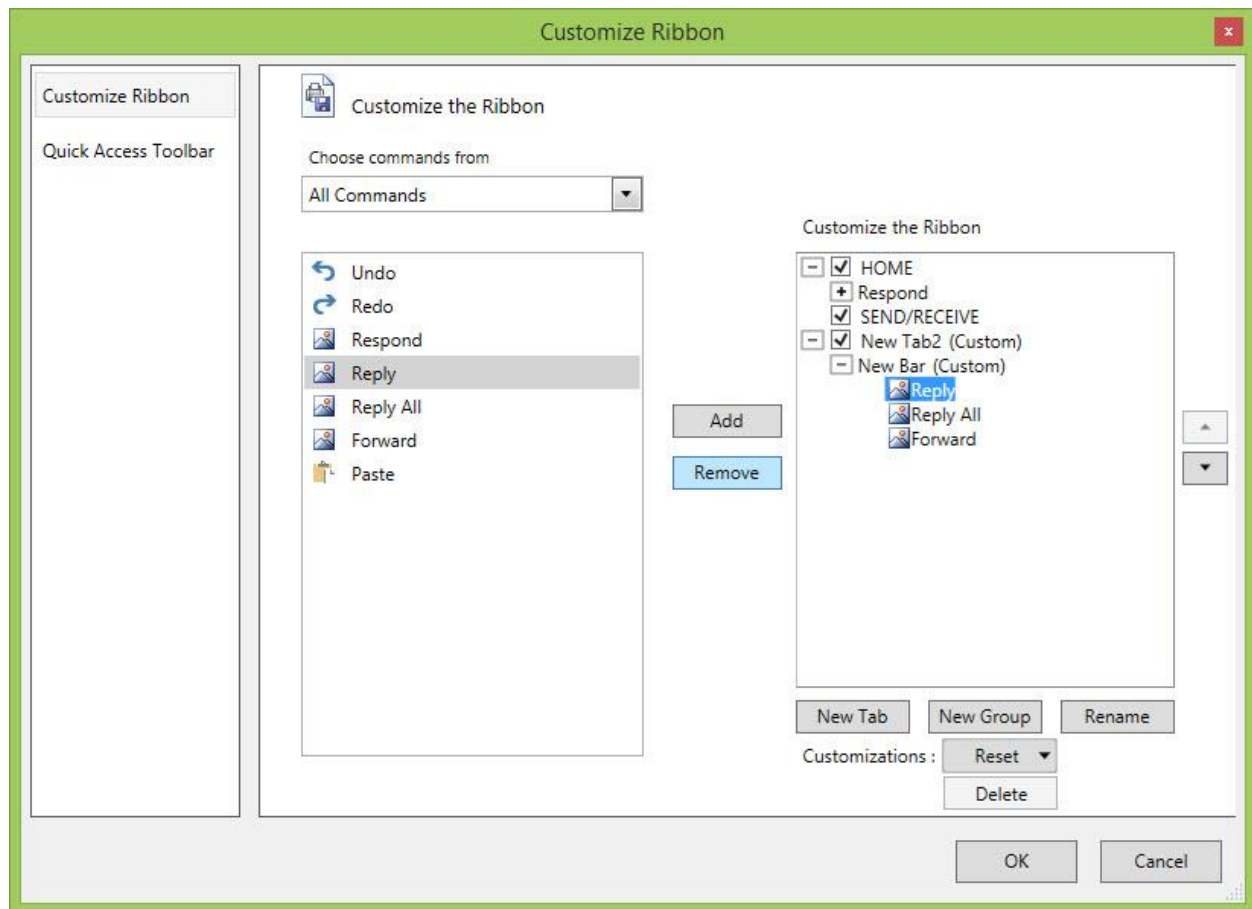

[Add items to the customized RibbonTab](#)

The steps to customize the Ribbon Item are as follows

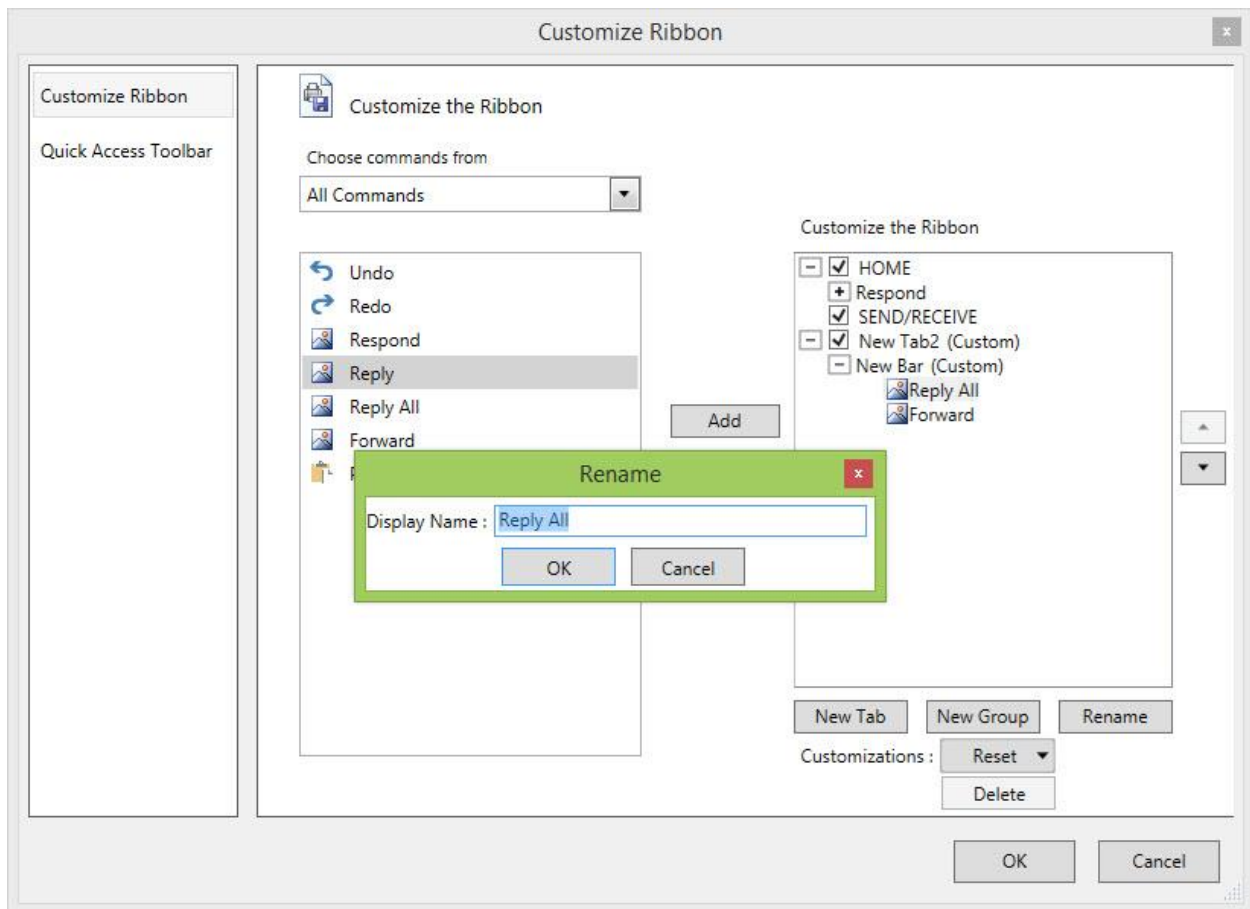

1. The **Choose commands from** drop-down list is used to filter the commands only from the Particular Tab.
2. To add the item under the right-side column of a newly added **RibbonBar** and **RibbonTab**, select the item from left-side column and click the **Add** button.

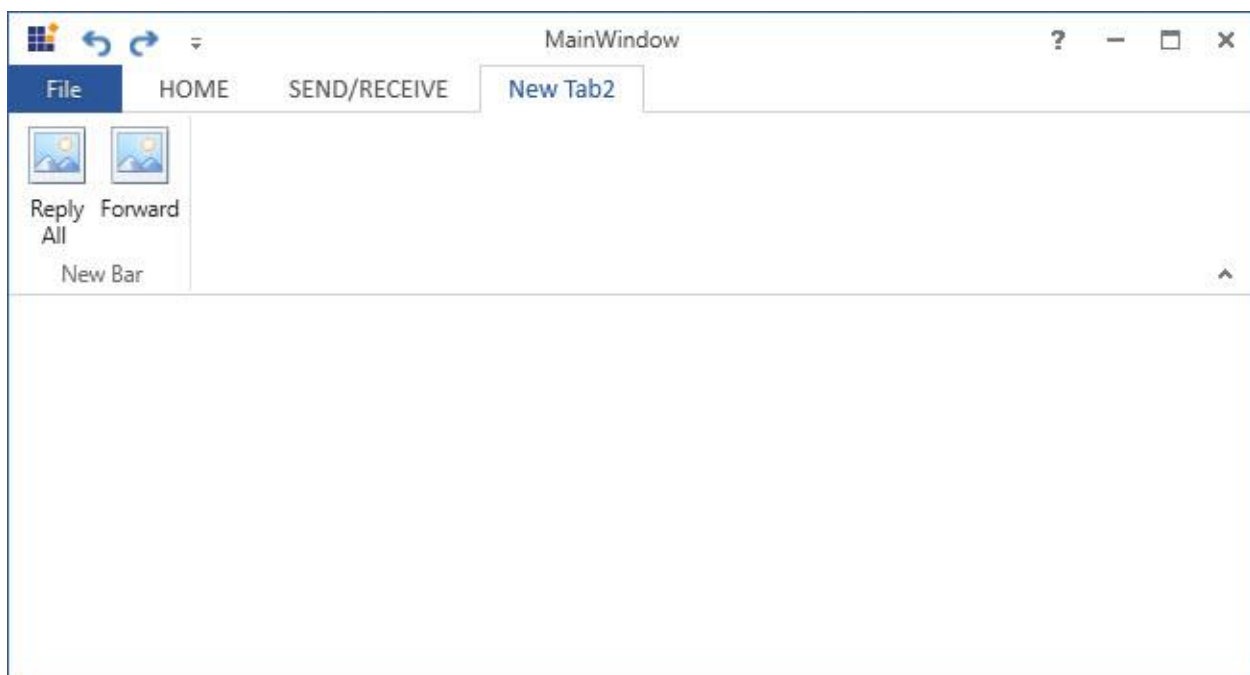

3. Also, the Ribbon Item from the RibbonBar can be removed that is added recently by using **Remove** option

4. The order of the RibbonItem within the RibbonBar can be changed by using **Up** and **Down** arrow
5. By using the Rename option, the RibbonItem can be renamed

6. Click **OK** button. The Changes are reflected in the output window.

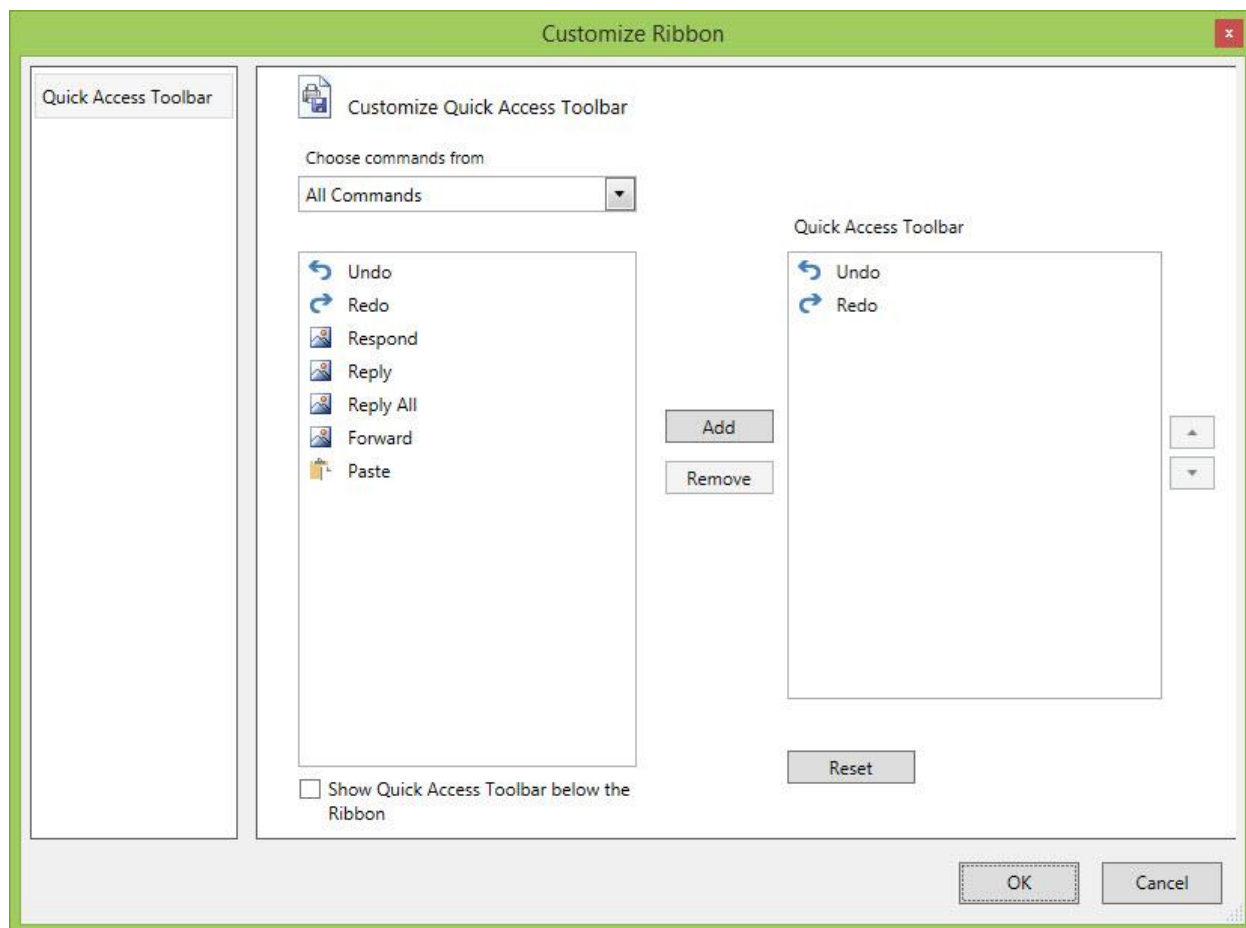

How to disable the customization in Ribbon

To disable the customization in the Ribbon, set `ShowCustomizeRibbon` property of the Ribbon as `False`

XML

```
<syncfusion:Ribbon VerticalAlignment="Top" x:Name="Ribbon"
ShowCustomizeRibbon="False">
<syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:QuickAccessToolBar >
<syncfusion:RibbonButton Label="Undo" SmallIcon="/Resources/Undo16.png"
SizeForm="ExtraSmall"
ToolTip="Undo" syncfusion:RibbonCommandManager.SynchronizedItem="Undo" />
<syncfusion:RibbonButton Label="Redo" SmallIcon="/Resources/Redo16.png"
SizeForm="ExtraSmall"
ToolTip="Redo" syncfusion:RibbonCommandManager.SynchronizedItem="Redo" />
</syncfusion:QuickAccessToolBar>
</syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:RibbonTab Caption="HOME" >
<syncfusion:RibbonBar Header="Respond">
<syncfusion:RibbonButton Label="Reply" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Reply All" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Forward" SizeForm="Large"/>
<syncfusion:RibbonButton Label="Paste" SizeForm="Large"
SmallIcon="/Resources/Paste32.png"
syncfusion:RibbonCommandManager.SynchronizedItem="Paste" />
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="SEND/RECIEVE"/>
</syncfusion:Ribbon>
```

In the following screenshot, customizing Ribbon is disabled and it shows only the QAT Customize window

Simplified Layout in WPF Ribbon

The Ribbon is available in simplified layout which is designed to display the most commonly used Ribbon commands in a single line interface, allowing more screen space for compact viewing of the content. For the best user experience, the other Ribbon commands are located under the overflow menu. It also provides option to switch back and forth between the simplified and the normal layout using the minimize button.

The [LayoutMode](#) enumeration property provides an option to load the Ribbon control in simplified layout. It contains the following options like:

- **Normal** - The Ribbon items are arranged in the standard layout. This is the default value.
- **Simplified** - The Ribbon items are arranged in the simplified layout.

XML

```
<Grid>
<syncfusion:Ribbon x:Name="ribbon" LayoutMode="Simplified"
VerticalAlignment="Top">
</syncfusion:Ribbon>
</Grid>
```

C#

```
Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
ribbon.LayoutMode = LayoutMode.Simplified;
grid.Children.Add(ribbon);
```

Switching between simplified and normal layouts

The Ribbon control allows to switch between simplified and normal layouts at runtime using the Ribbon minimize button located in the lower right corner of the Ribbon. To enable this option, set the [EnableSimplifiedLayoutMode](#) property to **True**. By default, its value is **False**.

XML

```
<Grid>
<syncfusion:Ribbon x:Name="ribbon" EnableSimplifiedLayoutMode="True"
VerticalAlignment="Top">
</syncfusion:Ribbon>
</Grid>
```

C#

```
Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
ribbon.EnableSimplifiedLayoutMode = true;
grid.Children.Add(ribbon);
```

Visibility of the Ribbon items between normal and simplified layout

The Ribbon items can be set common between different layouts or can be made visible only in a particular layout using the [SimplifiedLayoutSettings.DisplayMode](#) attached property. By default, items will be displayed in both normal and simplified layout. The [DisplayMode](#) is of flag enumeration type that contains the following values.

- **Normal** - The item will be displayed only in the normal layout.
- **Simplified** - The item will be displayed only in the simplified layout.
- **OverflowMenu** - The item will be displayed only inside the overflow menu when simplified layout is enabled.

Also, the [DisplayMode](#) property allows the following value combinations as well.

- **Normal, Simplified** – The item will be displayed in both normal and simplified layout.
- **Normal, OverflowMenu** – The item will be displayed in both normal layout and inside overflow menu during simplified layout.
- **Simplified, OverflowMenu** – The item will be displayed in simplified layout.

- **Normal, Simplified, OverflowMenu** – The item will be displayed in both normal and simplified layout.

In the below code snippet, the [SimplifiedLayoutSettings.DisplayMode](#) property for *Paste* option is set to **“Simplified”**, so it will only be displayed only in the simplified layout. The [SimplifiedLayoutSettings.DisplayMode](#) property for *Underline* option is set to **“Normal, Overflow”**, so it will be displayed in the normal layout and will also be displayed inside the overflow menu in the simplified layout.

XML

```
<!-- This item will only be displayed in simplified layout -->
<syncfusion:RibbonButton Label="Paste"
syncfusion:SimplifiedLayoutSettings.DisplayMode="Simplified" />
<!-- This item will only be displayed in normal layout -->
<syncfusion:RibbonButton
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal"
SizeForm="ExtraSmall" />
<!-- This item will be displayed in normal layout and inside overflow menu
during simplified layout -->
<syncfusion:RibbonButton Label="Underline"
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,OverflowMenu"
SizeForm="ExtraSmall"/>
<!-- This item will be displayed both in normal and simplified layout -->
<syncfusion:RibbonButton Label="Italic" SizeForm="ExtraSmall"/>
```

C#

```
// This item will only be displayed in simplified layout
RibbonButton pasteButton = new RibbonButton();
pasteButton.Label = "Paste";
SimplifiedLayoutSettings.SetDisplayMode(pasteButton,
DisplayMode.Simplified);
// This item will only be displayed in normal layout
RibbonButton boldButton = new RibbonButton();
boldButton.Label = "Bold";
boldButton.SizeForm = SizeForm.ExtraSmall;
SimplifiedLayoutSettings.SetDisplayMode(boldButton, DisplayMode.Normal);
// This item will be displayed in normal layout and inside overflow menu
during simplified layout
RibbonButton underlineButton = new RibbonButton();
underlineButton.Label = "Underline";
SimplifiedLayoutSettings.SetDisplayMode(underlineButton, DisplayMode.Normal
| DisplayMode.OverflowMenu);
// This item will be displayed both in normal and simplified layout
RibbonButton italicButton = new RibbonButton();
italicButton.Label = "Paste";
```

When using simplified layout, the **Margin**, **Width** and **Height** values of the Ribbon items can be ignored as they are changed based on the size form and layout mode. If the item to be shown in both normal and simplified layout, the **Margin**, **Width** and **Height** properties can be set for normal layout alone using triggers.

XML

```

<syncfusion:RibbonButton Label="Copy"
syncfusion:SimplifiedLayoutSettings.DisplayMode="Normal,Simplified"
SizeForm="Small" MediumIcon="/Resources/Copy_20.png"
SmallIcon="/Resources/Copy16.png" >
<syncfusion:RibbonButton.Style >
<Style TargetType="syncfusion:RibbonButton" BasedOn="{StaticResource
SyncfusionRibbonButtonStyle}">
<Style.Triggers>
<Trigger Property="syncfusion:SimplifiedLayoutSettings.LayoutMode"
Value="Normal">
<Setter Property="Height" Value="48"/>
<Setter Property="Width" Value="48"/>
<Setter Property="Margin" Value="2"/>
</Trigger>
</Style.Triggers>
</Style>
</syncfusion:RibbonButton.Style>
</syncfusion:RibbonButton>

```

Setting image for Ribbon items

For “**Normal**” layout mode, the images from the [SmallIcon](#) and [LargeIcon](#) properties are used inside the Ribbon items based on the size mode (extra small, small and large). However, the simplified layout mode uses 20 * 20 image size for the Ribbon items as standard and it can be obtained from the [MediumIcon](#) property. In-case if the [IconTemplate](#) property is used to display the image, the simplified layout will automatically resize it to 20 * 20 size.

XML

```

<syncfusion:RibbonButton Label="Paste"
syncfusion:SimplifiedLayoutSettings.DisplayMode="Simplified"
MediumIcon="/Resources/Paste20.png" />
<syncfusion:RibbonButton Label="Italic" SizeForm="ExtraSmall">
<syncfusion:RibbonButton.IconTemplate >
<DataTemplate>
<Path Margin="4,2,2,1"
Data="M2.000005,0 L6.000005,0 6.000005,1 4.4186966,1 2.4888427,8.9999952
4,8.9999952 4,9.9999952 0,9.9999952 0,8.9999952 1.4594386,8.9999952
3.3901918,1 2.000005,1 z"
Fill= "Black" />
</DataTemplate>
</syncfusion:RibbonButton.IconTemplate>
</syncfusion:RibbonButton>

```

C#

```

RibbonButton pasteButton = new RibbonButton();
pasteButton.Label = "Paste";
pasteButton.MediumIcon = new BitmapImage(new Uri(@"Resources/Paste20.png",
UriKind.RelativeOrAbsolute));
SimplifiedLayoutSettings.SetDisplayMode(pasteButton,
DisplayMode.Simplified);
RibbonButton italicButton = new RibbonButton();
italicButton.Label = "Italic";
italicButton.SizeForm = SizeForm.ExtraSmall;
DataTemplate iconDataTemplate = new DataTemplate();

```

```

FrameworkElementFactory icon_element = new
FrameworkElementFactory(typeof(Path));
icon_element.SetValue(Path.MarginProperty, new Thickness(4, 2, 2, 2));
icon_element.SetValue(Path.FillProperty, new SolidColorBrush(Colors.Black));
icon_element.SetValue(Path.DataProperty, Geometry.Parse("M2.000005,0
L6.000005,0 6.000005,1 4.4186966,1 2.4888427,8.9999952 4,8.9999952
4,9.9999952 0,9.9999952 0,8.9999952 1.4594386,8.9999952 3.3901918,1
2.000005,1 z"));
iconDataTemplate.VisualTree = icon_element;
italicButton.IconTemplate = iconDataTemplate;

```

The following screenshot shows the simplified layout within the Ribbon control.

Note: View [sample](#) in GitHub.

Customizing the Ribbon during runtime through the QAT window

The Ribbon control allows to customize the Ribbon and Ribbon items through the QAT window, where user can add the Ribbon items to a new [RibbonTab](#) or [RibbonBar](#). The newly added [RibbonTab](#) or [RibbonBar](#) will only be visible in the respective layout in which items were added originally. In the below example, the [LayoutMode](#) is set as “**Simplified**” and a new [RibbonTab](#) named *Folder* is created and added using the QAT window. This tab will now be visible only in the simplified layout and not in the normal layout which is the default behavior.

Normal layout

Simplified layout

In the meantime, the Ribbon control also allows to add items to the Quick Access Toolbar (QAT) with the help of the QAT window or through the context menu shortcut. Items added during normal or simplified layout will always be visible even when switching between layouts. In the below example, the [LayoutMode](#) is set as “**Simplified**” and the **Bold** item is added to the QAT through the context menu. This item will now be constantly visible in both normal and simplified layouts.

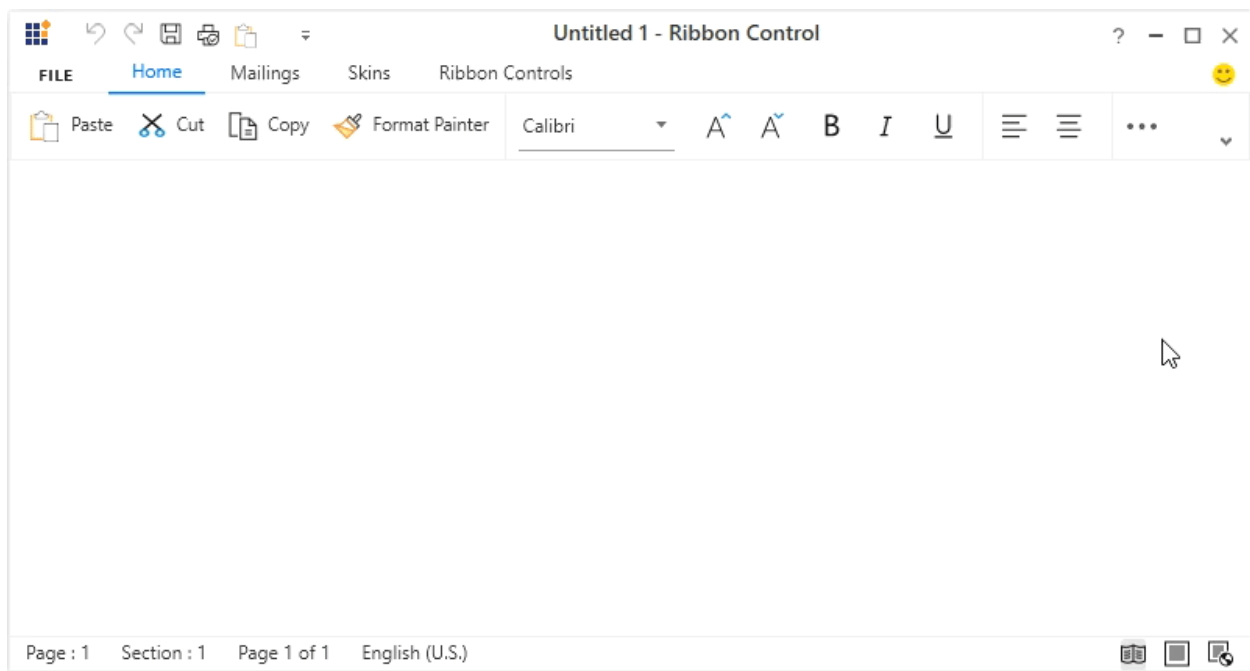

Normal layout

Simplified layout

Resizing Ribbon in simplified layout

While re-sizing the Ribbon, when the width of the window decreases and touches the last positioned item in the Ribbon, the appropriate item will be moved inside the overflow menu automatically. The same behavior will continue for each item when the window is resized continuously.

Dealing with Ribbon in WPF Ribbon

Ribbon can be changed into three different states such as **Normal**, **Hide** and **Adorner**

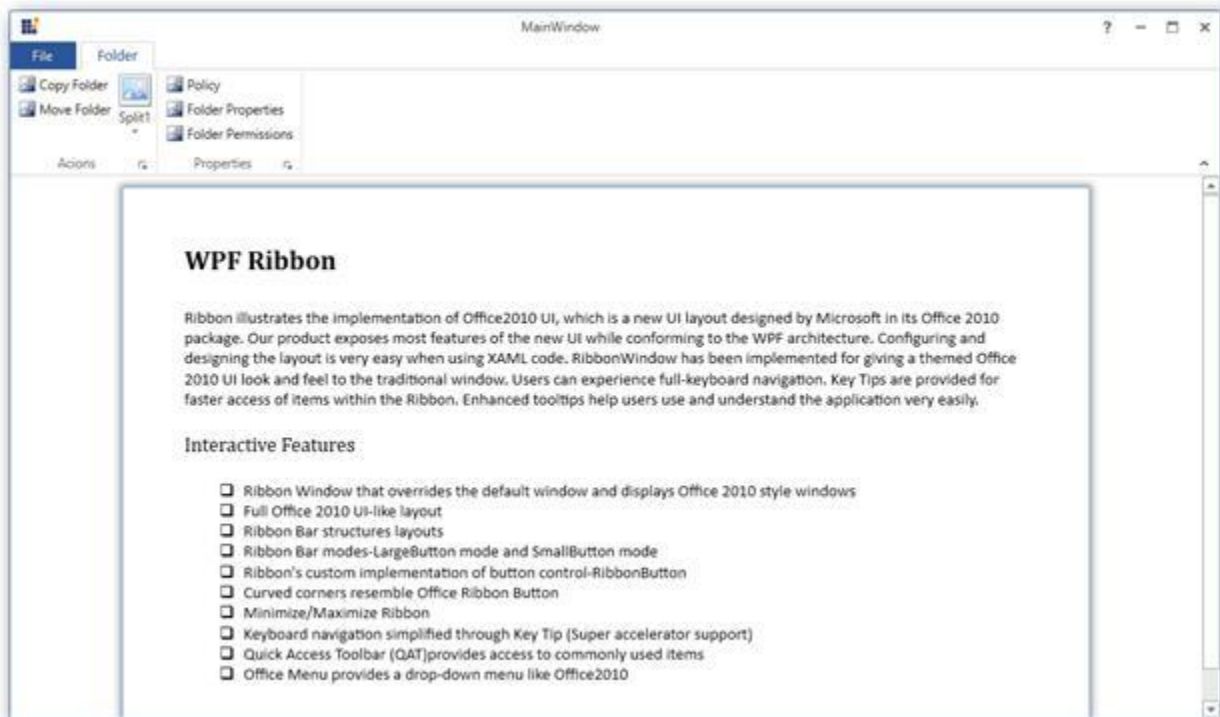

Three types of RibbonState

Normal – Ribbon control displays the RibbonTab content and the window content is arranged below the Ribbon. This is the default state

XML

```
<syncfusion:Ribbon RibbonState="Normal" VerticalAlignment="Top"
x:Name="_ribbon" >
```

```
<syncfusion:RibbonTab Caption="Folder" IsChecked="False" >
<syncfusion:RibbonBar Header="Acions">
<syncfusion:RibbonButton SizeForm="Small" Label="Copy Folder"/>
<syncfusion:RibbonButton SizeForm="Small" Label="Move Folder"/>
<syncfusion:SplitButton Label=" Split1 " SizeForm="Large" >
<syncfusion:RibbonButton SizeForm="Small" Label="Mark to Download"/>
<syncfusion:RibbonButton SizeForm="Small" Label="UnMark to Download"/>
</syncfusion:SplitButton>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Header="Properties">
<syncfusion:RibbonButton SizeForm="Small" Label="Policy"/>
<syncfusion:RibbonButton SizeForm="Small" Label="Folder Properties"/>
<syncfusion:RibbonButton SizeForm="Small" Label="Folder Permissions"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
```

Hide - RibbonTab content gets hidden in this state

XML

```
<syncfusion:Ribbon RibbonState="Hide" VerticalAlignment="Top"
x:Name="_ribbon" >
<syncfusion:RibbonTab Caption="Folder" IsChecked="False" >
<syncfusion:RibbonBar Header="Acions">
<syncfusion:RibbonButton SizeForm="Small" Label="Copy Folder"/>
<syncfusion:RibbonButton SizeForm="Small" Label="Move Folder"/>
<syncfusion:SplitButton Label=" Split1 " SizeForm="Large" >
<syncfusion:RibbonButton SizeForm="Small" Label="Mark to Download"/>
<syncfusion:RibbonButton SizeForm="Small" Label="UnMark to Download"/>
</syncfusion:SplitButton>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
```

```

</syncfusion:RibbonBar>
<syncfusion:RibbonBar Header="Properties">
<syncfusion:RibbonButton SizeForm="Small" Label="Policy"/>
<syncfusion:RibbonButton SizeForm="Small" Label="Folder Properties"/>
<syncfusion:RibbonButton SizeForm="Small" Label="Folder Permissions"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>

```

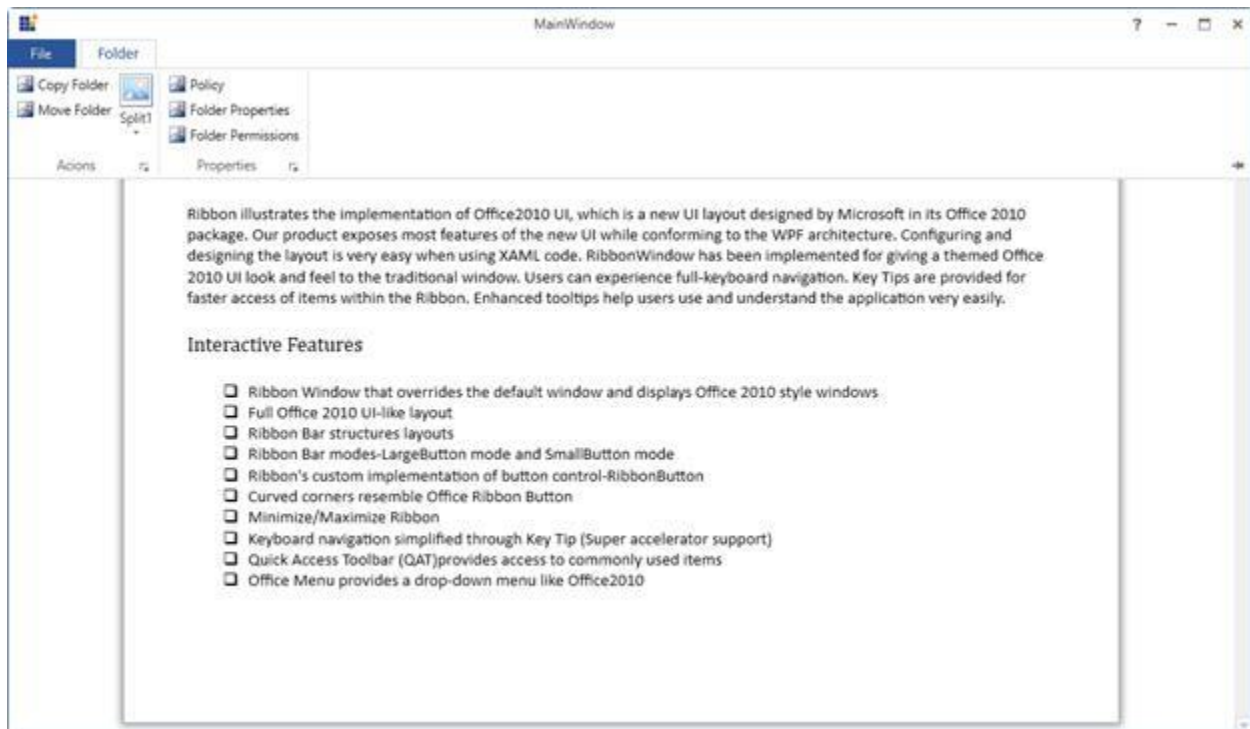

Adorner – In this state, RibbonTab content adorned above the window content

XML

```

<syncfusion:Ribbon RibbonState="Adorner" VerticalAlignment="Top"
x:Name="_ribbon" >
<syncfusion:RibbonTab Caption="Folder" IsChecked="False" >
<syncfusion:RibbonBar Header="Acions">
<syncfusion:RibbonButton SizeForm="Small" Label="Copy Folder"/>
<syncfusion:RibbonButton SizeForm="Small" Label="Move Folder"/>
<syncfusion:SplitButton Label=" Split1 " SizeForm="Large" >
<syncfusion:RibbonButton SizeForm="Small" Label="Mark to Download"/>
<syncfusion:RibbonButton SizeForm="Small" Label="UnMark to Download"/>
</syncfusion:SplitButton>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Header="Properties">
<syncfusion:RibbonButton SizeForm="Small" Label="Policy"/>
<syncfusion:RibbonButton SizeForm="Small" Label="Folder Properties"/>
<syncfusion:RibbonButton SizeForm="Small" Label="Folder Permissions"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>

```

How to change the RibbonState in run time

Ribbon State can also be changed at the Runtime. In the below code, Ribbon State has been changed dynamically in the button click event

C#

```
_ribbon.RibbonState = Syncfusion.Windows.Tools.RibbonState.Normal;
```

VB.NET

```
_ribbon.RibbonState = Syncfusion.Windows.Tools.RibbonState.Normal
```

C#

```
_ribbon.RibbonState = Syncfusion.Windows.Tools.RibbonState.Hide;
```

VB.NET

```
_ribbon.RibbonState = Syncfusion.Windows.Tools.RibbonState.Hide
```

C#

```
_ribbon.RibbonState = Syncfusion.Windows.Tools.RibbonState.Adorner;
```

VB.NET

```
_ribbon.RibbonState = Syncfusion.Windows.Tools.RibbonState.Adorner
```

Resize Ribbon Window

The ribbon control dynamically resizes as width of the window decreases, when the window's border touches the last placed Ribbon bar, the Ribbon will begin to resize its elements with the following priority.

1. **Compress Gallery** - If there is a [RibbonGallery](#) in a [RibbonBar](#), it will be resized until it is converted to a dropdown button. Once it is converted into dropdown button, then the Ribbon will begin to resize the [Large](#) size form items.
2. **Compress Large items** - When there are three or more continuous [Large](#) items, then Ribbon will reduce each pair of three continuous [Large](#) size form items, starting from the right side, into [Small](#) size form items. Once each pair of three continuous [Large](#) size form items are converted into [Small](#) size form, then Ribbon will begin to resize the [Small](#) size form items.
3. **Compress Small items** - When there are three or more continuous [Small](#) items, then Ribbon will reduce each pair of three continuous [Small](#) size form items, starting from the right side, into [ExtraSmall](#) size form items. Once each pair of three continuous [Small](#) size form items are converted into [ExtraSmall](#) size form, then Ribbon will begin convert the [RibbonBar](#) into dropdown button.
4. **Collapsing the RibbonBar** - When there are no three or more continuous [Large](#) or [Small](#) size form items and when there are other ribbon items such as CheckBox, RadioButton, ComboBox, TextBox, ListBox or any other custom items, then, starting with the last bar, each [RibbonBar](#) will be converted into a dropdown button, with its items accessible by clicking on the dropdown arrow.

When the size of the window is increased, the [RibbonBar](#) will become visible if the spacing between the window border and the [RibbonBar](#) is large enough to accommodate its items. These items will then be expanded in the order, starting with the most recently collapsed item and ending with the initially collapsed item.

The [IsAutoSizeFormEnabled](#) property must be set to True to get responsive ribbon window. The following snippet is used for resize the ribbon window.

XML

```
<Grid>
<syncfusion:Ribbon syncfusion:Ribbon.IsAutoSizeFormEnabled="True"
x:Name="_ribbon" VerticalAlignment="Top">
</syncfusion:Ribbon>
</Grid>
```

RibbonBar Positioning

The [RibbonBar](#) can be positioned either at the left or right side of the [Ribbon](#) by using the [Position](#) property. The RibbonBar's [Position](#) property has following two values,

- Left - RibbonBar is placed on the left side of the Ribbon
- Right - RibbonBar is placed on the right side of the Ribbon

The following code snippet illustrates this RibbonBar positioning support.

XML

```
<syncfusion:RibbonWindow

Note: [View sample in GitHub](#)

Resize based on collapse order

The Ribbon control provides support to resize the RibbonBar's based on the order specified in the `SizeReductionOrder` property in the `RibbonTab`. The `SizeReductionOrder` property accepts the names of the `RibbonBar` that determines the order in which `RibbonBar` size is reduced. The Ribbon will begin to resize its elements with the following priority.

1. Compressing the RibbonBar specified in the SizeReductionOrder:

- a) The Ribbon will initially retrieve the `RibbonBar` corresponding to the first name specified in the `SizeReductionOrder` and resize its elements based on its `SizeForm`. This `RibbonBar` will be converted to a dropdown if there are no three or more consecutive Large or Small size form items.
- b) Once the `RibbonBar` corresponding to the first name specified in the `SizeReductionOrder` is collapsed, the Ribbon will retrieve the next name and its corresponding `RibbonBar` and begin resizing in the same manner as in the previous step. This process continues until all of the `SizeReductionOrder` property's corresponding `RibbonBar`'s are collapsed into a dropdown.

2. Compressing the other RibbonBar's:

The remaining `RibbonBar`'s that are not specified in the `SizeReductionOrder` property will be resized according to the Ribbon's default resizing behaviour once the corresponding `RibbonBar` of the names specified in the `SizeReductionOrder` property are resized and collapsed. To know more about the default resizing behavior, refer [here](#).

When the size of the window is increased, the `RibbonBar` will become visible if the spacing between the window border and the `RibbonBar` is large enough to accommodate its items. These items will then be expanded in the order, starting with the most recently collapsed item and ending with the initially collapsed item.

In the below code snippet, the `SizeReductionOrder` property in the **Home RibbonTab** contains the name of **Clipboard** and **Paragraph RibbonBar**. So, when resizing the Ribbon, the Clipboard **RibbonBar** will be compressed and converted to a dropdown first, followed by the Paragraph **RibbonBar**. The remaining RibbonBar's will be collapsed as per the default resizing behaviour once the **Clipboard** and **Paragraph** RibbonBar's are converted to dropdown.

Note: [View sample in GitHub](#)

Setting collapse image for RibbonBar

When the RibbonBar is converted into a dropdown button during resizing, the [RibbonBar](#) allows us to display a image using its [IconTemplate](#) or [CollapseImage](#) property.

Note: The [RibbonBar](#) loads icon in the following priority order,

- [IconTemplate](#)
- [CollapselImage](#)

Setting icon template

The [IconTemplate](#) property provides support to set any type of image such as glyph, font or any custom content to the [RibbonBar](#). The [RibbonBar](#) displays the [IconTemplate](#) in 16 * 16 size.

clipboardBar.IconTemplate = iconDataTemplate2;
// Adding bars to the tabs
homeTab.Items.Add(clipboardBar);
homeTab.Items.Add(fontBar);
// Adding tabs to ribbon
ribbon.Items.Add(homeTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);

```

Note: [View sample in GitHub](#)

Setting image path

The [RibbonBar](#) allows to set the image for the dropdown button using its [CollapseImage](#) property. The [RibbonBar](#) displays the image in 16 * 16 size.

XML

```

<syncfusion:RibbonWindow x:Class="WpfAppl.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"

```

Grouping RibbonTabs using ContextTabGroups

ContextualTabGroups are used to group the RibbonTabs for easy Navigation. This ContextTabGroups appear when a user enable their context.

Creating ContextTabGroup

This ContextTabGroup can also be kept hidden and shown while required cases like in Word Document's TABLETOOLS ContextTabGroups which gets displayed automatically, while selecting the table. The following code snippet used to create a ContextTabGroup

XML

```
<syncfusion:Ribbon.ContextTabGroups>
<syncfusion:ContextTabGroup Label="Table tools" IsGroupVisible="True"
BackColor="Green">
<syncfusion:RibbonTab Caption="Tables" IsChecked="True" />
<syncfusion:RibbonTab Caption="Design" IsChecked="False" />
</syncfusion:ContextTabGroup>
</syncfusion:Ribbon.ContextTabGroups>
```

Add ContextTabGroup to the simplified layout

When the simplified layout is enabled, the ContextTabGroup can be added and its items will be displayed in a single line as shown below. To know more about the simplified layout, refer [here](#).

XML

```
<syncfusion:RibbonWindow x:Class="RibbonButton_IconTemp.Window1"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:RibbonButton_IconTemp" xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
```

```

mc:Ignorable="d" xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
skin:SfSkinManager.VisualStudio="MaterialLight"
Title="Untitled 1 - Ribbon Control" Height="450" Width="800">
<Grid x:Name="grid">
<syncfusion:Ribbon VerticalAlignment="Top" EnableSimplifiedLayoutMode="True"
LayoutMode="Simplified">
<syncfusion:Ribbon.ContextTabGroups>
<syncfusion:ContextTabGroup

SizeForm="Small">
</syncfusion:DropDownButton>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:ContextTabGroup>
</syncfusion:Ribbon.ContextTabGroups>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

C#

```

Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
ribbon.EnableSimplifiedLayoutMode = true;
ribbon.LayoutMode = LayoutMode.Simplified;
//Creating context tab group
ContextTabGroup contextTab = new ContextTabGroup();
contextTab.Label = "Tools";
contextTab.BackColor = Colors.Orange;
contextTab.IsGroupVisible = true;
// Creating new tabs
RibbonTab insertTab = new RibbonTab();

```

```

insertTab.Caption = "Insert";
insertTab.IsChecked = true;
// Creating new bar
RibbonBar illustrationsBar = new RibbonBar();
illustrationsBar.Header = "Illustrations";
// Creating items
// Creating items
RibbonButton pictureButton = new RibbonButton();
pictureButton.Label = "Picture";
pictureButton.SizeForm = SizeForm.Large;
pictureButton.MediumIcon = new BitmapImage(new
Uri(@"Resources/Picture20.png", UriKind.RelativeOrAbsolute));
RibbonButton commentButton = new RibbonButton();
commentButton.Label = "Comment";
commentButton.SizeForm = SizeForm.Large;
commentButton.MediumIcon = new BitmapImage(new Uri(@"Resources/New
Comment20.png", UriKind.RelativeOrAbsolute));
DropDownButton shapesButton = new DropDownButton();
shapesButton.Label = "Shapes";
shapesButton.SizeForm = SizeForm.Small;
shapesButton.MediumIcon = new BitmapImage(new Uri(@"Resources/Insert
Shapes20.png", UriKind.RelativeOrAbsolute));
DropDownButton chartButton = new DropDownButton();
chartButton.Label = "Chart";
chartButton.SizeForm = SizeForm.Small;
chartButton.MediumIcon = new BitmapImage(new Uri(@"Resources/Base
chart20.png", UriKind.RelativeOrAbsolute));
// Adding items to bar
illustrationsBar.Items.Add(pictureButton);
illustrationsBar.Items.Add(commentButton);
illustrationsBar.Items.Add(shapesButton);
illustrationsBar.Items.Add(chartButton);
// Adding bars to the tabs
insertTab.Items.Add(illustrationsBar);
//Adding ribbon tab to the context tab
contextTab.RibbonTabs.Add(insertTab);
// Adding context tab
ribbon.ContextTabGroups.Add(contextTab);
grid.Children.Add(ribbon);
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);

```

Multiple ContextTabs

To differentiate one ContextTabGroup with one another, change its **BackColor** property of the ContextTabGroup, Since a ContextTabGroup Support to have multiple context Tab.

XML

```
<syncfusion:Ribbon.ContextTabGroups>
```

```
<syncfusion:ContextTabGroup Label="Table Tools" BackColor="Green"
IsGroupVisible="True">
<syncfusion:RibbonTab Caption="Tables" IsChecked="True" />
<syncfusion:RibbonTab Caption="Design" IsChecked="False" />
</syncfusion:ContextTabGroup>
<syncfusion:ContextTabGroup Label="Table Grid" BackColor="Red"
IsGroupVisible="True">
<syncfusion:RibbonTab Caption="Tables" IsChecked="False" />
<syncfusion:RibbonTab Caption="Design" IsChecked="False" />
</syncfusion:ContextTabGroup>
</syncfusion:Ribbon.ContextTabGroups>
```

ContextTabGroup heading

The **Label** property of the ContextTabGroup is used to define the Heading for the ContextTabGroup.

XML

```
<syncfusion:Ribbon.ContextTabGroups>
<syncfusion:ContextTabGroup Label="Table tools" BackColor="Green"
IsGroupVisible="True">
<syncfusion:RibbonTab Caption="Tables" IsChecked="True" />
<syncfusion:RibbonTab Caption="Design" IsChecked="False" />
</syncfusion:ContextTabGroup>
</syncfusion:Ribbon.ContextTabGroups>
```

Changing the visibility at run time

ContextTabGroup visibility can also be changed at the runtime. To change the visibility, enable `IsGroupVisible` property of the ContextTabGroup

XML

```
<syncfusion:Ribbon VerticalAlignment="Top" >
  <syncfusion:Ribbon.ContextTabGroups>
    <syncfusion:ContextTabGroup x:Name="_contextTabGroup" Label="Table tools"
      BackColor="Red" >
      <syncfusion:RibbonTab Caption="Tables" IsChecked="True" >
      </syncfusion:RibbonTab>
      <syncfusion:RibbonTab Caption="Design" IsChecked="False" >
      </syncfusion:RibbonTab>
    </syncfusion:ContextTabGroup>
  </syncfusion:Ribbon.ContextTabGroups>
</syncfusion:Ribbon>
```

C#

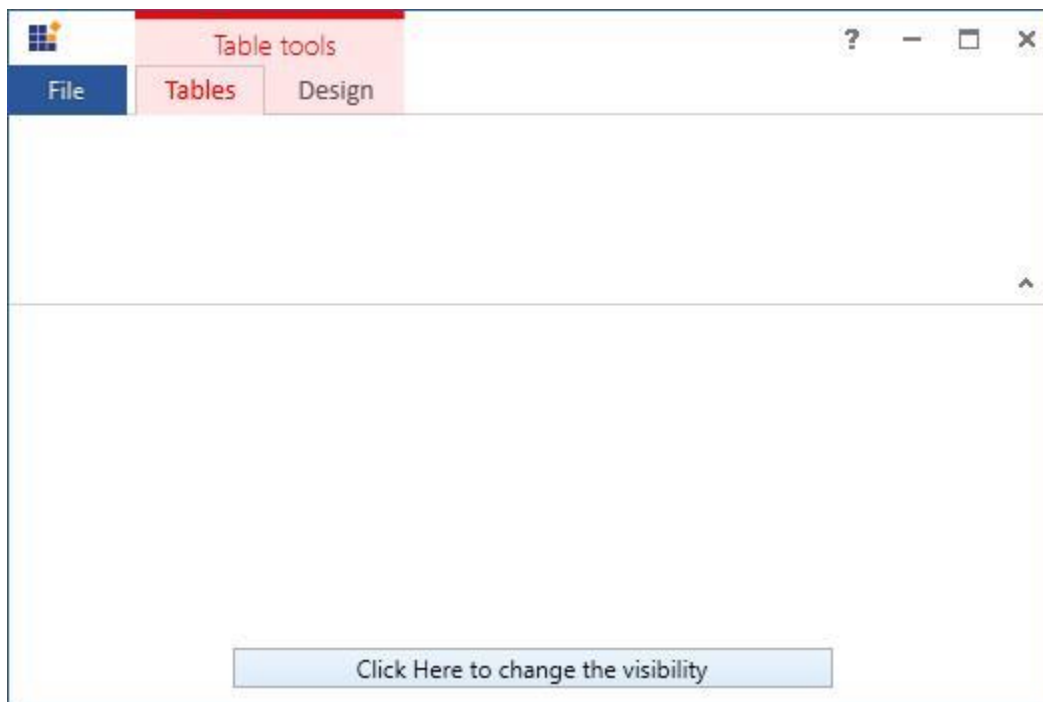

```
private void Button_Click(object sender, RoutedEventArgs e)
{
    _contextTabGroup.IsGroupVisible = true;
}
```

VB.NET

```
Private Sub Button_Click(ByVal sender As Object, ByVal e As RoutedEventArgs)
    _contextTabGroup.IsGroupVisible = True
End Sub
```

After the Button is clicked, the ContextTabGroup visibility changes as follows

Creating ContextTabGroup in MVVM

To create context tab group in Ribbon, use `ContextGroupSource` and `ContextGroupContainerStyle` properties. Similarly we can populate ContextTabGroup to corresponding RibbonTab using `ItemsSource` and `ItemContainerStyle` properties of ContextTabGroup.

To create a ContextTabGroup in MVVM, follow below steps.

1. Create a class for ContextTabGroup, RibbonBar and RibbonItems in Model CS file.

C#

```
public class CustomContextTab : INotifyPropertyChanged
{
    private string tabheader;
    public string TabHeader
    {
        get { return tabheader; }
        set
        {
            tabheader = value;
            RaisePropertyChanged("TabHeader");
        }
    }
    private Color _backcolor;
    public Color BackColor
    {
        get { return _backcolor; }
        set
        {
            _backcolor = value;
            RaisePropertyChanged("BackColor");
        }
    }
    private bool _isgroupvisible;
    public bool IsGroupVisible
    {
        get { return _isgroupvisible; }
        set
        {
            _isgroupvisible = value;
            RaisePropertyChanged("IsGroupVisible");
        }
    }
    public ObservableCollection<CustomRibbonTab> CustomContextRibbonTabs { get; set; }
    public CustomContextTab()
    {
        CustomContextRibbonTabs = new ObservableCollection<CustomRibbonTab>();
    }
    public void RaisePropertyChanged(string name)
    {
        if (PropertyChanged != null)
        {
            PropertyChanged(this, new PropertyChangedEventArgs(name));
        }
    }
    public event PropertyChangedEventHandler PropertyChanged;
}
public class CustomRibbonBar
{
    public string BarHeader { get; set; }
    public ObservableCollection<CustomRibbonItem> CustomRibbonItems { get; set; }
}
```

```
public CustomRibbonBar()
{
    CustomRibbonItems = new ObservableCollection<CustomRibbonItem>();
}
}
public class CustomRibbonItem
{
    public CustomRibbonItem()
    {
        IsSplitButton = false;
        IsBoolean = true;
    }
    public string ItemHeader
    {
        get;
        set;
    }
    public string Image { get; set; }
    public bool IsBoolean { get; set; }
    public bool IsLarge { get; set; }
    public bool IsSplitButton { get; set; }
}
```

VB.NET

```
Public Class CustomContextTab
Inherits INotifyPropertyChanged
Private tabheader As String
Public Property TabHeader As String
Get
Return tabheader
End Get
Set(ByVal value As String)
tabheader = value
RaisePropertyChanged("TabHeader")
End Set
End Property
Private _backcolor As Color
Public Property BackColor As Color
Get
Return _backcolor
End Get
Set(ByVal value As Color)
_backcolor = value
RaisePropertyChanged("BackColor")
End Set
End Property
Private _isgroupvisible As Boolean
Public Property IsGroupVisible As Boolean
Get
Return _isgroupvisible
End Get
Set(ByVal value As Boolean)
_isgroupvisible = value
RaisePropertyChanged("IsGroupVisible")
End Set
```

```

End Property
Public Property CustomContextRibbonTabs As ObservableCollection(Of
CustomRibbonTab)
Public Sub New()
CustomContextRibbonTabs = New ObservableCollection(Of CustomRibbonTab) ()
End Sub
Public Sub RaisePropertyChanged(ByVal name As String)
RaiseEvent PropertyChanged(Me, New PropertyChangedEventArgs(name))
End Sub
Public Event PropertyChanged As PropertyChangedEventHandler
End Class
Public Class CustomRibbonBar
Public Property BarHeader As String
Public Property CustomRibbonItems As ObservableCollection(Of
CustomRibbonItem)
Public Sub New()
CustomRibbonItems = New ObservableCollection(Of CustomRibbonItem) ()
End Sub
End Class
Public Class CustomRibbonItem
Public Sub New()
IsSplitButton = False
IsBoolean = True
End Sub
Public Property ItemHeader As String
Public Property Image As String
Public Property IsBoolean As Boolean
Public Property IsLarge As Boolean
Public Property IsSplitButton As Boolean
End Class

```

2. Create a View model class and then add ContextTabGroup , RibbonBars and RibbonItems with some properties.

C#

```

public class ViewModel
{
public ObservableCollection<CustomContextTab> CustomContextTabs { get; set; }
}
public ViewModel()
{
CustomContextTabs = new ObservableCollection<CustomContextTab>();
PopulateContextTabs();
}
private void PopulateContextTabs()
{
CustomContextTab contexttab1 = new CustomContextTab() { TabHeader =
"ContextTabGroup1", BackColor=Colors.Red, IsGroupVisible=true };
CustomRibbonTab Tab1 = new CustomRibbonTab() { TabHeader = "TabGroup1" };
PopulateRibbonHomeBars(Tab1);
CustomRibbonTab Tab2 = new CustomRibbonTab() { TabHeader = "TabGroup2" };
PopulateRibbonInsertBars(Tab2);
contexttab1.CustomContextRibbonTabs.Add(Tab1);
contexttab1.CustomContextRibbonTabs.Add(Tab2);
}
}

```

```

CustomContextTabs.Add(contexttab1);
CustomContextTab contexttab2 = new CustomContextTab() { TabHeader =
"ContextTabGroup2", BackColor=Colors.Green, IsGroupVisible=true };
CustomRibbonTab Tab11 = new CustomRibbonTab() { TabHeader = "TabGroup11" };
PopulateRibbonHomeBars(Tab11);
CustomRibbonTab Tab21 = new CustomRibbonTab() { TabHeader = "TabGroup21" };
PopulateRibbonInsertBars(Tab21);
contexttab2.CustomContextRibbonTabs.Add(Tab11);
contexttab2.CustomContextRibbonTabs.Add(Tab21);
CustomContextTabs.Add(contexttab2);
}
void PopulateRibbonHomeBars(CustomRibbonTab Tab)
{
CustomRibbonBar Bar1 = new CustomRibbonBar() { BarHeader = "Clipboard" };
PopulateRibbonNewItemS(Bar1);
CustomRibbonBar Bar2 = new CustomRibbonBar() { BarHeader = "Editing" };
PopulateRibbonEditingItems(Bar2);
Tab.CustomRibbonBars.Add(Bar1);
Tab.CustomRibbonBars.Add(Bar2);
}
void PopulateRibbonNewItemS(CustomRibbonBar Bar)
{
CustomRibbonItem Item1 = new CustomRibbonItem() { ItemHeader = "Paste",
IsLarge = true, Image = "Paste32.png" };
CustomRibbonItem Item2 = new CustomRibbonItem() { ItemHeader = "Cut", Image
= "Cut16.png" };
CustomRibbonItem Item3 = new CustomRibbonItem() { ItemHeader = "Copy", Image
= "Copy16.png" };
CustomRibbonItem Item4 = new CustomRibbonItem() { ItemHeader = "Format
Painter", Image = "FormatPainter16.png" };
Bar.CustomRibbonItems.Add(Item1);
Bar.CustomRibbonItems.Add(Item2);
Bar.CustomRibbonItems.Add(Item3);
Bar.CustomRibbonItems.Add(Item4);
}
private void PopulateRibbonEditingItems(CustomRibbonBar Bar)
{
CustomRibbonItem Item1 = new CustomRibbonItem() { ItemHeader = "Hyperlink",
IsLarge = true, Image = "hyperlink32.png" };
CustomRibbonItem Item2 = new CustomRibbonItem() { ItemHeader = "Replace",
IsLarge = true, Image = "replace_32.png" };
CustomRibbonItem Item3 = new CustomRibbonItem() { ItemHeader = "Zoom",
IsLarge = true, Image = "Zoom_32x32.png" };
Bar.CustomRibbonItems.Add(Item1);
Bar.CustomRibbonItems.Add(Item2);
Bar.CustomRibbonItems.Add(Item3);
}
private void PopulateRibbonInsertBars(CustomRibbonTab Tab)
{
CustomRibbonBar Bar2 = new CustomRibbonBar() { BarHeader = "Mail" };
PopulateRibbonMailItems(Bar2);
CustomRibbonBar Bar1 = new CustomRibbonBar() { BarHeader = "Tables" };
PopulateRibbonTablesItems(Bar1);
Tab.CustomRibbonBars.Add(Bar2);
Tab.CustomRibbonBars.Add(Bar1);
}
private void PopulateRibbonMailItems(CustomRibbonBar Bar)

```

```

{
CustomRibbonItem Item1 = new CustomRibbonItem() { ItemHeader = "Attach
File", IsLarge = true, Image = "base_paperclip_32.png", IsSplitButton=true };
CustomRibbonItem Item2 = new CustomRibbonItem() { ItemHeader = "Business
card", IsLarge = true, Image = "base_business_contacts.png" };
CustomRibbonItem Item3 = new CustomRibbonItem() { ItemHeader = "Audio",
IsLarge = true, Image = "base_speaker_32.png" };
Bar.CustomRibbonItems.Add(Item1);
Bar.CustomRibbonItems.Add(Item2);
Bar.CustomRibbonItems.Add(Item3);
}
private void PopuplateRibbonTablesItems(CustomRibbonBar Bar)
{
CustomRibbonItem Item1 = new CustomRibbonItem() { ItemHeader = "Tables",
IsLarge = true, IsSplitButton = true, Image = "Table_32.png" };
Bar.CustomRibbonItems.Add(Item1);
}
}

```

VB.NET

```

Public Class ViewModel
Public Property CustomContextTabs As ObservableCollection(Of
CustomContextTab)
Public Sub New()
CustomContextTabs = New ObservableCollection(Of CustomContextTab) ()
PopulateContextTabs ()
End Sub

End Sub
Private Sub PopulateRibbonTablesItems(ByVal Bar As CustomRibbonBar)
Dim Item1 As CustomRibbonItem = New CustomRibbonItem() With {
    .ItemHeader = "Tables",
    .IsLarge = True,
    .IsSplitButton = True,
    .Image = "Table_32.png"
}
Bar.CustomRibbonItems.Add(Item1)
End Sub
End Class

```

3. Now bind the properties of View model in XAML.

XML

```

<DataTemplate x:Key="Ribbonbutton">
<syncfusion:RibbonButton Label="{Binding ItemHeader}" SizeForm="{Binding
IsLarge, Converter={StaticResource sizeform}}" Visibility="{Binding

```

```

IsBoolean, Converter={StaticResource visibility}}" LargeIcon="{Binding
Image,Converter={StaticResource image}}" SmallIcon="{Binding
Image,Converter={StaticResource image}}"/>
</DataTemplate>
<DataTemplate x:Key="Splitbutton">
<syncfusion:SplitButton Label="{Binding ItemHeader}" SizeForm="{Binding
IsLarge, Converter={StaticResource sizeform}}" Visibility="{Binding
IsBoolean, Converter={StaticResource visibility}}" LargeIcon="{Binding
Image,Converter={StaticResource image}}" SmallIcon="{Binding
Image,Converter={StaticResource image}}"/>
</DataTemplate>
<syncfusion:Ribbon VerticalAlignment="Top"
Name="Ribbon1" RibbonBarCollapseImage="App.ico"
ItemsSource="{Binding CustomRibbonTabs}" ContextGroupSource="{Binding
CustomContextTabs}" >
<syncfusion:Ribbon.ItemContainerStyle>
<Style TargetType="{x:Type syncfusion:RibbonTab}">
<Setter Property="Caption" Value="{Binding TabHeader}"></Setter>
<Setter Property="ItemsSource" Value="{Binding CustomRibbonBars}" />
<Setter Property="ItemContainerStyle">
<Setter.Value>
<Style BasedOn="{StaticResource Office2013RibbonBarStyle}"
TargetType="{x:Type syncfusion:RibbonBar}">
<Setter Property="Header" Value="{Binding BarHeader}" />
<Setter Property="ItemsSource" Value="{Binding CustomRibbonItems}" />
<Setter Property="ItemTemplateSelector" Value="{StaticResource selector}" />
</Style>
</Setter.Value>
</Setter>
</Style>
</syncfusion:Ribbon.ItemContainerStyle>
<syncfusion:Ribbon.ContextGroupContainerStyle>
<Style TargetType="syncfusion:ContextTabGroup">
<Setter Property="Label" Value="{Binding TabHeader}" />
<Setter Property="BackColor" Value="{Binding BackColor, Mode=TwoWay}" />
<Setter Property="IsGroupVisible" Value="{Binding IsGroupVisible,
Mode=TwoWay}" />
<Setter Property="ItemsSource" Value="{Binding CustomContextRibbonTabs}" />
<Setter Property="ItemContainerStyle">
<Setter.Value>
<Style TargetType="syncfusion:RibbonTab">
<Setter Property="Caption" Value="{Binding TabHeader}" />
<Setter Property="ItemsSource" Value="{Binding CustomRibbonBars}" />
<Setter Property="ItemContainerStyle">
<Setter.Value>
<Style BasedOn="{StaticResource Office2013RibbonBarStyle}"
TargetType="{x:Type syncfusion:RibbonBar}">
<Setter Property="Header" Value="{Binding BarHeader}" />
<Setter Property="ItemsSource" Value="{Binding CustomRibbonItems}" />
<Setter Property="ItemTemplateSelector" Value="{StaticResource selector}" />
<Setter Property="CollapseImage" Value="/Images/FormatPainter16.png" />
</Style>
</Setter.Value>
</Setter>
</Style>
</Setter.Value>
</Setter>

```

```
</Style>
</syncfusion:Ribbon.ContextGroupContainerStyle>
</syncfusion:Ribbon>
```

4. Add a converter class for binding conversions

C#

```
public class BooltoSizeformConverter: IValueConverter
{
    #region IValueConverter Members
    public object Convert(object value, Type targetType, object parameter,
        System.Globalization.CultureInfo culture)
    {
        if (value.Equals(true))
        {
            return "Large";
        }
        else
        {
            return "Small";
        }
    }
    public object ConvertBack(object value, Type targetType, object parameter,
        System.Globalization.CultureInfo culture)
    {
        throw new NotImplementedException();
    }
    #endregion
}
public class BooltoVisibilityConverter : IValueConverter
{
    #region IValueConverter Members
    public object Convert(object value, Type targetType, object parameter,
        System.Globalization.CultureInfo culture)
    {
        if (value.Equals(true))
        {
            return Visibility.Visible;
        }
        else
        {
            return Visibility.Collapsed;
        }
    }
    public object ConvertBack(object value, Type targetType, object parameter,
        System.Globalization.CultureInfo culture)
    {
        throw new NotImplementedException();
    }
    #endregion
}
public class ItemDataTemplateSelector : DataTemplateSelector
{

```

```

public override DataTemplate SelectTemplate(object item, DependencyObject
container)
{
    FrameworkElement element = container as FrameworkElement;
    if (element != null && item != null )
    {
        if (item is CustomRibbonItem && (item as CustomRibbonItem).IsSplitButton)
        {
            return
            element.FindResource("Splitbutton") as DataTemplate;
        }
        else
        {
            return element.FindResource("Ribbonbutton") as DataTemplate;
        }
    }
    return null;
}

public class ImageConverter : IValueConverter
{
    public object Convert(object value, Type targetType, object parameter,
    System.Globalization.CultureInfo culture)
    {
        if (value != null)
        {
            string str = value.ToString();
            return "../Images/" + str;
        }
        else
        {
            return value;
        }
    }
    public object ConvertBack(object value, Type targetType, object parameter,
    System.Globalization.CultureInfo culture)
    {
        throw new NotImplementedException();
    }
}

```

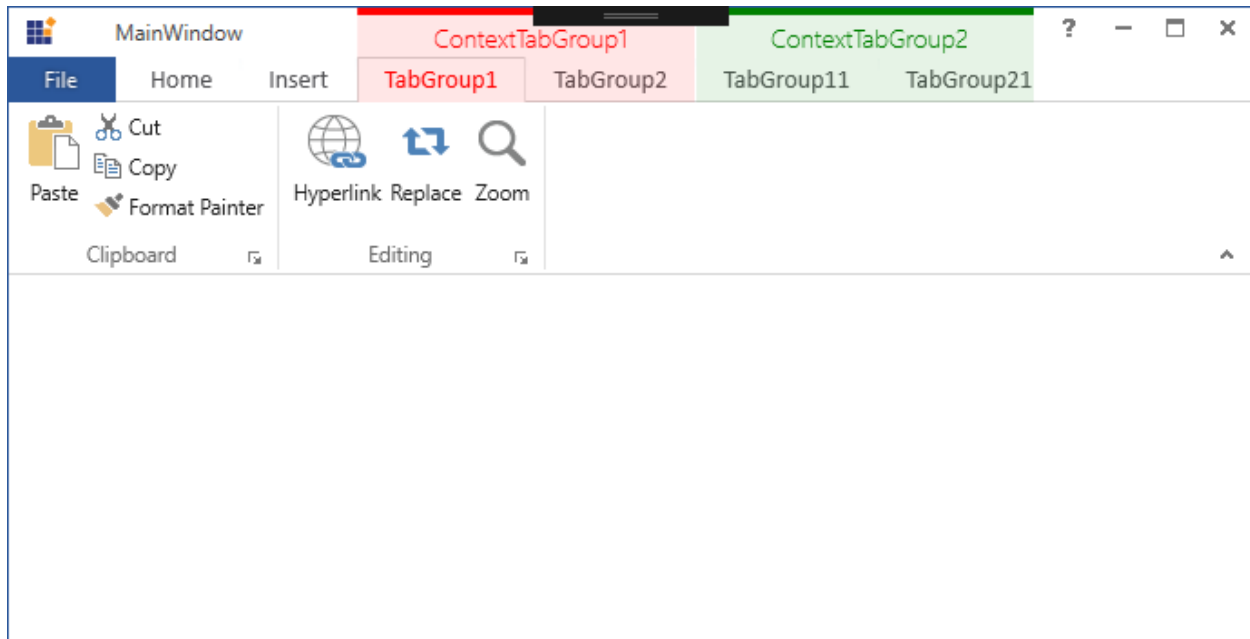

VB.NET

```

Public Class BooltoSizeformConverter
    Inherits IValueConverter
    Public Function Convert(ByVal value As Object, ByVal targetType As Type,
    ByVal parameter As Object, ByVal culture As
    System.Globalization.CultureInfo) As Object
    If value.Equals(True) Then
    Return "Large"
    Else
    Return "Small"
    End If
    End Function
    Public Function ConvertBack(ByVal value As Object, ByVal targetType As Type,
    ByVal parameter As Object, ByVal culture As
    System.Globalization.CultureInfo) As Object
    Throw New NotImplementedException()
    End Function
End Class

```

```
End Function
End Class
Public Class BooltoVisibilityConverter
Inherits IValueConverter
Public Function Convert(ByVal value As Object, ByVal targetType As Type,
ByVal parameter As Object, ByVal culture As
System.Globalization.CultureInfo) As Object
If value.Equals(True) Then
Return Visibility.Visible
Else
Return Visibility.Collapsed
End If
End Function
Public Function ConvertBack(ByVal value As Object, ByVal targetType As Type,
ByVal parameter As Object, ByVal culture As
System.Globalization.CultureInfo) As Object
Throw New NotImplementedException()
End Function
End Class
Public Class ItemDataTemplateSelector
Inherits DataTemplateSelector
Public Overrides Function SelectTemplate(ByVal item As Object, ByVal
container As DependencyObject) As DataTemplate
Dim element As FrameworkElement = TryCast(container, FrameworkElement)
If element IsNot Nothing AndAlso item IsNot Nothing Then
If TypeOf item Is CustomRibbonItem AndAlso (TryCast(item,
CustomRibbonItem)).IsSplitButton Then
Return TryCast(element.FindResource("Splitbutton"), DataTemplate)
Else
Return TryCast(element.FindResource("Ribbonbutton"), DataTemplate)
End If
End If
Return Nothing
End Function
End Class
Public Class ImageConverter
Inherits IValueConverter
Public Function Convert(ByVal value As Object, ByVal targetType As Type,
ByVal parameter As Object, ByVal culture As
System.Globalization.CultureInfo) As Object
If value IsNot Nothing Then
Dim str As String = value.ToString()
Return "../Images/" & str
Else
Return value
End If
End Function
Public Function ConvertBack(ByVal value As Object, ByVal targetType As Type,
ByVal parameter As Object, ByVal culture As
System.Globalization.CultureInfo) As Object
Throw New NotImplementedException()
End Function
End Class
```

Detecting selection changes in RibbonTab

The [SelectionChanging](#) event notifies when the user attempts to switch tab in the Ribbon control. The [SelectionChanging](#) event receives an argument of the type **CancelEventArgs** that allows us to cancel the switching operation.

XML

```
<syncfusion:Ribbon x:Name="ribbon" VerticalAlignment="Top"
SelectionChanging="Ribbon_SelectionChanging">
<syncfusion:RibbonTab Caption="HOME" IsChecked="True"/>
<syncfusion:RibbonTab Caption="SEND/RCEIVE" IsChecked="False"/>
<syncfusion:RibbonTab Caption="FOLDER" IsChecked="False"/>
<syncfusion:RibbonTab Caption="VIEW" IsChecked="False"/>
</syncfusion:Ribbon>
```

C#

```
private void Ribbon_SelectionChanging(object sender,
System.ComponentModel.CancelEventArgs e)
{
e.Cancel = true;
}
```

VB.NET

```
Private Sub Ribbon_SelectionChanging(ByVal sender As Object, ByVal e As
System.ComponentModel.CancelEventArgs)
e.Cancel = True
End Sub
```

Dealing with Ribbon Items in WPF Ribbon

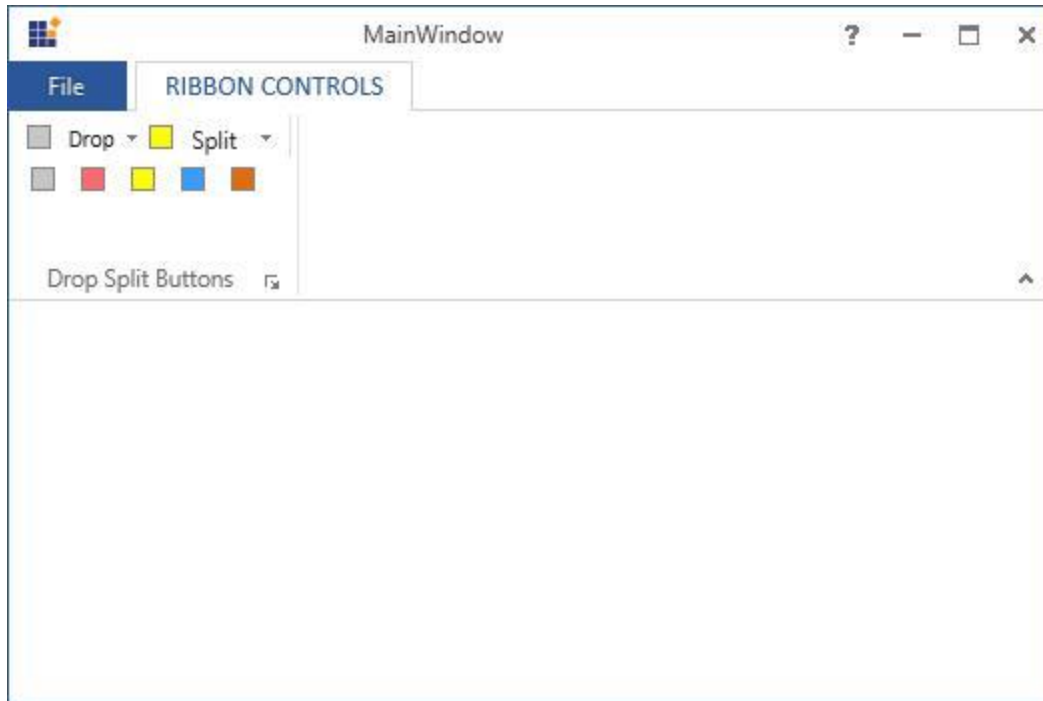

Button Panel represents a panel control that can display horizontal row of Ribbon Items in a single border. It is used to manage the place for the controls.

Adding items to ButtonPanel in XAML

Use the below code to create ButtonPanel in XAML

XML

```
<syncfusion:Ribbon VerticalAlignment="Top" x:Name="_ribbon">
<syncfusion:RibbonTab Caption="RIBBON CONTROLS" >
<syncfusion:RibbonBar Header="Drop Split Buttons">
<syncfusion:ButtonPanel>
<syncfusion:DropDownButton Label=" Drop "
SizeForm="Small"
SmallIcon="Images/Gray.png" />
<syncfusion:SplitButton Label=" Split "
SizeForm="Small"
SmallIcon="Images/Yellow.png" />
</syncfusion:ButtonPanel >
<syncfusion:ButtonPanel SeparatorVisibility="Collapsed">
<syncfusion:RibbonButton Label="Simple"
SizeForm="ExtraSmall"
SmallIcon="Images/Gray.png" />
<syncfusion:RibbonButton IsToggle="True"
Label="Toggle"
SizeForm="ExtraSmall"
SmallIcon="Images/Red.png" />
<syncfusion:RibbonButton Label="Simple"
SizeForm="ExtraSmall"
SmallIcon="Images/Yellow.png" />
<syncfusion:RibbonButton IsToggle="True"
Label="Toggle"
SizeForm="ExtraSmall"
SmallIcon="Images/Blue.png" />
<syncfusion:RibbonButton IsToggle="True"
Label="Toggle"
SizeForm="ExtraSmall"
SmallIcon="Images/Orange.png" />
</syncfusion:ButtonPanel>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
```

Adding items to ButtonPanel in code behind

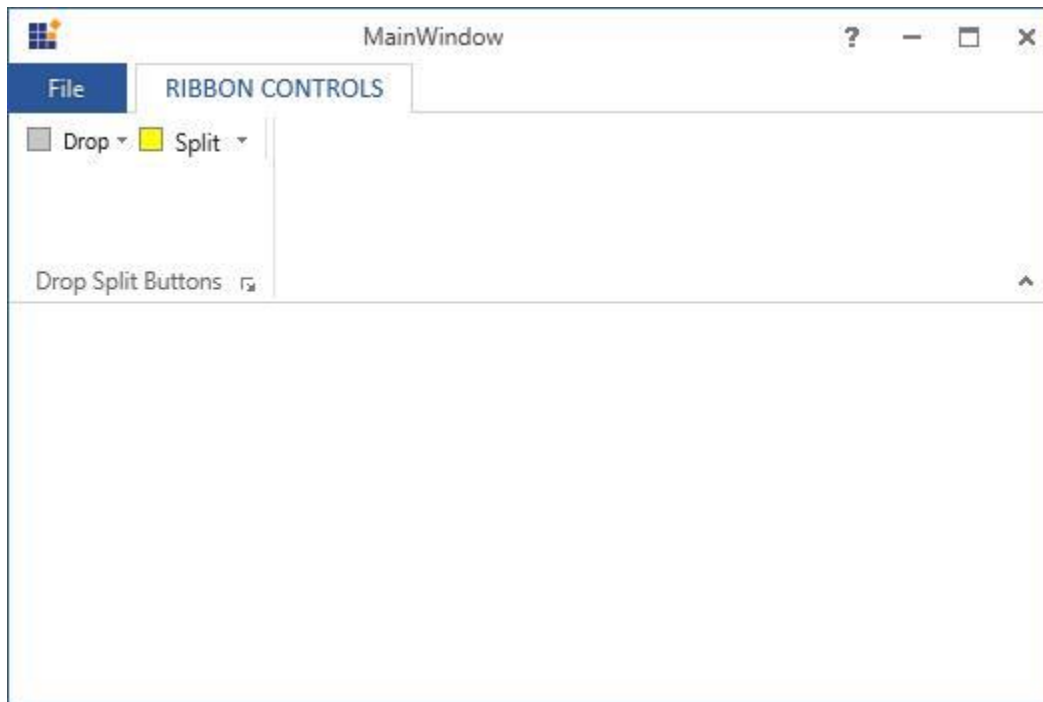

To create the ButtonPanel control in Code Behind, use the below code.

C#

```
DropDownButton _dropDownButton = new DropDownButton() { Label = "Drop",  
    SizeForm = Syncfusion.Windows.Tools.SizeForm.Small, SmallIcon = new  
    BitmapImage(new Uri("/Resources/Gray.png", UriKind.Relative)) };  
SplitButton _splitButton = new SplitButton() { Label = "Split", SizeForm =  
    Syncfusion.Windows.Tools.SizeForm.Small, SmallIcon = new BitmapImage(new  
    Uri("/Resources/Yellow.png", UriKind.Relative)) };  
ButtonPanel _buttonPanel = new ButtonPanel();  
_buttonPanel.Items.Add(_dropDownButton);  
_buttonPanel.Items.Add(_splitButton);
```

VB.NET

```
Dim _dropDownButton As New DropDownButton() With {  
    .Label = "Drop",  
    .SizeForm = Syncfusion.Windows.Tools.SizeForm.Small,  
    .SmallIcon = New BitmapImage(New Uri("/Resources/Gray.png",  
    UriKind.Relative))  
}  
Dim _splitButton As New SplitButton() With {  
    .Label = "Split",  
    .SizeForm = Syncfusion.Windows.Tools.SizeForm.Small,  
    .SmallIcon = New BitmapImage(New Uri("/Resources/Yellow.png",  
    UriKind.Relative))  
}  
Dim _buttonPanel As New ButtonPanel()  
_buttonPanel.Items.Add(_dropDownButton)  
_buttonPanel.Items.Add(_splitButton)
```

Changing size of ribbon items

SizeForm is used to set the size of the Ribbon items that are added inside the Ribbon control.

Possible values of **SizeForm** are Large, Small and ExtraSmall.

List of controls which support SizeForm

- RibbonButton
- DropDownButton
- SplitButton

The code to set SizeForm for the above controls is illustrated below

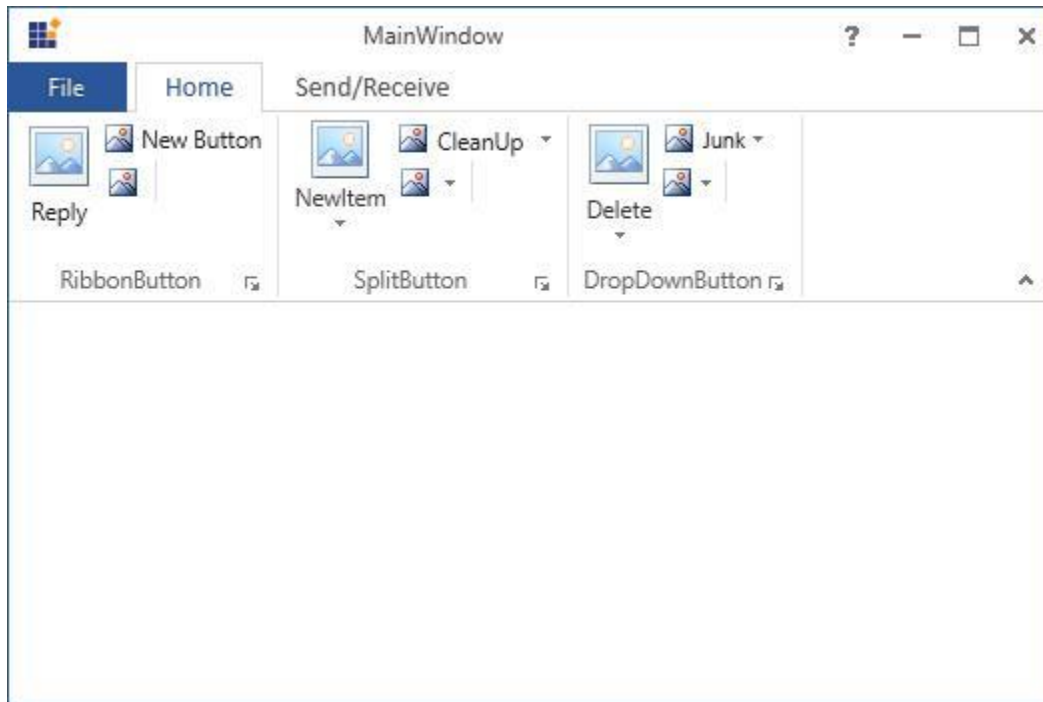

XML

```
<syncfusion:Ribbon VerticalAlignment="Top" >
<syncfusion:RibbonTab Caption="Home" IsChecked="True">
<syncfusion:RibbonBar Header="RibbonButton">
<syncfusion:RibbonButton SizeForm="Large" Label="Reply"/>
<syncfusion:RibbonButton SizeForm="Small" />
<syncfusion:ButtonPanel>
<syncfusion:RibbonButton SizeForm="ExtraSmall" Label="ReplyAll"/>
</syncfusion:ButtonPanel>
</syncfusion:RibbonBar>
<syncfusion:RibbonBar Header="SplitButton">
<syncfusion:SplitButton SizeForm="Large" Label="NewItem"/>
<syncfusion:SplitButton SizeForm="Small" Label="CleanUp"/>
<syncfusion:ButtonPanel>
<syncfusion:SplitButton SizeForm="ExtraSmall" />
</syncfusion:ButtonPanel>
</syncfusion:RibbonBar>
```

```

<syncfusion:RibbonBar Header="DropDownButton">
<syncfusion:DropDownButton SizeForm="Large" Label="Delete"/>
<syncfusion:DropDownButton SizeForm="Small" Label="Junk"/>
<syncfusion:ButtonPanel>
<syncfusion:DropDownButton SizeForm="ExtraSmall" />
</syncfusion:ButtonPanel>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="Send/Receive" IsChecked="False"/>
</syncfusion:Ribbon>

```

Add command to RibbonLauncherButton

Ribbon instance now provides command support for RibbonBar LauncherButton. It provides the following options.

- Setting LauncherButton Command
- Setting LauncherButton CommandTarget
- Setting LauncherButton CommandParameter

Set RibbonBar LauncherButton Command

Command for RibbonBar LauncherButton can be set by using **LauncherCommand** attached property. The following code example illustrates this.

XML

```

<syncfusion:Ribbon VerticalAlignment="Top" >
<syncfusion:RibbonTab Caption="Home" IsChecked="False">
<syncfusion:RibbonBar Header="Acions" IsLauncherButtonVisible="True"
syncfusion:RibbonBar.LauncherCommand="EditingCommands.IncreaseFontSize"
syncfusion:RibbonBar.LauncherCommandTarget="{Binding ElementName=Editor}">

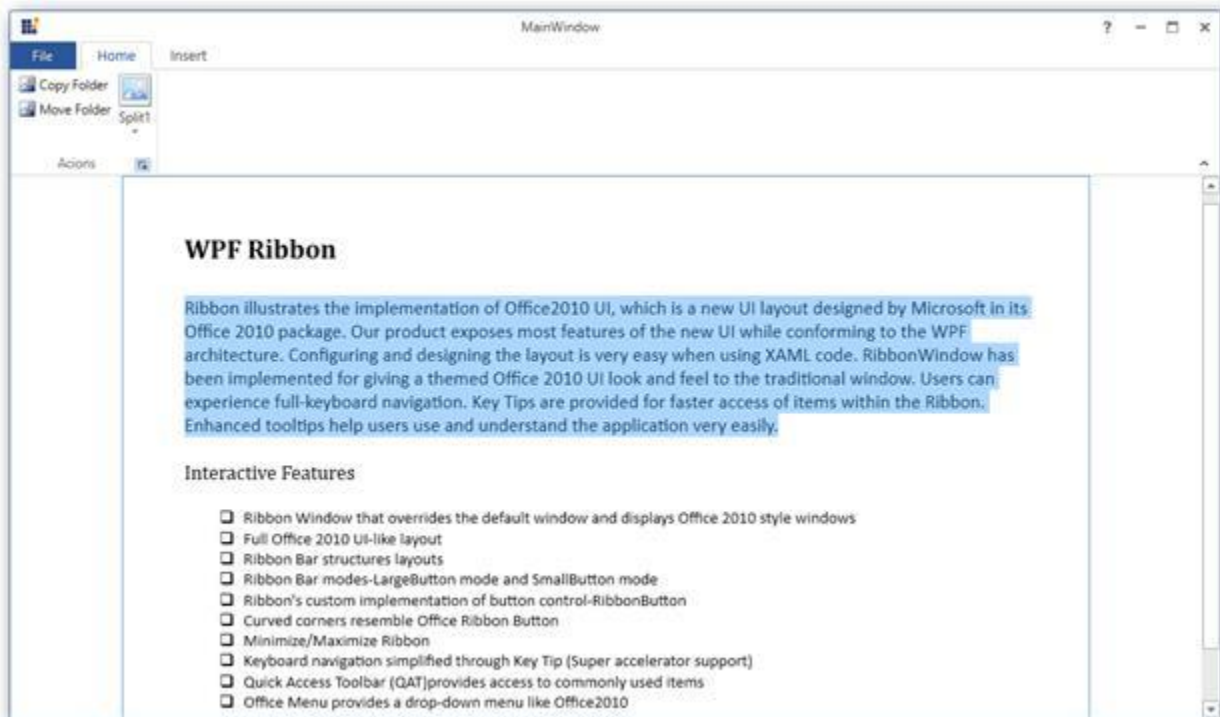

```

```

<syncfusion:RibbonButton SizeForm="Small" Label="Copy Folder"/>
<syncfusion:RibbonButton SizeForm="Small" Label="Move Folder"/>
<syncfusion:SplitButton Label=" Split1 " SizeForm="Large" >
<syncfusion:RibbonButton SizeForm="Small" Label="Mark to Download"/>
<syncfusion:RibbonButton SizeForm="Small" Label="UnMark to Download"/>
</syncfusion:SplitButton>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="Insert" />
</syncfusion:Ribbon>

```

The font size for the selected text is increased when launcher button is clicked

Show HelpButton in RibbonWindow

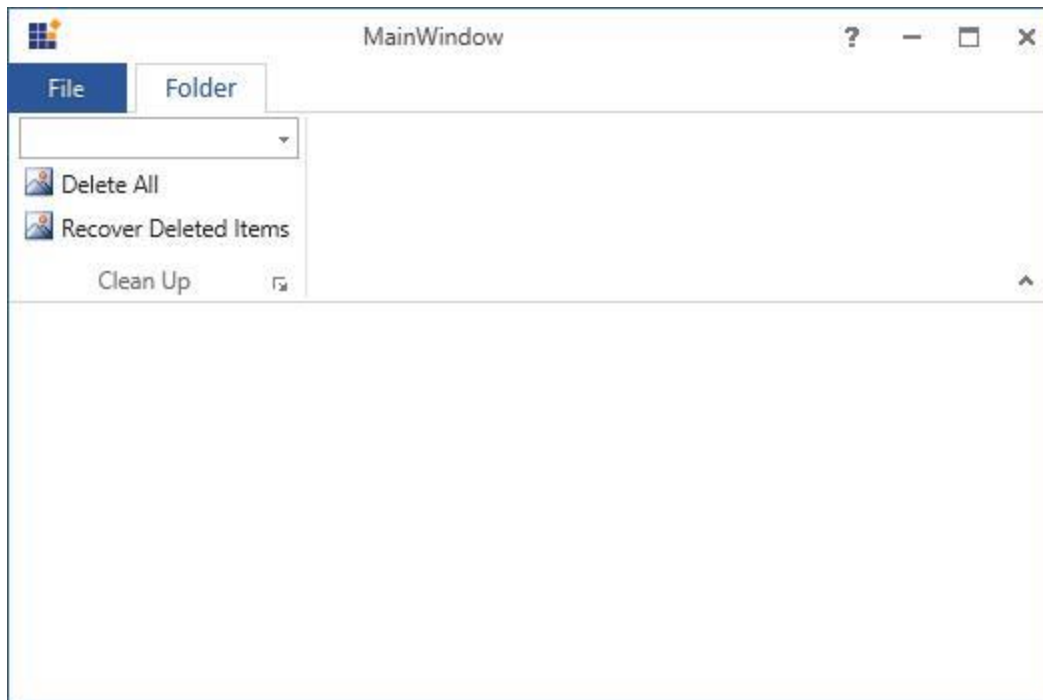

The HelpButton displays the information about the application. To enable this HelpButton in Office2013 theme, set ShowHelpButton as True

XML

```

<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonButtonPanel.MainWindow"
Title="MainWindow" Height="350" Width="525"
syncfusion:SkinStorage.VisualStudio="Office2013" ShowHelpButton="True"
x:Name="ribbonWindow"/>

```

To set the HelpButton at the right of the RibbonWindow for the themes except Office2013, use `TabPanelItem` property of the Ribbon

The `TabPanelItem` is located at the right corner below the main window close button in the following screen shot.

This following code snippet explains how to create and configure `TabPanelItem`.

XML

```
<syncfusion:Ribbon.TabPanelItem>  
<syncfusion:RibbonButton SizeForm="ExtraSmall" SmallIcon="help16.png" />  
</syncfusion:Ribbon.TabPanelItem>
```

Serialization and Deserialization in WPF Ribbon

State persistence is a combined process of serialization and deserialization. Serialization is the process of converting the state of the object to the format in which it can be stored as a file in the memory.

Deserialization is a complement process of serialization that converts into the object from the stored state information.

The Ribbon control has built-in serialization support to serialize the entire Ribbon control state and details of the layout mode. It also provides supports to save and load the Ribbon at any time while running the application, either with simplified or normal layout.

The following ribbon control states can persist separately.

1. Quick Access Tool Bar

- a. Quick Access Tool Bar Items
- b. Quick Access Tool Bar State (Above Ribbon, Below Ribbon)

2. Ribbon

- a. Ribbon State (Normal, Hide)
- b. Layout Mode (Normal, Simplified)

3. Ribbon Window

- a. Window Width
- b. Window Height
- c. Window Left
- d. Window Top

Use case scenarios

The Ribbon State Persistence feature helps users to load the state of the Ribbon control that existed when the application was closed. State Persistence feature gives a more consistent workflow for an application that is executed for a long time.

Persist ribbon states at application exit and load

To persist the Ribbon States at application exit and load, use `AutoPersist` property. It is also possible to handle the persisting states in Ribbon control by handling the `AutoPersist` property individually in Ribbon, QAT and Ribbon window.

The following code snippet shows how to handle the property in Ribbon elements.

XML

```
<syncfusion:RibbonWindow  
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
```

```

xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonStatePersistence.MainWindow"
Title="MainWindow" Height="350" Width="525" AutoPersist="True"
x:Name="RibbonWindow" WindowStyle="SingleBorderWindow"
WindowStartupLocation="CenterScreen" WindowState="Normal"
syncfusion:SkinStorage.VisualStudio="Office2013"
Loaded="RibbonWindow_Loaded">
<Grid>
<syncfusion:Ribbon x:Name="MyRibbon" AutoPersist="True"
VerticalAlignment="Top">
<syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:QuickAccessToolBar AutoPersist="True">
</syncfusion:QuickAccessToolBar>
</syncfusion:Ribbon.QuickAccessToolBar>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

Persist ribbon states any time while running the application

WPF Ribbon control supports the persistence of its states any time while running the application. Ribbon states can be saved and loaded at any time by using `SaveRibbonState` and `LoadRibbonState` methods

Before calling the methods, it is important to specify the persisting Ribbon elements in `PersistElements` collection. This collection can be changed at any time. Save and Load states at runtime are fully based on this collection details. The following code snippet shows how to add Ribbon elements that are required to retain its state.

C#

```

private void RibbonWindow_Loaded(object sender, RoutedEventArgs e)
{
    this.MyRibbon.PersistElements.Add(RibbonElements.Ribbon);
    this.MyRibbon.PersistElements.Add(RibbonElements.RibbonWindow);
    this.MyRibbon.PersistElements.Add(RibbonElements.QuickAccessToolbar);
}

```

VB.NET

```

Private Sub RibbonWindow_Loaded(ByVal sender As Object, ByVal e As
RoutedEventArgs)
    Me.MyRibbon.PersistElements.Add(RibbonElements.Ribbon)
    Me.MyRibbon.PersistElements.Add(RibbonElements.RibbonWindow)
    Me.MyRibbon.PersistElements.Add(RibbonElements.QuickAccessToolbar)
End Sub

```

Saving ribbon states

Ribbon State can be saved and loaded dynamically at run time. To save the current Ribbon State, use `SaveRibbonState` method in Ribbon.

This method has two overloaded methods for customizing the Save state process as follows:

1. void `SaveRibbonState()`

2. void SaveRibbonState(IsolatedStorageFile isoStorage, string storeFileName)

In the first method, there is no parameters. Current state of the Ribbon Control is saved to the default Isolated Storage file, which is built in the source.

C#

```
private void SaveRibbonState_Click(object sender, RoutedEventArgs e)
{
    this.MyRibbon.SaveRibbonState();
}
```

VB.NET

```
Private Sub SaveRibbonState_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
    Me.MyRibbon.SaveRibbonState()
End Sub
```

To store the current Ribbon State in the custom Isolated Storage file, use the second overloaded method. This method has two arguments namely IsolatedStorageFile and storeFileName.

C#

```
private void SaveRibbonState_Click(object sender, RoutedEventArgs e)
{
    IsolatedStorageFile storage =
    IsolatedStorageFile.GetStore(IsolatedStorageScope.User |
    IsolatedStorageScope.Assembly, null, null);
    this.MyRibbon.SaveRibbonState(storage, "Customfilename.dat");
}
```

VB.NET

```
Private Sub SaveRibbonState_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
    IsolatedStorageFile storage =
    IsolatedStorageFile.GetStore(IsolatedStorageScope.User Or
    IsolatedStorageScope.Assembly, null, null)
    Me.MyRibbon.SaveRibbonState(storage, "Customfilename.dat")
End Sub
```

Loading ribbon states

Load state process is also having the similar procedures of save states. We can load the Ribbon State at any time from the last saved Isolated Storage file. **LoadRibbonState** method is used to load the Ribbon state from the last saved state. This method has two overloaded methods as follows:

1. void LoadRibbonState()
2. void LoadRibbonState(IsolatedStorageFile isoStorage, string storeFileName)

The first method with no arguments loads the Ribbon State from the last saved state in the default Isolated Storage file, which is stored by the SaveRibbonState method.

C#

```
private void LoadRibbonState_Click(object sender, RoutedEventArgs e)
{
    this.MyRibbon.LoadRibbonState();
}
```

VB.NET

```
Private Sub LoadRibbonState_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
    Me.MyRibbon.LoadRibbonState()
End Sub
```

The second overloaded method loads the Ribbon State from the given file name in the mentioned Isolated Storage file.

C#

```
private void LoadRibbonState_Click(object sender, RoutedEventArgs e)
{
    IsolatedStorageFile storage =
    IsolatedStorageFile.GetStore(IsolatedStorageScope.User |
    IsolatedStorageScope.Assembly, null, null);
    this.MyRibbon.LoadRibbonState(storage, "Customfilename.dat");
}
```

VB.NET

```
Private Sub LoadRibbonState_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
    IsolatedStorageFile storage =
    IsolatedStorageFile.GetStore(IsolatedStorageScope.User Or
    IsolatedStorageScope.Assembly, null, null)
    Me.MyRibbon.LoadRibbonState(storage, "Customfilename.dat")
End Sub
```

Save and load many ribbon states

Ribbon control states can easily be maintained in the Isolated Storage files. Further, It supports to Save the consecutive or different states of the Ribbon control in different Isolated Storage files and also load any saved state from the Isolated Storage files which is in old state.

C#

```
private void SaveLevel1State_Click(object sender, RoutedEventArgs e)
{
    IsolatedStorageFile storage =
    IsolatedStorageFile.GetStore(IsolatedStorageScope.User |
    IsolatedStorageScope.Assembly, null, null);
    this.MyRibbon.SaveRibbonState(storage, "RibbonState1.dat");
}
private void SaveLevel2State_Click(object sender, RoutedEventArgs e)
{
```

```

IsolatedStorageFile storage =
IsolatedStorageFile.GetStore(IsolatedStorageScope.User |
IsolatedStorageScope.Assembly, null, null);
this.MyRibbon.SaveRibbonState(storage, "RibbonState2.dat");
}
private void SaveLevel3State_Click(object sender, RoutedEventArgs e)
{
IsolatedStorageFile storage =
IsolatedStorageFile.GetStore(IsolatedStorageScope.User |
IsolatedStorageScope.Assembly, null, null);
this.MyRibbon.SaveRibbonState(storage, "RibbonState3.dat");
}

```

VB.NET

```

Private Sub SaveLevel1State_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
IsolatedStorageFile storage =
IsolatedStorageFile.GetStore(IsolatedStorageScope.User Or
IsolatedStorageScope.Assembly, null, null)
Me.MyRibbon.SaveRibbonState(storage, "RibbonState1.dat")
End Sub
Private Sub SaveLevel2State_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
IsolatedStorageFile storage =
IsolatedStorageFile.GetStore(IsolatedStorageScope.User Or
IsolatedStorageScope.Assembly, null, null)
Me.MyRibbon.SaveRibbonState(storage, "RibbonState2.dat")
End Sub
Private Sub SaveLevel3State_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
IsolatedStorageFile storage =
IsolatedStorageFile.GetStore(IsolatedStorageScope.User Or
IsolatedStorageScope.Assembly, null, null)
Me.MyRibbon.SaveRibbonState(storage, "RibbonState3.dat")
End Sub

```

After saving the different states of the Ribbon Control, load the Ribbon state to any of the old states

C#

```

private void LoadLevel1State_Click(object sender, RoutedEventArgs e)
{
IsolatedStorageFile storage =
IsolatedStorageFile.GetStore(IsolatedStorageScope.User |
IsolatedStorageScope.Assembly, null, null);
this.MyRibbon.LoadRibbonState(storage, "RibbonState1.dat");
}
private void LoadLevel2State_Click(object sender, RoutedEventArgs e)
{
IsolatedStorageFile storage =
IsolatedStorageFile.GetStore(IsolatedStorageScope.User |
IsolatedStorageScope.Assembly, null, null);
this.MyRibbon.LoadRibbonState(storage, "RibbonState2.dat");
}
private void LoadLevel3State_Click(object sender, RoutedEventArgs e)

```

```
{
    IsolatedStorageFile storage =
    IsolatedStorageFile.GetStore(IsolatedStorageScope.User |
    IsolatedStorageScope.Assembly, null, null);
    this.MyRibbon.LoadRibbonState(storage, "RibbonState3.dat");
}
```

VB.NET

```
Private Sub LoadLevel1State_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
    IsolatedStorageFile storage =
    IsolatedStorageFile.GetStore(IsolatedStorageScope.User Or
    IsolatedStorageScope.Assembly, null, null)
    Me.MyRibbon.LoadRibbonState(storage, "RibbonState1.dat")
End Sub
Private Sub LoadLevel2State_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
    IsolatedStorageFile storage =
    IsolatedStorageFile.GetStore(IsolatedStorageScope.User Or
    IsolatedStorageScope.Assembly, null, null)
    Me.MyRibbon.LoadRibbonState(storage, "RibbonState2.dat")
End Sub
Private Sub LoadLevel3State_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
    IsolatedStorageFile storage =
    IsolatedStorageFile.GetStore(IsolatedStorageScope.User Or
    IsolatedStorageScope.Assembly, null, null)
    Me.MyRibbon.LoadRibbonState(storage, "RibbonState3.dat")
End Sub
```

Persisting ribbon states by XML writer

The WPF Ribbon control supports state persistence in the XML file created by the user. The ribbon states can be saved and loaded in the XML file by overloading the following methods:

- SaveRibbonState(XmlWriter xmlWriter)
- LoadRibbonState(XmlReader xmlReader)

The following code illustrates this

XML

```
<syncfusion:Ribbon Name="PART_Ribbon" VerticalAlignment="Top">
<syncfusion:Ribbon.PersistElements>
<syncfusion:RibbonElements>QuickAccessToolBar</syncfusion:RibbonElements>
</syncfusion:Ribbon.PersistElements>
<syncfusion:Ribbon.BackStage>
<syncfusion:Backstage />
</syncfusion:Ribbon.BackStage>
<syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:QuickAccessToolBar />
</syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:RibbonTab Caption="RibbonTab">
<syncfusion:RibbonBar Header="RibbonBar">
```

```

<syncfusion:SplitButton Label="SplitButton" SizeForm="Large">
<syncfusion:RibbonMenuItem Header="RibbonMenuItem" />
</syncfusion:SplitButton>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="Disk" IsChecked="False">
<syncfusion:RibbonBar>
<syncfusion:RibbonButton Click="OnSaveDisk" Label="Save to disk" />
<syncfusion:RibbonButton Click="OnLoadDisk" Label="Load from disk" />
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>

```

C#

```

private const string SaveLocation = @"D:\templ.xml";
private void OnLoadDisk(object sender, RoutedEventArgs e)
{
    if (!File.Exists(SaveLocation))
    {
        return;
    }
    using (var reader = new StringReader(File.ReadAllText(SaveLocation)))
    {
        this.PART_Ribbon.LoadRibbonState(reader);
    }
}
private void OnSaveDisk(object sender, RoutedEventArgs e)
{
    using (var stream = new FileStream(SaveLocation, FileMode.Create))
    using (var writer = XmlWriter.Create(stream))
    {
        this.PART_Ribbon.SaveRibbonState(writer);
    }
}

```

VB.NET

```

Private Const SaveLocation As String = "D:\templ.xml"
Private Sub OnLoadDisk(ByVal sender As Object, ByVal e As RoutedEventArgs)
    If Not File.Exists(SaveLocation) Then
        Return
    End If
    Using reader = New StringReader(File.ReadAllText(SaveLocation))
        Me.PART_Ribbon.LoadRibbonState(reader)
    End Using
End Sub
Private Sub OnSaveDisk(ByVal sender As Object, ByVal e As RoutedEventArgs)
    Using stream = New FileStream(SaveLocation, FileMode.Create)
    Using writer = XmlWriter.Create(stream)
        Me.PART_Ribbon.SaveRibbonState(writer)
    End Using
    End Using
End Sub

```

Reset Ribbon States

To load the Normal (Initial) Ribbon state at runtime call the `ResetRibbonState` method. This is a parameter less method. This loads the Normal state of the Ribbon control. Resetting the Ribbon state is applicable while `AutoPersist` is enabled in Ribbon elements.

C#

```
private void ResetState_Click(object sender, RoutedEventArgs e)
{
    this.MyRibbon.ResetRibbonState();
}
```

VB.NET

```
Private Sub ResetState_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
Me.MyRibbon.ResetRibbonState()
End Sub
```

Delete ribbon states

To delete the unused saved Isolated Storage files, use the `DeleteRibbonState` method.

C#

```
private void DeleteRibbonState_Click(object sender, RoutedEventArgs e)
{
    this.MyRibbon.DeleteRibbonState();
}
```

VB.NET

```
Private Sub DeleteRibbonState_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
Me.MyRibbon.DeleteRibbonState()
End Sub
```

Also this method is used to delete any file from specified Isolated Storage location.

C#

```
private void DeleteRibbonState_Click(object sender, RoutedEventArgs e)
{
    IsolatedStorageFile storage =
    IsolatedStorageFile.GetStore(IsolatedStorageScope.User |
    IsolatedStorageScope.Assembly, null, null);
    this.MyRibbon.DeleteRibbonState(storage, "RibbonState1.dat");
}
```

VB.NET

```
Private Sub DeleteRibbonState_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
```

```

IsolatedStorageFile storage =
IsolatedStorageFile.GetStore(IsolatedStorageScope.User Or
IsolatedStorageScope.Assembly, null, null)
Me.MyRibbon.DeleteRibbonState(storage, "RibbonState1.dat")
End Sub

```

Ribbon Merge in WPF Ribbon

WPF [Ribbon](#) allows merging of [RibbonTab](#) and [RibbonBar](#) of two different Ribbon controls in MDI applications. [DocumentContainer.MDIParentRibbon](#), [RibbonTab.MergeType](#) and [RibbonTab.MergeOrder](#) properties helps to perform menu merging.

In WPF, you can create MDI application using [DocumentContainer](#) control. Also, [Ribbon](#) controls allows to merge [RibbonTab](#) and [RibbonBar](#) of active child window to the [Ribbon](#) in parent window.

Creating MDI window and enabling menu merging

[DocumentContainer](#) helps to create MDI window in WPF Application. The [DocumentContainer](#) allows you to create MDI window and Tabbed MDI window layouts.

Follow the below steps to create simple sample to understand ribbon menu merging,

1. Creating main [RibbonWindow](#) with [Ribbon](#) and [DocumentContainer](#)

XML

```

<syncfusion:RibbonWindow
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="Ribbon.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:Ribbon"
mc:Ignorable="d"
WindowStartupLocation="CenterScreen"
xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
skin:SfSkinManager.VisualStudio="Office2019Colorful"
Title="Ribbon Merging" Height="450" Width="700">
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto"/>
<RowDefinition Height="*/"/>
</Grid.RowDefinitions>
<syncfusion:Ribbon x:Name="parentRibbon" >
<syncfusion:RibbonTab Caption="Home">
<syncfusion:RibbonBar Header="Mail">
<syncfusion:RibbonButton Label="New Mail" SizeForm="Large"
Click="RibbonButton_Click"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
<syncfusion:DocumentContainer x:Name="doc" Grid.Row="1" >
</syncfusion:DocumentContainer>
</Grid>
</syncfusion:RibbonWindow>

```

- Next, lets create two `UserControl` views with Ribbon which acts as child MDI windows.

Child View 1

XML

```
<UserControl x:Class="Ribbon.ChildView1"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:local="clr-namespace:Ribbon"
mc:Ignorable="d" xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
d:DesignHeight="450" d:DesignWidth="800">
<Grid>
<ContentPresenter>
<ContentPresenter.Content>
<Grid>
<syncfusion:Ribbon x:Name="childRibbon" >
<syncfusion:RibbonTab Caption="Home" MergeType="MergeItems">
<syncfusion:RibbonBar Header="Message">
<syncfusion:RibbonButton Label="New Message" SizeForm="Large"/>
<syncfusion:RibbonButton x:Name="MergeButton" Label="Merge"
SizeForm="Large" />
<syncfusion:RibbonButton x:Name="UnMergeButton" Label="UnMerge"
SizeForm="Large"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="View1 Tab2" >
<syncfusion:RibbonBar Header="Folders">
<syncfusion:RibbonButton Label="New Folder" SizeForm="Large"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
<TextBlock Text="View 1"/>
</Grid>
</ContentPresenter.Content>
</ContentPresenter>
</Grid>
</UserControl>
```

Child View 2

XML

```
<UserControl x:Class="Ribbon.ChildView2"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:local="clr-namespace:Ribbon"
mc:Ignorable="d" xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
d:DesignHeight="450" d:DesignWidth="800">
<Grid>
```

```

<ContentPresenter>
<ContentPresenter.Content>
<Grid>
<syncfusion:Ribbon x:Name="childRibbon" >
<syncfusion:RibbonTab Caption="View2 Home" MergeType="AddItems">
<syncfusion:RibbonBar Header="Message">
<syncfusion:RibbonButton Label="View Message" SizeForm="Large"/>
<syncfusion:RibbonButton x:Name="MergeButton" Label="Merge"
SizeForm="Large" />
<syncfusion:RibbonButton x:Name="UnMergeButton" Label="UnMerge"
SizeForm="Large"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="View2 Tab2" MergeOrder="1">
<syncfusion:RibbonBar Header="Folders">
<syncfusion:RibbonButton Label="New Folder" SizeForm="Large"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
<TextBlock Text="View 2"/>
</Grid>
</ContentPresenter.Content>
</ContentPresenter>
</Grid>
</UserControl>

```

- Now, add the both child view's into the [DocumentContainer](#) and set the the [DocumentContainer.MDIParentRibbon](#) property of [DocumentContainer](#).

XML

```

<syncfusion:RibbonWindow
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="Ribbon.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:Ribbon"
mc:Ignorable="d"
WindowStartupLocation="CenterScreen"
xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
skin:SfSkinManager.VisualStudio="Office2019Colorful"
Title="Ribbon Merging" Height="450" Width="700">
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto"/>
<RowDefinition Height="*/>
</Grid.RowDefinitions>
<syncfusion:Ribbon x:Name="parentRibbon" >
<syncfusion:RibbonTab Caption="Home">
<syncfusion:RibbonBar Header="Mail">
<syncfusion:RibbonButton Label="New Mail" SizeForm="Large"
Click="RibbonButton_Click"/>

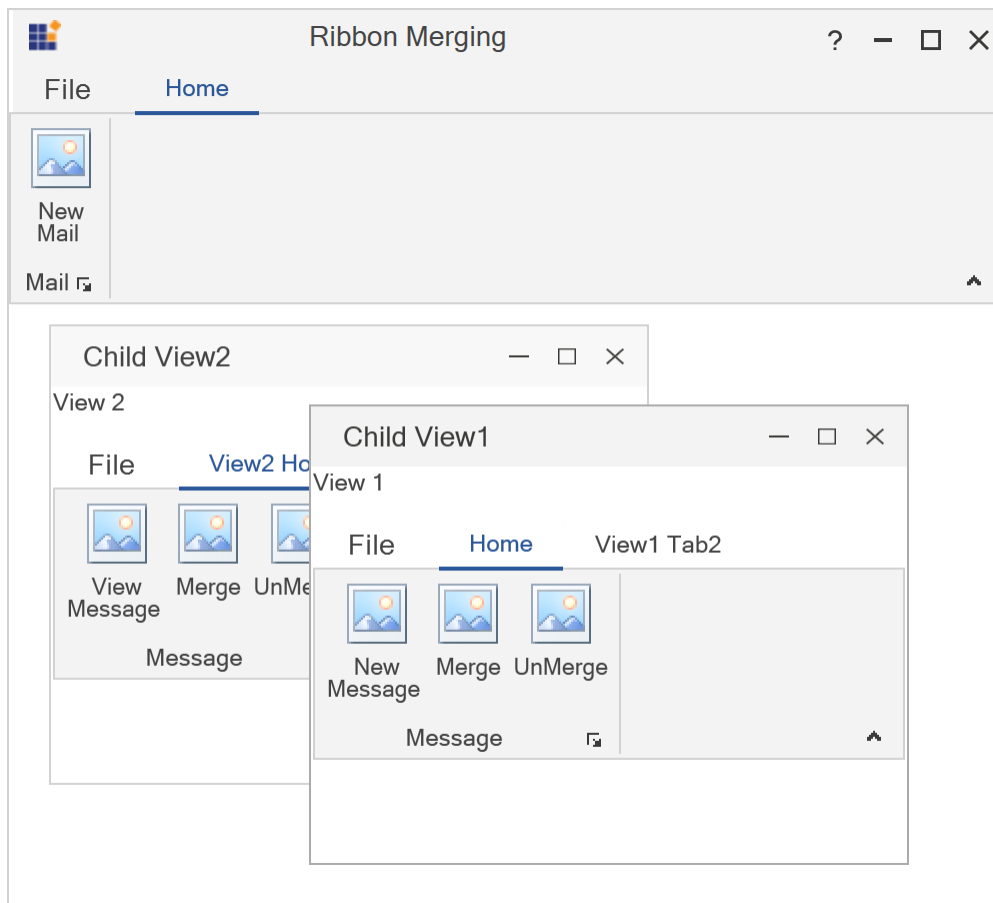

```

```

</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
<syncfusion:DocumentContainer x:Name="doc" Grid.Row="1"
MDIParentRibbon="{Binding ElementName=parentRibbon}">
<local:ChildView1 x:Name="ChildView1"
syncfusion:DocumentContainer.Header="Child View1"
syncfusion:DocumentContainer.MDIBounds="150,50,300,230"/>
<local:ChildView2 x:Name="ChildView2"
syncfusion:DocumentContainer.Header="Child View2"
syncfusion:DocumentContainer.MDIBounds="20,10,300,230"/>
</syncfusion:DocumentContainer>
</Grid>
</syncfusion:RibbonWindow>

```

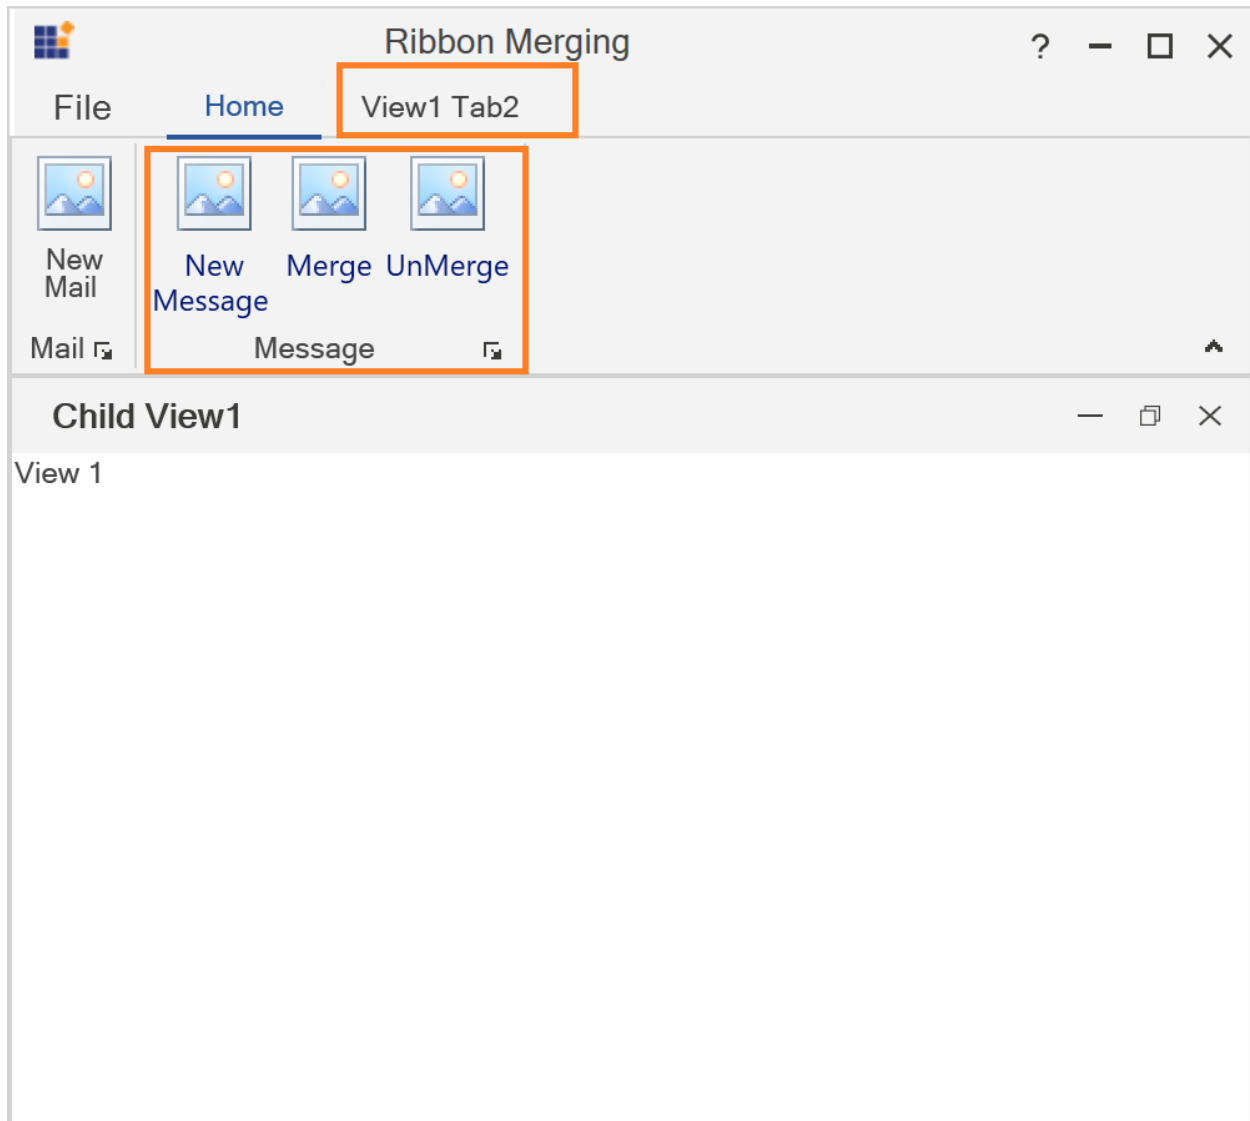

Now run the application and you can see an output like this.

- Now the child view's has been added inside the [DocumentContainer](#), and now lets see how to merge the child Ribbon into the parent Ribbon.

The merging operation performed based on [DocumentContainer.Mode](#) (MDI and TDI) property.

- [MDI](#) - The default value of [DocumentContainer.Mode](#). In the above image child view's are in MDI mode where each view loaded inside a child window. You can merge the [Ribbon](#) in child view's into the MDI parent Ribbon by maximizing the MDI child window.

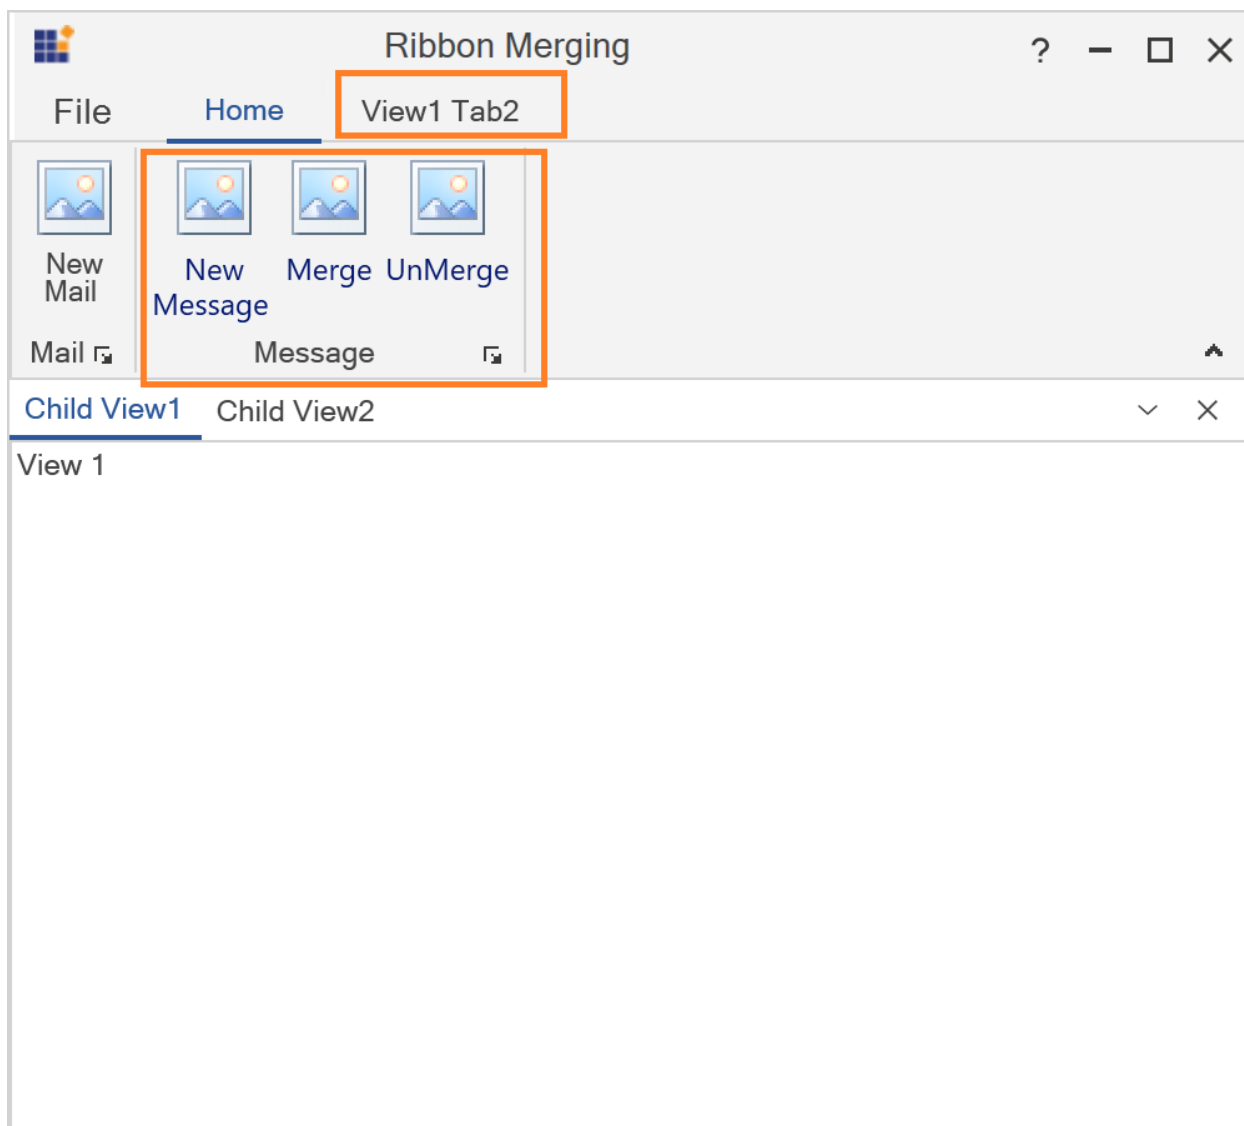

- [TDI](#) - The child view's will be loaded in tabs. In this mode, the child view's ribbon of the active tab will be merged to the MDI parent Ribbon.

In the below example the [DocumentContainer.Mode](#) property for [DocumentContainer](#) is set to [TDI](#).

XML

```
<syncfusion:RibbonWindow
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="Ribbon.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
```

```
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:Ribbon"
mc:Ignorable="d"
WindowStartupLocation="CenterScreen"
xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
skin:SfSkinManager.VisualStudio="Office2019Colorful"
Title="Ribbon Merging" Height="450" Width="450">
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto"/>
<RowDefinition Height="*/>
</Grid.RowDefinitions>
<syncfusion:Ribbon x:Name="parentRibbon" >
<syncfusion:RibbonTab Caption="Home">
<syncfusion:RibbonBar Header="Mail">
<syncfusion:RibbonButton Label="New Mail" SizeForm="Large"
Click="RibbonButton_Click"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
<syncfusion:DocumentContainer x:Name="doc" Grid.Row="1"
MDIParentRibbon="{Binding ElementName=parentRibbon}" Mode="TDI">
<local:ChildView1 x:Name="ChildView1"
syncfusion:DocumentContainer.Header="Child View1"
syncfusion:DocumentContainer.MDIBounds="150,50,300,230"/>
<local:ChildView2 x:Name="ChildView2"
syncfusion:DocumentContainer.Header="Child View2"
syncfusion:DocumentContainer.MDIBounds="20,10,300,230"/>
</syncfusion:DocumentContainer>
</Grid>
</syncfusion:RibbonWindow>
```

In the image notice that **Child View1** tab is selected and elements of selected child view's ribbon are merged into the MDI parent Ribbon.

Note: [View sample in GitHub](#)

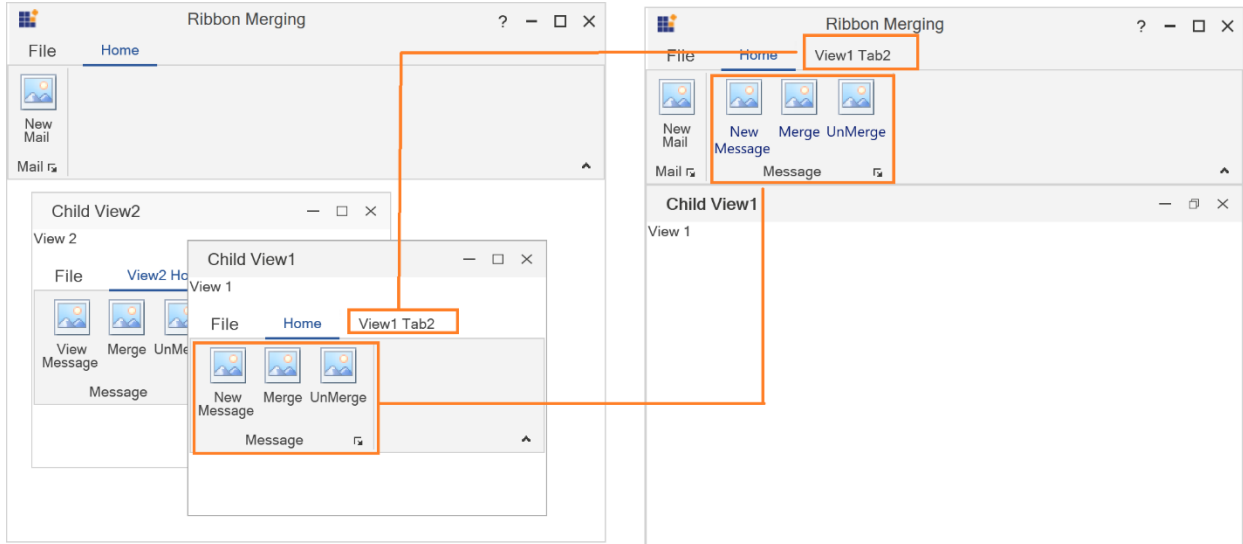

Merge Type

[RibbonTab.MergeType](#) property indicates how the items in child view's ribbon are merged with MDI parent ribbon. [MergeType](#) has following options,

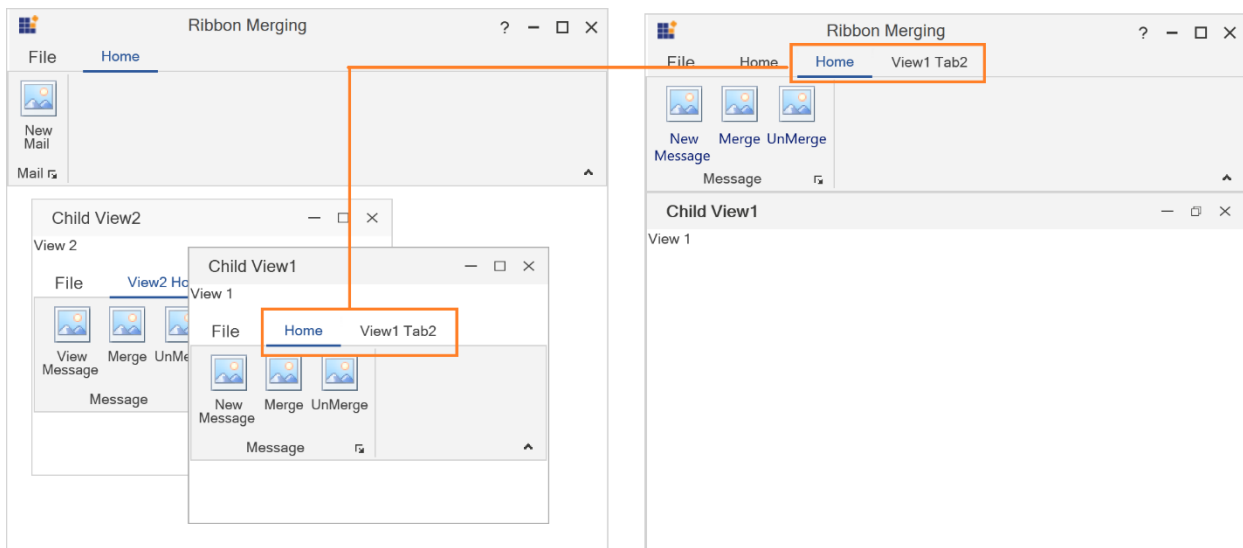

- [Add](#) - Adds the child view's [RibbonTab](#) to the MDI parent ribbon based on [RibbonTab.MergeOrder](#), even if MDI parent has [RibbonTab](#) with same [Caption](#).
- [Merge](#) - The default value of [RibbonTab.MergeType](#). If [RibbonTab.Caption](#) of MDI parent ribbon and [RibbonTab.Caption](#) of child view's ribbon has same name and child view's [RibbonTab.MergeType](#) is [Merge](#), then child view's [RibbonBar](#)'s are merged with MDI parent's tab. If MDI parent ribbon doesn't have tab with same caption, then child view's ribbon tab added to MDI parent ribbon based on [RibbonTab.MergeOrder](#).

Let's look at the example,

In the example both the MDI parent ribbon and child view1's ribbon has ribbon tab with same caption and the default value of [MergeType](#) is [Merge](#). So, when child view1 maximized, bar's in child view's Home tab get are merged to MDI parent ribbon's Home tab.

If you change the [MergeType](#) of ribbon tab in child view1 as [Add](#), then [Home](#) tab will be added as new tab like [View1 Tab2](#)

Note: [View sample in GitHub](#)

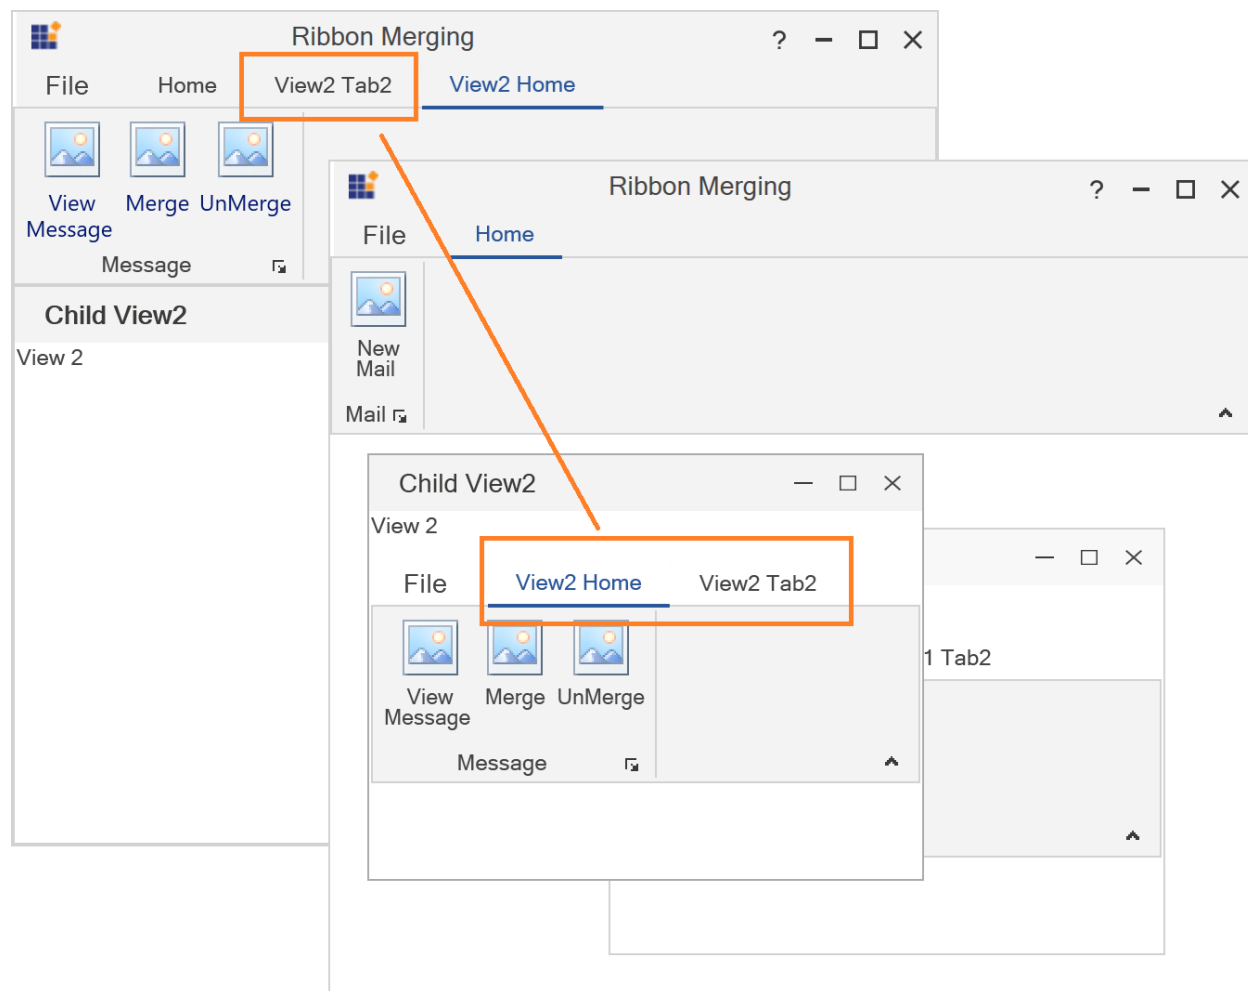

Merge Order

MDI parent ribbon positions the child view's ribbon tabs followed by the tabs of MDI parent ribbon. You can change the position of child view's ribbon using [RibbonTab.MergeOrder](#) property.

In the below code, the [RibbonTab.MergeOrder](#) for [View2 Tab2](#) is set as 1. So, the ribbon tab is positioned at 1st index while merging to MDI parent.

XML

```
<UserControl x:Class="Ribbon.ChildView2"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:local="clr-namespace:Ribbon"
mc:Ignorable="d" xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
d:DesignHeight="450" d:DesignWidth="800">
<Grid>
<ContentPresenter>
<ContentPresenter.Content>
<Grid>
<syncfusion:Ribbon x:Name="childRibbon" >
<syncfusion:RibbonTab Caption="View2 Home" MergeType="AddItems">
<syncfusion:RibbonBar Header="Message">
<syncfusion:RibbonButton Label="View Message" SizeForm="Large"/>
<syncfusion:RibbonButton x:Name="MergeButton" Label="Merge"
SizeForm="Large" />
<syncfusion:RibbonButton x:Name="UnMergeButton" Label="UnMerge"
SizeForm="Large"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="View2 Tab2" MergeOrder="1">
<syncfusion:RibbonBar Header="Folders">
<syncfusion:RibbonButton Label="New Folder" SizeForm="Large"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:Ribbon>
<TextBlock Text="View 2"/>
</Grid>
</ContentPresenter.Content>
</ContentPresenter>
</Grid>
</UserControl>
```

Note: [View sample in GitHub](#)

Merging and Unmerging in code

Ribbon merging can be performed in code by using [Ribbon.Merge](#) method of MDI parent ribbon. Child view's ribbon should be passed as parameter to perform merge operation.

Similarly, the child ribbon can be unmerged from MDI parent ribbon using [Ribbon.UnMerge](#) method of MDI parent ribbon.

C#

```
public MainWindow()
{
    InitializeComponent();
    this.Child1.MergeButton.Click += MergeButton_Click;
    this.Child1.UnMergeButton.Click += UnMergeButton_Click;
}

private void UnMergeButton_Click(object sender, RoutedEventArgs e)
{
    this.parentRibbon.UnMerge(this.Child1.childRibbon);
}

private void MergeButton_Click(object sender, RoutedEventArgs e)
{
}
```

```
this.parentRibbon.Merge(this.Child1.childRibbon);
}
```

VB.NET

```
Public Sub New()
    InitializeComponent()
    Me.Child1.MergeButton.Click += AddressOf MergeButton_Click
    Me.Child1.UnMergeButton.Click += AddressOf UnMergeButton_Click
End Sub
Private Sub UnMergeButton_Click(ByVal sender As Object, ByVal e As
    RoutedEventArgs)
    Me.parentRibbon.UnMerge(Me.Child1.childRibbon)
End Sub
Private Sub MergeButton_Click(ByVal sender As Object, ByVal e As
    RoutedEventArgs)
    Me.parentRibbon.Merge(Me.Child1.childRibbon)
End Sub
```

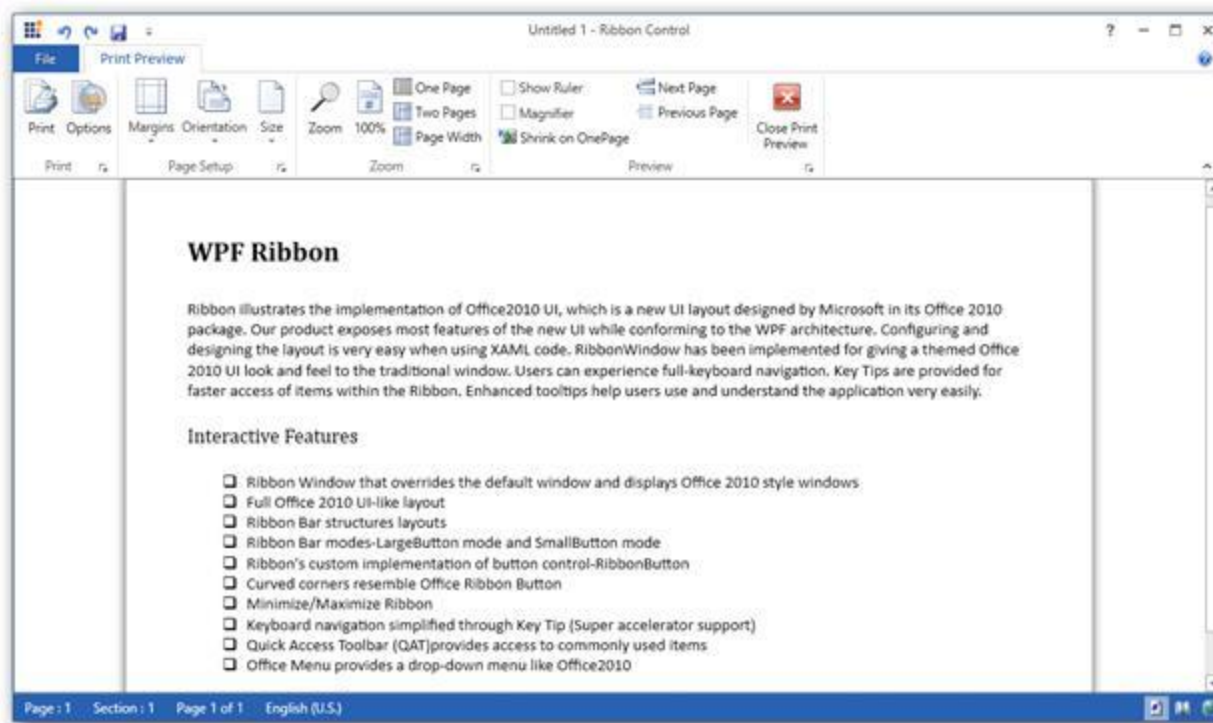

Ribbon ModelTab in WPF Ribbon

Modal Tab in Ribbon Control are used to display a collection of commands other than the commands which are available in the core tabs. At this point, the core tab gets disabled.

Use case scenarios

Print Preview is a Modal Tab which displays Print Preview related commands

Adding modal tabs to an application

To add RibbonTabs as ModalTabs in an application, use **ModalTabCollection** property of the Ribbon.

XML

```
<syncfusion:Ribbon.ModalTabCollection >
<syncfusion:ModalTabCollection >
<syncfusion:RibbonTab Caption="Print Preview" x:Name="_printPreviewTab">
<syncfusion:RibbonBar Header="Sample Bar">
<syncfusion:RibbonButton Label="Close Tab"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:ModalTabCollection>
</syncfusion:Ribbon.ModalTabCollection>
```

Add Modal Tab to the simplified layout

When the simplified layout is enabled, the Model tab can be added, and its items will be displayed in a single line as shown below. To know more about the simplified layout, refer [here](#).

XML

```
<syncfusion:RibbonWindow x:Class="RibbonButton_IconTemp.Window1"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:RibbonButton_IconTemp" xmlns:skin="clr-
namespace:Syncfusion.SfSkinManager;assembly=Syncfusion.SfSkinManager.WPF"
mc:Ignorable="d" xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
skin:SfSkinManager.VisualStudio="MaterialLight"
Title="Untitled 1 - Ribbon Control" Height="450" Width="800">
```

```

<Grid x:Name="grid">
<syncfusion:Ribbon VerticalAlignment="Top" EnableSimplifiedLayoutMode="True"
LayoutMode="Simplified">
<syncfusion:Ribbon.ModalTabCollection>
<syncfusion:ModalTabCollection>
<syncfusion:RibbonTab x:Name="insertTab"
Caption="Insert"
IsChecked="True">
<syncfusion:RibbonBar

MediumIcon="Resources/Base chart20.png"
SizeForm="Small">
</syncfusion:DropDownButton>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
</syncfusion:ModalTabCollection>
</syncfusion:Ribbon.ModalTabCollection>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

C#

```

Ribbon ribbon = new Ribbon();
ribbon.VerticalAlignment = VerticalAlignment.Top;
ribbon.EnableSimplifiedLayoutMode = true;
ribbon.LayoutMode = LayoutMode.Simplified;
// Creating new tabs
RibbonTab insertTab = new RibbonTab();
insertTab.Caption = "Insert";
insertTab.IsChecked = true;
// Creating new bar
RibbonBar illustrationsBar = new RibbonBar();
illustrationsBar.Header = "Illustrations";
// Creating items
// Creating items
RibbonButton pictureButton = new RibbonButton();
pictureButton.Label = "Picture";

```

```

pictureButton.SizeForm = SizeForm.Large;
pictureButton.MediumIcon = new BitmapImage(new
Uri(@"Resources/Picture20.png", UriKind.RelativeOrAbsolute));
RibbonButton commentButton = new RibbonButton();
commentButton.Label = "Comment";
commentButton.SizeForm = SizeForm.Large;
commentButton.MediumIcon = new BitmapImage(new Uri(@"Resources/New
Comment20.png", UriKind.RelativeOrAbsolute));
DropDownButton shapesButton = new DropDownButton();
shapesButton.Label = "Shapes";
shapesButton.SizeForm = SizeForm.Small;
shapesButton.MediumIcon = new BitmapImage(new Uri(@"Resources/Insert
Shapes20.png", UriKind.RelativeOrAbsolute));
DropDownButton chartButton = new DropDownButton();
chartButton.Label = "Chart";
chartButton.SizeForm = SizeForm.Small;
chartButton.MediumIcon = new BitmapImage(new Uri(@"Resources/Base
chart20.png", UriKind.RelativeOrAbsolute));
// Adding items to bar
illustrationsBar.Items.Add(pictureButton);
illustrationsBar.Items.Add(commentButton);
illustrationsBar.Items.Add(shapesButton);
illustrationsBar.Items.Add(chartButton);
// Adding bars to the tabs
insertTab.Items.Add(illustrationsBar);
// Adding modal tab
ribbon.ModalTabCollection.Add(insertTab);
insertTab.Name = "insertTab";
grid.Children.Add(ribbon);
//Displaying modal tab
ribbon.ShowModalTab("insertTab");
SfSkinManager.SetVisualStyle(this, VisualStyles.MaterialLight);

```

How to handle modal tabs in ribbon

The `ShowModalTab` and `CloseModalTabs` method handle the visibility of the Modal Tabs in the Ribbon control. Any ModalTab from the ModalTabCollection can be displayed whenever required.

To show specific Modal Tab in ribbon, call ShowModalTab method. This can be done from any event of core Ribbon Tab control.

C#

```

private void ShowModalTabBtn_Click(object sender, RoutedEventArgs e)
{
    this._ribbon.ShowModalTab("_printPreviewTab");
}

```

VB.NET

```
Private Sub ShowModalTabBtn_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
Me._ribbon.ShowModalTab("_printPreviewTab")
End Sub
```

CloseModalTabs method is used to close the currently opened Modal Tab in Ribbon control. This method should be called in any event of currently displaying Modal Tab element. This is illustrated in the code given below.

C#

```
private void CloseModalTabBtn_Click(object sender, RoutedEventArgs e)
{
this._ribbon.CloseModalTabs();
}
```

VB.NET

```
Private Sub CloseModalTabBtn_Click(ByVal sender As Object, ByVal e As
RoutedEventArgs)
Me._ribbon.CloseModalTabs()
End Sub
```

ToolTip in WPF Ribbon

ToolTip is used to display small information about the specific element while hovering mouse on it and it is implemented as like in MS Outlook.

ScreenTip is an enhanced ToolTip and it is used to show a popup window when the mouse cursor is hovered over **RibbonItem**. The popup is used to provide details of the **RibbonItem**'s function. The difference between ToolTip and ScreenTip is that, ToolTip hosts controls to show a small popup window, whereas ScreenTip includes predefined properties. With these predefined properties, you can create ScreenTip easily.

ScreenTip has four properties.

1. Description - Specifies the description of the ScreenTip. 2. Image - Specifies the image of the ScreenTip. 3. Content - Specifies the content of the ScreenTip. 4. HelpText - Specifies the HelpText of the ScreenTip.

Adding tooltip for ribbon items

Ribbon ToolTip can be set to each Ribbon items by defining ScreenTip inside the ToolTip.

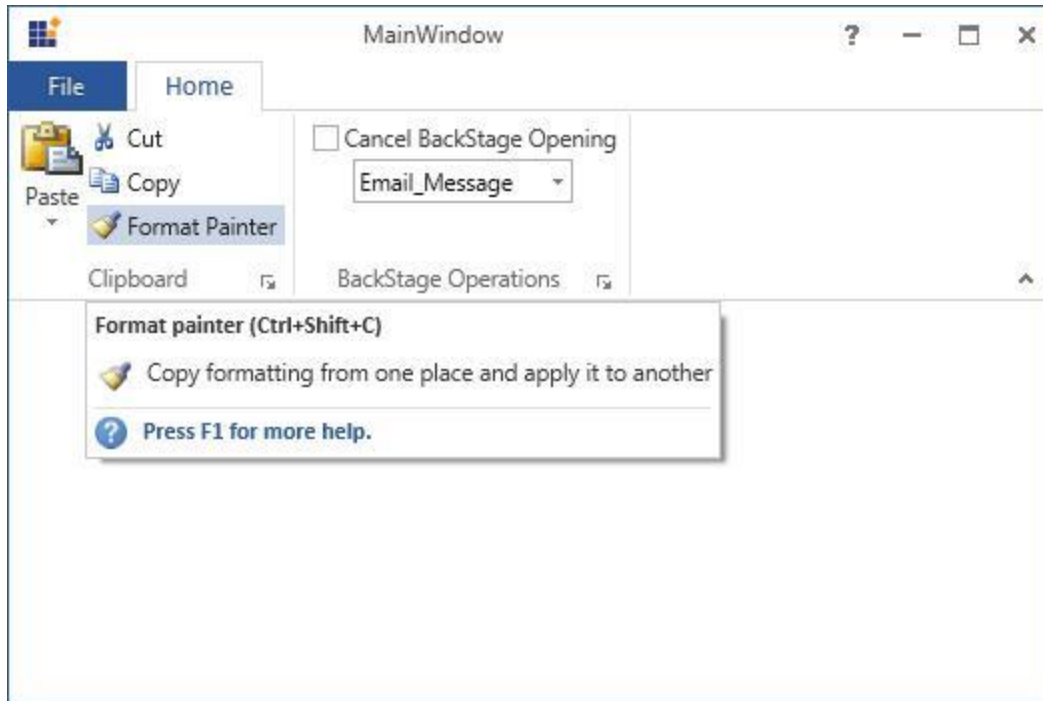

XML

```
<Syncfusion:Ribbon x:Name="_ribbon" VerticalAlignment="Top">
<Syncfusion:RibbonTab Caption="Home" IsChecked="False" >
<Syncfusion:RibbonBar Header="Clipboard">
<Syncfusion:RibbonBar.ToolTip>
<Syncfusion:ScreenTip MinWidth="150" Description="ScreenTip Example"
VerticalOffset="10" Content="Represent a ribbon simple buttons"/>
</Syncfusion:RibbonBar.ToolTip>
<Syncfusion:SplitButton Name="paste" Label="Paste" SizeForm="Large"
LargeIcon="/Resources/Paste16.png">
<Syncfusion:SplitButton.ToolTip>
```

```

<Syncfusion:ScreenTip Description="Paste (Ctrl+V)" Content="Paste the
contents of clipboard."/>
</Syncfusion:SplitButton.ToolTip>
</Syncfusion:SplitButton>
<Syncfusion:RibbonButton Label="Cut" SizeForm="Small"
SmallIcon="/Resources/Cut16.png" >
<Syncfusion:RibbonButton.ToolTip>
<Syncfusion:ScreenTip Description="Cut (Ctrl+X)" Content="Cut the selection
and put it on the clipboard."/>
</Syncfusion:RibbonButton.ToolTip>
</Syncfusion:RibbonButton>
<Syncfusion:RibbonButton Name="copy" Label="Copy" SizeForm="Small"
SmallIcon="/Resources/Copy16.png" >
<Syncfusion:RibbonButton.ToolTip>
<Syncfusion:ScreenTip Content="Copy the selection and put it on the
clipboard" Description="Copy (Ctrl+C)" HelpText="Press F1 for more help."/>
</Syncfusion:RibbonButton.ToolTip>
</Syncfusion:RibbonButton>
<Syncfusion:RibbonButton IsMultiLine="True" Label="Format Painter"
SizeForm="Small" SmallIcon="/Resources/FormatPainter16.png" >
<Syncfusion:RibbonButton.ToolTip>
<Syncfusion:ScreenTip Content="Copy formatting from one place and apply it
to another" Description="Format painter (Ctrl+Shift+C)"
ImageSource="/Resources/FormatPainter16.png" HelpText="Press F1 for more
help."/>
</Syncfusion:RibbonButton.ToolTip>
</Syncfusion:RibbonButton>
</Syncfusion:RibbonBar>
<Syncfusion:RibbonBar Header="BackStage Operations" >
<Syncfusion:RibbonCheckBox Content="Cancel BackStage Opening"
x:Name="BackStageOpeningCheckBox">
<Syncfusion:RibbonCheckBox.ToolTip>
<Syncfusion:ScreenTip Description="Cancel BackStage" Content="Restrict
backstage opening"/>
</Syncfusion:RibbonCheckBox.ToolTip>
</Syncfusion:RibbonCheckBox>
<Syncfusion:RibbonComboBox SelectedIndex="0" FlowDirection="LeftToRight"
Width="110">
<Syncfusion:RibbonComboBox.ToolTip>
<Syncfusion:ScreenTip Description="New Items" Content="Create a new item
such as Meeting or contact."/>
</Syncfusion:RibbonComboBox.ToolTip>
<Syncfusion:RibbonComboBoxItem>Email_Message</Syncfusion:RibbonComboBoxItem>
<Syncfusion:RibbonComboBoxItem>Meeting</Syncfusion:RibbonComboBoxItem>
<Syncfusion:RibbonComboBoxItem>Appointment</Syncfusion:RibbonComboBoxItem>
</Syncfusion:RibbonComboBox>
</Syncfusion:RibbonBar>
</Syncfusion:RibbonTab>
</Syncfusion:Ribbon>

```

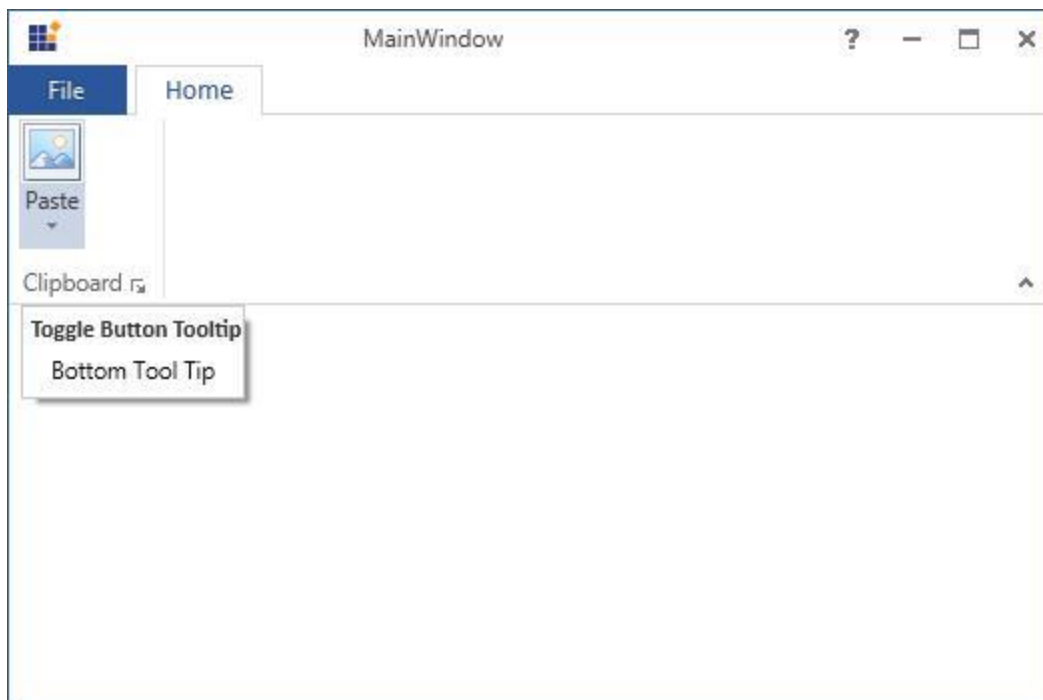

Setting the ToolTip for the upper and lower half of the split button

The ToolTip property is used to set the tooltip for the upper half of the Split Button, while the ToggleButtonToolTip property is used to set the tooltip for the drop-down in the lower half of the split button.

XML

```
<Syncfusion:SplitButton Label="Paste" SizeForm="Large" >
  <Syncfusion:SplitButton.ToolTip>
    <Syncfusion:ScreenTip Description="Split Button Tooltip"
      VerticalOffset="32">
      <TextBlock Text="Top Tool Tip" />
    </Syncfusion:ScreenTip>
  </Syncfusion:SplitButton.ToolTip>
  <Syncfusion:SplitButton.ToggleButtonToolTip>
    <Syncfusion:ScreenTip Description="Toggle Button Tooltip"
      VerticalOffset="29">
      <TextBlock Text="Bottom Tool Tip" />
    </Syncfusion:ScreenTip>
  </Syncfusion:SplitButton.ToggleButtonToolTip>
</Syncfusion:SplitButton>
```

Options for inserting help text in ScreenTip

Essential Tool WPF is enhanced with `HelpText` option. Users can add help text in ScreenTip. A line separator separates the Screen tip information from help text.

XML

```
<Syncfusion:RibbonButton IsMultiLine="True" Label="Format Painter"
SizeForm="Small" SmallIcon="/Resources/FormatPainter16.png" >
<Syncfusion:RibbonButton.ToolTip>
```

```
<Syncfusion:ScreenTip Content="Copy formatting from one place and apply it
to another" Description="Format painter (Ctrl+Shift+C)"
ImageSource="/Resources/FormatPainter16.png" HelpText="Press F1 for more
help."/>
</Syncfusion:RibbonButton.ToolTip>
</Syncfusion:RibbonButton>
```

Note: When no HelpText is set to the HelpText area and line separator get automatically hidden

KeyBoard Support in WPF Ribbon

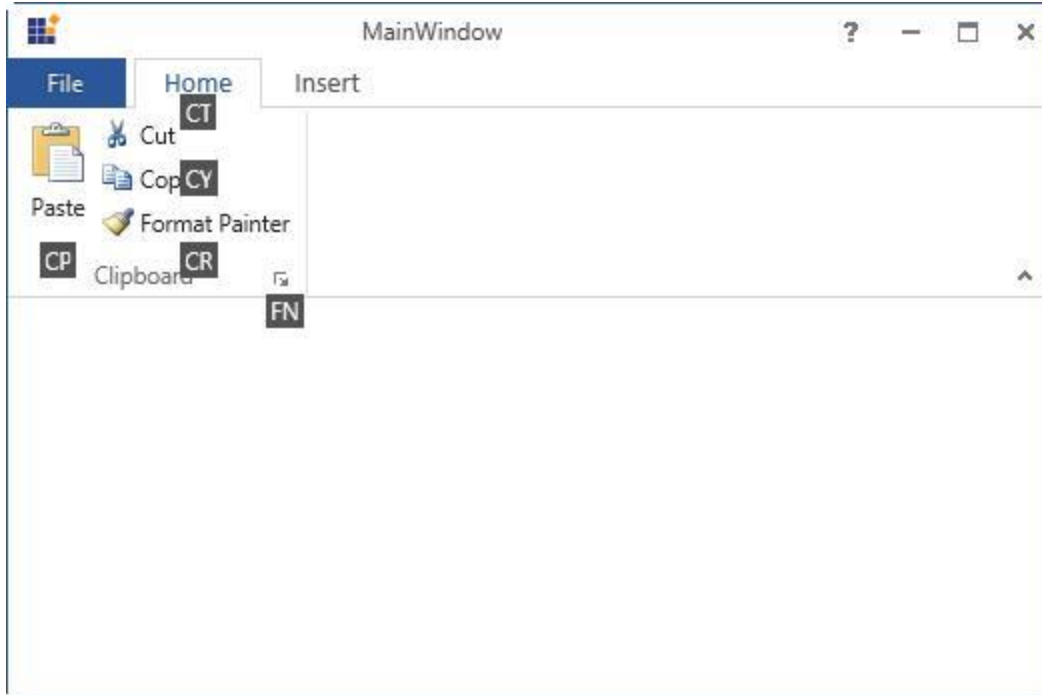

To invoke any command using KeyBoard, Ribbon control provides KeyTip support to access the RibbonItem. On pressing Alt key, KeyTips for the corresponding RibbonItem gets displayed.

Adding KeyTip to the ribbon items

RibbonControl provides with an attached property called **KeyTip** that helps to set the Key tip for the RibbonItem. It also let to set the Key tip for the RibbonTab, Launcher Button, and for the controls that are needed to add in the Ribbon like RibbonButton, SplitButton...etc

XML

```
<syncfusion:Ribbon Name="_ribbon" VerticalAlignment="Top">
<syncfusion:RibbonTab Caption="Home" syncfusion:Ribbon.KeyTip="H" >
<syncfusion:RibbonBar Header="Clipboard" syncfusion:Ribbon.KeyTip="FN" >
<syncfusion:RibbonButton Label="Paste" SizeForm="Large"
LargeIcon="/Resources/Paste32.png"
syncfusion:Ribbon.KeyTip="CP"/>
<syncfusion:RibbonButton Label="Cut" SizeForm="Small"
SmallIcon="/Resources/Cut16.png" syncfusion:Ribbon.KeyTip="CT"/>
<syncfusion:RibbonButton Label="Copy" SizeForm="Small"
SmallIcon="/Resources/Copy16.png"
syncfusion:Ribbon.KeyTip="CY" />
<syncfusion:RibbonButton Label="Format Painter" SizeForm="Small"
SmallIcon="/Resources/FormatPainter16.png"
syncfusion:Ribbon.KeyTip="CR" />
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab Caption="Insert" syncfusion:Ribbon.KeyTip="I"
IsChecked="True" />
</syncfusion:Ribbon>
```

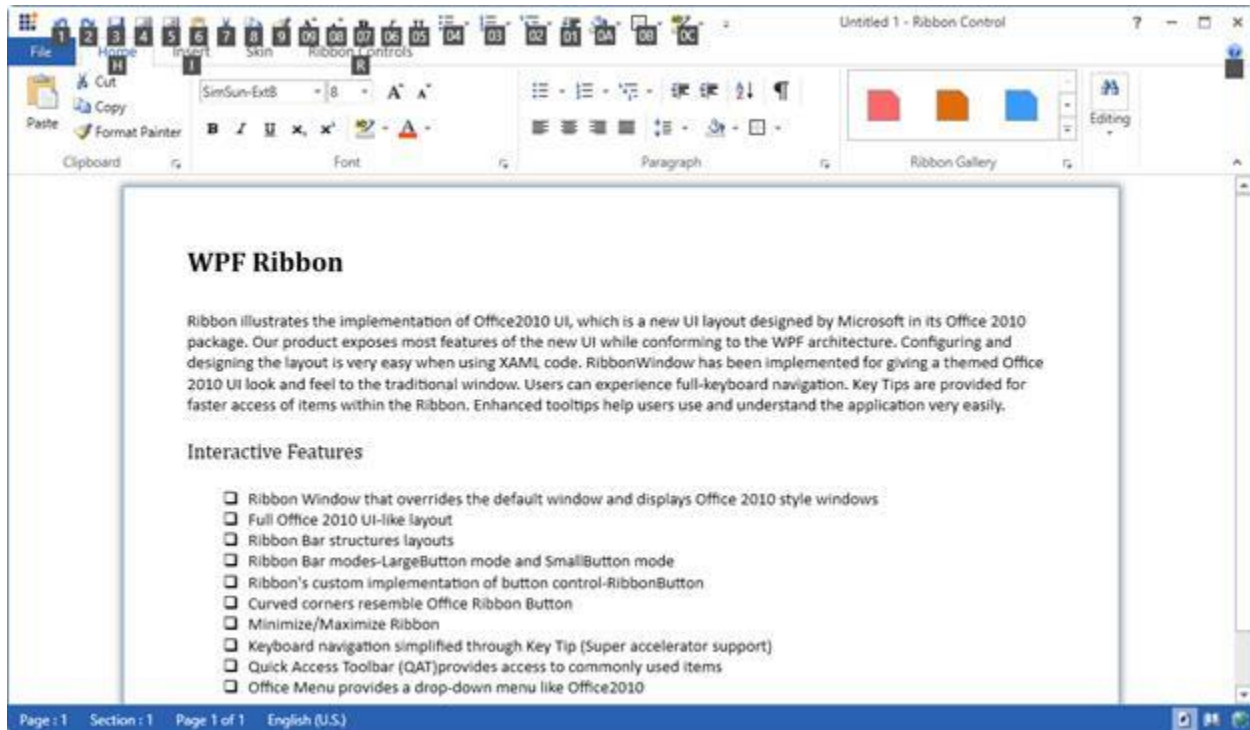

KeyTip for QAT items

KeyTip for the QAT items gets displayed by default by pressing Alt Key. The KeyTips are arranged in the order like...1,2,3,4,5,6,7,8,9,0,09,08,07.....01,0A,0B..... etc.

XML

```
<syncfusion:Ribbon.QuickAccessToolBar>
<syncfusion:QuickAccessToolBar>
<syncfusion:QuickAccessToolBar.QATMenuItems>
<syncfusion:RibbonButton Label="Save"
syncfusion:RibbonCommandManager.SynchronizedItem="Save" />
<syncfusion:RibbonButton Label="Quick Print"
syncfusion:RibbonCommandManager.SynchronizedItem="Quick Print"/>
<syncfusion:RibbonButton Label="Print Preview"
syncfusion:RibbonCommandManager.SynchronizedItem="Print Preview"/>
<syncfusion:RibbonButton Label="Undo"
syncfusion:RibbonCommandManager.SynchronizedItem="Undo" />
<syncfusion:RibbonButton Label="Redo"
syncfusion:RibbonCommandManager.SynchronizedItem="Redo" />
<syncfusion:RibbonButton Label="Paste"
syncfusion:RibbonCommandManager.SynchronizedItem="Paste"/>
</syncfusion:QuickAccessToolBar.QATMenuItems>
<syncfusion:RibbonButton Label="Undo" SmallIcon="/Resources/Undo16.png"
SizeForm="ExtraSmall"
ToolTip="Undo" syncfusion:RibbonCommandManager.SynchronizedItem="Undo" />
<syncfusion:RibbonButton Label="Redo" SmallIcon="/Resources/Redo16.png"
SizeForm="ExtraSmall"
ToolTip="Redo" syncfusion:RibbonCommandManager.SynchronizedItem="Redo"/>
<syncfusion:RibbonButton Command="ApplicationCommands.Save"
SizeForm="ExtraSmall"
syncfusion:RibbonCommandManager.SynchronizedItem="Save"
SmallIcon="/Resources/Save16.png"/>
</syncfusion:QuickAccessToolBar>
```

```
</syncfusion:Ribbon.QuickAccessToolBar>
```

How to access particular item in ribbon using KeyTip

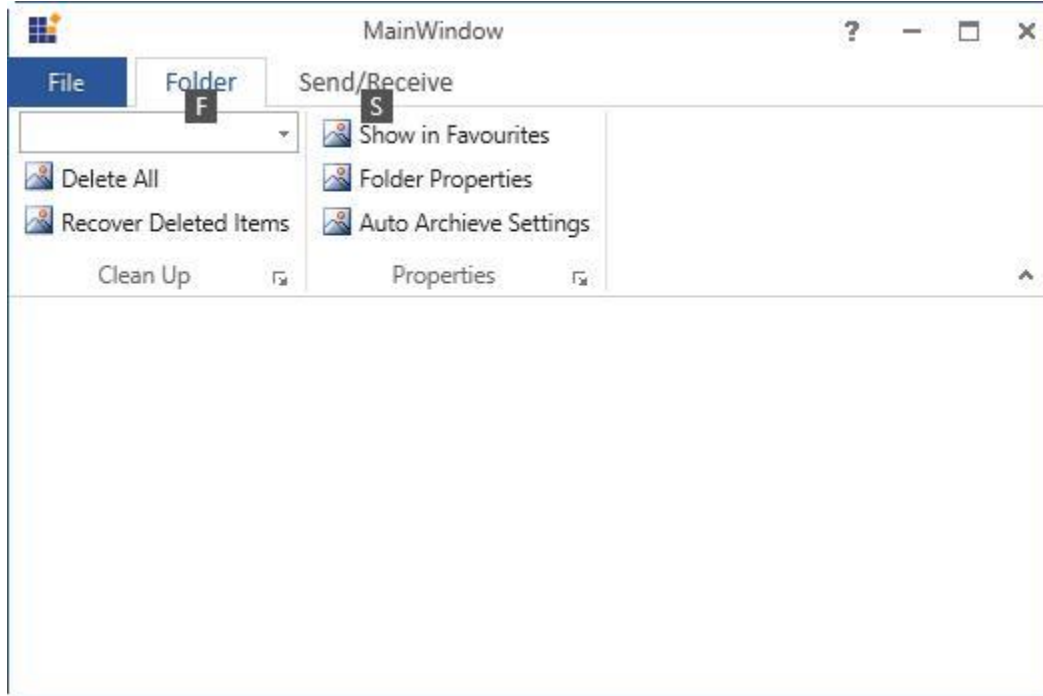

The below example illustrates how to access particular Ribbon item using KeyTip

XML

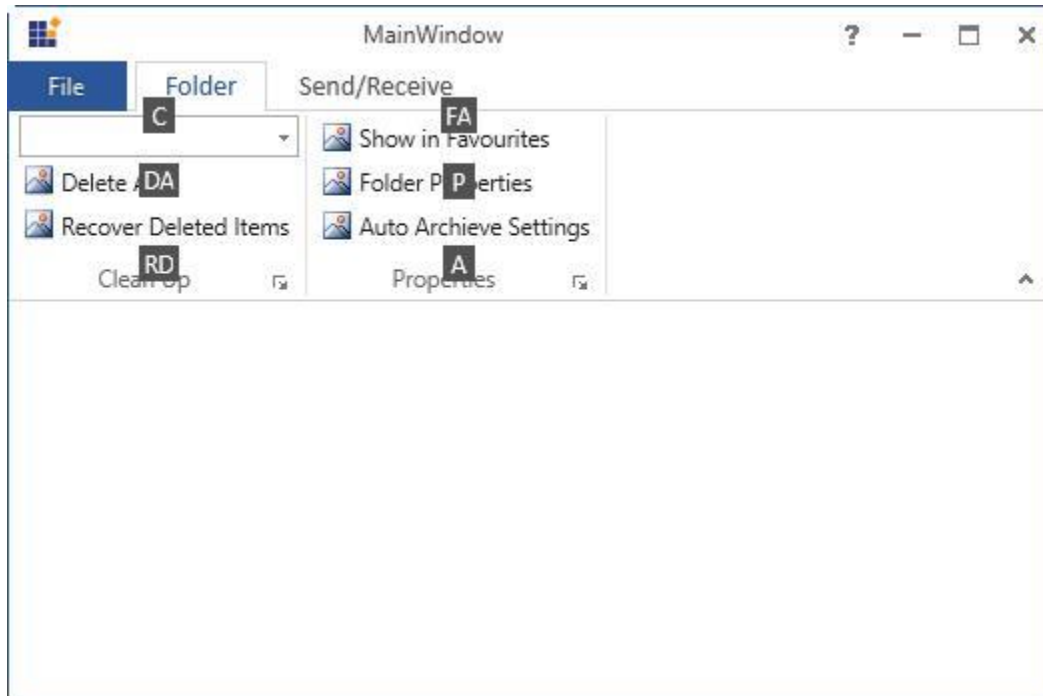

```
<syncfusion:Ribbon VerticalAlignment="Top" >
<syncfusion:RibbonTab syncfusion:Ribbon.KeyTip="F" Caption="Folder"
IsChecked="True" >
<syncfusion:RibbonBar Header="Clean Up" >
<syncfusion:RibbonComboBox syncfusion:Ribbon.KeyTip="C" Label="CleanUp">
<syncfusion:RibbonComboBoxItem Content="Cleanup Folder"/>
<syncfusion:RibbonComboBoxItem Content="Cleanup Folder and Sub Folders"/>
</syncfusion:RibbonComboBox>
<syncfusion:RibbonButton syncfusion:Ribbon.KeyTip="DA" SizeForm="Small"
Label="Delete All"/>
<syncfusion:RibbonButton syncfusion:Ribbon.KeyTip="RD" SizeForm="Small"
Label="Recover Deleted Items"/>
</syncfusion:RibbonBar >
<syncfusion:RibbonBar Name="_ribbonBar" Header="Properties" >
<syncfusion:RibbonButton syncfusion:Ribbon.KeyTip="FA" SizeForm="Small"
Label="Show in Favourites"/>
<syncfusion:RibbonButton syncfusion:Ribbon.KeyTip="P" SizeForm="Small"
Label="Folder Properties"/>
<syncfusion:RibbonButton syncfusion:Ribbon.KeyTip="A" SizeForm="Small"
Label="Auto Archieve Settings"/>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>
<syncfusion:RibbonTab syncfusion:Ribbon.KeyTip="S" Caption="Send/Receive"
IsChecked="False" />
```

```
</syncfusion:Ribbon>
```

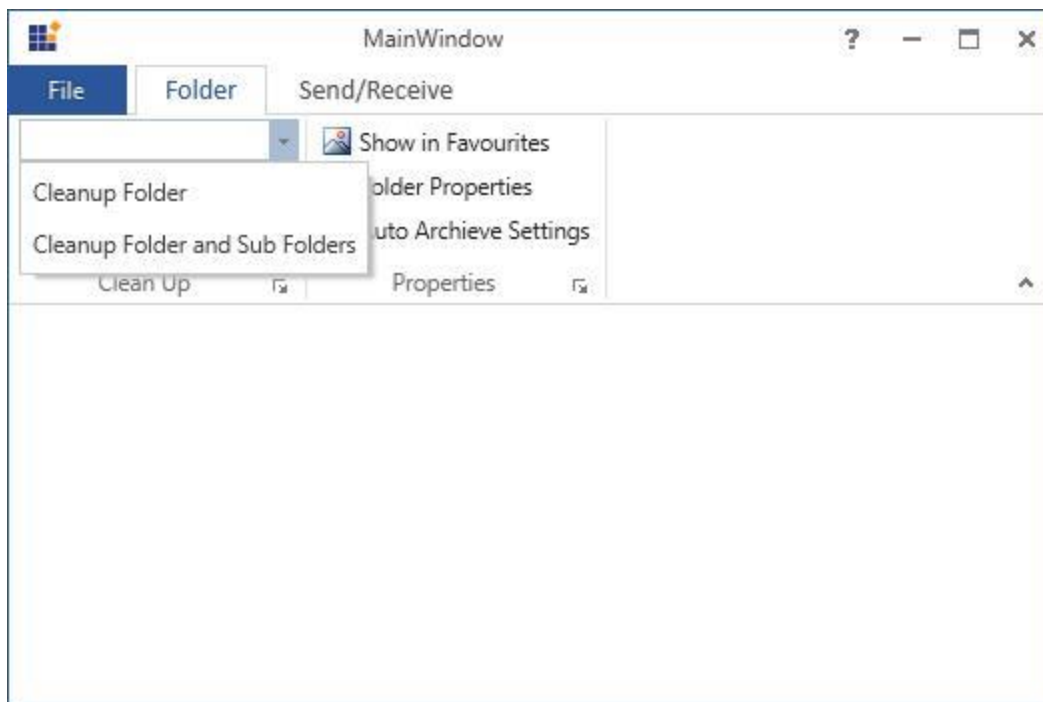

The below screenshot displays the steps involved to access RibbonComboBox. When Alt key is pressed, KeyTip for the RibbonTab gets displayed. Then choose the desired RibbonTab with the KeyTip

In the Next Step, all the KeyTips under RibbonTab gets displayed

Finally, Press the RibbonComboBox KeyTip to access it

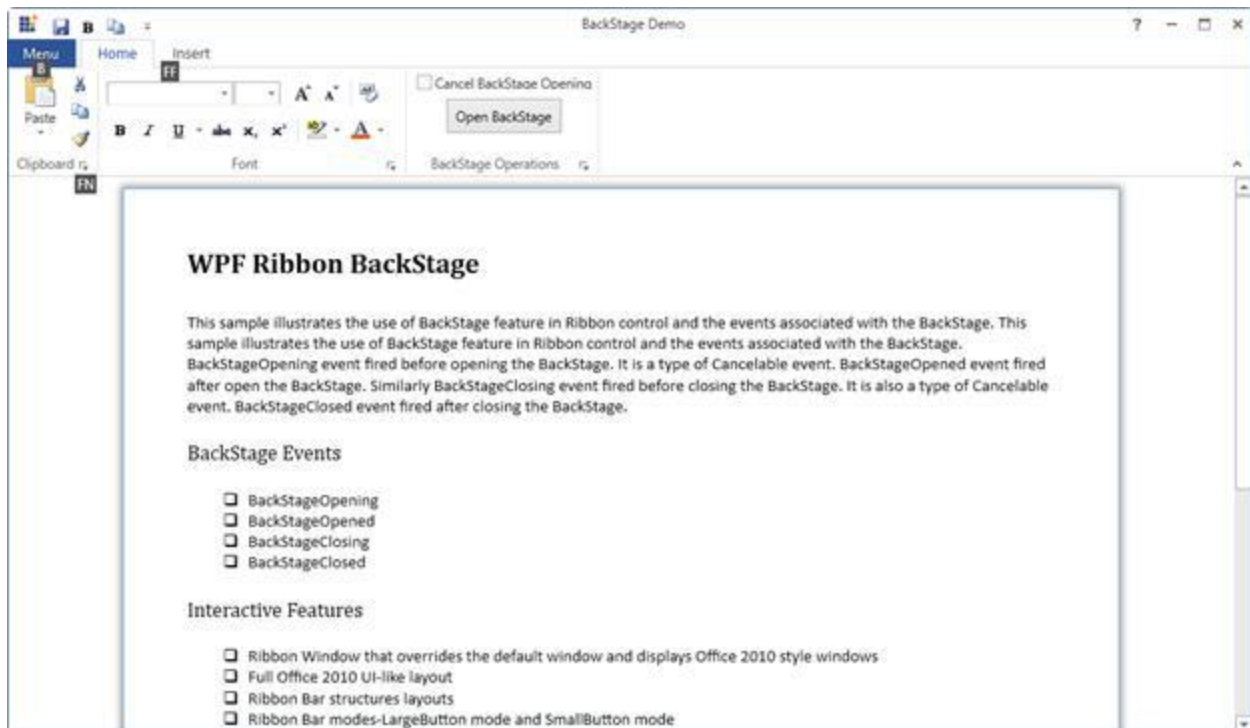

How does BackStage can be accessed using KeyTip

The backstage feature of the Ribbon control provides KeyTip support to display KeyTips on pressing the Alt key. It is also possible to set KeyTip for the BackStage elements which includes BackStageCommandButton, BackStageTabItem

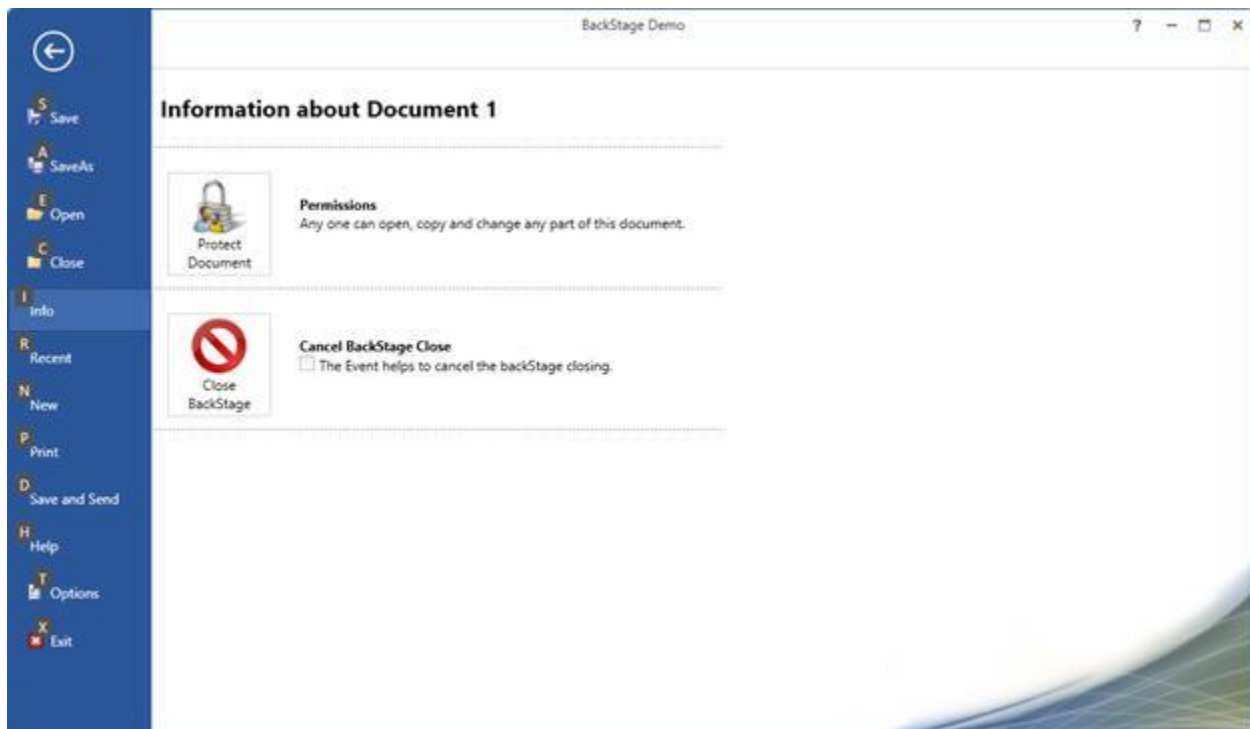

XML

```
<syncfusion:Ribbon.BackStage>
<syncfusion:Backstage x:Name="_ribbonBackStage"
syncfusion:Ribbon.KeyTip="B">
<syncfusion:BackStageCommandButton Header="Save"
syncfusion:Ribbon.KeyTip="S" Command="Save" Icon="/Resources/Save16.png"/>
<syncfusion:BackStageCommandButton Header="Save As"
syncfusion:Ribbon.KeyTip="A" Command="SaveAs"
Icon="/Resources/Save16.png"/>
<syncfusion:BackstageTabItem syncfusion:Ribbon.KeyTip="I" Header="Info"/>
<syncfusion:BackstageTabItem syncfusion:Ribbon.KeyTip="R" Header="Recent"/>
</syncfusion:Backstage>
</syncfusion:Ribbon.BackStage>
```

In the below screenshot, "B" is set as KeyTip for the Backstage. So when the user press "B", it automatically open the BackStage

The following screenshot display the KeyTip for the BackStageCommand and BackStageTabItem

Touch Support in WPF Ribbon

Ribbon control have touch support and it provides Touch UI which is easy to access the element in Ribbon.

How to enable touch in RibbonWindow

To enable touch in the RibbonWindow, set `EnableTouch` property of the `SkinStorage` as `True`. The following code snippet illustrates this

XML

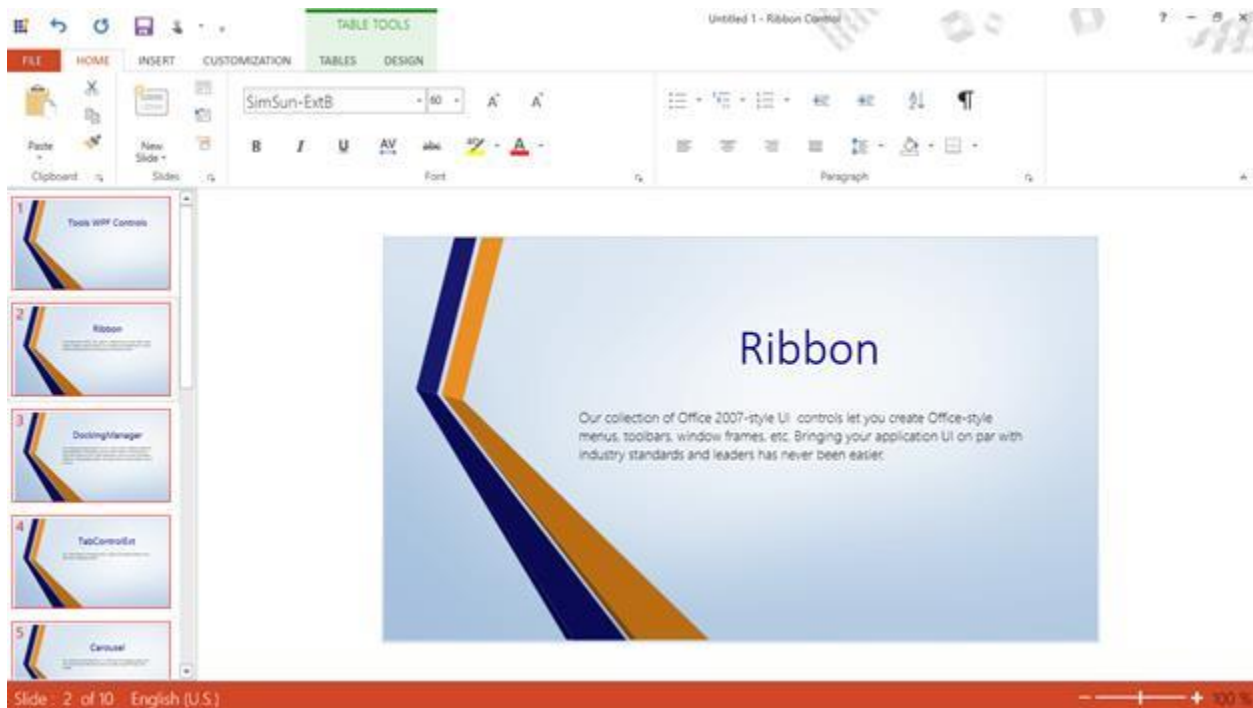

```
<syncfusion:RibbonWindow
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="RibbonButtonPanel.MainWindow"
Title="MainWindow" Height="350" Width="525"
syncfusion:SkinStorage.VisualStyle="Office2013" x:Name="_ribbonWindow"
syncfusion:SkinStorage.EnableTouch="True"/>
```

C#

```
SkinStorage.SetEnableTouch(_ribbonWindow, true);
```

VB.NET

```
SkinStorage.SetEnableTouch(_ribbonWindow, True)
```

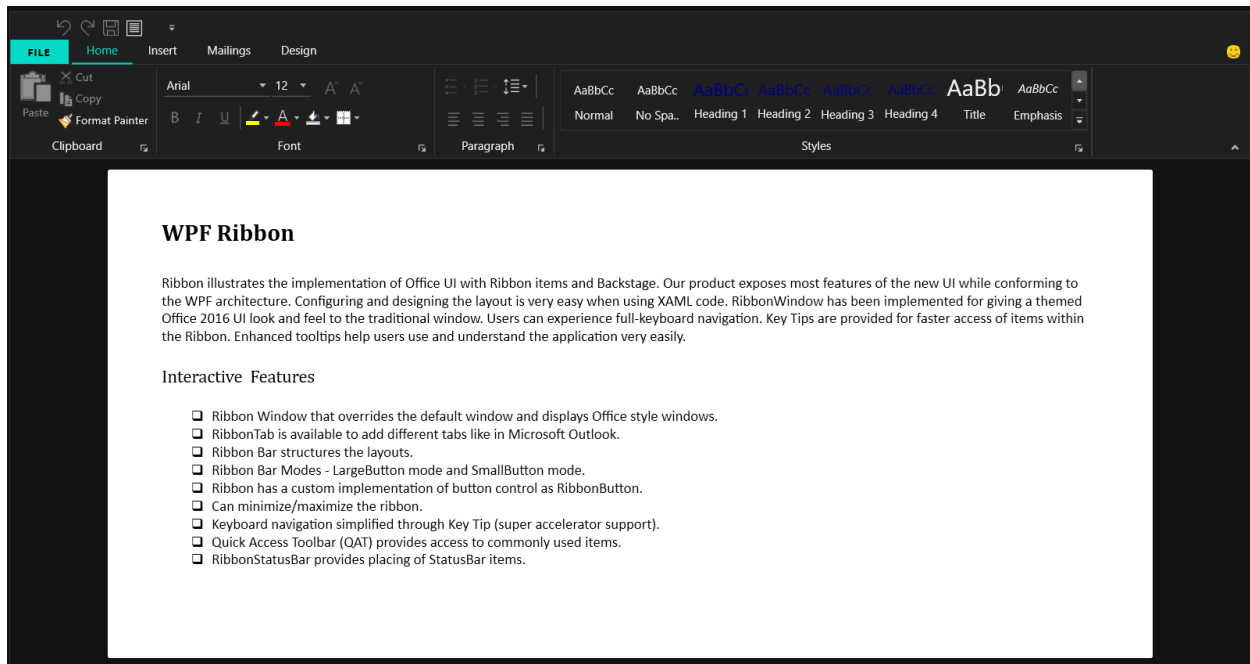

Styling and Templates in WPF Ribbon

Theme

Ribbon supports various built-in themes. Refer to the below links to apply themes for the Ribbon,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Patterns and Practices in WPF Ribbon

Ribbon with MVVM

For better control customization MVVM pattern can be followed. The following steps illustrate a simple MVVM pattern with Ribbon control

1.Create new WPF project 2.Add **Model** class for each element which need to be included in Ribbon control. In this sample class has been created for RibbonTab, RibbonBar and RibbonItem

Model

C#

```
public class CustomRibbonTab
{
    public string TabHeader { get; set; }
    public ObservableCollection<CustomRibbonBar> CustomRibbonBars { get; set; }
    public CustomRibbonTab()
    {
        CustomRibbonBars = new ObservableCollection<CustomRibbonBar>();
    }
}

public class CustomRibbonBar
{
    public string BarHeader { get; set; }
    public ObservableCollection<CustomRibbonItem> CustomRibbonItems { get; set; }
}

public CustomRibbonBar()
{
    CustomRibbonItems = new ObservableCollection<CustomRibbonItem>();
}

public class CustomRibbonItem
{
    public CustomRibbonItem()
    {
    }
}
```

```

IsSplitButton = false;
IsBoolean = true;
}
public string ItemHeader
{
    get;
    set;
}
public string Image { get; set; }
public bool IsBoolean { get; set; }
public bool IsLarge { get; set; }
public bool IsSplitButton { get; set; }
}

```

VB.NET

```

Public Class CustomRibbonTab
Public Property TabHeader() As String
Public Property CustomRibbonBars() As ObservableCollection(Of
CustomRibbonBar)
Public Sub New()
CustomRibbonBars = New ObservableCollection(Of CustomRibbonBar) ()
End Sub
End Class
Public Class CustomRibbonBar
Public Property BarHeader() As String
Public Property CustomRibbonItems() As ObservableCollection(Of
CustomRibbonItem)
Public Sub New()
CustomRibbonItems = New ObservableCollection(Of CustomRibbonItem) ()
End Sub
End Class
Public Class CustomRibbonItem
Public Sub New()
IsSplitButton = False
IsBoolean = True
End Sub
Public Property ItemHeader() As String
Public Property Image() As String
Public Property IsBoolean() As Boolean
Public Property IsLarge() As Boolean
Public Property IsSplitButton() As Boolean
End Class

```

3. Create **ViewModel** class where the collection has been declared and the items has been populated to it.

ViewModel

C#

```

public class ViewModel
{
    public ObservableCollection<CustomRibbonTab> CustomRibbonTabs { get; set; }
    public ViewModel()
    {

```

```

CustomRibbonTabs = new ObservableCollection<CustomRibbonTab>();
PopulateRibbonTabs();
}
void PopulateRibbonTabs()
{
    CustomRibbonTab Tab1 = new CustomRibbonTab() { TabHeader = "Home" };
    PopulateRibbonHomeBars(Tab1);
    CustomRibbonTabs.Add(Tab1);
}
//Home Tab
void PopulateRibbonHomeBars(CustomRibbonTab Tab)
{
    CustomRibbonBar Bar1 = new CustomRibbonBar() { BarHeader = "Clipboard" };
    PopulateRibbonNewItems(Bar1);
    CustomRibbonBar Bar2 = new CustomRibbonBar() { BarHeader = "Editing" };
    PopulateRibbonEditingItems(Bar2);
    Tab.CustomRibbonBars.Add(Bar1);
    Tab.CustomRibbonBars.Add(Bar2);
}
void PopulateRibbonNewItems(CustomRibbonBar Bar)
{
    CustomRibbonItem Item1 = new CustomRibbonItem() { ItemHeader = "Paste",
    IsLarge = true, Image = "Paste32.png" };
    CustomRibbonItem Item2 = new CustomRibbonItem() { ItemHeader = "Cut", Image
    = "Cut16.png" };
    CustomRibbonItem Item3 = new CustomRibbonItem() { ItemHeader = "Copy", Image
    = "Copy16.png" };
    CustomRibbonItem Item4 = new CustomRibbonItem() { ItemHeader = "Format
    Painter", Image = "FormatPainter16.png" };
    Bar.CustomRibbonItems.Add(Item1);
    Bar.CustomRibbonItems.Add(Item2);
    Bar.CustomRibbonItems.Add(Item3);
    Bar.CustomRibbonItems.Add(Item4);
}
private void PopulateRibbonEditingItems(CustomRibbonBar Bar)
{
    CustomRibbonItem Item1 = new CustomRibbonItem() { ItemHeader = "Hyperlink",
    IsLarge = true, Image = "hyperlink32.png" };
    CustomRibbonItem Item2 = new CustomRibbonItem() { ItemHeader = "Replace",
    IsLarge = true, Image = "replace_32.png" };
    CustomRibbonItem Item3 = new CustomRibbonItem() { ItemHeader = "Zoom",
    IsLarge = true, Image = "Zoom_32x32.png" };
    Bar.CustomRibbonItems.Add(Item1);
    Bar.CustomRibbonItems.Add(Item2);
    Bar.CustomRibbonItems.Add(Item3);
}
}

```

VB.NET

```

Public Class ViewModel
    Public Property CustomRibbonTabs() As ObservableCollection(Of
    CustomRibbonTab)
    Public Sub New()
        CustomRibbonTabs = New ObservableCollection(Of CustomRibbonTab) ()
        PopulateRibbonTabs()
    End Sub
End Class

```

```
End Sub
Private Sub PopulateRibbonTabs()
Dim Tab1 As New CustomRibbonTab() With {.TabHeader = "Home"}
PopulateRibbonHomeBars(Tab1)
CustomRibbonTabs.Add(Tab1)
End Sub
'Home Tab
Private Sub PopulateRibbonHomeBars(ByVal Tab As CustomRibbonTab)
Dim Bar1 As New CustomRibbonBar() With {.BarHeader = "Clipboard"}
PopulateRibbonNewItem(Bar1)
Dim Bar2 As New CustomRibbonBar() With {.BarHeader = "Editing"}
PopulateRibbonEditingItems(Bar2)
Tab.CustomRibbonBars.Add(Bar1)
Tab.CustomRibbonBars.Add(Bar2)
End Sub
Private Sub PopulateRibbonNewItem(ByVal Bar As CustomRibbonBar)
Dim Item1 As New CustomRibbonItem() With {
.ItemHeader = "Paste",
.IsLarge = True,
.Image = "Paste32.png"
}
Dim Item2 As New CustomRibbonItem() With {
.ItemHeader = "Cut",
.Image = "Cut16.png"
}
Dim Item3 As New CustomRibbonItem() With {
.ItemHeader = "Copy",
.Image = "Copy16.png"
}
Dim Item4 As New CustomRibbonItem() With {
.ItemHeader = "Format Painter",
.Image = "FormatPainter16.png"
}
Bar.CustomRibbonItems.Add(Item1)
Bar.CustomRibbonItems.Add(Item2)
Bar.CustomRibbonItems.Add(Item3)
Bar.CustomRibbonItems.Add(Item4)
End Sub
Private Sub PopulateRibbonEditingItems(ByVal Bar As CustomRibbonBar)
Dim Item1 As New CustomRibbonItem() With {
.ItemHeader = "Hyperlink",
.IsLarge = True,
.Image = "hyperlink32.png"
}
Dim Item2 As New CustomRibbonItem() With {
.ItemHeader = "Replace",
.IsLarge = True,
.Image = "replace_32.png"
}
Dim Item3 As New CustomRibbonItem() With {
.ItemHeader = "Zoom",
.IsLarge = True,
.Image = "Zoom_32x32.png"
}
Bar.CustomRibbonItems.Add(Item1)
Bar.CustomRibbonItems.Add(Item2)
Bar.CustomRibbonItems.Add(Item3)
```

```
End Sub
End Class
```

4. In XAML bind the collection to Ribbon control and use ItemContainerStyle to bind the inner level items like RibbonBar and RibbonItems

MainWindow.xaml

XML

```
<syncfusion:RibbonWindow x:Class="RibbonSample_in_MVVM.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
syncfusion:SkinStorage.VisualStudio="Office2013"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
xmlns:local="clr-namespace:RibbonSample_in_MVVM"
Title="MainWindow" Height="350" Width="525">
<Window.Resources>
<ResourceDictionary>
<ResourceDictionary.MergedDictionaries>
<ResourceDictionary
Source="/Syncfusion.Tools.WPF;component/Framework/Ribbon/Themes/Office2013St
yle.xaml" />
</ResourceDictionary.MergedDictionaries>
<local:BooltoSizeformConverter x:Key="sizeform"/>
<local:ItemDataTemplateSelector x:Key="selector"/>
<local:ImageConverter x:Key="image"/>
<DataTemplate x:Key="Ribbonbutton">
<syncfusion:RibbonButton Label="{Binding ItemHeader}" SizeForm="{Binding
IsLarge, Converter={StaticResource sizeform}}" LargeIcon="{Binding
Image,Converter={StaticResource image}}" SmallIcon="{Binding
Image,Converter={StaticResource image}}" />
</DataTemplate>
<DataTemplate x:Key="Splitbutton">
<syncfusion:SplitButton Label="{Binding ItemHeader}" SizeForm="{Binding
IsLarge, Converter={StaticResource sizeform}}" LargeIcon="{Binding
Image,Converter={StaticResource image}}" SmallIcon="{Binding
Image,Converter={StaticResource image}}" />
</DataTemplate>
</ResourceDictionary>
</Window.Resources>
<Window.DataContext>
<local:ViewModel/>
</Window.DataContext>
<Grid>
<syncfusion:Ribbon
x:Name="_ribbon" VerticalAlignment="Top"
ItemsSource="{Binding CustomRibbonTabs}"
<syncfusion:Ribbon.ItemContainerStyle>
<Style TargetType="{x:Type syncfusion:RibbonTab}">
<Setter Property="Caption" Value="{Binding TabHeader}"></Setter>
<Setter Property="ItemsSource" Value="{Binding CustomRibbonBars}" />
<Setter Property="ItemContainerStyle">
<Setter.Value>
<Style BasedOn="{StaticResource Office2013RibbonBarStyle}"
TargetType="{x:Type syncfusion:RibbonBar}">
<Setter Property="Header" Value="{Binding BarHeader}" />
```

```

<Setter Property="ItemsSource" Value="{Binding CustomRibbonItems}"/>
<Setter Property="ItemTemplateSelector" Value="{StaticResource selector}"/>
</Style>
</Setter.Value>
</Setter>
</Style>
</syncfusion:Ribbon.ItemContainerStyle>
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>

```

5. Converter class is used to set **SizeForm** for the Ribbon items and to set images.

[Converter.cs](#)

C#

```

public class BooltoSizeformConverter : IValueConverter
{
    public object Convert(object value, Type targetType, object parameter,
        System.Globalization.CultureInfo culture)
    {
        if (value.Equals(true))
        {
            return "Large";
        }
        else
        {
            return "Small";
        }
    }
    public object ConvertBack(object value, Type targetType, object parameter,
        System.Globalization.CultureInfo culture)
    {
        throw new NotImplementedException();
    }
}

public class ItemDataTemplateSelector : DataTemplateSelector
{
    public override DataTemplate SelectTemplate(object item, DependencyObject
        container)
    {
        FrameworkElement element = container as FrameworkElement;
        if (element != null && item != null)
        {
            if (item is CustomRibbonItem && (item as CustomRibbonItem).IsSplitButton)
            {
                return element.FindResource("Splitbutton") as DataTemplate;
            }
            else
            {
                return element.FindResource("Ribbonbutton") as DataTemplate;
            }
        }
        return null;
    }
}

```

```
public class ImageConverter : IValueConverter
{
    public object Convert(object value, Type targetType, object parameter,
        System.Globalization.CultureInfo culture)
    {
        if (value != null)
        {
            string str = value.ToString();
            return "../Images/" + str;
        }
        else
        {
            return value;
        }
    }
    public object ConvertBack(object value, Type targetType, object parameter,
        System.Globalization.CultureInfo culture)
    {
        throw new NotImplementedException();
    }
}
```

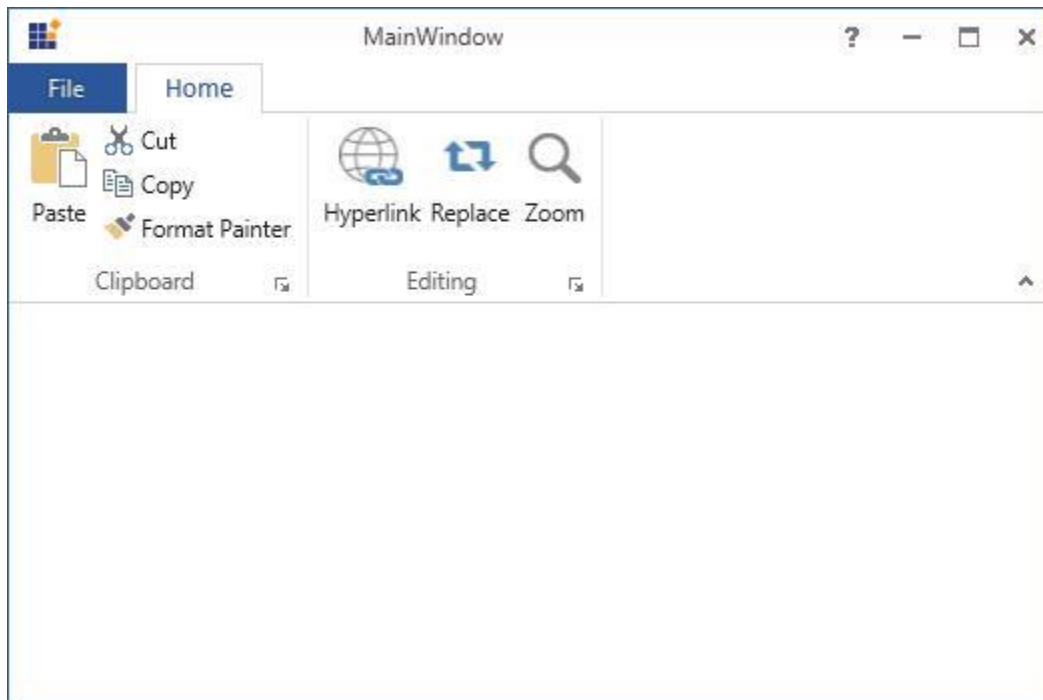

VB.NET

```
Public Class BooltoSizeformConverter
    Implements IValueConverter
    Public Function Convert(ByVal value As Object, ByVal targetType As Type,
        ByVal parameter As Object, ByVal culture As
        System.Globalization.CultureInfo) As Object
        If value.Equals(True) Then
            Return "Large"
        Else
            Return "Small"
        End If
    End Function
    Public Function ConvertBack(ByVal value As Object, ByVal targetType As Type,
        ByVal parameter As Object, ByVal culture As
        System.Globalization.CultureInfo) As Object
        Throw New NotImplementedException()
    End Function
End Class

Public Class ItemDataTemplateSelector
    Inherits DataTemplateSelector
    Public Overrides Function SelectTemplate(ByVal item As Object, ByVal
        container As DependencyObject) As DataTemplate
        Dim element As FrameworkElement = TryCast(container, FrameworkElement)
        If element IsNot Nothing AndAlso item IsNot Nothing Then
            If TypeOf item Is CustomRibbonItem AndAlso (TryCast(item,
                CustomRibbonItem)).IsSplitButton Then
                Return TryCast(element.FindResource("Splitbutton"), DataTemplate)
            Else
                Return TryCast(element.FindResource("Ribbonbutton"), DataTemplate)
            End If
        End If
        Return Nothing
    End Function
End Class
```

```
End Class
Public Class ImageConverter
Implements IValueConverter
Public Function Convert(ByVal value As Object, ByVal targetType As Type,
ByVal parameter As Object, ByVal culture As
System.Globalization.CultureInfo) As Object
If value IsNot Nothing Then
Dim str As String = value.ToString()
Return "../Images/" & str
Else
Return value
End If
End Function
Public Function ConvertBack(ByVal value As Object, ByVal targetType As Type,
ByVal parameter As Object, ByVal culture As
System.Globalization.CultureInfo) As Object
Throw New System.NotImplementedException()
End Function
End Class
```

Now the output displays the Ribbon control with the populated items

Practice with PRISM

Ribbon control provides PRISM support. The following steps explain about creating simple sample project in the PRISM.

1.Create new WPF project and add the following references to the solution project.

Microsoft.Practices.ServiceLocation.dll *Microsoft.Practices.Unity.dll*

Microsoft.Practices.Unity.Configuration.dll *Microsoft.Practices.Unity.RegistrationByConvention.dll*

Prism.dll *Prism.Unity.Wpf.dll* * *Prism.Wpf.dll* 2.Rename MainWindow to Shell in the Project 3.Add new class called Bootstrapper.cs to initialize the prism application.

C#

```
class Bootstrapper : UnityBootstrapper
{
    protected override DependencyObject CreateShell()
    {
        return Container.Resolve<Shell>();
    }
    protected override void InitializeShell()
    {
        base.InitializeShell();
        App.Current.MainWindow = (Shell) this.Shell;
        App.Current.MainWindow.Show();
    }
    protected override void ConfigureModuleCatalog()
    {
        base.ConfigureModuleCatalog();
        ModuleCatalog catalog = (ModuleCatalog) this.ModuleCatalog;
        catalog.AddModule(typeof(HomeTabModule.HomeTabModules));
    }
}
```

VB.NET

```
Friend Class Bootstrapper
Inherits UnityBootstrapper
Protected Overrides Function CreateShell() As DependencyObject
Return Container.Resolve(Of Shell)()
End Function
Protected Overrides Sub InitializeShell()
MyBase.InitializeShell()
App.Current.MainWindow = CType(Me.Shell, Shell)
App.Current.MainWindow.Show()
End Sub
Protected Overrides Sub ConfigureModuleCatalog()
MyBase.ConfigureModuleCatalog()
Dim catalog As ModuleCatalog = CType(Me.ModuleCatalog, ModuleCatalog)
catalog.AddModule(GetType(HomeTabModule.HomeTabModules))
End Sub
End Class
```

4. Override OnStartup method in the App.xaml.cs to execute Bootstrapper when the application starts

C#

```
public partial class App : Application
{
    protected override void OnStartup(StartupEventArgs e)
    {
        base.OnStartup(e);
        Bootstrapper bootstrapper = new Bootstrapper();
        bootstrapper.Run();
    }
}
```

VB.NET

```
Partial Public Class App
Inherits Application
Protected Overrides Sub OnStartup(ByVal e As StartupEventArgs)
MyBase.OnStartup(e)
Dim bootstrapper As New Bootstrapper()
bootstrapper.Run()
End Sub
End Class
```

5.Next step is to create regions in the shell. To do this, first add the following namespace in the shell Window

XML

```
xmlns:Cal="http://www.codeplex.com/CompositeWPF"
```

In the below code, a region called “Tabs” has been created to load RibbonTab Module views

XML

```
<syncfusion:RibbonWindow x:Class="RibbonDemoSample.Shell"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:Cal="http://www.codeplex.com/CompositeWPF"
syncfusion:SkinStorage.VisualStudio="Office2013"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
Title="MainWindow" Height="350" Width="525">
<Grid>
<syncfusion:Ribbon Cal:RegionManager.RegionName="Tabs"
VerticalAlignment="Top">
</syncfusion:Ribbon>
</Grid>
</syncfusion:RibbonWindow>
```

6.Adding Module to the project

Right click the Solution project, point to “Add” and then click “NewProject”. The new Window called AddNewProject gets open. Select “ClassLibrary” from Visual C# then rename the project with desired name and click “Ok”. Now a new Module has been created in the Solution Project

Now add following assemblies to the Module project

- PresentationCore.dll
- PresentationFramework.dll
- WindowsBase.dll

Also add following Prism assemblies

- Microsoft.Practices.ServiceLocation.dll
- Microsoft.Practices.Unity.dll
- Microsoft.Practices.Unity.Configuration.dll

- Microsoft.Practices.Unity
- RegistrationByConvention.dll
- Prism.dll
- Prism.Unity.Wpf.dll
- Prism.WPF.dll 7. In the Shell project, add the reference to the “HomeTabModule” project by registering with ModuleCatalog instance in the GetModuleCatalog method

C#

```
class Bootstrapper : UnityBootstrapper
{
    protected override DependencyObject CreateShell()
    {
        return Container.Resolve<Shell>();
    }
    protected override void InitializeShell()
    {
        base.InitializeShell();
        App.Current.MainWindow = (Shell) this.Shell;
        App.Current.MainWindow.Show();
    }
    protected override void ConfigureModuleCatalog()
    {
        base.ConfigureModuleCatalog();
        ModuleCatalog catalog = (ModuleCatalog) this.ModuleCatalog;
        catalog.AddModule(typeof(HomeTabModule.HomeTabModules));
    }
}
```

VB.NET

```
Friend Class Bootstrapper
Inherits UnityBootstrapper
Protected Overrides Function CreateShell() As DependencyObject
Return Container.Resolve(Of Shell)()
End Function
Protected Overrides Sub InitializeShell()
MyBase.InitializeShell()
App.Current.MainWindow = CType(Me.Shell, Shell)
App.Current.MainWindow.Show()
End Sub
Protected Overrides Sub ConfigureModuleCatalog()
MyBase.ConfigureModuleCatalog()
Dim catalog As ModuleCatalog = CType(Me.ModuleCatalog, ModuleCatalog)
catalog.AddModule(GetType(HomeTabModule.HomeTabModules))
End Sub
End Class
```

8.Adding Views to the Module**XML**

```
<syncfusion:RibbonTab x:Class="HomeTabModule.HomeTab"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
```

```

xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
mc:Ignorable="d"
d:DesignHeight="300" d:DesignWidth="300" Caption="Home" IsChecked="True" >
<syncfusion:RibbonBar>
<syncfusion:RibbonBar.Resources>
<ResourceDictionary
Source="/Syncfusion.Tools.WPF;component/Framework/Ribbon/Themes/Office2013St
yle.xaml" />
</syncfusion:RibbonBar.Resources>
<syncfusion:RibbonBar.Style>
<Style BasedOn="{StaticResource Office2013RibbonBarStyle}"
TargetType="{x:Type syncfusion:RibbonBar}">
</Style>
</syncfusion:RibbonBar.Style>
<syncfusion:RibbonButton Width="44"
Margin="3,0,3,3"
Label="Paste"
SizeForm="Large"
syncfusion:Ribbon.KeyTip="CP"
syncfusion:RibbonCommandManager.SynchronizedItem="Paste">
<syncfusion:RibbonButton.ToolTip>
<syncfusion:ScreenTip Description="Paste (Ctrl+V)">
<TextBlock Width="130"
HorizontalAlignment="Left"
Foreground="#FF4C4C4C"
Text="Paste the contents of clipboard."
TextWrapping="Wrap" />
</syncfusion:ScreenTip>
</syncfusion:RibbonButton.ToolTip>
</syncfusion:RibbonButton>
<syncfusion:RibbonButton HorizontalAlignment="Left"
Label="Cut"
SizeForm="Small"
syncfusion:Ribbon.KeyTip="CT">
<syncfusion:RibbonButton.ToolTip>
<syncfusion:ScreenTip Description="Cut (Ctrl+X)">
<TextBlock Width="130"
HorizontalAlignment="Left"
Text="Cut the selection and put it on the clipboard."
TextWrapping="Wrap" />
</syncfusion:ScreenTip>
</syncfusion:RibbonButton.ToolTip>
</syncfusion:RibbonButton>
<syncfusion:RibbonButton HorizontalAlignment="Left"
Label="Copy"
SizeForm="Small"
syncfusion:Ribbon.KeyTip="CY">
<syncfusion:RibbonButton.ToolTip>
<syncfusion:ScreenTip Description="Copy (Ctrl+C)">
<TextBlock Width="130"
HorizontalAlignment="Left"
Foreground="#FF4C4C4C"
Text="Copy the selection and put it on the clipboard."
TextWrapping="Wrap" />
</syncfusion:ScreenTip>

```

```

</syncfusion:RibbonButton.ToolTip>
</syncfusion:RibbonButton>
<syncfusion:RibbonButton Label="Format Painter"
SizeForm="Small"
syncfusion:Ribbon.KeyTip="CR">
<syncfusion:RibbonButton.ToolTip>
<syncfusion:ScreenTip Description="Format painter (Ctrl+Shift+C)"
HelpText="Press F1 for more help.">
<TextBlock Width="175"
HorizontalAlignment="Left"
Foreground="#FF4C4C4C"
TextWrapping="Wrap">
<Run Text="Copy formatting from one place and apply it to another." />
<LineBreak />
<LineBreak />
<Run Text="Double-click this button to apply the same formatting to multiple
places in the document." />
</TextBlock>
</syncfusion:ScreenTip>
</syncfusion:RibbonButton.ToolTip>
</syncfusion:RibbonButton>
</syncfusion:RibbonBar>
</syncfusion:RibbonTab>

```

9. Add a region to the shell and after creating View for the Module, register the view as Module using the below code

C#

```

public class HomeTabModules : IModule
{
    private readonly IRegionManager regionManager;
    public HomeTabModules(IRegionManager regionManager)
    {
        this.regionManager = regionManager;
    }
    public void Initialize()
    {
        regionManager.Regions["Tabs"].Add(new HomeTab());
    }
}

```

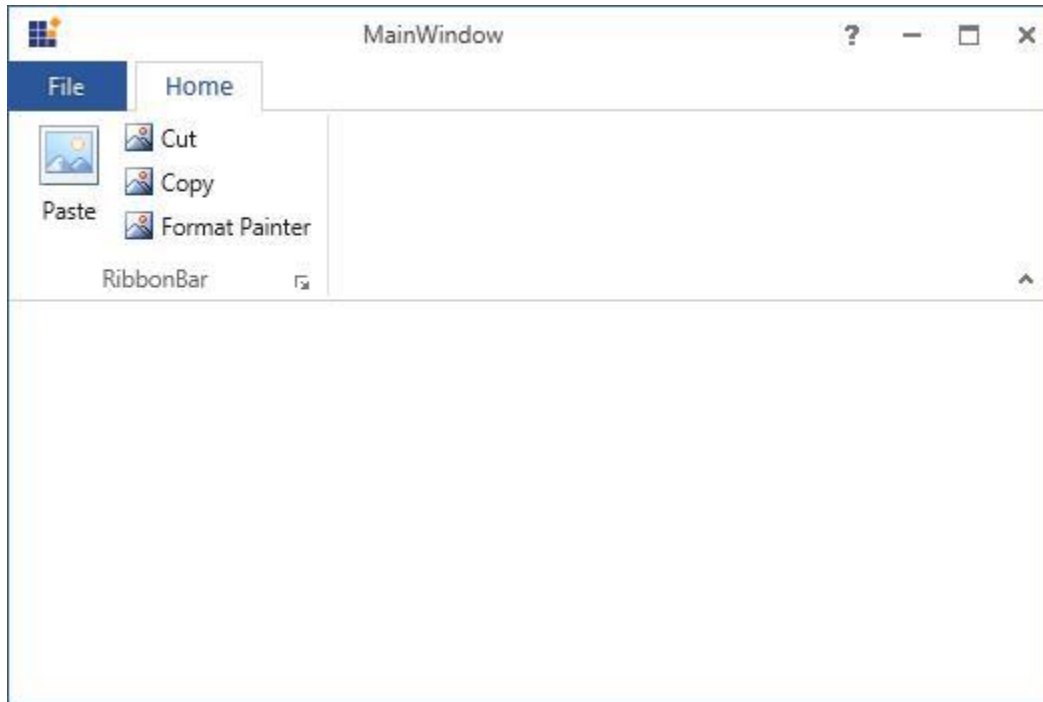

VB.NET

```

Public Class HomeTabModules
Implements IModule
Private ReadOnly regionManager As IRegionManager
Public Sub New(ByVal regionManager As IRegionManager)
Me.regionManager = regionManager
End Sub
Public Sub Initialize()
regionManager.Regions("Tabs").Add(New HomeTab())
End Sub
End Class

```

Now run the project. RibbonTabModule get added as one of the Module in the Shell. Similarly any number of Modules can be added based on the complexity of the project.

How to

Handle Pop-Up Opening and Closing Event in ApplicationMenu

To perform the action based on opening and closing of the ApplicationMenu, make use of `IsPopupOpenChanged` event.

XML

```
<syncfusion:ApplicationMenu Name="_applicationMenu" Width="38" Height="38"
ApplicationButtonImage="Resources/App.ico"
IsPopupOpenChanged="_applicationMenu_IsPopupOpenChanged">
```

C#

```
private void _applicationMenu_IsPopupOpenChanged(DependencyObject d,
DependencyPropertyChangedEventArgs e)
{
    if((d as ApplicationMenu).IsPopupOpen)
    {
        newMenuButton.IsEnabled = false;
    }
    else
    {
        newMenuButton.IsEnabled = true;
    }
}
```

VB.NET

```

Private Sub _applicationMenu_IsPopupOpenChanged(ByVal d As DependencyObject,
ByVal e As DependencyPropertyChangedEventArgs)
If(TryCast(d, ApplicationMenu)).IsPopupOpen Then
newMenuButton.IsEnabled = False
Else
newMenuButton.IsEnabled = True
End If
End Sub

```

SfRichTextBoxAdv

WPF RichTextBox (SfRichTextBoxAdv) Overview

The SfRichTextBoxAdv control allows you to view, edit and print rich text content including text, images, hyperlink etc. arranged in sections, tables, paragraphs, headers, footers and comments. You can perform all editing operations using keyboard, mouse and touch.

Features

The SfRichTextBoxAdv control supports basic features for editing rich text contents such as

- Viewing and editing rich text, images, tables and comments.
- Importing and exporting word documents (.doc, .docx), rich text format documents (.rtf), HTML documents (.htm, .html), XAML documents (.xaml) and text documents (.txt).
- Printing rendered contents as page by page.
- Supports all image types except Metafile images.
- Supports undo and redo all editing operation such as inserting text, table, images, hyperlink, comments and all formatting operations such as bold, italic etc.
- Supports first page header and footer as well as odd and even page headers and footers.
- Moving or copying portion of the document to clipboard and also pasting rich text contents from clipboard into the document.
- Supports loading encrypted word documents with valid password.

Note: Currently, the SfRichTextBoxAdv cannot edit rich text in headers and footers.

You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Getting Started with WPF RichTextBox (SfRichTextBoxAdv)

This section describes how to get started with [WPF RichTextBox](#) (SfRichTextBoxAdv) control.

Assembly Reference

You can find WPF RichTextBox (SfRichTextBoxAdv) control from the following assembly under the namespace Syncfusion.Windows.Controls.RichTextBoxAdv

- Syncfusion.SfRichTextBoxAdv.WPF

The following assembly references are required to deploy SfRichTextBoxAdv control in your application.

- Syncfusion.Compression.Base
- Syncfusion.OfficeChart.Base
- Syncfusion.Shared.WPF
- For 3.5 and 4.0 Frameworks – Syncfusion.DocIO.ClientProfile
- For 4.5 and higher Frameworks – Syncfusion.DocIO.Base

Note: Starting with v16.2.0.41 (2018 Vol 2), if you reference Syncfusion assemblies from trial setup or from the NuGet feed, you also have to add "Syncfusion.Licensing" assembly reference and include a license key in your projects. Please refer to this [link](#) to know about registering Syncfusion license key in your WPF application to use our components.

Adding SfRichTextBoxAdv to an application

After adding the aforementioned assembly references to your application, you can add SfRichTextBoxAdv as any normal control.

You can either drag the SfRichTextBoxAdv control from the toolbox window to the Design view or directly define the control in XAML view.

XML

```
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv"
xmlns:RichTextBoxAdv="clr-
namespace:Syncfusion.Windows.Controls.RichTextBoxAdv;assembly=Syncfusion.SfR
ichTextBoxAdv.Wpf" />
```

C#

```
// Initializes a new instance of RichTextBoxAdv.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
```

Using SfRichTextBoxAdv as a standard RichTextBox

This section discusses about how to use the SfRichTextBoxAdv control as a standard RichTextBox control with rich text formatting options.

XML

```
<Window x:Class="Sample.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:RichTextBoxAdv="clr-
namespace:Syncfusion.Windows.Controls.RichTextBoxAdv;assembly=Syncfusion.SfR
ichTextBoxAdv.Wpf">
<Window.Resources>
<RichTextBoxAdv:UnderlineToggleConverter x:Key="UnderlineToggleConverter"/>
<RichTextBoxAdv:LeftAlignmentToggleConverter
x:Key="LeftAlignmentToggleConverter"/>
<RichTextBoxAdv:CenterAlignmentToggleConverter
x:Key="CenterAlignmentToggleConverter"/>
```

```

<RichTextBoxAdv:RightAlignmentToggleConverter
x:Key="RightAlignmentToggleConverter"/>
<RichTextBoxAdv:JustifyAlignmentToggleConverter
x:Key="JustifyAlignmentToggleConverter"/>
<Style TargetType="Button">
<Setter Property="Background" Value="Transparent" />
<Setter Property="Margin" Value="12 4"/>
</Style>
<Style TargetType="ToggleButton">
<Setter Property="Background" Value="Transparent" />
<Setter Property="Margin" Value="12 4"/>
</Style>
</Window.Resources>
<Grid Background="#F1F1F1">
<Grid.RowDefinitions>
<RowDefinition Height="Auto"/>
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<Grid>
<!-- Defines the data context as RichTextBoxAdv -->
<StackPanel Orientation="Horizontal" DataContext="{Binding
ElementName=richTextBoxAdv}">
<!-- UI option to perform Undo/Redo using command binding -->
<StackPanel Orientation="Horizontal">
<Button Command="RichTextBoxAdv:SfRichTextBoxAdv.UndoCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" Focusable="False">
<Image Source="/Images/Undo.png" Height="40" Width="40" />
</Button>
<Button Command="RichTextBoxAdv:SfRichTextBoxAdv.RedoCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" Focusable="False">
<Image Source="/Images/Redo.png" Height="40" Width="40" />
</Button>
</StackPanel>
<!-- UI option to perform Clipboard operations using command binding -->
<Border Width="2" Height="46" Background="#1F1F1F"/>
<StackPanel Orientation="Horizontal">
<Button Command="RichTextBoxAdv:SfRichTextBoxAdv.CutCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" Focusable="False">
<Image Source="/Images/Cut.png" Height="40" Width="40" />
</Button>
<Button Command="RichTextBoxAdv:SfRichTextBoxAdv.CopyCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" Focusable="False">
<Image Source="/Images/Copy.png" Height="40" Width="40" />
</Button>
<Button Command="RichTextBoxAdv:SfRichTextBoxAdv.PasteCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" Focusable="False">
<Image Source="/Images/Paste.png" Height="40" Width="40" />
</Button>
</StackPanel>
<!-- UI option to apply character formatting using property binding -->
<Border Width="2" Height="46" Background="#1F1F1F"/>
<StackPanel Orientation="Horizontal">
<ToggleButton IsChecked="{Binding Selection.CharacterFormat.Bold}"
Focusable="False">
<Image Source="/Images/Bold.png" Height="40" Width="40" />
</ToggleButton>

```

```

<ToggleButton IsChecked="{Binding Selection.CharacterFormat.Italic}"
Focusable="False">
<Image Source="/Images/Italic.png" Height="40" Width="40" />
</ToggleButton>
<ToggleButton IsChecked="{Binding Selection.CharacterFormat.Underline,
Converter={StaticResource UnderlineToggleConverter}}" Focusable="False">
<Image Source="/Images/Underline.png" Height="40" Width="40" />
</ToggleButton>
</StackPanel>
<Border Width="2" Height="46" Background="#1F1F1F"/>
<!-- UI option to apply paragraph formatting using property binding -->
<StackPanel Orientation="Horizontal">
<ToggleButton IsChecked="{Binding Selection.ParagraphFormat.TextAlignment,
Converter={StaticResource LeftAlignmentToggleConverter}}" Focusable="False">
<Image Source="/Images/Left.png" Height="40" Width="40" />
</ToggleButton>
<ToggleButton IsChecked="{Binding Selection.ParagraphFormat.TextAlignment,
Converter={StaticResource CenterAlignmentToggleConverter}}"
Focusable="False">
<Image Source="/Images/Center.png" Height="40" Width="40" />
</ToggleButton>
<ToggleButton IsChecked="{Binding Selection.ParagraphFormat.TextAlignment,
Converter={StaticResource RightAlignmentToggleConverter}}"
Focusable="False">
<Image Source="/Images/Right.png" Height="40" Width="40" />
</ToggleButton>
<ToggleButton IsChecked="{Binding Selection.ParagraphFormat.TextAlignment,
Converter={StaticResource JustifyAlignmentToggleConverter}}"
Focusable="False">
<Image Source="/Images/Justify.png" Height="40" Width="40" />
</ToggleButton>
</StackPanel>
</StackPanel>
</Grid>
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv" Grid.Row="1" />
</Grid>
</Window>

```

Note: [View Standard RichTextBox example in GitHub](#)

Creating Document editor with Ribbon

This section discusses about how to create document editor with ribbon similar to Microsoft Word. The SfRichTextRibbon is a Ribbon control customized to work with SfRichTextBoxAdv control, which gives you the look and feel of Microsoft Word.

You can find the SfRichTextRibbon control from the following assembly under the namespace Syncfusion.Windows.Controls.RichTextBoxAdv

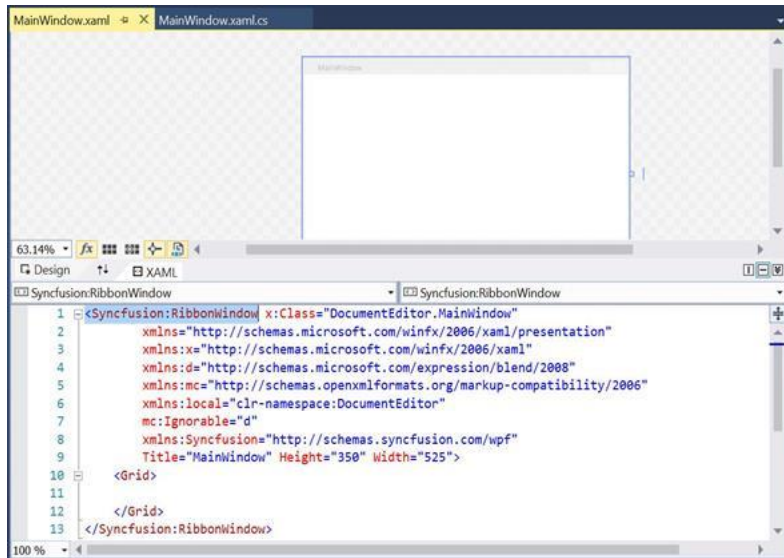

- Syncfusion.SfRichTextRibbon.WPF

The following assembly reference are additionally required to deploy SfRichTextRibbon control along with aforementioned assemblies.

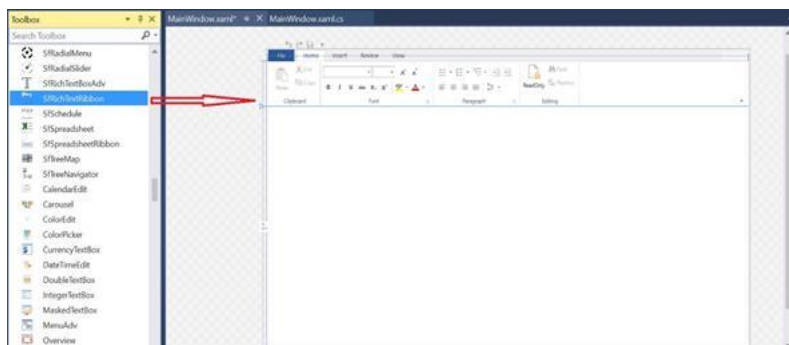

- Syncfusion.Tools.WPF

Adding the Control via Designer

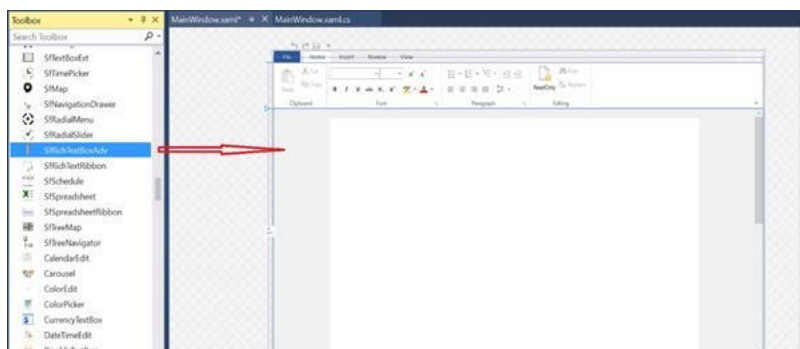

1. Create new WPF application in Visual Studio 2. Use the Syncfusion RibbonWindow instead of Window

3. Drag the SfRichTextRibbon control from the Toolbox window to the Design View. An instance of the SfRichTextRibbon control is created in the Design view

4. Drag the SfRichTextBoxAdv control from the Toolbox window to the Design View. An instance of the SfRichTextBoxAdv control is created in the Design view

5. To make an interaction between SfRichTextRibbon and SfRichTextBoxAdv, bind the SfRichTextBoxAdv as DataContext to the SfRichTextRibbon

XML

```
<Syncfusion:SfRichTextRibbon x:Name="richTextRibbon"
SnapsToDevicePixels="True" DataContext="{Binding
ElementName=richTextBoxAdv}" />
```

Adding Control via code.

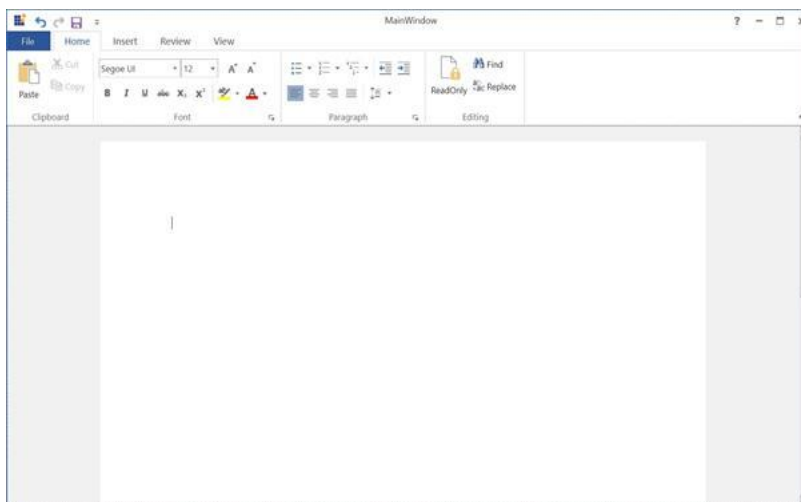

You can also add the SfRichTextRibbon and SfRichTextBoxAdv programmatically by using XAML

XML

```
<Syncfusion:RibbonWindow x:Class="DocumentEditor.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:DocumentEditor"
mc:Ignorable="d"
xmlns:Syncfusion="http://schemas.syncfusion.com/wpf"
Title="MainWindow" Height="350" Width="525"
Syncfusion:SkinStorage.VisualStudio="Office2013">
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto"/>
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<Syncfusion:SfRichTextRibbon x:Name="richTextRibbon"
SnapsToDevicePixels="True" />
<Syncfusion:SfRichTextBoxAdv x:Name="richTextBoxAdv" Background="#F1F1F1"
Grid.Row="1"></Syncfusion:SfRichTextBoxAdv>
</Grid>
</Syncfusion:RibbonWindow>
```

Note: Prefer using SfRichTextRibbon within RibbonWindow in your application, since the backstage of Ribbon will be opened only when the ribbon is loaded under the RibbonWindow

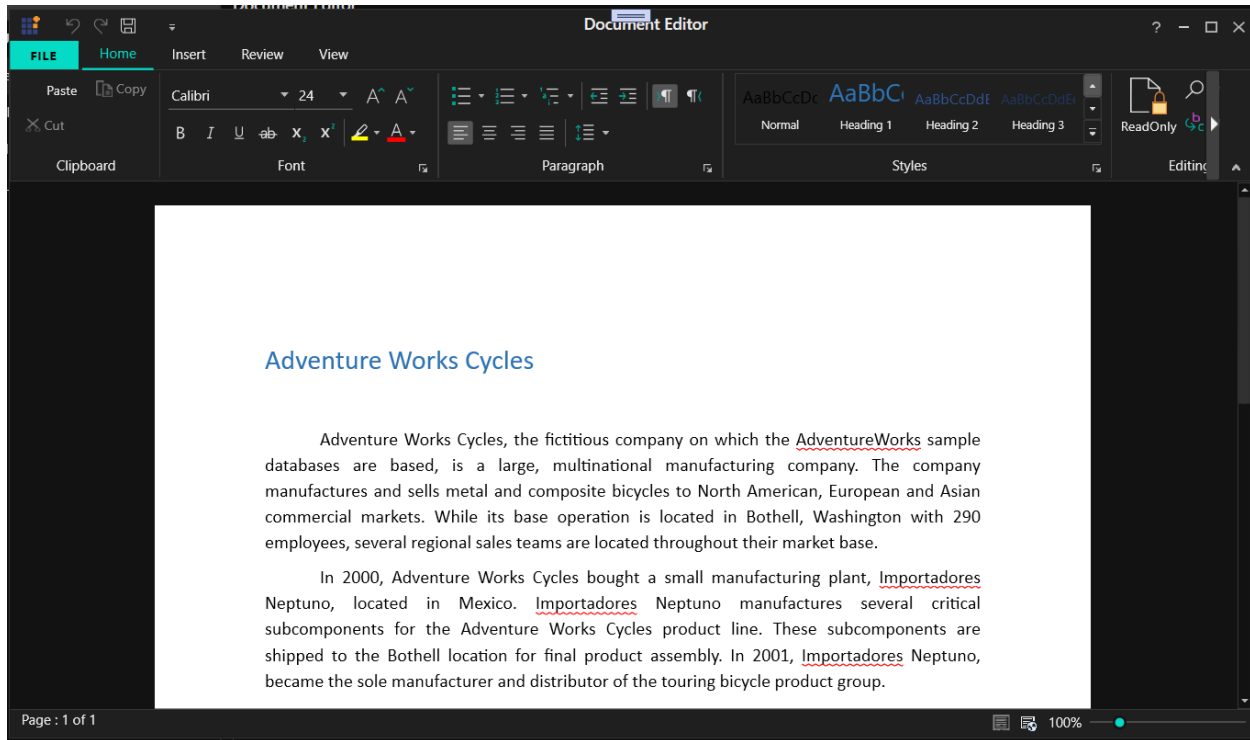

Finally, you can get the following output similar to Microsoft Word on executing the application

Theme

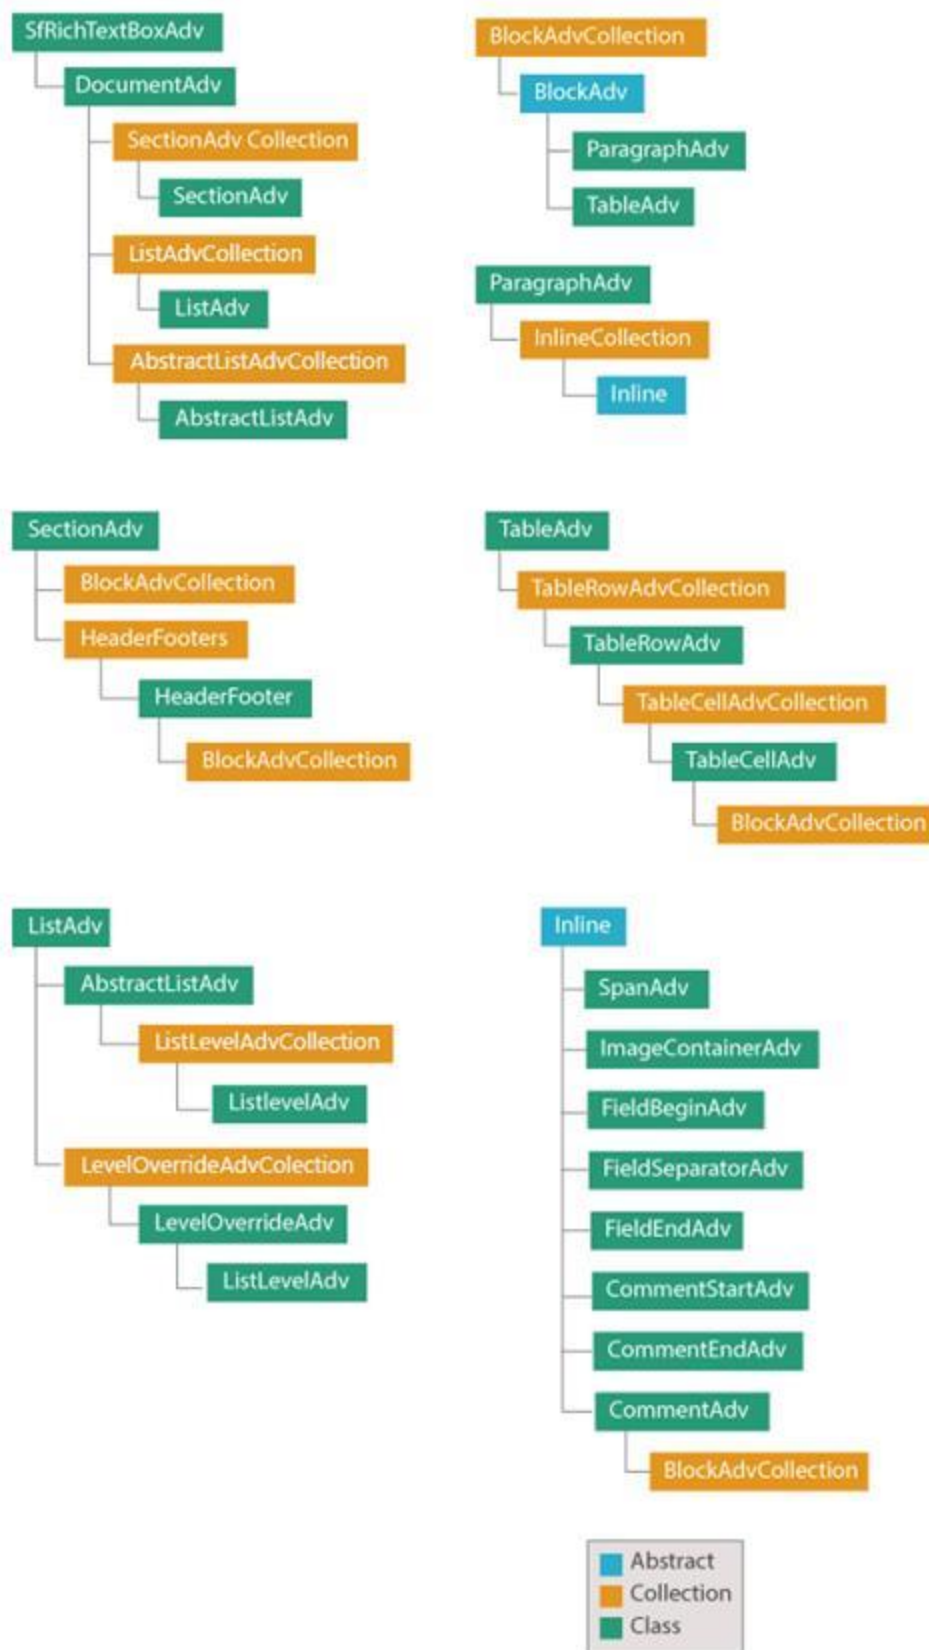

SfRichTextBoxAdv supports various built-in themes. Refer to the below links to apply themes for the SfRichTextBoxAdv,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Document Structure in WPF RichTextBox (SfRichTextBoxAdv)

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Document Properties in WPF RichTextBox (SfRichTextBoxAdv)

[WPF RichTextBox](#) keeps tracking the statistics about your documents. These statistics contain information about word count, paragraph count and pages count.

Word Count

RichTextBox automatically counts the number of words in a document while you type. You can get the words count from [WordCount](#) property. The default value of this property is 0.

The following sample code demonstrates how to get the total number of words in the document.

XML

```
<TextBlock Text="{Binding Path=WordCount, Mode=TwoWay}" />
```

C#

```
int wordCount.Text = richTextBoxAdv.WordCount.ToString();
```

VB.NET

```
wordCount.Text = richTextBoxAdv.WordCount.ToString()
```

Paragraph Count

RichTextBox automatically counts the number of paragraphs in a document while you type. You can get the paragraph count from [ParagraphCount](#) property. The default value of this property is 0. Also, it ignores empty paragraphs.

The following sample code demonstrates how to get the total number of paragraphs in the document.

XML

```
<TextBlock Name="ParagraphCount" Text="{Binding Path=ParagraphCount, Mode=TwoWay}" />
```

C#

```
int paragraphCount.Text = richTextBoxAdv.ParagraphCount.ToString();
```

VB.NET

```
paragraphCount.Text = richTextBoxAdv.ParagraphCount.ToString()
```

Page Count

RichTextBox counts the number of pages in a document while you type. You can get the pages count from [PageCount](#) property. The default value of this property is 0.

The following sample code demonstrates how to get the total number of pages in the document.

XML

```
<TextBlock x:Name="PageCount" Grid.Row="0" />
<RichTextBoxAdv:SfRichTextBoxAdv Grid.Row="1" x:Name="richTextBoxAdv"
SelectionChanged="RichTextBoxAdv_SelectionChanged"/>
```

C#

```
private void RichTextBoxAdv_SelectionChanged(object obj,
SelectionChangedEventArgs args)
{
    pageCount.Text = richTextBoxAdv.PageCount.ToString();
}
```

VB.NET

```
Private Sub RichTextBoxAdv_SelectionChanged(ByVal obj As Object, ByVal args
As SelectionChangedEventArgs)
    pageCount.Text = richTextBoxAdv.PageCount.ToString()
End Sub
```

Current Page number

The [CurrentPageNumber](#) property in the RichTextBox control returns the page number where the selection(cursor) is present.

The following sample code demonstrates how to get current page number in the document.

XML

```
<TextBlock x:Name="CurrentPageNumber" Grid.Row="0" />
<RichTextBoxAdv:SfRichTextBoxAdv Grid.Row="1" x:Name="richTextBoxAdv"
SelectionChanged="RichTextBoxAdv_SelectionChanged"/>
```

C#

```
private void RichTextBoxAdv_SelectionChanged(object obj,
SelectionChangedEventArgs args)
{
    currentPageNumber.Text = richTextBoxAdv.CurrentPageNumber.ToString();
}
```

VB.NET

```
Private Sub RichTextBoxAdv_SelectionChanged(ByVal obj As Object, ByVal args
As SelectionChangedEventArgs)
    currentPageNumber.Text = richTextBoxAdv.CurrentPageNumber.ToString()
End Sub
```

Note: The above PageCount and CurrentPageNumber properties are not a dependency property. And it is not notifying for dynamic changes. So, get these properties value in

selection changed event.

You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Layout Types in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv control allows you to choose between the following layout types.

- Pages
- Continuous
- Block

Pages

When using Pages layout type, the rich text document content is rendered sequentially in several pages, similar to the Print layout view of Microsoft Word. The size and margin of each page are defined by Section format properties.

The following code example demonstrates how to define layout type of SfRichTextBoxAdv control as Pages.

XML

```
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv" LayoutType="Pages"
xmlns:RichTextBoxAdv="clr-
namespace:Syncfusion.Windows.Controls.RichTextBoxAdv;assembly=Syncfusion.SfR
ichTextBoxAdv.Wpf"/>
```

C#

```
// Initializes a new instance of RichTextBoxAdv.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
// Defines the layout type as Pages
richTextBoxAdv.LayoutType = LayoutType.Pages;
```

VB.NET

```
' Initializes a new instance of RichTextBoxAdv.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
' Defines the layout type as Pages
richTextBoxAdv.LayoutType = LayoutType.Pages
```

Continuous

When using Continuous layout type, the entire rich text document content is rendered continuously in a single page, similar to the Web layout view of Microsoft Word. This layout looks like a simple text box with rich-text content and can be used for applications such as forums and blogs.

The following code example demonstrates how to define layout type of SfRichTextBoxAdv control as Continuous.

XML

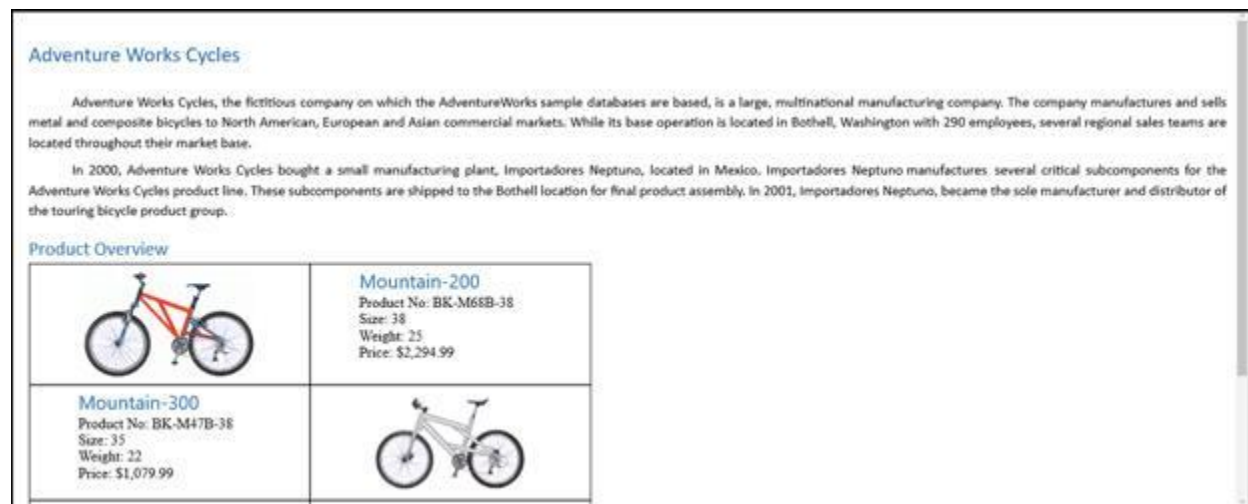

```
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv"
LayoutType="Continuous" xmlns:RichTextBoxAdv="clr-
namespace:Syncfusion.Windows.Controls.RichTextBoxAdv;assembly=Syncfusion.SfR
ichTextBoxAdv.Wpf"/>
```

C#

```
// Initializes a new instance of RichTextBoxAdv.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
// Defines the layout type as Continuous.
richTextBoxAdv.LayoutType = LayoutType.Continuous;
```

VB.NET

```
' Initializes a new instance of RichTextBoxAdv.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
' Defines the layout type as Continuous.
richTextBoxAdv.LayoutType = LayoutType.Continuous
```

Block

When using Block layout type, the rich text content is rendered continuously in a single page as read only. This layout looks like a simple text block with rich text content such as texts, images, and tables. Block Layout also supports copying contents to the clipboard. This can be used for applications such as forums and blogs in order to display the rich-text contents with same look and feel as in the continuous layout type.

The following code example demonstrates how to define layout type of SfRichTextBoxAdv control as Block.

XML

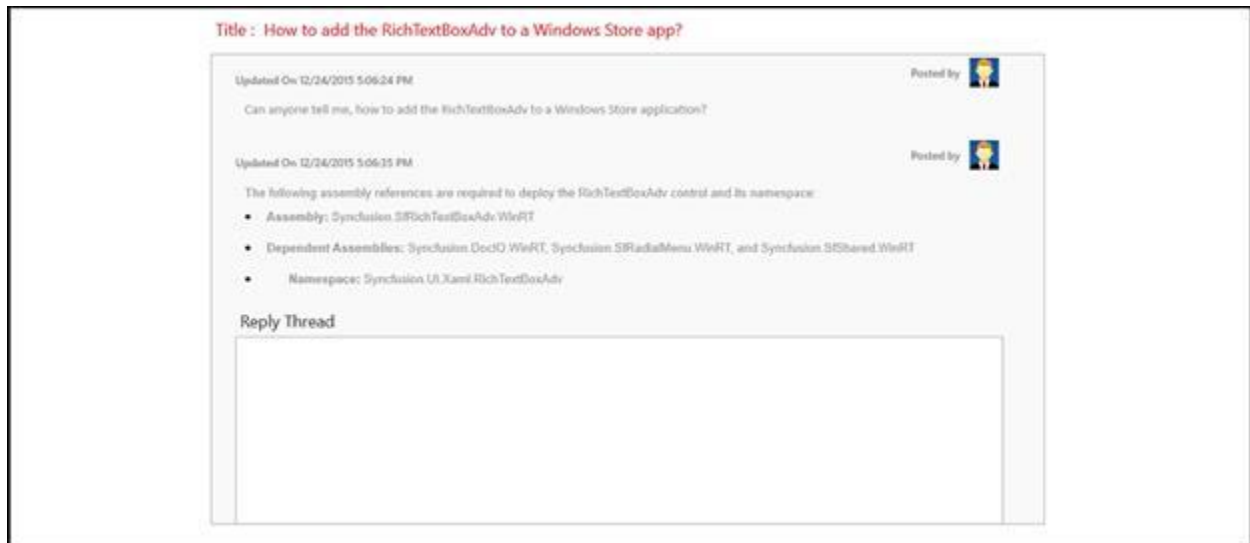

```
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv" LayoutType="Block"
xmlns:RichTextBoxAdv="clr-
namespace:Syncfusion.Windows.Controls.RichTextBoxAdv;assembly=Syncfusion.SfR
ichTextBoxAdv.Wpf"/>
```

C#

```
// Initializes a new instance of RichTextBoxAdv.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
// Defines the layout type as Block.
richTextBoxAdv.LayoutType = LayoutType.Block;
```

VB.NET

```
' Initializes a new instance of RichTextBoxAdv.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
' Defines the layout type as Block.
richTextBoxAdv.LayoutType = LayoutType.Block
```

Commands in WPF RichTextBox (SfRichTextBoxAdv)

Commands are a way to handle user interface (UI) actions. They are a loosely coupled way to bind the UI to the logic that performs the action. The SfRichTextBoxAdv supports commands for mostly used operations which are classified below.

- Character Formatting – Bold, Italic, Underline, Strike through, Baseline alignment, Font family, Font size, Font color and Highlight color.

- Paragraph Formatting – Left indent, Right indent, First line indent, Text alignment, Before spacing, After spacing, Line spacing, Line spacing type, Increase indent, Decrease indent and Change list type.
- Clipboard – Cut, Copy and Paste.
- History – Undo and Redo.
- Import and Export – Open document, Save document and New document.
- Comments – New comment, Delete comment, Delete all comments, Previous comment, Next comment and Show comments.
- Table – Insert table, Insert row, Insert column, Delete table, Delete row, Delete column and Merge selected cells, Select cell, Select column, Select row, Select table and Align cell content.
- UI options – Show hyperlink dialog, Show options pane and Layout type.
- Insert – Insert picture and Insert hyperlink.
- Document Styles – Create, modify, apply and clear style.

UI Command to access character formatting

The following code example demonstrates how to bind commands for applying character format.

XML

```
<!-- Binds button to the BoldCommand -->
<Button Content="Bold" Command="RichTextBoxAdv:SfRichTextBoxAdv.BoldCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ItalicCommand -->
<Button Content="Italic"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ItalicCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
```

The following code example demonstrates how to bind commands with parameter.

XML

```
<Button Content="Textalignment"
Command="Syncfusion:SfRichTextBoxAdv.TextAlignmentCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}"
CommandParameter="Right" />
```

List of available Commands

The following table contains the list of available UI Commands in SfRichTextBoxAdv.

Command Name	Description	Command parameter (optional)
AddToDictionaryCommand	Represents the command to add the selected or specified custom word into the custom dictionary.	The custom word to be added.
AfterSpacingCommand	Represents the command to apply after spacing for the selected paragraphs.	The after spacing value to be applied.

Command Name	Description	Command parameter (optional)
AutoFitTableCommand	Represents the command that fits the columns width of selected table based on the specified AutoFitType .	The AutoFitType to fit the columns of the table.
BackSpaceKeyCommand	Represents the command that performs action for "Backspace" key.	NA
BaselineAlignmentCommand	Represents the command to apply BaselineAlignment for the selected text.	The baseline alignment value to be applied.
BeforeSpacingCommand	Represents the command to apply before spacing for the selected paragraphs.	The before spacing value to be applied.
BoldCommand	Represents the command to toggle bold style for the selected text.	NA
CellBottomMarginCommand	Represents the command to apply bottom margin for the selected table cells.	The bottom margin value to be applied.
CellContentAlignmentCommand	Represents the command to apply content alignment for the selected table cells.	The cell content alignment value to be applied.
CellLeftMarginCommand	Represents the command to apply left margin for the selected table cells.	The left margin value to be applied.
CellRightMarginCommand	Represents the command to apply right margin for the selected table cells.	The right margin value to be applied.
CellSpacingCommand	Represents the command to apply cell spacing for the selected table.	The cell spacing value to be applied.
CellTopMarginCommand	Represents the command to apply top margin for the selected table cells.	The top margin value to be applied.
CellVerticalAlignmentCommand	Represents the command to apply vertical	The vertical alignment value to be applied.

Command Name	Description	Command parameter (optional)
	alignment for the selected table cells.	
ChangeAllSpellingCommand	Represents the command that changes all occurrences of a selected misspelled word.	The word to be replaced.
ChangeSpellingCommand	Represents the command that changes the selected misspelled word.	The word to be replaced.
CheckSpellingCommand	Represents the command that checks spelling mistakes in the document of SfRichTextBoxAdv control.	NA
ControlDownKeyCommand	Represents the command that performs navigation for "CTRL + DOWN" key.	NA
ControlEndKeyCommand	Represents the command that performs navigation for "CTRL + END" key.	NA
ControlHomeKeyCommand	Represents the command that performs navigation for "CTRL + HOME" key.	NA
ControlLeftKeyCommand	Represents the command that performs navigation for "CTRL + LEFT" key.	NA
ControlRightKeyCommand	Represents the command that performs navigation for "CTRL + RIGHT" key.	NA
ControlShiftDownKeyCommand	Represents the command that performs selection for "CTRL + SHIFT + DOWN" key.	NA
ControlShiftEndKeyCommand	Represents the command that performs selection for "CTRL + SHIFT + END" key.	NA
ControlShiftHomeKeyCommand	Represents the command that performs selection for	NA

Command Name	Description	Command parameter (optional)
	"CTRL + SHIFT + HOME" key.	
ControlShiftLeftKeyCommand	Represents the command that performs selection for "CTRL + SHIFT + LEFT" key.	NA
ControlShiftRightKeyCommand	Represents the command that performs selection for "CTRL + SHIFT + RIGHT" key.	NA
ControlShiftUpKeyCommand	Represents the command that performs selection for "CTRL + SHIFT + UP" key.	NA
ControlUpKeyCommand	Represents the command that performs navigation for "CTRL + UP" key.	NA
CopyCommand	Represents the command that copies the selected contents to clipboard.	NA
CopyHyperlinkCommand	Represents the command that copies the selected hyperlink to clipboard.	NA
CutCommand	Represents the command that removes the selected contents from SfRichTextBoxAdv control and copies the same to clipboard.	NA
DecreaseFontSizeCommand	Represents the command to decrease font size for the selected text.	The font size value to be applied.
DecreaseIndentCommand	Represents the command to decrease left indent for the selected paragraphs.	NA
DefaultCellBottomMarginCommand	Represents the command to apply bottom margin for the selected table.	The cell bottom margin value to be applied.
DefaultCellLeftMarginCommand	Represents the command to apply left margin for the selected table.	The cell left margin value to be applied.

Command Name	Description	Command parameter (optional)
DefaultCellRightMarginCommand	Represents the command to apply right margin for the selected table.	The cell right margin value to be applied.
DefaultCellTopMarginCommand	Represents the command to apply top margin for the selected table.	The cell top margin value to be applied.
DeleteAllCommentsCommand	Represents the command to delete all the comments in the document.	NA
DeleteColumnCommand	Represents the command to delete the selected column of a table.	NA
DeleteCommentCommand	Represents the command that deletes the selected comment.	NA
DeleteKeyCommand	Represents the command that performs action for "DELETE" key.	NA
DeleteRowCommand	Represents the command to delete the selected row of a table.	NA
DeleteTableCommand	Represents the command to delete the selected table.	NA
DownKeyCommand	Represents the command that performs navigation for "DOWN" key.	NA
EndKeyCommand	Represents the command that performs navigation for "END" key.	NA
EnterKeyCommand	Represents the command that performs action for "ENTER" key.	NA
FirstLineIndentCommand	Represents the command to apply first line indent for the selected paragraphs.	The first line indent value to be applied.
FontColorCommand	Represents the command to apply font color for the selected text.	The font color value to be applied.

Command Name	Description	Command parameter (optional)
FontFamilyCommand	Represents the command to apply font family for the selected text.	The font family value to be applied.
FontSizeCommand	Represents the command to apply font size for the selected text.	The font size value to be applied.
HighlightColorCommand	Represents the command to apply HighlightColor for the selected text.	The highlight color value to be applied.
HomeKeyCommand	Represents the command that performs navigation for "HOME" key.	NA
IgnoreAllSpellingErrorsCommand	Represents the command that ignores all the occurrence of a selected misspelled word.	The misspelled word to be ignored.
IncreaseFontSizeCommand	Represents the command to increase font size for the selected text.	The font size value to be applied.
IncreaseIndentCommand	Represents the command to increase indent for the selected paragraphs.	NA
InsertBreakCommand	Represents the command that inserts a break at selection.	The break type to be inserted
InsertColumnCommand	Represents the command that inserts a column to the selected table.	The ColumnPlacement value to insert column.
InsertHyperlinkCommand	Represents the command that inserts a hyperlink at selection.	The hyperlink to be inserted.
InsertPictureCommand	Represents the command that inserts a picture at selection.	The picture to be inserted.
InsertRowCommand	Represents the command that inserts a row to the selected table.	The RowPlacement value to insert row.
InsertTableCommand	Represents the command that inserts a table at selection.	The row and column count of the table.

Command Name	Description	Command parameter (optional)
ItalicCommand	Represents the command to toggle italic style for the selected text.	NA
LayoutTypeCommand	Represents the command to change layout type of the SfRichTextBoxAdv control.	The layout type to set for the SfRichTextBoxAdv control.
LeftIndentCommand	Represents the command to apply left indent for the selected paragraphs.	The left indent value to be applied.
LeftKeyCommand	Represents the command that performs navigation for "LEFT" key.	NA
LineSpacingCommand	Represents the command to apply line spacing for the selected paragraphs.	The line spacing value to be applied.
LineSpacingTypeCommand	Represents the command to apply LineSpacingType for the selected paragraphs.	The LineSpacingType value to be applied.
MergeSelectedCellsCommand	Represents the command that merges the selected table cells.	NA
NavigateHyperlinkCommand	Represents the command that performs navigation for the selected hyperlink.	NA
NewCommentCommand	Represents the command that adds a comment at the selection.	NA
NewDocumentCommand	Represents the command that creates a new document in SfRichTextBoxAdv control.	NA
NextCommentCommand	Represents the command that performs navigation to next comment in the document.	NA
OpenDocumentCommand	Represents the command that opens an existing document in the	NA

Command Name	Description	Command parameter (optional)
	SfRichTextBoxAdv control.	
PageDownKeyCommand	Represents the command that performs navigation for "PAGEDOWN" key.	NA
PageFitCommand	Represents the command to apply PageFitType for the SfRichTextBoxAdv control.	The PageFitType value to be applied.
PageUpKeyCommand	Represents the command that performs navigation for "PAGEUP" key.	NA
PasteCommand	Represents the command that pastes the content from clipboard to SfRichTextBoxAdv control.	NA
PreviousCommentCommand	Represents the command that performs navigation to previous comment in the document.	NA
PrintDocumentCommand	Represents the command that prints the document of SfRichTextBoxAdv control.	NA
RedoCommand	Represents the command that redo the last undo operation in SfRichTextBoxAdv control.	NA
RemoveHyperlinkCommand	Represents the command that removes the selected hyperlink.	NA
RightIndentCommand	Represents the command to apply right indent for the selected paragraphs.	The right indent value to be applied.
RightKeyCommand	Represents the command that performs navigation for "RIGHT" key.	NA
SaveAsDocumentCommand	Represents the command that saves the document	NA

Command Name	Description	Command parameter (optional)
	of SfRichTextBoxAdv control.	
SaveDocumentCommand	Represents the command that saves the document of SfRichTextBoxAdv control.	NA
SelectAllCommand	Represents the command that selects all the content of SfRichTextBoxAdv control.	NA
SelectCellCommand	Represents the command that selects the table cell.	NA
SelectColumnCommand	Represents the command that selects the entire column of a table.	NA
SelectRowCommand	Represents the command that selects the entire row of a table.	NA
SelectTableCommand	Represents the command that selects the table.	NA
ShiftDownKeyCommand	Represents the command that performs selection for "SHIFT + DOWN" key.	NA
ShiftEndKeyCommand	Represents the command that performs selection for "SHIFT + END" key.	NA
ShiftEnterKeyCommand	Represents the command that performs action [inserts line break] for "SHIFT + ENTER" key.	NA
ShiftHomeKeyCommand	Represents the command that performs selection for "SHIFT + HOME" key.	NA
ShiftLeftKeyCommand	Represents the command that performs selection for "SHIFT + LEFT" key.	NA
ShiftRightKeyCommand	Represents the command that performs selection for "SHIFT + RIGHT" key.	NA
ShiftTabKeyCommand	Represents the command that performs selection for "SHIFT + TAB" key.	NA

Command Name	Description	Command parameter (optional)
ShiftUpKeyCommand	Represents the command that performs selection for "SHIFT + UP" key.	NA
ShowBordersAndShadingDialogCommand	Represents the command that shows the borders and shading dialog.	NA
ShowCellOptionsDialogCommand	Represents the command that shows the cell options dialog.	NA
ShowCommentsCommand	Represents the command to show or hide comments in the SfRichTextBoxAdv control.	NA
ShowEncryptDocumentDialogCommand	Represents the command that shows dialog to specify password for opening encrypted Word document.	NA
ShowFindAndReplaceDialogCommand	Represents the command that shows the find and replace dialog.	The Boolean value to show find or replace tab.
ShowFontDialogCommand	Represents the command that shows the font dialog.	NA
ShowHyperlinkDialogCommand	Represents the command that shows the hyperlink dialog.	NA
ShowInsertTableDialogCommand	Represents the command that shows the insert table dialog.	NA
ShowListDialogCommand	Represents the command that shows the list dialog.	NA
ShowOptionsPaneCommand	Represents the command that shows the options pane.	NA
ShowParagraphDialogCommand	Represents the command that shows the paragraph dialog.	NA
ShowSpellingPaneCommand	Represents the command that shows the spelling pane.	NA

Command Name	Description	Command parameter (optional)
ShowTableDialogCommand	Represents the command that shows the table dialog.	NA
ShowTableOptionsDialogCommand	Represents the command that shows the table options dialog.	NA
SpaceKeyCommand	Represents the command that performs action [inserts space] for "SPACE" key.	NA
StrikeThroughCommand	Represents the command to apply StrikeThrough for the selected text.	The strike through value to be applied.
TabKeyCommand	Represents the command that performs action [inserts tab] for "TAB" key.	NA
TableAlignmentCommand	Represents the command to apply table alignment for the selected table.	The table alignment value to be applied.
TableLeftIndentCommand	Represents the command to apply left indent for the selected table.	The left indent value to be applied.
TextAlignmentCommand	Represents the command to apply text alignment for the selected paragraphs.	The TextAlignment value to be applied.
ToggleBaselineAlignmentCommand	Represents the command that toggles baseline alignment for the selected text.	The baseline alignment value to be applied.
ToggleBeforeSpacingCommand	Represents the command that toggles before spacing for the selected paragraphs.	NA
ToggleHighlightColorCommand	Represents the command that toggles highlight color for the selected text.	NA
ToggleUnderlineCommand	Represents the command that toggles underline for the selected text.	The Underline value to be applied.

Command Name	Description	Command parameter (optional)
UnderlineCommand	Represents the command to apply underline for the selected text.	The Underline value to be applied.
UndoCommand	Represents the command that undo the last edit operation in SfRichTextBoxAdv control.	NA
UpKeyCommand	Represents the command that performs navigation for "UP" key.	NA
ShowStyleDialogCommand	Represents the command that shows the create style dialog.	NA
ShowStylesDialogCommand	Represents the command that shows the modify style dialog.	NA
ApplyStyleCommand	Represents the command, which requests to apply style for the selected paragraph.	Name of the Style
ClearFormattingCommand	Represents the command, which requests to remove formatting from the selected paragraph.	NA

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Selection in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv supports selecting a portion of the document either through UI interactions by using mouse, touch, keyboard or through supported APIs.

The following sample code demonstrates how to retrieve text position from document using paragraph instance and offset value.

C#

```
// Gets the first section of the document.
SectionAdv sectionAdv = richTextBoxAdv.Document.Sections[0];
```

VB.NET

```
'Gets the first section of the document
Dim sectionAdv As SectionAdv = richTextBoxAdv.Document.Sections(0)
```

C#

```
// Gets the first block from the section, which is a paragraph.
ParagraphAdv paragraphAdv = sectionAdv.Blocks[0] as ParagraphAdv;
// Gets the text position of the specified paragraph at offset 24.
// TextPosition is returned as null, if no such paragraph or offset exists
in the document.
TextPosition startPosition =
richTextBoxAdv.Document.GetTextPosition(paragraphAdv, 24);
```

VB.NET

```
' Gets the first block from the section, which is a paragraph.
Dim paragraphAdv As ParagraphAdv = TryCast(sectionAdv.Blocks(0),
ParagraphAdv)
' Gets the text position of the specified paragraph at offset 24.
' TextPosition is returned as null, if no such paragraph or offset exists in
the document.
Dim startPosition As TextPosition =
richTextBoxAdv.Document.GetTextPosition(paragraphAdv, 24)
```

C#

```
// Gets the third block of a section, which is table.
TableAdv tableAdv = sectionAdv.Blocks[2] as TableAdv;
// Gets the third block from second row second cell of the table, which is
paragraph.
ParagraphAdv paragraphAdv = tableAdv.Rows[1].Cells[1].Blocks[2] as
ParagraphAdv;
TextPosition position =
richTextBoxAdv.Document.GetTextPosition(paragraphAdv, 12);
```

VB.NET

```
' Gets the third block of a section, which is table.
Dim tableAdv As TableAdv = TryCast(sectionAdv.Blocks(2), TableAdv)
' Gets the third block from second row second cell of the table, which is
paragraph.
Dim paragraphAdv As ParagraphAdv =
TryCast(tableAdv.Rows(1).Cells(1).Blocks(2), ParagraphAdv)
Dim position As TextPosition =
richTextBoxAdv.Document.GetTextPosition(paragraphAdv, 12)
```

The following sample code demonstrates how to retrieve text position from document using hierarchical index.

C#

```
/*
The hierarchical index should be given as "section-index;block-index;offset-
in-paragraph"
If block in the index is paragraph, then next value is considered as offset
and position is retrieved.
```

```

For example "0;0;1" gets text position of Paragraph (first block of first
section) at the offset=1.
If block in the index is table, then next value is considered as row index
and following value as cell index.
The value after cell is again a block index. Then the same process
continues.
"table-index;row-index;cell-index;block-index;"
For example "0;2;1;1;0;21" gets text position of Paragraph at first block of
second cell of second row of table (at third block of first section) at the
offset=21.
If offset value is followed by "C" which stands for comment, then the
comment is retrieved which is followed by block index in comment. Then the
process of retrieving paragraph from block index continues.
paragraph-index;offset-in-paragraph;C;block-index;offset-in-paragraph
For example "0;3;16;C;2;6", gets text position of Paragraph at third block
of comment (present at offset = 16 in paragraph at third block of first
section) at the offset=6.
*/
// Gets the text position from the document based on hierarchical index.
TextPosition position = richTextBoxAdv.Document.GetTextPosition("0;0;24");
/* Here text position returned should be first section's first block (which
is paragraph) and offset=24. */

```

VB.NET

```

'
'The hierarchical index should be given as "section-index;block-
index;offset-in-paragraph"
'If block in the index is paragraph, then next value is considered as offset
and position is retrieved.
'For example "0;0;1" gets text position of Paragraph (first block of first
section) at the offset=1.
'If block in the index is table, then next value is considered as row index
and following value as cell index.
'The value after cell is again a block index. Then the same process
continues.
'"table-index;row-index;cell-index;block-index;"
'For example "0;2;1;1;0;21" gets text position of Paragraph at first block of
second cell of second row of table (at third block of first section) at
the offset=21.
'If offset value is followed by "C" which stands for comment, then the
comment is retrieved which is followed by block index in comment. Then the
process of retrieving paragraph from block index continues.
'paragraph-index;offset-in-paragraph;C;block-index;offset-in-paragraph
'For example "0;3;16;C;2;6", gets text position of Paragraph at third block
of comment (present at offset = 16 in paragraph at third block of first
section) at the offset=6.
'
' Gets the text position from the document based on hierarchical index.
Dim position As TextPosition =
richTextBoxAdv.Document.GetTextPosition("0;0;24")
' Here text position returned should be first section's first block (which
is paragraph) and offset=24.

```

The following sample code demonstrates how to move selection start and selection end both at a specific text position.

C#

```
// Makes an empty selection at the specific text position.  
richTextBoxAdv.Selection.Select(position, position);
```

VB.NET

```
' Makes an empty selection at the specific text position.  
richTextBoxAdv.Selection.[Select](position, position)
```

The following sample code demonstrates how to select a portion of document.

C#

```
// Retrieves the position of the first paragraph start.  
TextPosition startPosition =  
richTextBoxAdv.Document.GetTextPosition("0;0;0");  
// Retrieves the position of the first paragraph at offset=20.  
TextPosition endPosition =  
richTextBoxAdv.Document.GetTextPosition("0;0;20");  
// Selects the text positions in forward direction.  
richTextBoxAdv.Selection.Select(startPosition, endPosition);
```

VB.NET

```
' Retrieves the position of the first paragraph start.  
Dim startPosition As TextPosition =  
richTextBoxAdv.Document.GetTextPosition("0;0;0")  
' Retrieves the position of the first paragraph at offset=20.  
Dim endPosition As TextPosition =  
richTextBoxAdv.Document.GetTextPosition("0;0;20")  
' Selects the text positions in forward direction.  
richTextBoxAdv.Selection.[Select](startPosition, endPosition)
```

C#

```
// Selects the text positions in reverse direction.  
richTextBoxAdv.Selection.Select(endPosition, startPosition);
```

VB.NET

```
' Selects the text positions in reverse direction.  
richTextBoxAdv.Selection.[Select](endPosition, startPosition)
```

Note: You can select a text position within a comment with another text position within the same comment only. It is not possible to select a text position within comment with a text position that exists outside of that comment.

Multi Selection

The SfRichTextBoxAdv also supports selecting different portions of the document at a time. The following code example demonstrates how to perform multi selection in SfRichTextBoxAdv.

C#

```
// Retrieves the position of the first paragraph start.
TextPosition startPosition1 =
richTextBoxAdv.Document.GetTextPosition("0;0;0");
// Retrieves the position of the first paragraph at offset=20.
TextPosition endPosition1 =
richTextBoxAdv.Document.GetTextPosition("0;0;20");
// Retrieves the position of the third paragraph start.
TextPosition startPosition2 =
richTextBoxAdv.Document.GetTextPosition("0;2;0");
// Retrieves the position of the third paragraph at offset=20.
TextPosition endPosition2 =
richTextBoxAdv.Document.GetTextPosition("0;2;20");
// Selects the first paragraph and third paragraph at a time, leaving second
paragraph.
richTextBoxAdv.Selection.SelectionRanges.Add(startPosition1, endPosition1);
richTextBoxAdv.Selection.SelectionRanges.Add(startPosition2, endPosition2);
```

VB.NET

```
' Retrieves the position of the first paragraph start.
Dim startPosition1 As TextPosition =
richTextBoxAdv.Document.GetTextPosition("0;0;0")
' Retrieves the position of the first paragraph at offset=20.
Dim endPosition1 As TextPosition =
richTextBoxAdv.Document.GetTextPosition("0;0;20")
' Retrieves the position of the third paragraph start.
Dim startPosition2 As TextPosition =
richTextBoxAdv.Document.GetTextPosition("0;2;0")
' Retrieves the position of the third paragraph at offset=20.
Dim endPosition2 As TextPosition =
richTextBoxAdv.Document.GetTextPosition("0;2;20")
' Selects the first paragraph and third paragraph at a time, leaving second
paragraph.
richTextBoxAdv.Selection.SelectionRanges.Add(startPosition1, endPosition1)
richTextBoxAdv.Selection.SelectionRanges.Add(startPosition2, endPosition2)
```

Apply Formatting for selection

The SfRichTextBoxAdv supports the following format properties that can be applied for selection contents.

Character Format-bold, italic, font size, font family, font color, highlight color, underline, strikethrough, subscript, and superscript.

Paragraph Format-before and after spacing, first line, left and right indenting, text justification, line spacing, and multilevel list.

Selection Format-page size and page margin.

The following sample code demonstrates how to apply subscript format for the selected content.

C#

```
// Applies subscript format for the selected text contents.  
richTextBoxAdv.Selection.CharacterFormat.BaselineAlignment =  
Syncfusion.Windows.Controls.RichTextBoxAdv.BaselineAlignment.Subscript;
```

VB.NET

```
' Applies subscript format for the selected text contents.  
richTextBoxAdv.Selection.CharacterFormat.BaselineAlignment =  
Syncfusion.Windows.Controls.RichTextBoxAdv.BaselineAlignment.Subscript
```

The following sample code demonstrates how to apply after spacing for the selected paragraphs.

C#

```
// Applies after spacing for the selected paragraphs.  
richTextBoxAdv.Selection.ParagraphFormat.AfterSpacing = 24;
```

VB.NET

```
' Applies after spacing for the selected paragraphs.  
richTextBoxAdv.Selection.ParagraphFormat.AfterSpacing = 24
```

The following sample code demonstrates how to apply page margin for the selected sections.

C#

```
// Applies page margin for the selected sections.  
richTextBoxAdv.Selection.SectionFormat.PageMargin = new Thickness(96, 48,  
96, 48);
```

VB.NET

```
' Applies page margin for the selected sections.  
richTextBoxAdv.Selection.SectionFormat.PageMargin = New Thickness(96, 48,  
96, 48)
```

Binding Selection format properties

The SfRichTextBoxAdv provides support to bind the rich-text format options of selection content.

The following code sample demonstrates how to bind the bold format option of SfRichTextBoxAdv.

XML

```
<!-- Binds the toggle button to Selection bold character format -->  
<ToggleButton x:Name="toggleButton" Content="Bold" IsChecked="{Binding  
Path=Selection.CharacterFormat.Bold, Mode=TwoWay,  
ElementName=richTextBoxAdv}" />
```

C#

```
// Initializes the new binding for toggle bold.
```

```
Binding binding = new Binding() { Source = richTextBoxAdv, Path = new
PropertyPath("Selection.CharacterFormat.Bold"), Mode = BindingMode.TwoWay };
// Binds the IsChecked property to Selection.CharacterFormat.Bold property
of RichTextBoxAdv.
toggleButton.SetBinding(ToggleButton.IsCheckedProperty, binding);
```

VB.NET

```
' Initializes the new binding for toggle bold.
Dim binding As New Binding() With { _
Key .Source = richTextBoxAdv, _
Key .Path = New PropertyPath("Selection.CharacterFormat.Bold"), _
Key .Mode = BindingMode.TwoWay _
}
' Binds the IsChecked property to Selection.CharacterFormat.Bold property of
RichTextBoxAdv.
toggleButton.SetBinding(ToggleButton.IsCheckedProperty, binding)
```

The following code sample demonstrates how to bind the bold format option of SfRichTextBoxAdv.

XML

```
<!--Binds IsChecked property of toggle button to Selection text alignment
paragraph format -->
<ToggleButton x:Name="toggleButton" Content="Left" IsChecked="{Binding
ElementName=richTextBoxAdv,Path=Selection.ParagraphFormat.TextAlignment,Conv
erter={StaticResource LeftAlignmentToggleConverter}}"/>
```

C#

```
//Initializes the new binding for toggle text alignment property as left.
Binding binding = new Binding() { Source = richTextBoxAdv, Path = new
PropertyPath("Selection.ParagraphFormat.TextAlignment"), Mode =
BindingMode.TwoWay, Converter = new LeftAlignmentToggleConverter() };
//Binds the IsChecked property to Selection.ParagraphFormat.TextAlignment
property of RichTextBoxAdv.
toggleButton.SetBinding(ToggleButton.IsCheckedProperty, binding);
```

VB.NET

```
'Initializes the new binding for toggle text alignment property as left.
Dim binding As New Binding() With { _
Key .Source = richTextBoxAdv, _
Key .Path = New PropertyPath("Selection.ParagraphFormat.TextAlignment"), _
Key .Mode = BindingMode.TwoWay, _
Key .Converter = New LeftAlignmentToggleConverter() _
}
' Binds the IsChecked property to Selection.ParagraphFormat.TextAlignment
property of RichTextBoxAdv.
toggleButton.SetBinding(ToggleButton.IsCheckedProperty, binding)
```

Keyboard shortcuts to perform selection

The following keyboard shortcuts are supported by SfRichTextBoxAdv for navigation.

Navigation Shortcut	Description
Right Arrow	Navigates to one position forward.
Left Arrow	Navigates to one position backward.
Down Arrow	Navigates to the same position at next line.
Up Arrow	Navigates to the same position at previous line.
Home	Navigates to start of the current line.
End	Navigates to end of the current line.
CTRL + Home	Navigates to the document start position.
CTRL + End	Navigates to the document end position.
CTRL + Right	Navigates to the next word start position.
CTRL + Left	Navigates to the current word start position.
CTRL + Down	Navigates to the next paragraph start position.
CTRL + Up	Navigates to the current paragraph start position.

The following keyboard shortcuts are supported by SfRichTextBoxAdv for selection.

Selection Shortcut	Description
CTRL + Right Arrow	Extends selection to one position forward.
CTRL + Left Arrow	Extends selection to one position backward.
CTRL + Down Arrow	Extends selection to the same position at next line.
CTRL + Up Arrow	Extends selection to the same position at previous line.
SHIFT + Home	Extends selection to start of the current line.
SHIFT + End	Extends selection to end of the current line.
CTRL + SHIFT + Home	Extends selection to the document start position.
CTRL + SHIFT + End	Extends selection to the document end position.
CTRL + SHIFT + Right	Extends selection to the current word end position.
CTRL + SHIFT + Left	Extends selection to the current word start position.
CTRL + SHIFT + Down	Extends selection to the current paragraph end position.
CTRL + SHIFT + Up	Extends selection to the current paragraph start position.
CTRL + A	Selects the entire document.

How to show blinking cursor and selection highlight even when the control lost focus

The SfRichTextBoxAdv control allows you to show the blinking cursor and selection highlight even when the control doesn't have focus. You can choose any one of the following selection visibility options:

- **None** - Don't display neither caret nor selection highlight when the RichTextBox control doesn't have focus.
- **ShowCaret** - Displays the caret (blinking cursor) when the RichTextBox control doesn't have focus.
- **ShowSelection** - Displays the selection highlight when the RichTextBox control doesn't have focus.

The following code example demonstrates how to display the selection highlight even when the RichTextBox control doesn't have focus.

XML

```
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv"
LostFocusBehavior="ShowSelection" xmlns:RichTextBoxAdv="clr-
namespace:Syncfusion.Windows.Controls.RichTextBoxAdv;assembly=Syncfusion.SfR
ichTextBoxAdv.Wpf" />
```

C#

```
// Initializes a new instance of RichTextBoxAdv.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
// Displays the selection highlight when the RichTextBox control doesn't
have focus.
richTextBoxAdv.LostFocusBehavior = LostFocusBehavior.ShowSelection;
```

VB.NET

```
' Initializes a new instance of RichTextBoxAdv.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
' Displays the selection highlight when the RichTextBox control doesn't have
focus.
richTextBoxAdv.LostFocusBehavior = LostFocusBehavior.ShowSelection
```

Note: This API is supported starting from release version v17.4.0.X.

How to determine the editing context type

The SfRichTextBoxAdv control allows you to know the editing context type based on the selected content. The following are the editing context types:

- **Text** - Denotes that the editing context is text
- **Image** - Denotes that the editing context is image
- **Table** - Denotes that the editing context is table

The following code example demonstrates how to determine the editing context type based on the selection.

C#

```
// Initializes a new instance of RichTextBoxAdv.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
if (richTextBoxAdv.Selection EditingContext.Type == EditingContextType.Text)
{
}
```

VB.NET

```
' Initializes a new instance of RichTextBoxAdv.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
If (richTextBoxAdv.Selection EditingContext.Type == EditingContextType.Text)
Then
End If
```

How to delete the selected content

The SfRichTextBoxAdv supports deleting the selected portion of the document either through UI command, keyboard or through supported APIs.

The following code sample demonstrates how to delete the selected portion of the document using the DeleteKeyCommand.

XML

```
<!-- Binds button to the DeleteKeyCommand -->
<Button Content="Delete"
Command="RichTextBoxAdv:SfRichTextBoxAdv.DeleteKeyCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}"/>
```

The following code sample demonstrates how to delete the selected portion of the document using the Delete method. This method is valid only when the selection is non-empty, and it returns true if the selected content is deleted. Otherwise false.

C#

```
//Deletes the selected content in SfRichTextBoxAdv control.
bool isDeleted = richTextBoxAdv.Selection.Delete();
```

VB.NET

```
Dim isDeleted As Boolean = richTextBoxAdv.Selection.Delete()
```

Note: This API is supported starting from release version v18.2.0.X.

You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Find and Replace in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv control supports searching text contents in the document. This when used in combination with selection becomes a powerful tool enabling scenarios like highlighting specific parts of the document, applying formatting such as bold or replacing text. You can extend your search by using regular expression to find particular pattern of text in the document.

The following code example explains how to find the first occurrence of a particular text in the document and apply bold formatting.

C#

```
// Finds the first occurrence of specified text that matches case in
RichTextBoxAdv document from current selection.
TextSearchResult textSearchResult = richTextBoxAdv.Find("Panda",
FindOptions.CaseSensitive);
// Selects the text search result.
richTextBoxAdv.Selection.Select(textSearchResult.Start,
textSearchResult.End);
// Applies Bold formatting for the current selection.
richTextBoxAdv.Selection.CharacterFormat.Bold = true;
```

VB.NET

```
' Finds the first occurrence of specified text that matches case in
RichTextBoxAdv document from current selection.
Dim textSearchResult As TextSearchResult = richTextBoxAdv.Find("Panda",
FindOptions.CaseSensitive)
' Selects the text search result.
richTextBoxAdv.Selection.[Select](textSearchResult.Start,
textSearchResult.[End])
' Applies Bold formatting for the current selection.
richTextBoxAdv.Selection.CharacterFormat.Bold = True
```

The following code example demonstrates how to find all occurrences of a particular pattern of text in the document and highlighting the result.

C#

```
// Finds all the words that starts with 'S' in RichTextBoxAdv document.
TextSearchResults textSearchResults = richTextBoxAdv.FindAll(new
Regex(@"\bS\S*"), FindOptions.None);
// If any text search results found.
if (textSearchResults != null)
{
for (int j = 0; j < textSearchResults.Count; j++)
{
TextSearchResult textSearchResult = textSearchResults[j];
// Adds the search result text positions to the selection.
richTextBoxAdv.Selection.SelectionRanges.Add(textSearchResult.Start,
textSearchResult.End);
}
// Apply highlight color for the selection.
richTextBoxAdv.Selection.CharacterFormat.HighlightColor =
HighlightColor.Yellow;
}
```

VB.NET

```
' Finds all the words that starts with 'S' in RichTextBoxAdv document.
Dim textSearchResults As TextSearchResults = richTextBoxAdv.FindAll(New
Regex(@"\bS\S*"), FindOptions.None)
' If any text search results found.
```

```
If textSearchResults IsNot Nothing Then
For j As Integer = 0 To textSearchResults.Count - 1
Dim textSearchResult As TextSearchResult = textSearchResults(j)
' Adds the search result text positions to the selection.
richTextBoxAdv.Selection.SelectionRanges.Add(textSearchResult.Start,
textSearchResult.[End])
Next
' Apply highlight color for the selection.
richTextBoxAdv.Selection.CharacterFormat.HighlightColor =
HighlightColor.Yellow
End If
```

Replacing existing text

You can replace a single occurrence or all occurrences of a particular text or pattern of text in a document with another text by performing search operation. This helps you to modify the contents easily.

The following code example demonstrates how to replace a single occurrence of a text with another text in SfRichTextBoxAdv.

C#

```
// Finds the text "colour" that matches whole word in the document.
TextSearchResult textSearchResult = richTextBoxAdv.Find("colour",
FindOptions.WholeWord);
// If any text search result found, replace it with the text "color".
if (textSearchResult != null)
textSearchResult.Replace("color");
```

VB.NET

```
' Finds the text "colour" that matches whole word in the document.
Dim textSearchResult As TextSearchResult = richTextBoxAdv.Find("colour",
FindOptions.WholeWord)
' If any text search result found, replace it with the text "color".
If textSearchResult IsNot Nothing Then
textSearchResult.Replace("color")
End If
```

The following code example demonstrates how to replace all occurrences of a particular text with another text in SfRichTextBoxAdv.

C#

```
// Finds the text "analyse" that matches whole word in the document.
TextSearchResults textSearchResults = richTextBoxAdv.FindAll("analyse",
FindOptions.WholeWord);
// If any text search results found, replace all occurrences with the text
"analyze".
if(textSearchResults != null)
textSearchResults.ReplaceAll("analyze");
```

VB.NET

```
' Finds the text "analyse" that matches whole word in the document.
Dim textSearchResults As TextSearchResults =
richTextBoxAdv.FindAll("analyse", FindOptions.WholeWord)
' If any text search results found, replace all occurrences with the text
"analyze".
If textSearchResults IsNot Nothing Then
textSearchResults.ReplaceAll("analyse")
End If
```

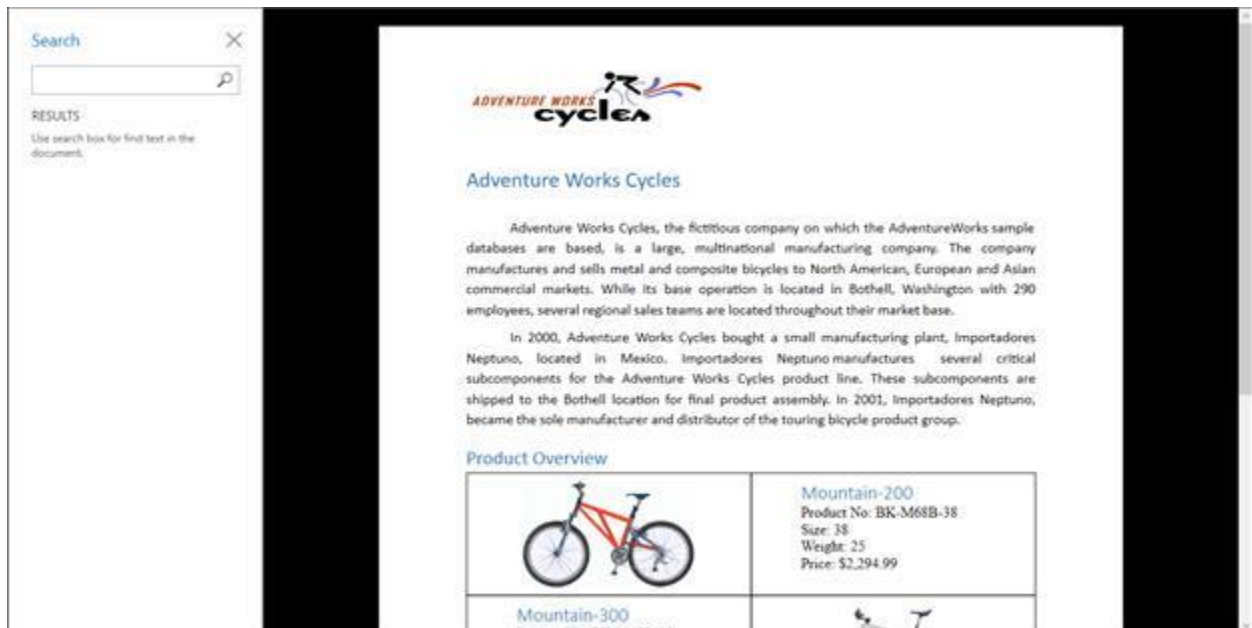

Options Pane

The SfRichTextBoxAdv provides the built-in options pane support to find the text and navigate to text results similar to Microsoft Word application.

The following code example demonstrates how to show the options pane in SfRichTextBoxAdv through command binding.

XML

```
<!-- Binding Button to UI Command that shows the options pane -->
<Button Content="Show Options Pane"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowOptionsPaneCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
```

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Spell Check in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv provides support for checking spelling mistakes in the rich text document content. It also supports enabling the following spell checking options.

- Ignore words in UPPERCASE.

- Ignore words that contain numbers.
- Ignore URIs.

The following sample code demonstrates how to enable spell checker in SfRichTextBoxAdv.

XML

```
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv"
xmlns:RichTextBoxAdv="clr-
namespace:Syncfusion.Windows.Controls.RichTextBoxAdv;assembly=Syncfusion.SfR
ichTextBoxAdv.Wpf">
<RichTextBoxAdv:SfRichTextBoxAdv.SpellChecker>
<RichTextBoxAdv:SpellChecker IsEnabled="True" IgnoreURIs="true"
IgnoreAlphaNumericWords="true" IgnoreUppercaseWords="true"/>
</RichTextBoxAdv:SfRichTextBoxAdv.SpellChecker>
</RichTextBoxAdv:SfRichTextBoxAdv>
```

C#

```
// Enables spell checker in RichTextBoxAdv.
richTextBoxAdv.SpellChecker.IsEnabled = true;
// Ignores alpha numeric words while spell check.
richTextBoxAdv.SpellChecker.IgnoreAlphaNumericWords = true;
// Ignores upper case words while spell check.
richTextBoxAdv.SpellChecker.IgnoreUppercaseWords = true;
// Ignores URIs while spell check.
richTextBoxAdv.SpellChecker.IgnoreURIs = true;
```

VB.NET

```
' Enables spell checker in RichTextBoxAdv.
richTextBoxAdv.SpellChecker.IsEnabled = True
' Ignores alpha numeric words while spell check.
richTextBoxAdv.SpellChecker.IgnoreAlphaNumericWords = True
' Ignores upper case words while spell check.
richTextBoxAdv.SpellChecker.IgnoreUppercaseWords = True
' Ignores URIs while spell check.
richTextBoxAdv.SpellChecker.IgnoreURIs = True
```

Adding Custom Dictionaries

The SfRichTextBoxAdv also supports defining custom dictionaries that can be referred while check spelling mistakes. The SfRichTextBoxAdv ignores words that are defined in the referenced custom dictionaries. The SfRichTextBoxAdv supports option for adding misspelled word to dictionary. This option will be enabled only when at least one custom dictionary is defined. The misspelled words will be added to first item in the custom dictionary collection.

The following code example demonstrates how to define custom dictionaries for spell checking.

XML

```
<!-- xmlns:System="clr-namespace:System;assembly=mscorlib" -->
<!-- xmlns:RichTextBoxAdv="clr-
namespace:Syncfusion.Windows.Controls.RichTextBoxAdv;assembly=Syncfusion.SfR
ichTextBoxAdv.Wpf" -->
```

```
<RichTextBoxAdv:SpellChecker IsEnabled="True" IgnoreURIs="true"
IgnoreAlphaNumericWords="true" IgnoreUppercaseWords="true">
<RichTextBoxAdv:SpellChecker.CustomDictionaries>
<System:String>../../../../Assets/DefaultDictionary.dic</System:String>
<System:String>../../../../Assets/CustomDictionary.dic</System:String>
</RichTextBoxAdv:SpellChecker.CustomDictionaries>
</RichTextBoxAdv:SpellChecker>
```

Multilingual Spell Check Support

The SfRichTextBoxAdv provides support for check spelling mistakes based on multi languages. You can do it so by defining language property for SfRichTextBoxAdv control.

The following code example demonstrates how to enable spell checking based on language.

XML

```
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv"
xmlns:RichTextBoxAdv="clr-
namespace:Syncfusion.Windows.Controls.RichTextBoxAdv;assembly=Syncfusion.SfR
ichTextBoxAdv.Wpf" Language="fr">
<RichTextBoxAdv:SfRichTextBoxAdv.SpellChecker>
<RichTextBoxAdv:SpellChecker IsEnabled="True" IgnoreURIs="true"
IgnoreAlphaNumericWords="true" IgnoreUppercaseWords="true"/>
</RichTextBoxAdv:SfRichTextBoxAdv.SpellChecker>
</RichTextBoxAdv:SfRichTextBoxAdv>
```

Note: In order to enable spell checking functionality based on particular language, language pack for .NET Framework should be installed in the machine.

You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Clipboard in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv takes advantage of the clipboard support and allows you to copy or paste contents to and from the clipboard in the following formats.

- Rich text format.
- Text.
- Image.

UI Command to access clipboard operations

The following code example demonstrates how to bind commands for accessing clipboard operations.

XML

```
<!-- Binds button to the CutCommand -->
<Button Content="Cut" Command="RichTextBoxAdv:SfRichTextBoxAdv.CutCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the CopyCommand -->
<Button Content="Copy" Command="RichTextBoxAdv:SfRichTextBoxAdv.CopyCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the PasteCommand -->
```

```
<Button Content="Paste"
Command="RichTextBoxAdv:SfRichTextBoxAdv.PasteCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
```

Note: In order to cut, copy or paste, the standard keyboard shortcuts such as CTRL + X, CTRL + C, CTRL + V can also be used.

You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Undo Redo in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv provides history preservation support, which means each editing operation performed against its document content will be preserved in history. You can easily undo any editing action with ease. The undone actions will also be preserved in a separate stack enabling you to redo the action again.

Note: Currently, the number of actions that can be preserved in both undo and redo stacks is limited to 500.

UI Command to perform undo/redo operations

The following code example demonstrates how to bind commands for performing undo and redo operations.

XML

```
<!-- Binds button to the UndoCommand -->
<Button Content="Undo" Command="RichTextBoxAdv:SfRichTextBoxAdv.UndoCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the RedoCommand -->
<Button Content="Redo" Command="RichTextBoxAdv:SfRichTextBoxAdv.RedoCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
```

Note: In order to perform undo/redo, the standard keyboard shortcuts such as CTRL + Z, CTRL + Y can also be used.

Enable/Disable Undo Redo

Disable Undo for all the editing actions

In SfRichTextBoxAdv, the Undo functionality is enabled by default. You can disable it by using the `IsUndoEnabled` property of the `EditorSettings` class.

The following code example demonstrates how to disable the Undo functionality in SfRichTextBoxAdv.

XML

```
<Syncfusion:SfRichTextBoxAdv x:Name="richTextBoxAdv">
<Syncfusion:SfRichTextBoxAdv.EditorSettings>
<Syncfusion:EditorSettings IsUndoEnabled="False"/>
</Syncfusion:SfRichTextBoxAdv.EditorSettings>
</Syncfusion:SfRichTextBoxAdv>
```

C#

```
// Defines the SfRichTextBoxAdv control with undo operation disabled.
```

```
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
richTextBoxAdv.EditorSettings.IsUndoEnabled = false;
```

VB.NET

```
' Defines the SfRichTextBoxAdv control with undo operation disabled.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
richTextBoxAdv.EditorSettings.IsUndoEnabled = false
```

Note: This API is supported starting from release version v18.1.0.X.

Disable Undo for style modification actions

In SfRichTextBoxAdv, the Undo functionality is enabled by default for all the editing operations. If you want to disable the Undo functionality for modifying an existing style alone. You can disable it by using the `CanUndoStyle` property of the `EditorSettings` class.

The following code example demonstrates how to disable the Undo support for modifying an existing style in SfRichTextBoxAdv.

XML

```
<Syncfusion:SfRichTextBoxAdv x:Name="richTextBoxAdv">
  <Syncfusion:SfRichTextBoxAdv.EditorSettings>
    <Syncfusion:EditorSettings CanUndoStyle="False"/>
  </Syncfusion:SfRichTextBoxAdv.EditorSettings>
</Syncfusion:SfRichTextBoxAdv>
```

C#

```
// Defines the SfRichTextBoxAdv control with document style undo operation disabled.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
richTextBoxAdv.EditorSettings.CanUndoStyle = false;
```

VB.NET

```
' Defines the SfRichTextBoxAdv control with document style undo operation disabled.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
richTextBoxAdv.EditorSettings.CanUndoStyle = false
```

Note: This API is supported starting from release version v18.1.0.X.

You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

List in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv supports both the single-level and multilevel lists similar to the Microsoft Word. Lists are used to organize data as step-by-step instructions in documents for easy understanding of key points.

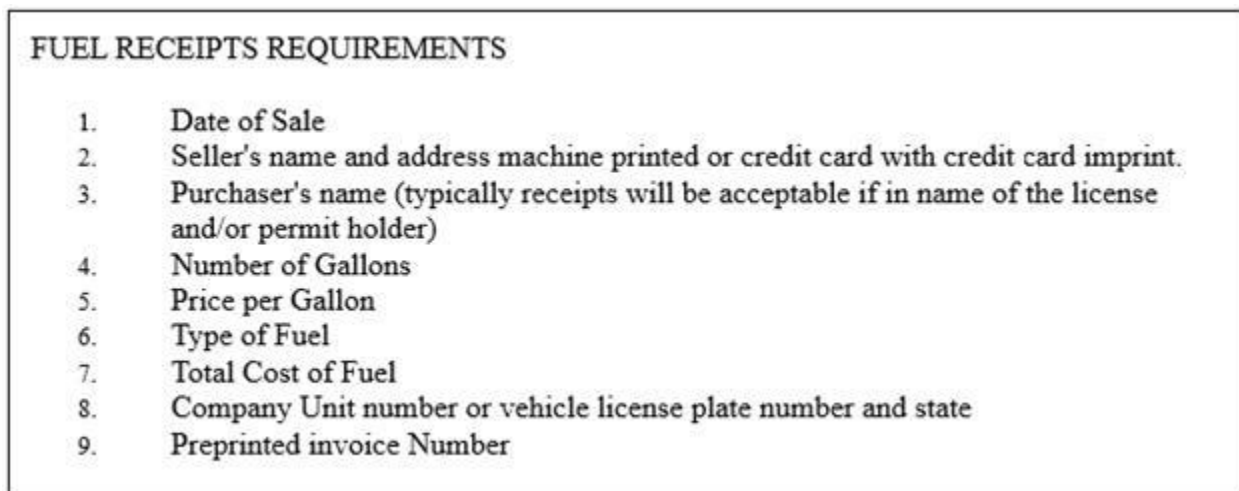

Single Level List

Single level means that all the items in the list have the same hierarchy and indentation. It can be a numbered or a bulleted list.

The following screenshot shows single level bulleted list.

The following screenshot shows single level numbered list.

Multilevel List

Multilevel means defining a list within a list where up to nine levels can be defined similar to the Microsoft Word. A multilevel list can be bulleted or numbered and also mixed with numbers, letters, and bullets. For example, one level can be bulleted and next level can be a numbered list inside it.

The following screenshot shows multilevel list.

Image Formats

1. Image File Compression
 - 1.1. Lossless Compression
 - 1.2. Lossy Compression
2. Exif – Exchangable Image File Format those using JPEG Compression
3. Major graphic file formats
 - 3.1. Raster formats
 - 3.1.1.JPEG
 - 3.1.2.TIF
 - 3.1.3.RAW

Adding List

Each list in the document can contain reference to any one of the abstract lists in the document. Both abstract list and list should be defined a unique Id. List should refer the abstract list with the abstract list's Id. List format for a paragraph should refer to the list with the list's Id.

The following code example demonstrates how to define a single level numbered list for a document and how it is applied to a paragraph.

XML

```
<RichTextBoxAdv:DocumentAdv>
<RichTextBoxAdv:DocumentAdv.AbstractLists>
<RichTextBoxAdv:AbstractListAdv AbstractListId="1">
<RichTextBoxAdv:AbstractListAdv.Levels>
<RichTextBoxAdv:ListLevelAdv ListLevelPattern="LowLetter" NumberFormat="%1."
StartAt="1" FollowCharacter="Tab" RestartLevel="0">
<RichTextBoxAdv:ListLevelAdv.ParagraphFormat>
<RichTextBoxAdv:ParagraphFormat LeftIndent="48" FirstLineIndent="24"/>
</RichTextBoxAdv:ListLevelAdv.ParagraphFormat>
</RichTextBoxAdv:ListLevelAdv>
</RichTextBoxAdv:AbstractListAdv.Levels>
</RichTextBoxAdv:AbstractListAdv>
</RichTextBoxAdv:DocumentAdv.AbstractLists>
<RichTextBoxAdv:DocumentAdv.Lists>
<RichTextBoxAdv:ListAdv AbstractListId="1" ListId="1">
</RichTextBoxAdv:ListAdv>
</RichTextBoxAdv:DocumentAdv.Lists>
<RichTextBoxAdv:SectionAdv>
<RichTextBoxAdv:ParagraphAdv>
<RichTextBoxAdv:ParagraphAdv.ParagraphFormat>
<RichTextBoxAdv:ParagraphFormat>
<RichTextBoxAdv:ParagraphFormat.ListFormat>
<RichTextBoxAdv:ListFormat ListId="1" ListLevelNumber="0"/>
</RichTextBoxAdv:ParagraphFormat.ListFormat>
</RichTextBoxAdv:ParagraphFormat>
```

```

</RichTextBoxAdv:ParagraphAdv.ParagraphFormat>
<RichTextBoxAdv:SpanAdv>List Item 1</RichTextBoxAdv:SpanAdv>
</RichTextBoxAdv:ParagraphAdv>
</RichTextBoxAdv:SectionAdv>
</RichTextBoxAdv:DocumentAdv>

```

C#

```

// Initializes a new abstract list instance.
AbstractListAdv abstractListAdv = new AbstractListAdv(null);
abstractListAdv.AbstractListId = 1;
// Defines new ListLevel instance.
ListLevelAdv listLevel = new ListLevelAdv(abstractListAdv);
listLevel.ParagraphFormat.LeftIndent = 48d;
listLevel.ParagraphFormat.FirstLineIndent = 24d;
listLevel.FollowCharacter = FollowCharacterType.Tab;
listLevel.ListLevelPattern = ListLevelPattern.LowLetter;
listLevel.NumberFormat = "%1.";
listLevel.RestartLevel = 0;
listLevel.StartAt = 1;
// Adds list level to abstract list.
abstractListAdv.Levels.Add(listLevel);
// Adds abstract list to the document.
richTextBoxAdv.Document.AbstractLists.Add(abstractListAdv);
// Creates a new list instance.
ListAdv listAdv = new ListAdv(null);
listAdv.ListId = 1;
// Sets the abstract list Id for this list.
listAdv.AbstractListId = 1;
// Adds list to the document.
richTextBoxAdv.Document.Lists.Add(listAdv);
// Add list item 1
ParagraphAdv paragraphAdv = new ParagraphAdv();
SpanAdv spanAdv = new SpanAdv() { Text = "List Item 1" };
paragraphAdv.Inlines.Add(spanAdv);
richTextBoxAdv.Document.Sections[0].Blocks.Add(paragraphAdv);
// Defines the list format for the paragraph.
paragraphAdv.ParagraphFormat.ListFormat.ListId = 1;
paragraphAdv.ParagraphFormat.ListFormat.ListLevelNumber = 0;

```

VB.NET

```

' Initializes a new abstract list instance.
Dim abstractListAdv As New AbstractListAdv(Nothing)
abstractListAdv.AbstractListId = 1
' Defines new ListLevel instance.
Dim listLevel As New ListLevelAdv(abstractListAdv)
listLevel.ParagraphFormat.LeftIndent = 48.0
listLevel.ParagraphFormat.FirstLineIndent = 24.0
listLevel.FollowCharacter = FollowCharacterType.Tab
listLevel.ListLevelPattern = ListLevelPattern.LowLetter
listLevel.NumberFormat = "%1."
listLevel.RestartLevel = 0
listLevel.StartAt = 1
' Adds list level to abstract list.
abstractListAdv.Levels.Add(listLevel)

```

```

' Adds abstract list to the document.
richTextBoxAdv.Document.AbstractLists.Add(abstractListAdv)
' Creates a new list instance.
Dim listAdv As New ListAdv(Nothing)
listAdv.ListId = 1
' Sets the abstract list Id for this list.
listAdv.AbstractListId = 1
' Adds list to the document.
richTextBoxAdv.Document.Lists.Add(listAdv)
' Add list item 1
Dim paragraphAdv As ParagraphAdv = New ParagraphAdv()
Dim spanAdv As SpanAdv = New SpanAdv()
spanAdv.Text = "List Item 1"
paragraphAdv.Inlines.Add(spanAdv)
richTextBoxAdv.Document.Sections(0).Blocks.Add(paragraphAdv)
' Defines the list format for the paragraph.
paragraphAdv.ParagraphFormat.ListFormat.ListId = 1
paragraphAdv.ParagraphFormat.ListFormat.ListLevelNumber = 0

```

The following code example demonstrates how to define number format for numbered list in the SfRichTextBoxAdv control.

C#

```

// Defines the number format for the list level.
/* Note
 * The percent sign (%) followed by any number from 1 through 9 represents
 the number style from the respective list level.
 * For example, if you wanted the format for the first level to be "Article
 I." "Article II," and so on, the string for the NumberFormat property would
 be "Article %1." and the ListLevelPattern property would be set to
 ListLevelPattern.UpRoman.
 */
listLevel.NumberFormat = "Article %1.";
listLevel.ListLevelPattern = ListLevelPattern.UpRoman;

```

VB.NET

```

' Defines the number format for the list level.
' Note
' * The percent sign (%) followed by any number from 1 through 9 represents
 the number style from the respective list level.
' * For example, if you wanted the format for the first level to be "Article
 I." "Article II," and so on, the string for the NumberFormat property would
 be "Article %1." and the ListLevelPattern property would be set to
 ListLevelPattern.UpRoman.
'
listLevel.NumberFormat = "Article %1."
listLevel.ListLevelPattern = ListLevelPattern.UpRoman

```

You can define bulleted list by setting list level pattern as Bullet. You can define various bullets by defining the bullet character. The following code sample demonstrates how to define dot, square and arrow bullets in the SfRichTextBoxAdv control.

C#

```
// Defines Bulleted List.
listLevel.ListLevelPattern = ListLevelPattern.Bullet;
// Defining Dot Bullet
listLevel.NumberFormat = "\uf0b7";
listLevel.CharacterFormat.FontFamily = new FontFamily("Symbol");
// Defines Square bullet.
listLevel.NumberFormat = "\uf0a7";
listLevel.CharacterFormat.FontFamily = new FontFamily("Wingdings");
// Defines Arrow Bullet.
listLevel.NumberFormat = "\u27a4";
listLevel.CharacterFormat.FontFamily = new FontFamily("Symbol");
```

VB.NET

```
' Defines Bulleted List.
listLevel.ListLevelPattern = ListLevelPattern.Bullet
' Defining Dot Bullet
listLevel.NumberFormat = "\uf0b7"
listLevel.CharacterFormat.FontFamily = New FontFamily("Symbol")
' Defines Square bullet.
listLevel.NumberFormat = "\uf0a7"
listLevel.CharacterFormat.FontFamily = New FontFamily("Wingdings")
' Defines Arrow Bullet.
listLevel.NumberFormat = "\u27a4"
listLevel.CharacterFormat.FontFamily = New FontFamily("Symbol")
```

Level overrides

The list levels for a list are defined in the abstract list to which it refers to. Additionally you can define level overrides for any list level. The SfRichTextBoxAdv supports two types of level overrides.

1. Start at override – Only start value for the list is overridden and other properties are referred to list level defined in abstract list.
2. Level override – The list level is completely overridden.

The following code example demonstrates how to override the start at value for an existing list level in the SfRichTextBoxAdv control.

XML

```
<RichTextBoxAdv:ListAdv AbstractListId="1" ListId="1">
  <RichTextBoxAdv:ListAdv.LevelOverrides>
    <RichTextBoxAdv:LevelOverrideAdv StartAt="2" LevelNumber="0"/>
  </RichTextBoxAdv:ListAdv.LevelOverrides>
</RichTextBoxAdv:ListAdv>
```

C#

```
// Adds StartAtOverride for the list at first level.
// LevelNumber ranges from 0 to 8.
LevelOverrideAdv levelOverride = new LevelOverrideAdv(listAdv);
levelOverride.LevelNumber = 0;
levelOverride.StartAt = 2;
listAdv.LevelOverrides.Add(levelOverride);
```

VB.NET

```
' Adds StartAtOverride for the list at first level.
' LevelNumber ranges from 0 to 8.
Dim levelOverride As New LevelOverrideAdv(listAdv)
levelOverride.LevelNumber = 0
levelOverride.StartAt = 2
listAdv.LevelOverrides.Add(levelOverride)
```

The following code example demonstrates how to add level override for any existing list level in the SfRichTextBoxAdv control.

XML

```
<RichTextBoxAdv:ListAdv AbstractListId="1" ListId="1">
  <RichTextBoxAdv:ListAdv.LevelOverrides>
    <!-- Overrides fourth list level-->
    <RichTextBoxAdv:LevelOverrideAdv LevelNumber="3">
      <RichTextBoxAdv:LevelOverrideAdv.OverrideListLevel>
        <RichTextBoxAdv:ListLevelAdv ListLevelPattern="UpRoman" StartAt="3"
        NumberFormat="%1) " />
      </RichTextBoxAdv:LevelOverrideAdv.OverrideListLevel>
    </RichTextBoxAdv:LevelOverrideAdv>
  </RichTextBoxAdv:ListAdv.LevelOverrides>
</RichTextBoxAdv:ListAdv>
```

C#

```
// Adds ListLevel override for the list at fourth level.
// LevelNumber ranges from 0 to 8.
LevelOverrideAdv levelOverride = new LevelOverrideAdv(listAdv);
levelOverride.LevelNumber = 3;
levelOverride.OverrideListLevel = new ListLevelAdv(levelOverride);
levelOverride.OverrideListLevel.ListLevelPattern = ListLevelPattern.UpRoman;
levelOverride.OverrideListLevel.NumberFormat = "%1) ";
levelOverride.OverrideListLevel.StartAt = 3;
listAdv.LevelOverrides.Add(levelOverride);
```

VB.NET

```
' Adds ListLevel override for the list at fourth level.
' LevelNumber ranges from 0 to 8.
Dim levelOverride As New LevelOverrideAdv(listAdv)
levelOverride.LevelNumber = 3
levelOverride.OverrideListLevel = New ListLevelAdv(levelOverride)
levelOverride.OverrideListLevel.ListLevelPattern = ListLevelPattern.UpRoman
levelOverride.OverrideListLevel.NumberFormat = "%1) "
levelOverride.OverrideListLevel.StartAt = 3
listAdv.LevelOverrides.Add(levelOverride)
```

Editing list

You can retrieve the list applied for the current selection. By doing so, you can edit the list according to your requirement. After editing the list, you need to set it for the current selection in order to make the changes effective.

The following code sample demonstrates how to apply the list to the selection content in the SfRichTextBoxAdv control.

C#

```
// Gets the current list for the selection content.
ListAdv listAdv = richTextBoxAdv.Selection.ParagraphFormat.GetList();
```

VB.NET

```
' Gets the current list for the selection content.
Dim listAdv As ListAdv = richTextBoxAdv.Selection.ParagraphFormat.GetList()
```

The following code example demonstrates how to apply a list for the selection content in the SfRichTextBoxAdv control. When the selection content has a list, then it gets modified with that list. Otherwise the list is added to the document and applied to the selection content.

C#

```
// Applies list for the Selection content.
richTextBoxAdv.Selection.ParagraphFormat.SetList(listAdv);
richTextBoxAdv.Selection.ParagraphFormat.ListLevelNumber = 0;
```

VB.NET

```
' Applies list for the Selection content.
richTextBoxAdv.Selection.ParagraphFormat.SetList(listAdv)
richTextBoxAdv.Selection.ParagraphFormat.ListLevelNumber = 0
```

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Hyperlink in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv supports hyperlink field similar to the Microsoft Word. You can link part of the document content to Internet or file location, mail address or any text.

The following code example illustrates how to insert a hyperlink field.

XML

```
<RichTextBoxAdv:ParagraphAdv>
<RichTextBoxAdv:FieldBeginAdv></RichTextBoxAdv:FieldBeginAdv>
<RichTextBoxAdv:SpanAdv Text=" HYPERLINK &#34;http://www.syncfusion.com&#34;
"></RichTextBoxAdv:SpanAdv>
<RichTextBoxAdv:FieldSeparatorAdv></RichTextBoxAdv:FieldSeparatorAdv>
<RichTextBoxAdv:SpanAdv Text="Syncfusion">
<RichTextBoxAdv:SpanAdv.CharacterFormat>
<RichTextBoxAdv:CharacterFormat Underline="Single" FontColor="#ff0563c1"/>
```

```

</RichTextBoxAdv:SpanAdv.CharacterFormat>
</RichTextBoxAdv:SpanAdv>
<RichTextBoxAdv:FieldEndAdv></RichTextBoxAdv:FieldEndAdv>
</RichTextBoxAdv:ParagraphAdv>

```

C#

```

// Appends the field start.
paragraphAdv.Inlines.Add(new FieldBeginAdv());
// Appends the field code.
SpanAdv fieldCode = new SpanAdv();
string url = "www.syncfusion.com";
fieldCode.Text = " HYPERLINK \"" + url + "\" ";
paragraphAdv.Inlines.Add(fieldCode);
// Appends the field separator
paragraphAdv.Inlines.Add(new FieldSeparatorAdv());
// Appends the field result.
SpanAdv fieldResult = new SpanAdv();
fieldResult.Text = "Syncfusion";
fieldResult.CharacterFormat.Underline = Underline.Single;
fieldResult.CharacterFormat.FontColor = Color.FromArgb(0xff, 0x05, 0x63,
0xc1);
paragraphAdv.Inlines.Add(fieldResult);
// Appends the field end.
paragraphAdv.Inlines.Add(new FieldEndAdv());

```

VB.NET

```

' Appends the field start.
paragraphAdv.Inlines.Add(New FieldBeginAdv())
' Appends the field code.
Dim fieldCode As New SpanAdv()
Dim url As String = "www.syncfusion.com"
fieldCode.Text = (Convert.ToString(" HYPERLINK """) & url) + "" "
paragraphAdv.Inlines.Add(fieldCode)
' Appends the field separator
paragraphAdv.Inlines.Add(New FieldSeparatorAdv())
' Appends the field result.
Dim fieldResult As New SpanAdv()
fieldResult.Text = "Syncfusion"
fieldResult.CharacterFormat.Underline = Underline.[Single]
fieldResult.CharacterFormat.FontColor = Color.FromArgb(&Hff, &H5, &H63,
&Hc1)
paragraphAdv.Inlines.Add(fieldResult)
' Appends the field end.
paragraphAdv.Inlines.Add(New FieldEndAdv())

```

The following code example illustrates how to insert hyperlink field into SfRichTextBoxAdv Document through UI command.

XML

```

<Button Content="Insert Hyperlink"
Command="RichTextBoxAdv:SfRichTextBoxAdv.InsertHyperlinkCommand"

```

```
CommandTarget="{Binding ElementName=richTextBoxAdv}"
CommandParameter="www.google.com"/>
```

Hyperlink ScreenTip

In RichTextBox control ToolTip (ScreenTip) shows some information or navigation link, when the mouse hovers over that hyperlink and it disappears when the mouse is moved away from that hyperlink. By default, it shows navigation link of that hyperlink and you can set the text you want to use for your ScreenTip.

Without ScreenTipText	With ScreenTipText
	

The following code example illustrates how to insert a hyperlink field with ScreenTip.

XML

```
<RichTextBoxAdv:ParagraphAdv>
<RichTextBoxAdv:FieldBeginAdv></RichTextBoxAdv:FieldBeginAdv>
<RichTextBoxAdv:SpanAdv Text=" HYPERLINK
&#34;\http://www.syncfusion.com&#34; \o SfRichTextBox
"></RichTextBoxAdv:SpanAdv>
<RichTextBoxAdv:FieldSeparatorAdv></RichTextBoxAdv:FieldSeparatorAdv>
<RichTextBoxAdv:SpanAdv Text="SfRichTextBoxAdv">
<RichTextBoxAdv:SpanAdv.CharacterFormat>
<RichTextBoxAdv:CharacterFormat Underline="Single" FontColor="#ff0563c1"/>
</RichTextBoxAdv:SpanAdv.CharacterFormat>
</RichTextBoxAdv:SpanAdv>
<RichTextBoxAdv:FieldEndAdv></RichTextBoxAdv:FieldEndAdv>
</RichTextBoxAdv:ParagraphAdv>
```

C#

```
ParagraphAdv paragraphAdv = new ParagraphAdv();
// Appends the field start.
paragraphAdv.Inlines.Add(new FieldBeginAdv());
// Appends the field code.
SpanAdv fieldCode = new SpanAdv();
string url = "www.syncfusion.com";
string screenTip = "SfRichTextBox";
fieldCode.Text = " HYPERLINK \"" + url + "\" \o \"" + screenTip + "\" ";
paragraphAdv.Inlines.Add(fieldCode);
// Appends the field separator
paragraphAdv.Inlines.Add(new FieldSeparatorAdv());
// Appends the field result.
SpanAdv fieldResult = new SpanAdv();
fieldResult.Text = "SfRichTextBoxAdv";
fieldResult.CharacterFormat.Underline = Underline.Single;
fieldResult.CharacterFormat.FontColor = Color.FromArgb(0xff, 0x05, 0x63,
0xc1);
paragraphAdv.Inlines.Add(fieldResult);
// Appends the field end.
paragraphAdv.Inlines.Add(new FieldEndAdv());
```

```
richTextBoxAdv.Document.Sections[0].Blocks.Add(paragraphAdv);
```

VB.NET

```
' Appends the field start.
paragraphAdv.Inlines.Add(New FieldBeginAdv())
' Appends the field code.
Dim fieldCode As New SpanAdv()
Dim url As String = "www.syncfusion.com"
Dim screenTip As String = "SfRichTextBox"
fieldCode.Text = (Convert.ToString(" HYPERLINK """) & url) + "" "" "" "" "" +
(screenTip) + "" "" "" "" ""
paragraphAdv.Inlines.Add(fieldCode)
' Appends the field separator
paragraphAdv.Inlines.Add(New FieldSeparatorAdv())
' Appends the field result.
Dim fieldResult As New SpanAdv()
fieldResult.Text = "SfRichTextBoxAdv"
fieldResult.CharacterFormat.Underline = Underline.[Single]
fieldResult.CharacterFormat.FontColor = Color.FromArgb(&Hff, &H5, &H63,
&Hcl)
paragraphAdv.Inlines.Add(fieldResult)
' Appends the field end.
paragraphAdv.Inlines.Add(New FieldEndAdv())
```

The following code example illustrates how to insert hyperlink field with ScreenTip into RichTextBox Document through UI command.

C#

```
SfRichTextBoxAdv.InsertHyperlinkCommand.Execute(new string[3] {
"www.syncfusion.com", "SfRichTextBoxAdv", "SfRichTextBox" },
richTextBoxAdv);
```

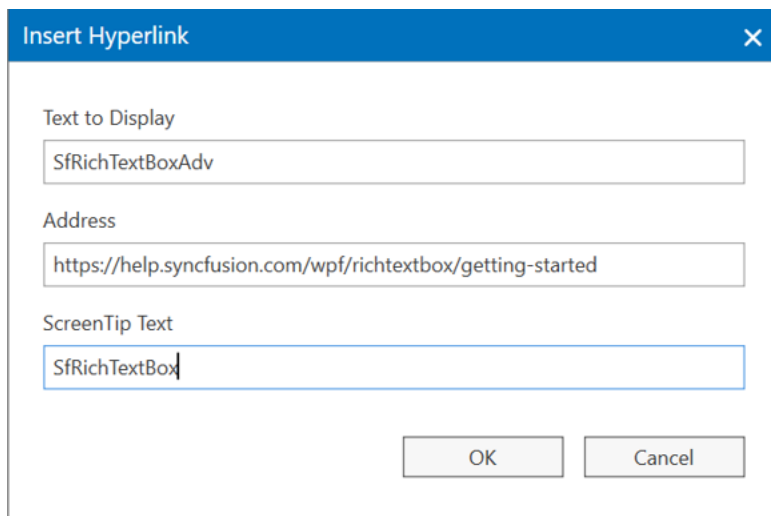

The following section illustrates how to insert hyperlink field with ScreenTip in RichTextBox Document through built-in hyperlink dialog UI command like Microsoft Word application.

1. Open insert hyperlink dialog.

XML

```
<!-- Binds button to the ShowHyperlinkDialogCommand -->
<Button Content="Hyperlink"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowHyperlinkDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
```

2. Enter the display text, URL link and ScreenTip text. 3. Click on OK to close the dialog box.

Note: ScreenTip option is supported from V18.4.0.30

Hyperlink Navigation

The SfRichTextBoxAdv supports event to identify whenever hyperlink navigation is requested. This allows you to easily customize the hyperlink navigation functionality.

The following code example demonstrates how to customize hyperlink navigation functionality for the SfRichTextBoxAdv instance.

C#

```
// Hooks the event handler for RequestNavigate event.
richTextBoxAdv.RequestNavigate += RichTextBoxAdv_RequestNavigate;
/// <summary>
/// Handles the RequestNavigate event of the richTextBoxAdv control.
/// </summary>
/// <param name="obj">The source of the event.</param>
/// <param name="args">The <see cref="RequestNavigateEventArgs"/> instance
/// containing the event data.</param>
private void RichTextBoxAdv_RequestNavigate(object obj,
Syncfusion.Windows.Controls.RichTextBoxAdv.RequestNavigateEventArgs args)
{
    if (args.Hyperlink.LinkType == HyperlinkType.Webpage ||
args.Hyperlink.LinkType == HyperlinkType.Email)
        Process.Start(new ProcessStartInfo(new
Uri(args.Hyperlink.NavigationLink).AbsoluteUri));
    else if (args.Hyperlink.LinkType == HyperlinkType.File &&
File.Exists(args.Hyperlink.NavigationLink))
        Process.Start(args.Hyperlink.NavigationLink);
}
// Unhooks the event handler for RequestNavigate event.
richTextBoxAdv.RequestNavigate -= RichTextBoxAdv_RequestNavigate;
```

VB.NET

```
' Hooks the event handler for RequestNavigate event.
AddHandler richTextBoxAdv.RequestNavigate, AddressOf
RichTextBoxAdv_RequestNavigate
''' <summary>
```

```

''' Handles the RequestNavigate event of the richTextBoxAdv control.
''' </summary>
''' <param name="obj">The source of the event.</param>
''' <param name="args">The <see cref="RequestNavigateEventArgs"/> instance
    containing the event data.</param>
Private Sub RichTextBoxAdv_RequestNavigate(obj As Object, args As
Syncfusion.Windows.Controls.RichTextBoxAdv.RequestNavigateEventArgs)
If args.Hyperlink.LinkType = HyperlinkType.Webpage OrElse
args.Hyperlink.LinkType = HyperlinkType.Email Then
Process.Start(New ProcessStartInfo(New
Uri(args.Hyperlink.NavigationLink).AbsoluteUri))
ElseIf args.Hyperlink.LinkType = HyperlinkType.File AndAlso
File.Exists(args.Hyperlink.NavigationLink) Then
Process.Start(args.Hyperlink.NavigationLink)
End If
End Sub
' Unhooks the event handler for RequestNavigate event.
RemoveHandler richTextBoxAdv.RequestNavigate, AddressOf
RichTextBoxAdv_RequestNavigate

```

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Image in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv allows you to insert images of various formats such as bitmap images (.bmp), JPEG (.jpg, .jpeg), PNG (.png) except Metafile images.

The following code example illustrates how to insert picture into the SfRichTextBoxAdv document through UI Command.

XML

```

<Button Content="Insert Picture"
Command="RichTextBoxAdv:SfRichTextBoxAdv.InsertPictureCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />

```

Image Resizer

The SfRichTextBoxAdv also supports built-in image resizer to resize the images present in the document to your wish. The image resizer accepts both touch and mouse interactions.

Text wrapping style

Text wrapping refers to how images are fit with surrounding text in a document. Please [refer to this page](#) for more information about text wrapping styles available in Word documents.

Positioning the image

Starting from v19.1.0.x, RichTextBox preserves the position properties of the image and displays the image based on position properties. It does not support modifying the position properties. Whereas the image will be automatically moved along with text edited if it is positioned relative to the line or paragraph.

Note: At present, the image with text wrapping style **In-Line with Text** can only be dragged and dropped anywhere in the document.

You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

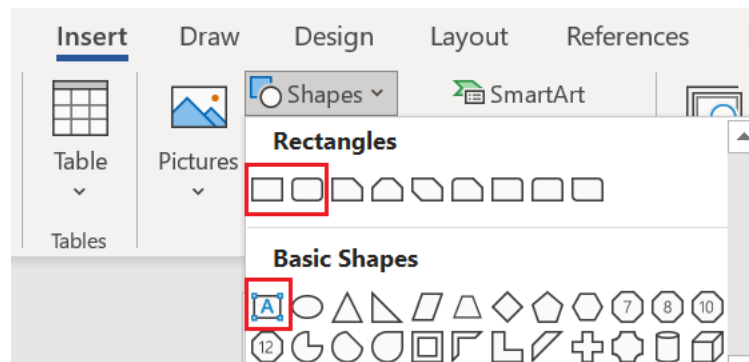

Shapes in WPF RichTextBox (SfRichTextBoxAdv)

Shapes are drawing objects that include a text box, rectangles, lines, curves, circles, etc. It can be preset or custom geometry. At present, RichTextBox does not have support to insert shapes. However, if the document contains a shape while importing, it will be preserved properly.

Note: Starting from v18.3.0.x, the shape preservation is supported.

Supported shapes

The RichTextBox has preservation support for Text box and Rectangle shapes.

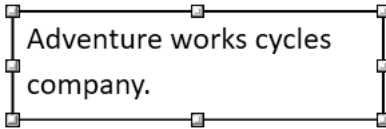

Text box Shape

A text box is a rectangular area on the document where you can enter text. When you click in a text box, a flashing cursor will display indicating that you can begin typing. It allows you to enter multiple lines of text with all text formatting.

Adventure Works Cycles, the fictitious company on which the Adventure Works sample databases are based, is a large, multinational manufacturing company. The company manufactures and sells metal Adventure works cycles and composite bicycles to North American, European and and company. Asian commercial markets. While its base operation is located in Bothell, Washington with 290 employees, several regional sales teams are located throughout their market base.

Shape Resizer

The RichTextBox also supports a built-in shape resizer to resize the shapes present in the document. The shape resizer accepts both touch and mouse interactions.

Text wrapping style

Text wrapping refers to how shapes fit with surrounding text in a document. Please [refer to this page](#) for more information about text wrapping styles available in Word documents.

Positioning the shape

Starting from v19.1.0.x, RichTextBox preserves the position properties of the shape and displays the shape based on position properties. It does not support modifying the position properties. Whereas the shape will be automatically moved along with text edited if it is positioned relative to the line or paragraph.

Note: At present, the shape with text wrapping style **In-Line with Text** can only be dragged and dropped anywhere in the document.

You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Table in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv allows you to add tables into the rich text document. You can insert any rows or columns to the existing table and also can delete existing rows and columns. The SfRichTextBoxAdv also allows you to merge the selected cells into one (both vertically and horizontally).

The following code example illustrates how to add tables into the rich text document.

XML

```
<RichTextBoxAdv:DocumentAdv>
<RichTextBoxAdv:SectionAdv>
<RichTextBoxAdv:TableAdv>
<RichTextBoxAdv:TableRowAdv>
<RichTextBoxAdv:TableCellAdv>
<RichTextBoxAdv:TableCellAdv.CellFormat>
<RichTextBoxAdv:CellFormat CellWidth="240"/>
</RichTextBoxAdv:TableCellAdv.CellFormat>
<RichTextBoxAdv:ParagraphAdv>
<RichTextBoxAdv:SpanAdv>Cell 1</RichTextBoxAdv:SpanAdv>
</RichTextBoxAdv:ParagraphAdv>
</RichTextBoxAdv:TableCellAdv>
<RichTextBoxAdv:TableCellAdv>
<RichTextBoxAdv:TableCellAdv.CellFormat>
<RichTextBoxAdv:CellFormat CellWidth="240"/>
</RichTextBoxAdv:TableCellAdv.CellFormat>
<RichTextBoxAdv:ParagraphAdv>
<RichTextBoxAdv:SpanAdv>Cell 2</RichTextBoxAdv:SpanAdv>
</RichTextBoxAdv:ParagraphAdv>
</RichTextBoxAdv:TableCellAdv>
</RichTextBoxAdv:TableRowAdv>
</RichTextBoxAdv:TableAdv>
<RichTextBoxAdv:ParagraphAdv/>
</RichTextBoxAdv:SectionAdv>
```

```
</RichTextBoxAdv:DocumentAdv>
```

C#

```
// Initializes a document.
DocumentAdv document = new DocumentAdv();
// Initialize a section.
SectionAdv section = new SectionAdv();
// Initialize a table.
TableAdv tableAdv = new TableAdv();
// Initialize a row.
TableRowAdv tableRowAdv = new TableRowAdv();
// Initialize a table cell.
TableCellAdv tableCellAdv = new TableCellAdv();
tableCellAdv.CellFormat.CellWidth = 240;
// Initializes a paragraph.
ParagraphAdv paragraphAdv = new ParagraphAdv();
SpanAdv spanAdv = new SpanAdv();
spanAdv.Text = "Cell 1";
paragraphAdv.Inlines.Add(spanAdv);
tableCellAdv.Blocks.Add(paragraphAdv);
// Initialize and add any number of blocks to the cell here.
tableRowAdv.Cells.Add(tableCellAdv);
// Initialize and add any number of cells to the row here.
tableAdv.Rows.Add(tableRowAdv);
// Initialize and add any number of rows to the table here.
section.Blocks.Add(tableAdv);
// Initialize and add any number of blocks to the section here.
document.Sections.Add(section);
// Initialize and add any number of sections to the document here.
// Assign the document to the RichTextBoxAdv instance.
richTextBoxAdv.Document = document;
```

VB.NET

```
' Initializes a document.
Dim document As New DocumentAdv()
' Initialize a section.
Dim section As New SectionAdv()
' Initialize a table.
Dim tableAdv As New TableAdv()
' Initialize a row.
Dim tableRowAdv As New TableRowAdv()
' Initialize a table cell.
Dim tableCellAdv As New TableCellAdv()
tableCellAdv.CellFormat.CellWidth = 240
' Initializes a paragraph.
Dim paragraphAdv As New ParagraphAdv()
Dim spanAdv As New SpanAdv()
spanAdv.Text = "Cell 1"
paragraphAdv.Inlines.Add(spanAdv)
tableCellAdv.Blocks.Add(paragraphAdv)
' Initialize and add any number of blocks to the cell here.
tableRowAdv.Cells.Add(tableCellAdv)
' Initialize and add any number of cells to the row here.
tableAdv.Rows.Add(tableRowAdv)
```

```
' Initialize and add any number of rows to the table here.
section.Blocks.Add(tableAdv)
' Initialize and add any number of blocks to the section here.
document.Sections.Add(section)
' Initialize and add any number of sections to the document here.
' Assign the document to the RichTextBoxAdv instance.
richTextBoxAdv.Document = document
```

UI Commands for accessing table

The following code example illustrates how to bind the Button UI Command for inserting a table.

XML

```
<!-- Inserts the table with default size of one row and two columns -->
<Button Content="Insert Table"
Command="RichTextBoxAdv:SfRichTextBoxAdv.InsertTableCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Inserts the table with the size of two rows and three columns -->
<Button Content="Insert Table"
Command="RichTextBoxAdv:SfRichTextBoxAdv.InsertTableCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}"
CommandParameter="2,3"/>
```

C#

```
// InsertTableCommand accepting string parameter.
SfRichTextBoxAdv.InsertTableCommand.Execute("2,3", richTextBoxAdv);
// InsertTableCommand accepting int[] with row, column size as parameter
SfRichTextBoxAdv.InsertTableCommand.Execute(new int[] { 2, 3 },
richTextBoxAdv);
```

VB.NET

```
' InsertTableCommand accepting string parameter.
SfRichTextBoxAdv.InsertTableCommand.Execute("2,3", richTextBoxAdv)
' InsertTableCommand accepting int[] with row, column size as parameter
SfRichTextBoxAdv.InsertTableCommand.Execute(New Integer() { 2, 3 },
richTextBoxAdv)
```

The following code example illustrates how to bind the Button UI Command for inserting rows and columns.

XML

```
<!-- Inserts one row above to the current row -->
<!-- Command parameter can be either Above or Below -->
<Button Content="Insert Row"
Command="RichTextBoxAdv:SfRichTextBoxAdv.InsertRowCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}"
CommandParameter="Above"/>
<!-- Inserts one column to the right of current column -->
<!-- Command parameter can be either Left or Right -->
<Button Content="Insert Column"
Command="RichTextBoxAdv:SfRichTextBoxAdv.InsertColumnCommand"
```

```
CommandTarget="{Binding ElementName=richTextBoxAdv}"
CommandParameter="Right"/>
```

The following code example illustrates how to bind the Button UI Command for selecting cell, row, column and table.

XML

```
<!--Selects the Cell-->
<Button Content="Select Cell"
Command="RichTextBoxAdv:SfRichTextBoxAdv.SelectCellCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!--Selects the Column-->
<Button Content="Select Column"
Command="RichTextBoxAdv:SfRichTextBoxAdv.SelectColumnCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!--Selects the Row-->
<Button Content="Select Row"
Command="RichTextBoxAdv:SfRichTextBoxAdv.SelectRowCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!--Selects the Table-->
<Button Content="Select Table"
Command="RichTextBoxAdv:SfRichTextBoxAdv.SelectTableCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
```

The following code example illustrates how to bind the Button UI Command for merging selected cells.

XML

```
<!-- Merges the selected cells -->
<Button Content="Merge Cells"
Command="RichTextBoxAdv:SfRichTextBoxAdv.MergeSelectedCellsCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
```

The following code example illustrates how to bind the Button UI Command to change content alignment of the selected cells.

XML

```
<!--Change cell content alignment with command parameter as comma
separated(vertical alignment and text alignment)-->
<Button Content="Cell Content Alignment"
Command="RichTextBoxAdv:SfRichTextBoxAdv.CellContentAlignmentCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}"
CommandParameter="Top,Left" />
<!--or-->
<!--Change cell content alignment with command parameter single sting
(vertical alignment and text alignment)-->
<Button Content="Cell Content Alignment"
Command="RichTextBoxAdv:SfRichTextBoxAdv.CellContentAlignmentCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}"
CommandParameter="CenterRight"/>
<!--or-->
<!--Change cell content alignment with command parameter as string
array(vertical alignment and text alignment string order respectively)-->
```

```
<Button Content="Cell Content Alignment"
Command="RichTextBoxAdv:SfRichTextBoxAdv.CellContentAlignmentCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}">
<Button.CommandParameter>
<x:Array Type="sys:String"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml" xmlns:sys="clr-
namespace:System;assembly=mscorlib">
<sys:String>Bottom</sys:String>
<sys:String>Left</sys:String>
</x:Array>
</Button.CommandParameter>
</Button>
```

The following code example illustrates how to Button UI Command for deleting a row, deleting a column and deleting an entire table.

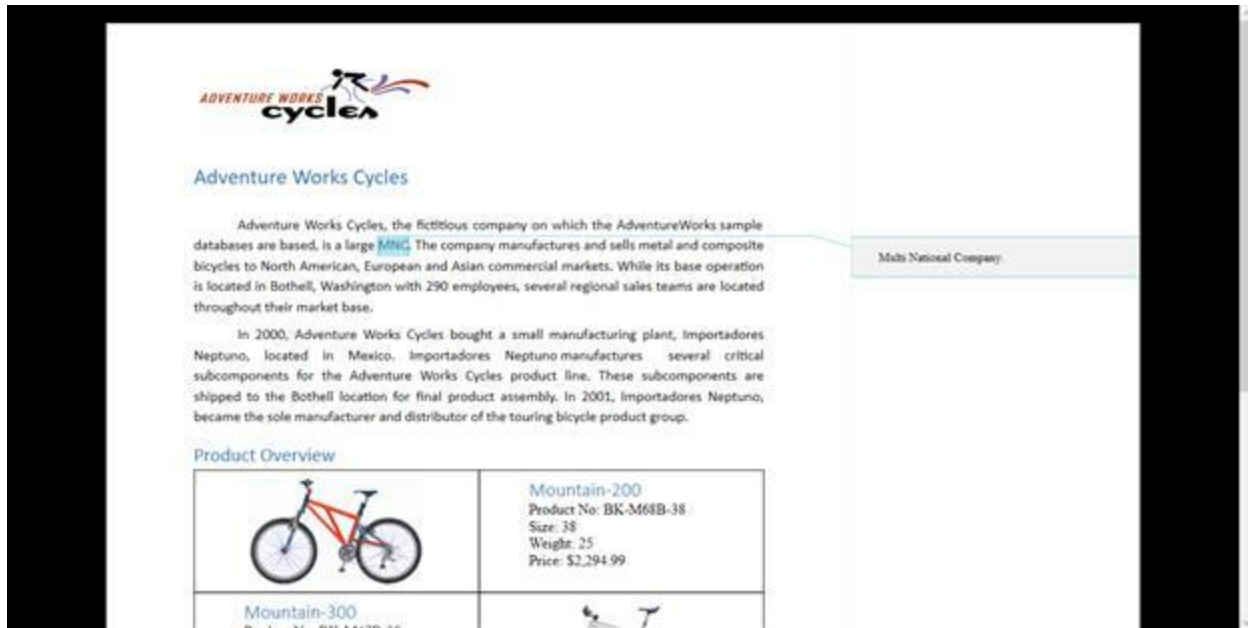

XML

```
<!-- Deletes the column -->
<Button Content="Delete Column"
Command="RichTextBoxAdv:SfRichTextBoxAdv.DeleteColumnCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Deletes the row -->
<Button Content="Delete Row"
Command="RichTextBoxAdv:SfRichTextBoxAdv.DeleteRowCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Deletes the table -->
<Button Content="Delete Table"
Command="RichTextBoxAdv:SfRichTextBoxAdv.DeleteTableCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
```

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Comment in WPF RichTextBox (SfRichTextBoxAdv)

A Comment is a note or annotation that an author or reviewer can add to the document. The SfRichTextBoxAdv control supports viewing and editing the comments in the document. It renders the comments present in the document in review pane, similar to the Microsoft Word.

Note: Currently, the SfRichTextBoxAdv shows review pane only with Pages layout type.

UI Commands for accessing comment

The following operations can be performed through command binding in SfRichTextBoxAdv control:

- Insert a new comment.
- Delete an existing comment or delete all the existing comments.
- Navigate to the next comment.
- Navigate to the previous comment.
- Show/Hide review pane.

The following code example demonstrates how to bind commands for accessing comment in SfRichTextBoxAdv document.

XML

```
<!-- Binds button to the ShowCommentsCommand -->
<Button Content="Show Comments"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowCommentsCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the NewCommentCommand -->
<Button Content="New Comment"
Command="RichTextBoxAdv:SfRichTextBoxAdv.NewCommentCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the DeleteCommentCommand -->
<Button Content="Delete Comment"
Command="RichTextBoxAdv:SfRichTextBoxAdv.DeleteCommentCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the DeleteAllCommentsCommand -->
<Button Content="Delete All Comments"
Command="RichTextBoxAdv:SfRichTextBoxAdv.DeleteAllCommentsCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the PreviousCommentCommand -->
```

```

<Button Content="Previous Comment"
Command="RichTextBoxAdv:SfRichTextBoxAdv.PreviousCommentCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the NextCommentCommand -->
<Button Content="Next Comment"
Command="RichTextBoxAdv:SfRichTextBoxAdv.NextCommentCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />

```

Customizing comment visual style

The SfRichTextBoxAdv provides event support to notify whenever a comment is added to the document. With the help of it, you can customize the visual style for the comment. You can also set the author and initial of the comment.

The following code example demonstrates how to customize comment visual style using event.

C#

```

// Hooks the CommentAdding event of RichTextBoxAdv.
richTextBoxAdv.CommentAdding += RichTextBoxAdv_CommentAdding;
// Unhooks the CommentAdding event of RichTextBoxAdv.
richTextBoxAdv.CommentAdding -= RichTextBoxAdv_CommentAdding;
// Handles the CommentAdding event of the richTextBoxAdv control.
private void RichTextBoxAdv_CommentAdding(object obj, CommentAddingEventArgs args)
{
    if (!isFileLoading)
    {
        //Defines the author and initial for the comment.
        args.Comment.Author = "Peter";
        args.Comment.Initial = "Franken";
    }
    // Defines the background brush for the comment.
    argsVisualStyle.BackgroundBrush = new SolidColorBrush(Color.FromArgb(0xff, 0xff, 0xa8, 0xa8));
    // Defines the border brush for the comment.
    argsVisualStyle.BorderBrush = new SolidColorBrush(Color.FromArgb(0xff, 0xFF, 0x01, 0x01));
    // Defines the highlight color for the commented content.
    argsVisualStyle.HighlightColor = Color.FromArgb(0xff, 0xFF, 0xa8, 0x8);
}

```

VB.NET

```

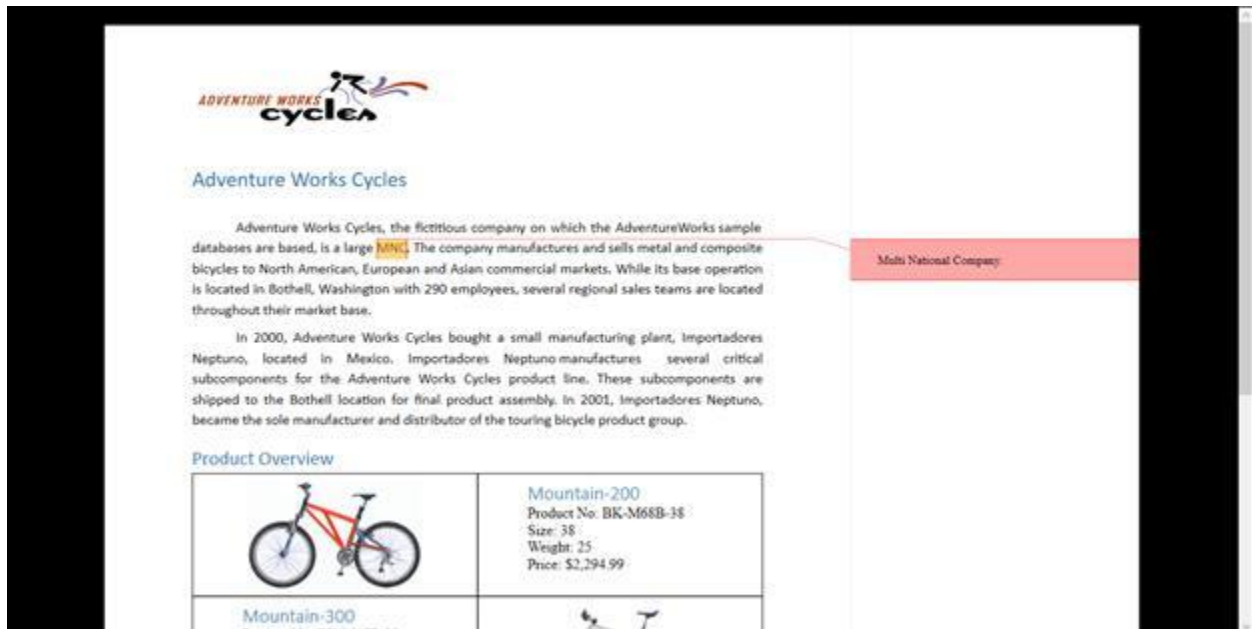

' Hooks the CommentAdding event of RichTextBoxAdv.
AddHandler richTextBoxAdv.CommentAdding, AddressOf
RichTextBoxAdv_CommentAdding
' Unhooks the CommentAdding event of RichTextBoxAdv.
RemoveHandler richTextBoxAdv.CommentAdding, AddressOf
RichTextBoxAdv_CommentAdding
' Handles the CommentAdding event of the richTextBoxAdv control.
Private Sub RichTextBoxAdv_CommentAdding(obj As Object, args As
CommentAddingEventArgs)
If Not isFileLoading Then
'Defines the author and initial for the comment.
args.Comment.Author = "Peter"

```

```

args.Comment.Initial = "Franken"
End If
' Defines the background brush for the comment.
argsVisualStyle.BackgroundBrush = New SolidColorBrush(Color.FromArgb(&Hff,
&Hff, &Ha8, &Ha8))
' Defines the border brush for the comment.
argsVisualStyle.BorderBrush = New SolidColorBrush(Color.FromArgb(&Hff,
&Hff, &H1, &H1))
' Defines the highlight color for the commented content.
argsVisualStyle.HighlightColor = Color.FromArgb(&Hff, &Hff, &Ha8, &H8)
End Sub

```

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Document Styles in WPF RichTextBox (SfRichTextBoxAdv)

A style is a predefined set of table, numbering, paragraph, and character formatting properties that can be applied to regions within a document.

In RichTextBoxAdv, styles are created and added to a document programmatically or using the built-in Styles dialog.

A style in a document should have the following properties:

Name

Name of the style. All styles in a document have a unique name, which is used as an identifier when applying the style.

Type

Specifies the document elements that the style will target. For example, paragraph or character.

Next

Specifies the style that will be automatically applied to a new paragraph, which is created following a paragraph with the parent paragraph style applied.

Link

Provides a relation between the paragraph and character style.

CharacterFormat

Specifies the properties of paragraph and character style.

ParagraphFormat

Specifies the properties of paragraph style.

BasedOn

Specifies that the current style inherits the style set to this property. This is how hierarchical styles are defined. It can be optional.

Note: The style type should match the inherited style type. For example, it is not possible to have a character style inherit a paragraph style.

Default style

The default style for span and paragraph properties is normal. It internally inherits the default style of the document loaded or RichTextBoxAdv control.

Style hierarchy

Each style initially checks its local value for the property that is being evaluated and turns to the style it is based on. If no local value is found, it turns to its default style.

Style inheritance of different styles are listed as follows:

Character style

Character styles are based only on other character styles, and character properties are inherited from the base character style.

Paragraph style

Paragraph styles are based on other paragraph styles or on linked styles.

When a paragraph style is based on another paragraph style, the inheritance of the properties is as follows:

- Paragraph properties are inherited from the base paragraph style.
- Span properties are inherited from the base paragraph style.

When a paragraph style is based on a linked style, the inheritance of the properties is as follows:

- Paragraph properties are inherited from the paragraph style part in its base linked style.
- Span properties are inherited from the span style part in its base linked style.

Linked style

Linked styles are composite styles and their components are paragraph and character styles with link between them. To apply paragraph properties, take the properties from the linked paragraph style. Similarly, to apply character properties, take the properties from linked character style.

Linked styles are based on other linked styles or on paragraph styles.

When a linked style is based on a paragraph style, the hierarchy of the properties is as follows:

- Paragraph properties are inherited from its base paragraph style.
- Character properties are inherited from its base character style.

When a linked style is based on another linked style, the hierarchy of the properties is as follows:

- Paragraph properties are inherited from the paragraph style part in its base linked style.
- Span properties are inherited from the character style part in its base linked style.

SfRichTextBoxAdv provides the following functionalities related with styles:

- Create new style
- Modify an existing style
- Apply style
- Clear formatting

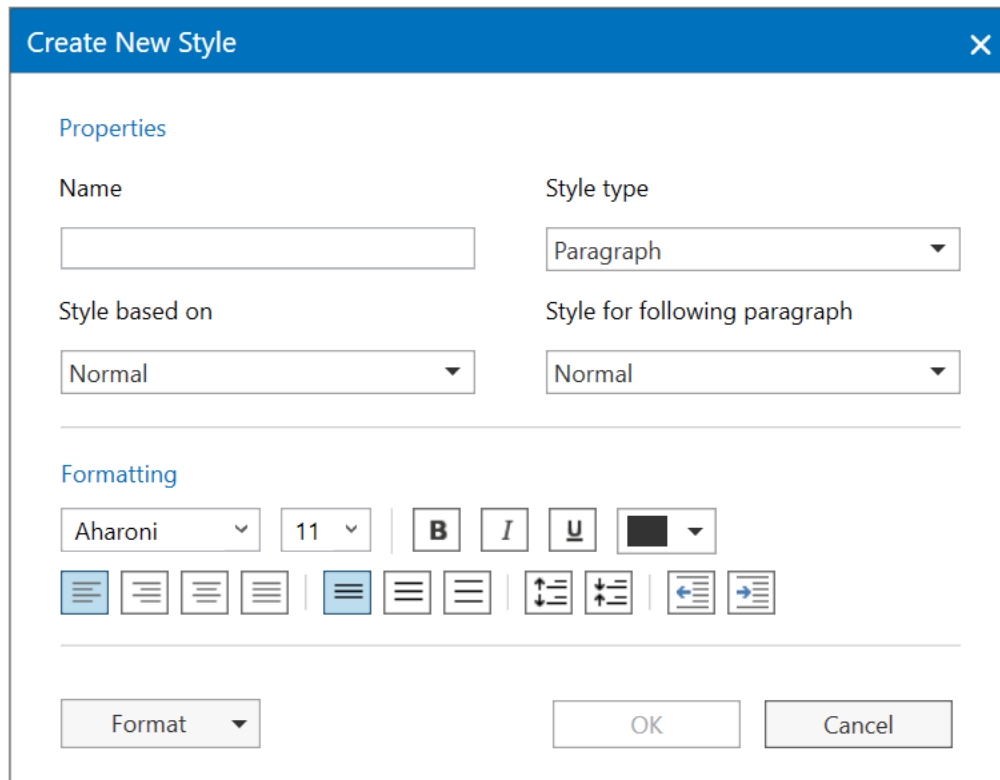

Create new style

New styles are created and added to the style collection of the document. Here, you can create character, paragraph and linked type styles.

The following code example explains how to create new style dialog through command binding.

XML

```
<Button Content="Create style"
Command="Syncfusion:SfRichTextBoxAdv.ShowStyleDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" ></Button>
```

The image shows a 'Create New Style' dialog box with a blue header bar containing a close button. The dialog is divided into two main sections: 'Properties' and 'Formatting'. In the 'Properties' section, there is a 'Name' text box, a 'Style type' dropdown menu set to 'Paragraph', a 'Style based on' dropdown menu set to 'Normal', and a 'Style for following paragraph' dropdown menu set to 'Normal'. The 'Formatting' section contains a row of controls: a font family dropdown set to 'Aharoni', a font size dropdown set to '11', and buttons for bold (B), italic (I), underline (U), and a color selection box. Below these are two rows of alignment and indentation icons. At the bottom of the dialog are three buttons: 'Format' with a dropdown arrow, 'OK', and 'Cancel'.

Modify an existing style

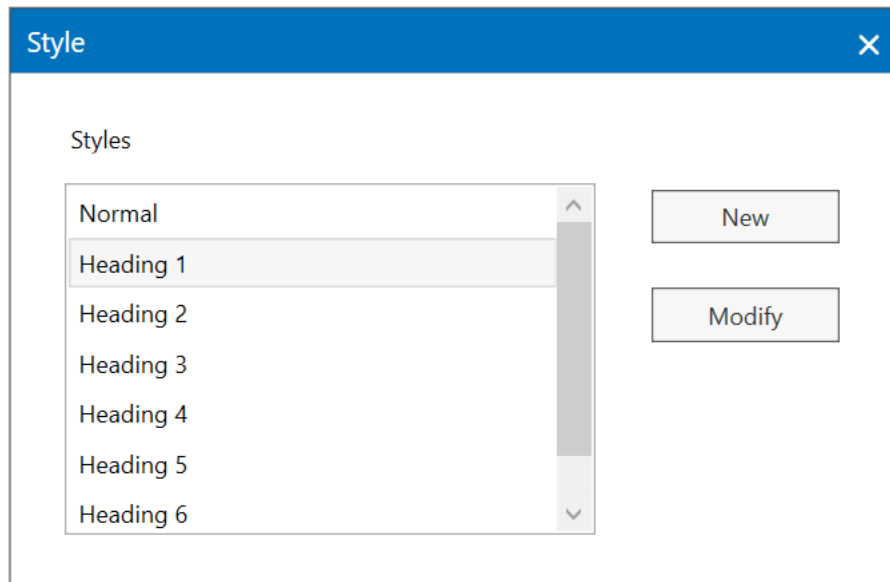

You can modify a style directly using the `ShowStylesDialogCommand` in `SfRichTextBoxAdv`.

The following code example explains how to modify the style dialog through command binding.

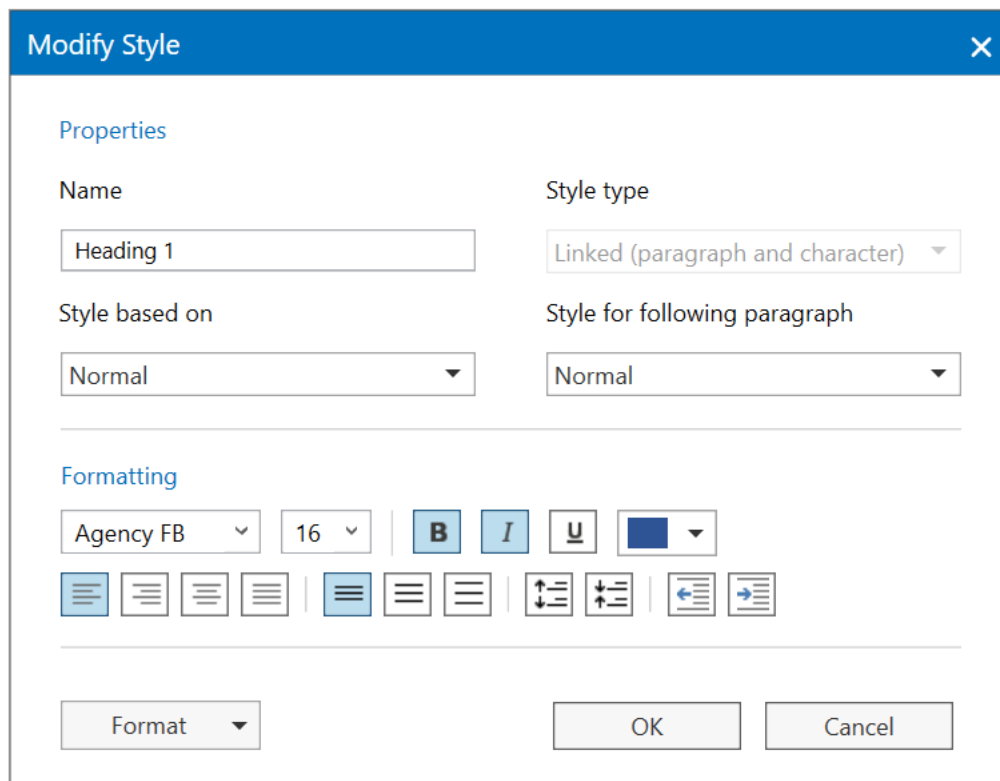

XML

```
<Button Content="Modify style"
Command="Syncfusion:SfRichTextBoxAdv.ShowStylesDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}"></Button>
```

From the styles list select a style you want to modify.

In the Formatting section, make any formatting changes you want, such as font style, size, or color, alignment, line spacing, or indentation.

Apply style

The styles are applied using the `ApplyStyleCommand` in `SfRichTextBoxAdv`. The parameter should be passed is the Name of the Style.

The styles of the Character type are applied to the currently selected part of the document. If there is no selection, the values that will be applied to the word at caret position. The styles of Paragraph type follow the same logic and are applied to all paragraphs in the selection or the current paragraph.

When there is no selection, styles of Linked type will change the values of the paragraph and apply both the Paragraph and Character properties. When there is selection, Linked Style changes only the character properties of the selected text.

The following code example explains how to apply style through command binding.

XML

```
<Button Content="Apply style"
Command="Syncfusion:SfRichTextBoxAdv.ApplyStyleCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}"
CommandParameter="Heading 1"></Button>
```

Clear formatting

It will remove all the formatting from the selection leaving only the normal unformatted text. But when there is no selection, it will remove only the formatting inherited from style.

The following code example explains how to clear the formatting of text through command binding.

XML

```
<Button Content="Clear formatting"
Command="Syncfusion:SfRichTextBoxAdv.ClearFormattingCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}"></Button>
```

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Import and Export in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv allows you to import/export word documents (.docx, .doc), rich text format documents (.rtf), HTML documents (.htm, .html), XAML documents (.xaml) and text documents (.txt).

The following sample code demonstrates how to import contents from a file into SfRichTextBoxAdv.

C#

```
// Imports the document.
void ImportDocument ()
{
    // Initializes the open file dialog.
    OpenFileDialog openFileDialog = new OpenFileDialog()
    {
        Filter = "All supported files (*.docx;*.doc;*.htm;*.html;*.rtf;*.txt;*.xaml)|*.docx;*.doc;*.htm;*.html;*.rtf;*.txt;*.xaml|Word Document (*.docx)|*.docx|Word 97 - 2003 Document (*.doc)|*.doc|Web Page (*.htm;*.html)|*.htm;*.html|Rich Text File (*.rtf)|*.rtf|Text File (*.txt)|*.txt|Xaml File (*.xaml)|*.xaml",
        FilterIndex = 1,
        Multiselect = false
    };
    if ((bool)openFileDialog.ShowDialog())
    {
        // Loads the file into RichTextBoxAdv.
        richTextBoxAdv.Load(openFileDialog.FileName);
        // Sets the File name as Document Title.
    }
}
```

```
richTextBoxAdv.DocumentTitle =
openFileDialog.FileName.Remove(openFileDialog.FileName.LastIndexOf("."));
}
}
```

VB.NET

```
' Imports the document.
Private Sub ImportDocument()
' Initializes the open file dialog.
Dim openFileDialog As New OpenFileDialog() With { _
Key .Filter = "All supported files
(*.docx;*.doc;*.htm;*.html;*.rtf;*.txt;*.xaml)|*.docx;*.doc;*.htm;*.html;*.r
tf;*.txt;*.xaml|Word Document (*.docx)|*.docx|Word 97 - 2003 Document
(*.doc)|*.doc|Web Page (*.htm;*.html)|*.htm;*.html|Rich Text File
(*.rtf)|*.rtf|Text File (*.txt)|*.txt|Xaml File (*.xaml)|*.xaml", _
Key .FilterIndex = 1, _
Key .Multiselect = False _
}
If CBool(openFileDialog.ShowDialog()) Then
' Loads the file into RichTextBoxAdv.
richTextBoxAdv.Load(openFileDialog.FileName)
' Sets the File name as Document Title.
richTextBoxAdv.DocumentTitle =
openFileDialog.FileName.Remove(openFileDialog.FileName.LastIndexOf("."))
End If
End Sub
```

The following code example demonstrates how to export SfRichTextBoxAdv contents into a file.

C#

```
// Exports the document.
void ExportDocument ()
{
// Initializes the file save picker.
SaveFileDialog saveFileDialog = new SaveFileDialog()
{
Filter = "Word Document (*.docx)|*.docx|Word 97 - 2003 Document
(*.doc)|*.doc|Web Page (*.htm;*.html)|*.htm;*.html|Rich Text File
(*.rtf)|*.rtf|Text File (*.txt)|*.txt|Xaml File (*.xaml)|*.xaml",
FilterIndex = 1
};
if ((bool)saveFileDialog.ShowDialog())
{
// Saves the document content into a file.
richTextBoxAdv.Save(saveFileDialog.FileName);
}
}
```

VB.NET

```
' Exports the document.
Private Sub ExportDocument()
' Initializes the file save picker.
```

```

Dim saveFileDialog As New SaveFileDialog() With { _
Key .Filter = "Word Document (*.docx)|*.docx|Word 97 - 2003 Document (*.doc)|*.doc|Web Page (*.htm,*.html)|*.htm;*.html|Rich Text File (*.rtf)|*.rtf|Text File (*.txt)|*.txt|Xaml File (*.xaml)|*.xaml", _
Key .FilterIndex = 1 _
}
If CBool(saveFileDialog.ShowDialog()) Then
' Saves the document content into a file.
richTextBoxAdv.Save(saveFileDialog.FileName)
End If
End Sub

```

Note: When the SfRichTextBoxAdv control encounters an unsupported element, it does not render the element, instead, it continues to the next supported element and render it. Examples of unsupported elements are AutoShapes, watermarks, charts, SmartArt, WordArt, equations, document structure tags, styles, wrapping styles, fields other than hyperlinks, absolutely positioned tables, and absolutely positioned images.

UI Commands for importing/exporting documents

The following code example demonstrates how to bind commands for performing importing and exporting documents.

XML

```

<!-- Binds button to the OpenDocumentCommand -->
<Button Content="Open"
Command="RichTextBoxAdv:SfRichTextBoxAdv.OpenDocumentCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the SaveDocumentCommand -->
<Button Content="Save"
Command="RichTextBoxAdv:SfRichTextBoxAdv.SaveDocumentCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />

```

Note: In order to perform import/export documents, the standard keyboard shortcuts such as CTRL + O, CTRL + S can also be used.

Asynchronous import settings

Show or hide the loading page number

The SfRichTextBoxAdv control shows the current loading page number by default at the bottom right corner of the control while loading the document asynchronously. You can hide this loading page number by using the ShowPageNumber property of LoadAsyncSettings class.

The following code example demonstrates how to hide the loading page number in SfRichTextBoxAdv control.

XML

```

<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv">
<RichTextBoxAdv:SfRichTextBoxAdv.LoadAsyncSettings>
<RichTextBoxAdv:LoadAsyncSettings ShowPageNumber="False"/>
</RichTextBoxAdv:SfRichTextBoxAdv.LoadAsyncSettings>
</RichTextBoxAdv:SfRichTextBoxAdv>

```

C#

```
// Initializes a new instance of RichTextBoxAdv.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
////Hides the loading page number.
richTextBoxAdv.LoadAsyncSettings.ShowPageNumber = false;
```

VB.NET

```
' Initializes a new instance of RichTextBoxAdv.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
' Hides the loading page number.
richTextBoxAdv.LoadAsyncSettings.ShowPageNumber = false
```

Note: This API is supported starting from release version v17.4.0.X.

Events to notify document starts and completes loading and saving

SfRichTextBoxAdv control also provides below events to notify document starts and completes loading and saving.

Events Table

Event	Description
DocumentChanging	This event is triggered when the document starts loading.
DocumentChanged	This event is triggered after the document is successfully loaded.
DocumentSaving	This event is triggered when the document starts saving.
DocumentSaved	This event is triggered after the document is successfully saved.

Note: This API is supported starting from release version v18.2.0.X.

You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Printing Contents in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv supports API to print the rich text content rendered as pages using the print dialog.

The following sample code demonstrates how to print the document content as pages.

C#

```
// Displays the Print Dialog to perform printing of document content as pages.
richTextBoxAdv.PrintDocument();
```

VB.NET

```
' Displays the Print Dialog to perform printing of document content as pages.
richTextBoxAdv.PrintDocument()
```

The SfRichTextBoxAdv also supports event to notify whenever the printing operation is completed. The following code example demonstrates how to handle for the print completed event.

C#

```
// Hooks the print completed event.
richTextBoxAdv.PrintCompleted += RichTextBoxAdv_PrintCompleted;
// Called whenever the print completed event is fired.
private void RichTextBoxAdv_PrintCompleted(object obj,
PrintCompletedEventArgs args)
{
    // Handle your code here.
}
// Unhooks the print completed event.
richTextBoxAdv.PrintCompleted -= RichTextBoxAdv_PrintCompleted;
```

VB.NET

```
' Hooks the print completed event.
AddHandler richTextBoxAdv.PrintCompleted, AddressOf
RichTextBoxAdv_PrintCompleted
' Called whenever the print completed event is fired.
Private Sub RichTextBoxAdv_PrintCompleted(obj As Object, args As
PrintCompletedEventArgs)
' Handle your code here.
End Sub
' Unhooks the print completed event.
RemoveHandler richTextBoxAdv.PrintCompleted, AddressOf
RichTextBoxAdv_PrintCompleted
```

UI Command for printing

The following code example demonstrates how to bind UI Command to invoke printing in SfRichTextBoxAdv.

XML

```
<!-- Binds button to the PrintDocumentCommand -->
<Button Content="Print"
Command="RichTextBoxAdv:SfRichTextBoxAdv.PrintDocumentCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
```

Note: In order to invoke printing, the standard keyboard shortcut CTRL + P can also be used.

You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Mini Toolbar in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv supports built-in mini toolbar to provide rich text formatting options such as Bold, Italic etc. The following screenshot shows built-in mini toolbar of SfRichTextBoxAdv control.

Enable/Disable Mini Toolbar

In SfRichTextBoxAdv, the built-in mini toolbar is enabled by default. It is possible to enable/disable the built-in mini toolbar. The following code example demonstrates how to disable the built-in mini toolbar in SfRichTextBoxAdv.

XML

```
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv"
EnableMiniToolBar="False" xmlns:RichTextBoxAdv="clr-
namespace:Syncfusion.Windows.Controls.RichTextBoxAdv;assembly=Syncfusion.SfR
ichTextBoxAdv.Wpf" />
```

C#

```
// Initializes a new instance of RichTextBoxAdv.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
//Disables the built-in mini tool bar in SfRichTextBoxAdv.
richTextBoxAdv.EnableMiniToolBar = false;
```

VB.NET

```
' Initializes a new instance of RichTextBoxAdv.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
'Disables the built-in mini tool bar in SfRichTextBoxAdv.
richTextBoxAdv.EnableMiniToolBar = False
```

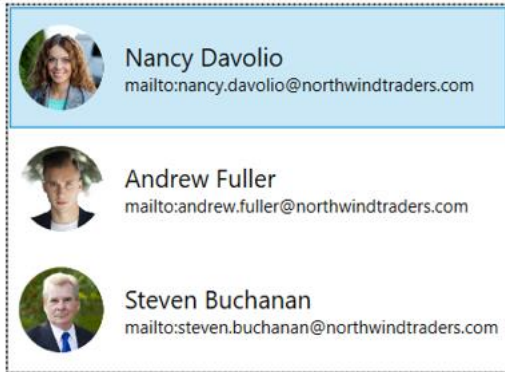

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Automatic Suggestion in WPF RichTextBox (SfRichTextBoxAdv)

Automatic Suggestion functionality for using @mentions

[WPF RichTextBox](#) control shows an inline dropdown with a list of suggested names while type the mention character (@ symbol). The list of names will filter as you type more letters. You can use up or down arrow key to move selection and Tab or Enter key to insert selected item in keyboard or use mouse to click any option in the list. The selected item from the suggestion list will be inserted as hyperlink with the display text and its respective link.

Hi @an

The following sample code demonstrates how to use @mentions in RichTextBox.

XML

```
<Window.Resources>
<x:Array Type="{x:Type RichTextBoxAdv:NameSuggestionItem}"
x:Key="suggestionItems">
<RichTextBoxAdv:NameSuggestionItem Name = "Nancy Davolio"
Link="mailto:nancy.davolio@northwindtraders.com"
ImageSource="/Assets/People_Circle0.png" />
<RichTextBoxAdv:NameSuggestionItem Name = "Andrew Fuller"
Link="mailto:andrew.fuller@northwindtraders.com"
ImageSource="/Assets/People_Circle5.png"/>
<RichTextBoxAdv:NameSuggestionItem Name = "Steven Buchanan"
Link="mailto:steven.buchanan@northwindtraders.com"
ImageSource="/Assets/People_Circle18.png"/>
</x:Array>
</Window.Resources>
<Grid>
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextboxadv"
LayoutType="Continuous">
<RichTextBoxAdv:SfRichTextBoxAdv.SuggestionSettings>
<RichTextBoxAdv:SuggestionSettings>
<RichTextBoxAdv:SuggestionSettings.SuggestionProviders>
<RichTextBoxAdv:NameSuggestionProvider ItemsSource="{StaticResource
suggestionItems}">
</RichTextBoxAdv:NameSuggestionProvider>
</RichTextBoxAdv:SuggestionSettings.SuggestionProviders>
</RichTextBoxAdv:SuggestionSettings>
</RichTextBoxAdv:SfRichTextBoxAdv.SuggestionSettings>
</RichTextBoxAdv:SfRichTextBoxAdv>
</Grid>
```

C#

```
ISuggestionProvider suggestionProvider = new NameSuggestionProvider();
List<NameSuggestionItem> suggestionItems = new List<NameSuggestionItem>();
NameSuggestionItem suggestionItem = new NameSuggestionItem();
suggestionItem.Name = "Nancy Davolio";
suggestionItem.Link = "mailto:nancy.davolio@northwindtraders.com";
BitmapImage bitmapImage = new BitmapImage(new Uri(new
DirectoryInfo(@"..\..\Assets\People_Circle0.png").FullName));
suggestionItem.ImageSource = bitmapImage;
```

```

suggestionItems.Add(suggestionItem);
suggestionItem = new NameSuggestionItem();
suggestionItem.Name = "Andrew Fuller";
suggestionItem.Link = "mailto:andrew.fuller@northwindtraders.com";
bitmapImage = new BitmapImage(new Uri(new
DirectoryInfo(@"..\..\Assets\People_Circle5.png").FullName));
suggestionItem.ImageSource = bitmapImage;
suggestionItems.Add(suggestionItem);
suggestionItem = new NameSuggestionItem();
suggestionItem.Name = "Steven Buchanan";
suggestionItem.Link = "mailto:steven.buchanan@northwindtraders.com";
bitmapImage = new BitmapImage(new Uri(new
DirectoryInfo(@"..\..\Assets\People_Circle18.png").FullName));
suggestionItem.ImageSource = bitmapImage;
suggestionItems.Add(suggestionItem);
(suggestionProvider as NameSuggestionProvider).ItemsSource =
suggestionItems;
richTextboxadv.SuggestionSettings.SuggestionProviders.Add(suggestionProvider
);

```

VB.NET

```

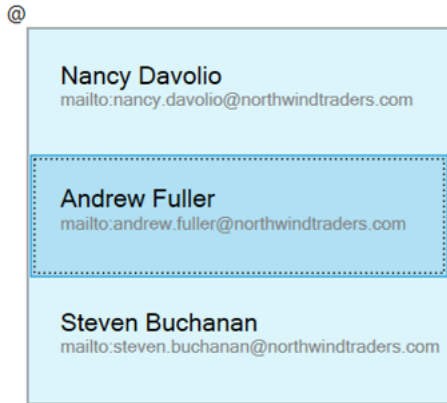

Dim suggestionProvider As ISuggestionProvider = New NameSuggestionProvider()
Dim suggestionItems As List<NameSuggestionItem> = New
List<NameSuggestionItem>()
Dim suggestionItem As NameSuggestionItem = New NameSuggestionItem()
suggestionItem.Name = "Nancy Davolio"
suggestionItem.Link = "mailto:nancy.davolio@northwindtraders.com"
Dim bitmapImage As BitmapImage = New BitmapImage(New Uri(New
DirectoryInfo(@"..\..\Assets\People_Circle0.png").FullName))
suggestionItem.ImageSource = bitmapImage
suggestionItems.Add(suggestionItem)
suggestionItem = New NameSuggestionItem()
suggestionItem.Name = "Andrew Fuller"
suggestionItem.Link = "mailto:andrew.fuller@northwindtraders.com"
bitmapImage = New BitmapImage(New Uri(New
DirectoryInfo(@"..\..\Assets\People_Circle5.png").FullName))
suggestionItem.ImageSource = bitmapImage
suggestionItems.Add(suggestionItem)
suggestionItem = New NameSuggestionItem()
suggestionItem.Name = "Steven Buchanan"
suggestionItem.Link = "mailto:steven.buchanan@northwindtraders.com"
bitmapImage = New BitmapImage(New Uri(New
DirectoryInfo(@"..\..\Assets\People_Circle18.png").FullName))
suggestionItem.ImageSource = bitmapImage
suggestionItems.Add(suggestionItem)
TryCast(suggestionProvider, NameSuggestionProvider).ItemsSource =
suggestionItems
richTextboxadv.SuggestionSettings.SuggestionProviders.Add(suggestionProvider
)

```

[View example in GitHub](#)

Customize the SuggestionBox ItemTemplate and Style

By default, the drop-down window lists the filtered items as an image, display text and link. If you want to remove the image or link. You can write your own item Template.

The following sample code demonstrates how to modify the suggestion box item template and style.

XML

```
<Window.Resources>
<x:Array Type="{x:Type RichTextBoxAdv:NameSuggestionItem}"
x:Key="suggestionItems">
<RichTextBoxAdv:NameSuggestionItem Name = "Nancy Davolio"
Link="mailto:nancy.davolio@northwindtraders.com" />
<RichTextBoxAdv:NameSuggestionItem Name = "Andrew Fuller"
Link="mailto:andrew.fuller@northwindtraders.com" />
<RichTextBoxAdv:NameSuggestionItem Name = "Steven Buchanan"
Link="mailto:steven.buchanan@northwindtraders.com" />
</x:Array>
<Style x:Key="SuggestionBoxStyle" TargetType="ListBox">
<Setter Property="MinWidth" Value="300" />
<Setter Property="MinHeight" Value="250" />
<Setter Property="Background" Value="#FFDBF5FB"/>
<Setter Property="ItemTemplate">
<Setter.Value>
<DataTemplate DataType="local:NameSuggestionItem">
<StackPanel Orientation="Vertical" Height="50" VerticalAlignment="Center"
Margin="12,15,0,0">
<TextBlock Text="{Binding Name}" FontFamily="microsoft sans serif"
FontSize="14" />
<TextBlock Text="{Binding Link}" FontFamily="microsoft sans serif"
Foreground="Gray" FontSize="10" />
</StackPanel>
</DataTemplate>
</Setter.Value>
</Setter>
</Style>
</Window.Resources>
<Grid>
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextboxadv"
LayoutType="Continuous">
<RichTextBoxAdv:SfRichTextBoxAdv.SuggestionSettings>
<RichTextBoxAdv:SuggestionSettings>
<RichTextBoxAdv:SuggestionSettings.SuggestionProviders>
```

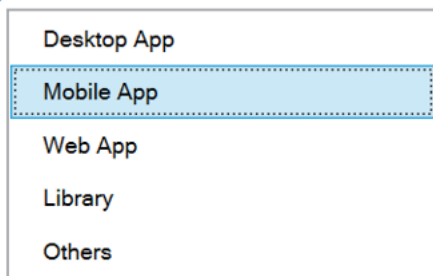

```
<RichTextBoxAdv:NameSuggestionProvider ItemsSource="{StaticResource
suggestionItems}"
SuggestionBoxStyle="{StaticResource SuggestionBoxStyle}">
</RichTextBoxAdv:NameSuggestionProvider>
</RichTextBoxAdv:SuggestionSettings.SuggestionProviders>
</RichTextBoxAdv:SuggestionSettings>
</RichTextBoxAdv:SfRichTextBoxAdv.SuggestionSettings>
</RichTextBoxAdv:SfRichTextBoxAdv>
</Grid>
```

Custom mention character

Any character can be used as mention character, default value is @.

#Desktop App

#

The following sample code demonstrates how to use '#' as mention character.

XML

```
<Grid>
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextboxadv"
LayoutType="Continuous">
<RichTextBoxAdv:SfRichTextBoxAdv.SuggestionSettings>
<RichTextBoxAdv:SuggestionSettings>
<RichTextBoxAdv:SuggestionSettings.SuggestionProviders>
<RichTextBoxAdv:NameSuggestionProvider MentionCharacter="#"
ItemsSource="{StaticResource suggestionItems}">
</RichTextBoxAdv:NameSuggestionProvider>
</RichTextBoxAdv:SuggestionSettings.SuggestionProviders>
</RichTextBoxAdv:SuggestionSettings>
</RichTextBoxAdv:SfRichTextBoxAdv.SuggestionSettings>
</RichTextBoxAdv:SfRichTextBoxAdv>
</Grid>
```

C#

```
ISuggestionProvider suggestionProvider = new NameSuggestionProvider();
suggestionProvider.MentionCharacter = '#';
richTextboxadv.SuggestionSettings.SuggestionProviders.Add(suggestionProvider
);
```

Multiple Suggestion provider

Two or more suggestion providers can be used at a time but, each suggestion provider should have different mention character. And each suggestion provider can have different item source and suggestion box style.

The following sample code demonstrates how to use two suggestion providers. Here we have used '@' and '#' as mention characters.

XML

```
<Window.Resources>
<Style x:Key="SuggestionBoxStyle" TargetType="ListBox">
<Setter Property="MinWidth" Value="300" />
<Setter Property="MinHeight" Value="250" />
<Setter Property="ItemTemplate">
<Setter.Value>
<DataTemplate DataType="local:NameSuggestionItem">
<StackPanel Orientation="Vertical" Height="50" Width="200"
VerticalAlignment="Center" Margin="12,15,0,0">
<TextBlock Text="{Binding Name}" FontFamily="microsoft sans serif"
FontSize="14" />
<TextBlock Text="{Binding Link}" FontFamily="microsoft sans serif"
Foreground="Gray" FontSize="10" />
</StackPanel>
</DataTemplate>
</Setter.Value>
</Setter>
</Style>
<x:Array Type="{x:Type RichTextBoxAdv:NameSuggestionItem}"
x:Key="suggestionItems">
<RichTextBoxAdv:NameSuggestionItem Name = "Nancy Davolio"
Link="mailto:nancy.davolio@northwindtraders.com"
ImageSource="/Assets/People_Circle0.png" />
<RichTextBoxAdv:NameSuggestionItem Name = "Andrew Fuller"
Link="mailto:andrew.fuller@northwindtraders.com"
ImageSource="/Assets/People_Circle5.png"/>
<RichTextBoxAdv:NameSuggestionItem Name = "Steven Buchanan"
Link="mailto:steven.buchanan@northwindtraders.com"
ImageSource="/Assets/People_Circle18.png"/>
</x:Array>
<x:Array Type="{x:Type RichTextBoxAdv:NameSuggestionItem}"
x:Key="suggestionItems01">
<RichTextBoxAdv:NameSuggestionItem Name = "Desktop App" Link="10 queries"
/>
<RichTextBoxAdv:NameSuggestionItem Name = "Mobile App" Link="13 queries" />
<RichTextBoxAdv:NameSuggestionItem Name = "Web App" Link="15 queries"/>
</x:Array>
</Window.Resources>
<Grid>
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextboxadv"
LayoutType="Continuous">
<RichTextBoxAdv:SfRichTextBoxAdv.SuggestionSettings>
```

```

<RichTextBoxAdv:SuggestionSettings>
<RichTextBoxAdv:SuggestionSettings.SuggestionProviders>
<RichTextBoxAdv:NameSuggestionProvider
ItemsSource="{StaticResource suggestionItems}">
</RichTextBoxAdv:NameSuggestionProvider>
<RichTextBoxAdv:NameSuggestionProvider MentionCharacter="#"
ItemsSource="{StaticResource suggestionItems01}"
SuggestionBoxStyle="{StaticResource SuggestionBoxStyle}">
</RichTextBoxAdv:NameSuggestionProvider>
</RichTextBoxAdv:SuggestionSettings.SuggestionProviders>
</RichTextBoxAdv:SuggestionSettings>
</RichTextBoxAdv:SfRichTextBoxAdv.SuggestionSettings>
</RichTextBoxAdv:SfRichTextBoxAdv>
</Grid>

```

C#

```

ISuggestionProvider suggestionProvider = new NameSuggestionProvider();
List<NameSuggestionItem> suggestionItems = new List<NameSuggestionItem>();
NameSuggestionItem suggestionItem1 = new NameSuggestionItem();
suggestionItem1.Name = "Nancy Davolio";
suggestionItem1.Link = "mailto:nancy.davolio@northwindtraders.com";
BitmapImage bitmapImage = new BitmapImage(new Uri(new
DirectoryInfo(@"..\..\Assets\People_Circle0.png").FullName));
suggestionItem1.ImageSource = bitmapImage;
suggestionItems.Add(suggestionItem1);
NameSuggestionItem suggestionItem2 = new NameSuggestionItem();
suggestionItem2.Name = "Andrew Fuller";
suggestionItem2.Link = "mailto:andrew.fuller@northwindtraders.com";
bitmapImage = new BitmapImage(new Uri(new
DirectoryInfo(@"..\..\Assets\People_Circle5.png").FullName));
suggestionItem2.ImageSource = bitmapImage;
suggestionItems.Add(suggestionItem2);
NameSuggestionItem suggestionItem3 = new NameSuggestionItem();
suggestionItem3.Name = "Steven Buchanan";
suggestionItem3.Link = "mailto:steven.buchanan@northwindtraders.com";
bitmapImage = new BitmapImage(new Uri(new
DirectoryInfo(@"..\..\Assets\People_Circle18.png").FullName));
suggestionItem3.ImageSource = bitmapImage;
suggestionItems.Add(suggestionItem3);
(suggestionProvider as NameSuggestionProvider).ItemsSource =
suggestionItems;
richTextboxadv.SuggestionSettings.SuggestionProviders.Add(suggestionProvider
);
ISuggestionProvider suggestionProviderAppType = new
NameSuggestionProvider();

webApp.Name = "Web App";
webApp.Link = "15 queries";
webApp.ImageSource = bitmapImage;
appTypes.Add(webApp);
(suggestionProviderAppType as NameSuggestionProvider).ItemsSource =
appTypes;
richTextboxadv.SuggestionSettings.SuggestionProviders.Add(suggestionProvider
AppType);
```

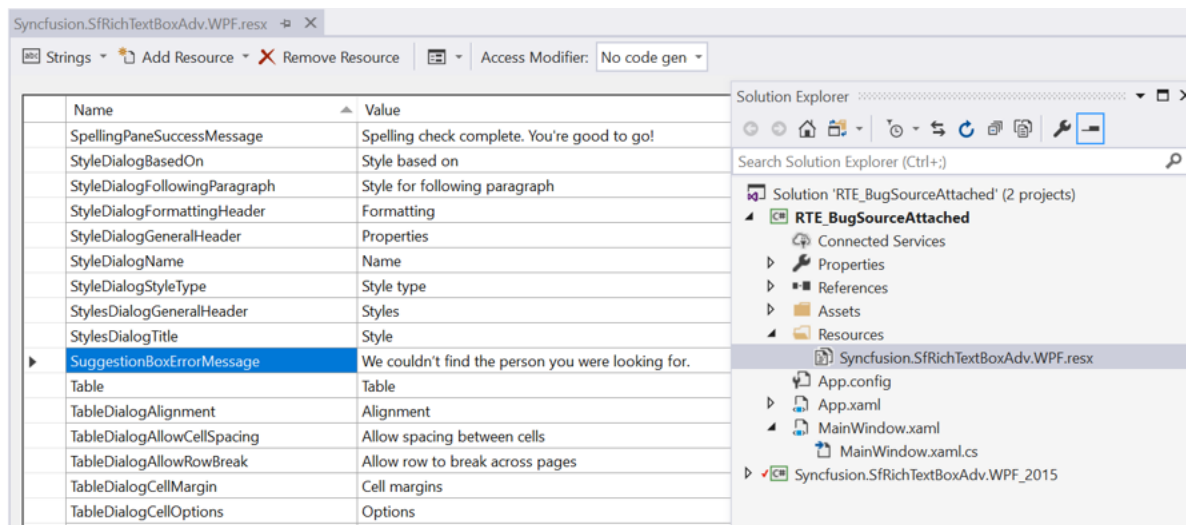

[View example in GitHub](#)

Display error message when suggestions are empty

When the entered item is not in the suggestion list, suggestion box displays a text indicating that “We couldn’t find the person you were looking for.”. The text to be displayed for this can be customized using the `SuggestionBoxErrorMessage` property in resource file (.resx).

- Right click your project and add new folder named Resources.
- Add [default resource file](#) of RichTextBox control into Resources folder.
- Modify the value of resource key `SuggestionBoxErrorMessage` in resource file.

@z|
We couldn't find the person you were looking for.

Custom suggestion provider

By default, we have implemented [NameSuggestionProvider](#) as suggestion provider. And you can implement your own suggestion provider, inheriting from [ISuggestionProvider](#). Which helps you to customize the search and insert selected item functionalities.

The following sample code demonstrates how to create your own suggestion provider inherited from ISuggestionProvider.

C#

```
internal class AppTypeSuggestionProvider : DependencyObject,
ISuggestionProvider
{
    #region Property
    public char MentionCharacter
    {
        get
        {
            return (char)GetValue(MentionCharacterProperty);
        }
        set
        {
            SetValue(MentionCharacterProperty, value);
        }
    }
    public Style SuggestionBoxStyle
    {
        get
        {
            return (Style)GetValue(SuggestionBoxStyleProperty);
        }
        set
        {
            SetValue(SuggestionBoxStyleProperty, value);
        }
    }
    public IEnumerable ItemsSource
    {
        get
        {
            return (IEnumerable)GetValue(ItemsSourceProperty);
        }
        set
        {
            SetValue(ItemsSourceProperty, value);
        }
    }
    public static DependencyProperty MentionCharacterProperty
    {
        get
        {
            return mentionCharacterProperty;
        }
    }
    public static DependencyProperty ItemsSourceProperty
    {
        get
        {
            return itemsSourceProperty;
        }
    }
    public static DependencyProperty SuggestionBoxStyleProperty
```

```

{
    get
    {
        return suggestionBoxStyleProperty;
    }
}
#endregion
#region Static Dependency Properties
/// <summary>
/// Identifies the MentionCharacter dependency property.
/// </summary>
private static DependencyProperty mentionCharacterProperty =
DependencyProperty.Register("MentionCharacter", typeof(char),
typeof(NameSuggestionProvider), new PropertyMetadata('@'));
/// <summary>
/// Identifies the ItemSource dependency property.
/// </summary>
private static DependencyProperty itemsSourceProperty =
DependencyProperty.Register("ItemsSource", typeof(IEnumerable),
typeof(NameSuggestionProvider), new PropertyMetadata(null));
/// <summary>
/// Identifies the SuggestionBoxStyle dependency property.
/// </summary>
private static DependencyProperty suggestionBoxStyleProperty =
DependencyProperty.Register("SuggestionBoxStyle", typeof(Style),
typeof(NameSuggestionProvider), new PropertyMetadata(null));
#endregion
public void Dispose()
{
    ClearValue(mentionCharacterProperty);
    if (ItemsSource != null)
    {
        foreach (NameSuggestionItem itemSource in ItemsSource)
        {
            itemSource.Dispose();
        }
    }
    ClearValue(itemsSourceProperty);
    ClearValue(suggestionBoxStyleProperty);
}
public void InsertSelectedItem(SfRichTextBoxAdv richTextBoxAdv, object
selectedItem)
{
    NameSuggestionItem nameSuggestionItem = selectedItem as NameSuggestionItem;
    richTextBoxAdv.Selection.InsertText(MentionCharacter +
nameSuggestionItem.Name);
}
public List<object> Search(string searchText)
{
    List<object> matchedItems = new List<object>();
    foreach (NameSuggestionItem item in ItemsSource)
    {
        if (item.Name.ToUpperInvariant().StartsWith(searchText.ToUpperInvariant()))
        {
            matchedItems.Add(item);
        }
    }
}

```

```
return matchedItems;
}
}
```

[View example in GitHub](#)

Customize search

In default searching, it list the items which contains the typed text. And you can modify the searching logic like list the items starts or ends with typed text, by implementing your own suggestion provider and overriding the Search method.

Search "€" contains	Search "€" starts with
	

The following sample code demonstrates how to override search operation in your suggestion provider.

C#

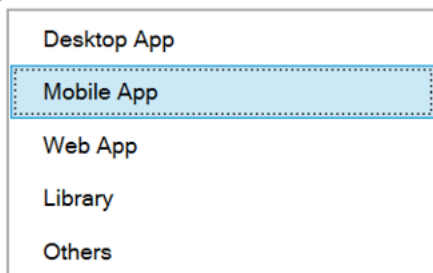

```
public List<object> Search(string searchText)
{
    List<object> matchedItems = new List<object>();
    foreach (NameSuggestionItem item in ItemsSource)
    {
        if (item.Name.ToUpperInvariant().StartsWith(searchText.ToUpperInvariant()))
        {
            matchedItems.Add(item);
        }
    }
    return matchedItems;
}
```

Customize insert item

By default, the selected item from the suggestions list is inserted as hyperlink. And you can insert it as plain text or without link, by implementing your own suggestion provider and overriding the "InsertSelectedItem" method.

#Desktop App

#

The following sample code demonstrates how to override insert selected item operation in your suggestion provider.

C#

```
public void InsertSelectedItem(SfRichTextBoxAdv richTextBoxAdv, object
selectedItem)
{
    NameSuggestionItem nameSuggestionItem = selectedItem as NameSuggestionItem;
    richTextBoxAdv.Selection.InsertText (MentionCharacter +
    nameSuggestionItem.Name) ;
}
```

Note: This feature is supported from V18.4.0.30.

Dialogs in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv provides support for the following built-in dialogs similar to Microsoft Word application.

- Font Dialog
- Paragraph Dialog
- List Dialog
- Insert Table Dialog
- Insert Hyperlink Dialog
- Find and Replace Dialog
- Password Dialog
- Table Properties Dialog
- Table Options Dialog
- Cell Options Dialog
- Borders and Shading Dialog
- Styles Dialog

UI Commands for accessing dialogs

The following code example demonstrates how to show the built-in dialogs in SfRichTextBoxAdv through command binding.

XML

```
<!-- Binds button to the ShowFontDialogCommand -->
<Button Content="Font"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowFontDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowParagraphDialogCommand -->
<Button Content="Paragraph"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowParagraphDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowListDialogCommand -->
<Button Content="List"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowListDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowInsertTableDialogCommand -->
```

```

<Button Content="Insert Table"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowInsertTableDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowHyperlinkDialogCommand -->
<Button Content="Hyperlink"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowHyperlinkDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowFindAndReplaceDialogCommand -->
<Button Content="Find and Replace"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowFindAndReplaceDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowEncryptDocumentDialogCommand -->
<Button Content="Encrypt Document"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowEncryptDocumentDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowTableDialogCommand -->
<Button Content="Table Properties"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowTableDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowTableOptionsDialogCommand -->
<Button Content="Table Options"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowTableOptionsDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowCellOptionsDialogCommand -->
<Button Content="Cell Options"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowCellOptionsDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowBordersAndShadingDialogCommand -->
<Button Content="Borders and Shading"
Command="RichTextBoxAdv:SfRichTextBoxAdv.ShowBordersAndShadingDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowStyleDialogCommand -->
<Button Content="Create style"
Command="Syncfusion:SfRichTextBoxAdv.ShowStyleDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />
<!-- Binds button to the ShowStylesDialogCommand -->
<Button Content="Modify style"
Command="Syncfusion:SfRichTextBoxAdv.ShowStylesDialogCommand"
CommandTarget="{Binding ElementName=richTextBoxAdv}" />

```

Customizing dialogs

This section describes how to create custom window for the dialogs of SfRichTextBoxAdv.

The following code example demonstrates how to design custom window for the font dialog of SfRichTextBoxAdv.

XML

```

<Window x:Class="DocumentEditor.FontWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:DocumentEditor"
mc:Ignorable="d"
xmlns:Syncfusion="http://schemas.syncfusion.com/wpf"

```

```

xmlns:System="clr-namespace:System;assembly=mscorlib"
Title="FontWindow" Height="530" Width="500">
<Grid>
<Syncfusion:FontDialog Name="fontDialog"></Syncfusion:FontDialog>
</Grid>
</Window>

```

C#

```

public partial class FontWindow : Window
{
    public FontWindow(SfRichTextBoxAdv rte)
    {
        InitializeComponent();
        fontDialog.DataContext = rte;
        this.Loaded += FontWindow_Loaded;
    }
    /// <summary>
    /// Called when the font window is loaded.
    /// </summary>
    /// <param name="sender"></param>
    /// <param name="e"></param>
    private void FontWindow_Loaded(object sender, RoutedEventArgs e)
    {
        //Hooks the event for cancel button of font dialog.
        FontDialog font = VisualUtils.FindDescendant(sender as FontWindow,
        typeof(FontDialog)) as FontDialog;
        Button cancelButton = font.Template.FindName("PART_CancelButton", font as
        FrameworkElement) as Button;
        if (cancelButton != null)
        {
            cancelButton.Click += CancelButton_Click;
        }
        Button applybutton = font.Template.FindName("PART_ApplyFontFormatButton",
        font as FrameworkElement) as Button;
        if (applybutton != null)
        {
            applybutton.Click += Applybutton_Click;
        }
    }
    private void Applybutton_Click(object sender, RoutedEventArgs e)
    {
        this.Hide(); //Hides the window.
    }
    protected override void OnClosing(CancelEventArgs e)
    {
        //Hiding the window on close button.
        base.OnClosing(e);
        Hide();
        e.Cancel = true;
    }
    /// <summary>
    /// Called when the cancel button is clicked.
    /// </summary>
    /// <param name="sender"></param>
    /// <param name="e"></param>

```

```
private void CancelButton_Click(object sender, RoutedEventArgs e)
{
    this.Hide();//hides the window.
}
}
```

VB.NET

```
Public Partial Class FontWindow
    Inherits Window
    Public Sub New(rte As SfRichTextBoxAdv)
        InitializeComponent()
        fontDialog.DataContext = rte
        AddHandler this.Loaded, AddressOf FontWindow_Loaded
    End Sub
    ''' <summary>
    ''' Called when the font window is loaded.
    ''' </summary>
    ''' <param name="sender"></param>
    ''' <param name="e"></param>
    Private Sub FontWindow_Loaded(sender As Object, e As RoutedEventArgs)
        'Hooks the event for cancel button of font dialog.
        Dim font As FontDialog = TryCast(VisualUtils.FindDescendant(TryCast(sender,
        FontWindow), GetType(FontDialog)), FontDialog)
        Dim cancelButton As Button =
        TryCast(font.Template.FindName("PART_CancelButton", TryCast(font,
        FrameworkElement)), Button)
        If cancelButton IsNot Nothing Then
            AddHandler cancelButton.Click, AddressOf CancelButton_Click
        End If
        Dim applybutton As Button =
        TryCast(font.Template.FindName("PART_ApplyFontFormatButton", TryCast(font,
        FrameworkElement)), Button)
        If applybutton IsNot Nothing Then
            Addhandler applybutton.Click, AddressOf Applybutton_Click
        End If
    End Sub
    Private Sub Applybutton_Click(sender As Object, e As RoutedEventArgs)
        Me.Hide()
        'Hides the window.
    End Sub
    Protected Overrides Sub OnClosing(e As CancelEventArgs)
        'Hiding the window on close button.
        MyBase.OnClosing(e)
        Hide()
        e.Cancel = True
    End Sub
    ''' <summary>
    ''' Called when the cancel button is clicked.
    ''' </summary>
    ''' <param name="sender"></param>
    ''' <param name="e"></param>
    Private Sub CancelButton_Click(sender As Object, e As RoutedEventArgs)
        Me.Hide()
        'hides the window.
    End Sub
```

End Class

Note: After creating custom dialog window, you have to set the SfRichTextBoxAdv instance as DataContext of the dialog.

The following code example demonstrates how to deploy the created font dialog window in your application.

XML

```
<Syncfusion:RibbonWindow x:Class="DocumentEditor.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:DocumentEditor"
mc:Ignorable="d"
xmlns:Syncfusion="http://schemas.syncfusion.com/wpf"
xmlns:System="clr-namespace:System;assembly=mscorlib"
xmlns:RichTextBoxAdv="clr-namespace:Syncfusion.Windows.Controls.RichTextBoxAdv;assembly=Syncfusion.SfRichTextBoxAdv.WPF"
Title="MainWindow" Width="1087" Height="635"
Syncfusion:SkinStorage.VisualStudio="Office2013">
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto"/>
<RowDefinition Height="*/>
</Grid.RowDefinitions>
<Button Content="Font Dialog" Height="50" Width="200"
Click="Button_Click"></Button>
<Syncfusion:SfRichTextBoxAdv x:Name="richTextBoxAdv" Background="#F1F1F1"
DocumentTitle="RichTextBoxAdv" LayoutType="Pages" AcceptsTab="True"
Grid.Row="1"></Syncfusion:SfRichTextBoxAdv>
</Grid>
</Syncfusion:RibbonWindow>
```

C#

```
public partial class MainWindow : RibbonWindow
{
    public FontWindow fontWindow { get; set; }
    public MainWindow()
    {
        InitializeComponent();
        fontWindow = new FontWindow(richTextBoxAdv);
        this.Unloaded += MainWindow_Unloaded;
    }
    private void MainWindow_Unloaded(object sender, RoutedEventArgs e)
    {
        fontWindow.Close(); //closing the font window.
    }
    private void Button_Click(object sender, RoutedEventArgs e)
    {
        fontWindow.Show(); //showing the font window.
    }
}
```

}
VB.NET

```
Public Partial Class MainWindow
Inherits RibbonWindow
Public Property fontWindow() As FontWindow
Get
Return m_fontWindow
End Get
Set
m_fontWindow = Value
End Set
End Property
Private m_fontWindow As FontWindow
Public Sub New()
InitializeComponent()
fontWindow = New FontWindow(richTextBoxAdv)
AddHandler this.Unloaded, AddressOf MainWindow_Unloaded
End Sub
Private Sub MainWindow_Unloaded(sender As Object, e As RoutedEventArgs)
fontWindow.Close()
'closing the font window.
End Sub
Private Sub Button_Click(sender As Object, e As RoutedEventArgs)
fontWindow.Show()
'showing the font window.
End Sub
End Class
```

Localization in WPF RichTextBox (SfRichTextBoxAdv)

Localization is the process of configuring the application to a specific language. SfRichTextBoxAdv provides support to localize all the static text in ribbon and all its dialogs. Localization can be done by adding resource file (Resx) and setting the specific culture in the application.

Setting Current UI Culture

For localizing your application to specific culture, you have to set the 'CurrentUICulture' as required before invoking the InitializeComponent() method.

The following code example demonstrates how to set culture information for localizing an application.

C#

```
public MainWindow()
{
System.Threading.Thread.CurrentThread.CurrentUICulture = new
System.Globalization.CultureInfo("fr-FR");
InitializeComponent();
}
```

VB.NET

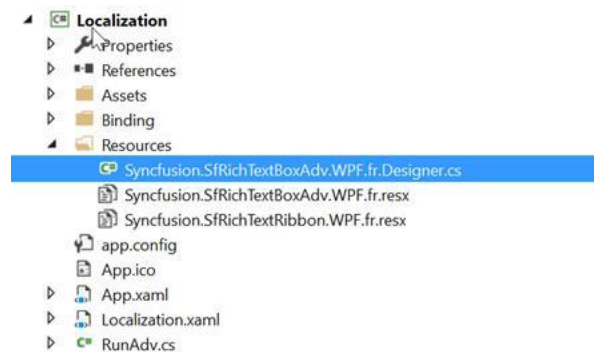

```

Partial Public Class MainWindow
Public Sub New ()
    System.Threading.Thread.CurrentThread.CurrentUICulture = new
    System.Globalization.CultureInfo ("fr-FR")
    InitializeComponent ()
End Sub
End Class

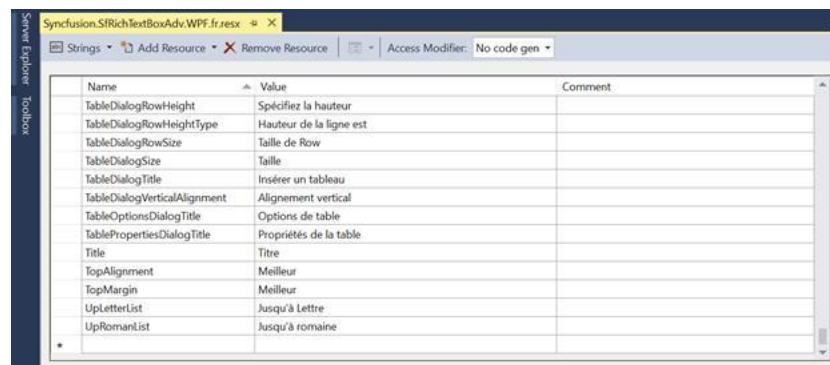

```

Adding Resource file

- Create a folder with name 'Resources' in your application.
- Add default English("en-US") [Resx](#) (resource) file of SfRichTextBoxAdv and SfRichTextRibbon in the 'Resources' folder named as Syncfusion.SfRichTextBoxAdv.WPF.resx and Syncfusion.SfRichTextRibbon.WPF.resx respectively
- Create Resx (resource) files and named as Syncfusion.SfRichTextBoxAdv.WPF. [Culture name].resx and Syncfusion.SfRichTextRibbon.WPF. [Culture name].resx. For example, Syncfusion.SfRichTextBoxAdv.WPF.fr.resx and Syncfusion.SfRichTextRibbon.WPF.fr.resx for French culture. For your reference, French("fr-FR") [Resx](#) file.

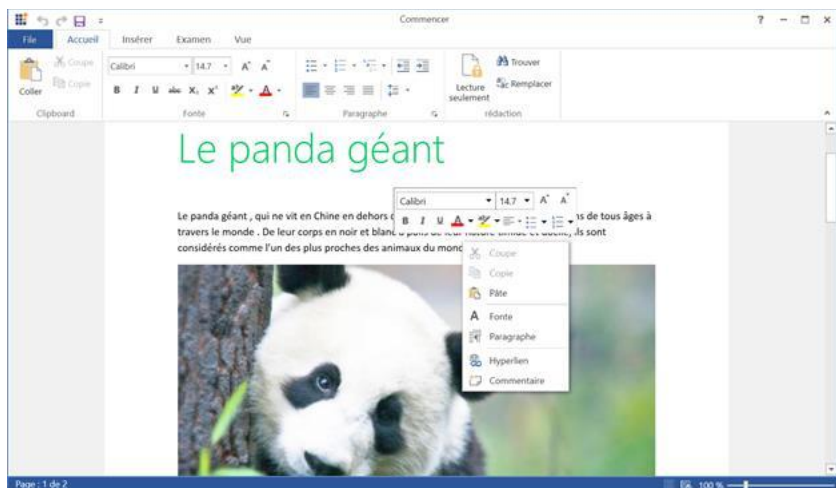

- Add the resource key such as name and its corresponding localized value in Resource Designer of Syncfusion.SfRichTextBoxAdv.WPF.fr.resx and Syncfusion.SfRichTextRibbon.WPF.fr.resx file.

Note: If you have not used SfRichTextRibbon in your application, you can skip Syncfusion.SfRichTextRibbon.WPF.[Culture name].resx file mentioned above.

The following screenshot shows the localization in SfRichTextBoxAdv and SfRichTextRibbon

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

MVVM in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv control can be used with Model-View-View Model (MVVM) pattern. This section will demonstrate how to use the SfRichTextBoxAdv control with MVVM pattern.

Creating a View Model

The following code example demonstrates how to implement a view model class that contains properties to preserve the description about some of the animals and the animal that is selected for discussion. Whenever the animal chosen for discussion is changed, previously chosen animal description is updated to the database and newly chosen animal description is updated to the text property.

C#

```
/// <summary>
/// Represents the view model class.
/// </summary>
public class ViewModel : INotifyPropertyChanged
{
    #region Field
    private string animal;
    private string text;
    Dictionary<string, string> animals = null;
    bool skipUpdating = false;
    #endregion
    #region Properties
    /// <summary>
    /// Gets or sets the animal.
    /// </summary>
    /// <value>
    /// The document title.
    /// </value>
    public string Animal
    {
        get
        {
            return animal;
        }
    }
}
```

```

    }
    set
    {
        animal = value;
        NotifyPropertyChanged("Animal");
    }
}

/// <summary>
/// Gets the animals.
/// </summary>
/// <value>
/// The animals.
/// </value>
public ICollection<string> Animals
{
    get
    {
        return animals.Keys;
    }
}

/// <summary>
/// Gets or sets the Text.
/// </summary>
/// <value>
/// The document.
/// </value>
public string Text
{
    get
    {
        return text;
    }
    set
    {
        text = value;
        NotifyPropertyChanged("Text");
    }
}
#endregion
#region Event
public event PropertyChangedEventHandler PropertyChanged;
#endregion
#region Constructor
/// <summary>
/// Initializes a new instance of the <see cref="ViewModel"/> class.
/// </summary>
public ViewModel()
{
    Initialize();
}
#endregion
#region Implementation
/// <summary>
/// Handles initialization.
/// </summary>
private void Initialize()
{

```

```

animals = new Dictionary<string, string>();
animals.Add("Tiger", "The tiger is the largest cat species, reaching a total
body length of up to 3.38 m over curves and exceptionally weighing up to
388.7 kg in the wild.");
animals.Add("Lion", "The lion is one of the strongest animal. It is also
known as the king of jungles.");
animals.Add("Panda", "The giant panda, also known as panda bear or simply
panda, is a bear native to south central China. It is easily recognized by
the large, distinctive black patches around its eyes, over the ears, and
across its round body.");
animals.Add("Bear", "Bears are mammals and are classified as dog like
carnivorous.");
animals.Add("Deer", "Deer are the ruminant mammals. Species in the family
include the white-tailed deer, mule deer, elk, moose, red deer, reindeer,
fallow deer, roe deer.");
Animal = "Lion";
}
/// <summary>

Implementing extension class for SfRichTextBoxAdv

The following code example demonstrates how to implement an extension class for SfRichTextBoxAdv with dependency property that supports two way binding.

C#

```

/// <summary>
/// Represents the extension class for SfRichTextBoxAdv.
/// </summary>
public class SfRichTextBoxAdvExtension : SfRichTextBoxAdv
{
    #region Fields
    bool skipUpdating = false;
    #endregion
    #region Properties
    /// <summary>
    /// Gets or Sets the text.
    /// </summary>
    public string Text
    {

```

```

get
{
    return (string)GetValue(TextProperty);
}
set
{
    SetValue(TextProperty, value);
}
}
#endregion
#region Constructor
/// <summary>
/// Initializes the instance of SfRichTextBoxAdvExtension class.
/// </summary>
public SfRichTextBoxAdvExtension()
{
    // Wires the ContentChanged event.
    this.ContentChanged += RicTextBoxAdv_ContentChanged;
}
#endregion
#region Static Dependency Properties
/// <summary>
/// Using as a backing store for Text dependency property to enable styling,
/// animation etc.
/// </summary>
public static readonly DependencyProperty TextProperty =
    DependencyProperty.Register("Text", typeof(string),
        typeof(SfRichTextBoxAdvExtension), new PropertyMetadata(string.Empty, new
            PropertyChangedCallback(OnTextChanged)));
#endregion
#region Static Events
/// <summary>
/// Called when text changed.
/// </summary>
/// <param name="obj"></param>
/// <param name="e"></param>
private static void OnTextChanged(DependencyObject obj,
    DependencyPropertyChangedEventArgs e)
{
    SfRichTextBoxAdvExtension richTextBox = (SfRichTextBoxAdvExtension)obj;
    //Update the document with the Text.
    richTextBox.UpdateDocument((string)e.NewValue);
}
#endregion
#region Events
/// <summary>
/// Called when content changes in SfRichTextBoxAdv.
/// </summary>
/// <param name="obj"></param>
/// <param name="args"></param>
void RicTextBoxAdv_ContentChanged(object obj, ContentChangedEventArgs args)
{
    if (this.Document != null)
    {
        // To skip internal updation of document on setting Text property.
        skipUpdating = true;
        Stream stream = new MemoryStream();
    }
}

```

```

// Saves the document's text into a Stream.
this.Save(stream, FormatType.Txt);
stream.Position = 0;
// Reads the text from the stream.
using (StreamReader reader = new StreamReader(stream))
{
    this.Text = reader.ReadToEnd();
}
skipUpdating = false;
}
}
#endregion
#region Implementation
/// <summary>
/// Updates the document.
/// </summary>
/// <param name="text"></param>
private void UpdateDocument(string text)
{
    // If text property is set internally means, skip updating the document.
    if (!skipUpdating && !string.IsNullOrEmpty(text))
    {
        Stream stream = new MemoryStream();
        // Convert the text to byte array.
        byte[] bytes = Encoding.UTF8.GetBytes(text);
        // Writes the byte array to stream.
        stream.Write(bytes, 0, bytes.Length);
        stream.Position = 0;
        //Load the stream.
        Load(stream, FormatType.Txt);
    }
}
/// <summary>
/// Disposes the instance.

Creating XAML View

The following code example demonstrates how to create XAML view with SfRichTextBoxAdv and UI properties bound to view model properties.

XML

```

<Window x:Class="Sample.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:local="clr-namespace:Sample">
<Window.DataContext>
<local:ViewModel />
</Window.DataContext>
<Border>
<Grid>
<Grid.RowDefinitions>
<RowDefinition Height="Auto"/>

```

```

<RowDefinition Height="*" />
</Grid.RowDefinitions>
<StackPanel Orientation="Horizontal" Margin="4">
<TextBlock Text="Animal :"/>
<ComboBox IsTabStop="False" ItemsSource="{Binding Animals}"
SelectedValue="{Binding Animal, Mode=TwoWay}" />
</StackPanel>
<Grid Margin="10" Grid.Row="1">
<Grid.RowDefinitions>
<RowDefinition Height="Auto" />
<RowDefinition Height="*" />
</Grid.RowDefinitions>
<TextBlock Text="Description" />
<Border BorderThickness="1" BorderBrush="#A3A3A3">
<local:SfRichTextBoxAdvExtension Grid.Row="1" Text="{Binding
Path=Text,Mode=TwoWay}" LayoutType="Continuous" />
</Border>
</Grid>
</Grid>
</Border>
</Window>

```

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Virtualization in WPF RichTextBox (SfRichTextBoxAdv)

The SfRichTextBoxAdv control supports UI Virtualization. UI elements are created only for the contents that are visible in the viewer. The UI elements are created for the contents that become visible while scrolling the viewer. This reduces the main memory utilization and also improves UI performance.

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Styles and Templates in WPF RichTextBox (SfRichTextBoxAdv)

This section describes the styles and templates for the SfRichTextBoxAdv control. The Template defines the structure of the SfRichTextBoxAdv control and the Style defines its visual appearance. You can modify the default Control template to define a unique appearance for the control.

The following XAML shows the default style and template for the SfRichTextBoxAdv control.

XAML

```

<RichTextBoxAdv:SfRichTextBoxAdvResourceWrapper
x:Key="SfRichTextBoxAdvResourceWrapper" />
<SolidColorBrush x:Key="RichTextBoxAdvBackgroundBrush" Color="#000000" />
<SolidColorBrush x:Key="TextSelectionBrush" Color="#FF808080" />
<SolidColorBrush x:Key="ContextMenuForegroundBrush" Color="#333333" />
<SolidColorBrush x:Key="ContextMenuBorderBrush" Color="#D7D7D7" />
<SolidColorBrush x:Key="ContextMenuBackgroundBrush" Color="#FFFFFF" />
<SolidColorBrush x:Key="ContextMenuMouseOverBackgroundBrush"
Color="#D5DDEB" />
<SolidColorBrush x:Key="MiniToolBarButtonMouseOverBrush" Color="#CAD5E5" />
<SolidColorBrush x:Key="MiniToolBarButtonSelectedBrush" Color="#AABBD6" />

```

```

<SolidColorBrush x:Key="MiniToolBarBorderBrush" Color="LightGray"/>
<SolidColorBrush x:Key="MiniToolBarBackgroundBrush" Color="#FFFFFF"/>
<SolidColorBrush x:Key="PaneBackgroundBrush" Color="#FFFFFF"/>
<SolidColorBrush x:Key="SearchResultItemBackgroundBrush" Color="#FFFFFF"/>
<SolidColorBrush x:Key="SearchResultItemForegroundBrush" Color="#333333"/>
<SolidColorBrush x:Key="SearchResultItemSelectedBorderBrush"
Color="#959595"/>
<SolidColorBrush x:Key="SearchResultItemMouseOverBorderBrush"
Color="#959595"/>
<SolidColorBrush x:Key="SearchResultItemSeparatorForegroundBrush"
Color="#666666"/>
<SolidColorBrush x:Key="SuggestionItemSelectedBrush" Color="#FFCBCFE5"/>
<SolidColorBrush x:Key="SuggestionItemMouseOverBrush" Color="#FFD5E1F2"/>

Style="{StaticResource SpellingPaneButtonStyle}" Margin="15 0 0 0"/>
</Grid>
</Grid>
</Grid>
</Border>
</ControlTemplate>
</Setter.Value>
</Setter>
</Style>

```

Note: In the control template, you are allowed to reorder the template parts and to add your own elements. However, when changing the control template you should be careful to include all required parts. Usually required parts are marked with Name attribute. Omission of required parts may impact some of the functionality.

Styling the SfRichTextBoxAdv

You can define custom style for the SfRichTextBoxAdv control either by creating empty style and set it up on your own or by copying the default style and modifying it.

The following example demonstrates how to customize the style for SfRichTextBoxAdv control.

XML

```

<RichTextBoxAdv:SfRichTextBoxAdvResourceWrapper
x:Key="SfRichTextBoxAdvResourceWrapper"/>
<SolidColorBrush x:Key="RichTextBoxAdvBackgroundBrush" Color="#000000"/>
<SolidColorBrush x:Key="TextSelectionBrush" Color="#FF808080"/>
<ContextMenu x:Key="ContextMenuStyle">
<MenuItem Header="{Binding Source={StaticResource
SfRichTextBoxAdvResourceWrapper}, Path=ContextMenuCut}"
Command="RichTextBoxAdv:SfRichTextBoxAdv.CutCommand" >
<MenuItem.Icon>
<Image
Source="/Syncfusion.SfRichTextBoxAdv.WPF;component/Images/Cut_Icon.png"/>
</MenuItem.Icon>
</MenuItem>

```

```

<MenuItem Header="{Binding Source={StaticResource
SfRichTextBoxAdvResourceWrapper}, Path=ContextMenuCopy}"
Command="RichTextBoxAdv:SfRichTextBoxAdv.CopyCommand" >
<MenuItem.Icon>
<Image
Source="/Syncfusion.SfRichTextBoxAdv.WPF;component/Images/Copy_Icon.png"/>
</MenuItem.Icon>
</MenuItem>
<MenuItem Header="{Binding Source={StaticResource
SfRichTextBoxAdvResourceWrapper}, Path=ContextMenuPaste}"
Command="RichTextBoxAdv:SfRichTextBoxAdv.PasteCommand" >
<MenuItem.Icon>
<Image
Source="/Syncfusion.SfRichTextBoxAdv.WPF;component/Images/Paste_Icon.png"/>
</MenuItem.Icon>
</MenuItem>
</ContextMenu>
<Style TargetType="RichTextBoxAdv:SfRichTextBoxAdv"
x:Key="RichTextBoxAdvCustomStyle" >
<Setter Property="Background" Value="{StaticResource
RichTextBoxAdvBackgroundBrush}"/>
<Setter Property="SelectionBrush" Value="{StaticResource
TextSelectionBrush}"/>
<Setter Property="ContextMenu" Value="{StaticResource ContextMenuStyle}"/>
<Setter Property="EnableMiniToolBar" Value="False"/>
<Setter Property="Template">
<Setter.Value>
<ControlTemplate TargetType="RichTextBoxAdv:SfRichTextBoxAdv">
<Border BorderBrush="{TemplateBinding BorderBrush}"
BorderThickness="{TemplateBinding BorderThickness}"
Background="{TemplateBinding Background}">
<Grid>
<Grid.ColumnDefinitions>
<ColumnDefinition Width="*" />
<ColumnDefinition Width="Auto" />
</Grid.ColumnDefinitions>
<Grid.RowDefinitions>
<RowDefinition Height="*" />
<RowDefinition Height="Auto" />
</Grid.RowDefinitions>
<ContentControl x:Name="content" HorizontalAlignment="Stretch"
VerticalAlignment="Stretch" Grid.Row="0" Grid.Column="0" />
<ScrollBar x:Name="HorizontalScrollBar" Grid.Column="0" Height="16"
Visibility="Collapsed" IsTabStop="False" Minimum="0"
Orientation="Horizontal" Grid.Row="1" />
<ScrollBar x:Name="VerticalScrollBar" Grid.Column="1" IsTabStop="False"
Visibility="Collapsed" Minimum="0" Orientation="Vertical" Grid.Row="0"
Width="16" />
</Grid>
</Border>
</ControlTemplate>
</Setter.Value>
</Setter>
</Style>

```

The following code example demonstrates how to apply the custom style for SfRichTextBoxAdv control. Applying this style will result in a SfRichTextBoxAdv control with no options pane and no spelling pane.

XML

```
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv"
Style="{StaticResource RichTextBoxAdvCustomStyle}" />
```

Note: You can refer to our [WPF RichTextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

Setting Background for WPF RichTextBox

The [WPF RichTextBox](#) control allows you to change background color of the control. A background of a control is represented by **Background** property of **SfRichTextBoxAdv** class. The default value of this property is black.

The following code illustrates how to apply color as background to the document.

XML

```
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv"
Background="#6699cc" />
```

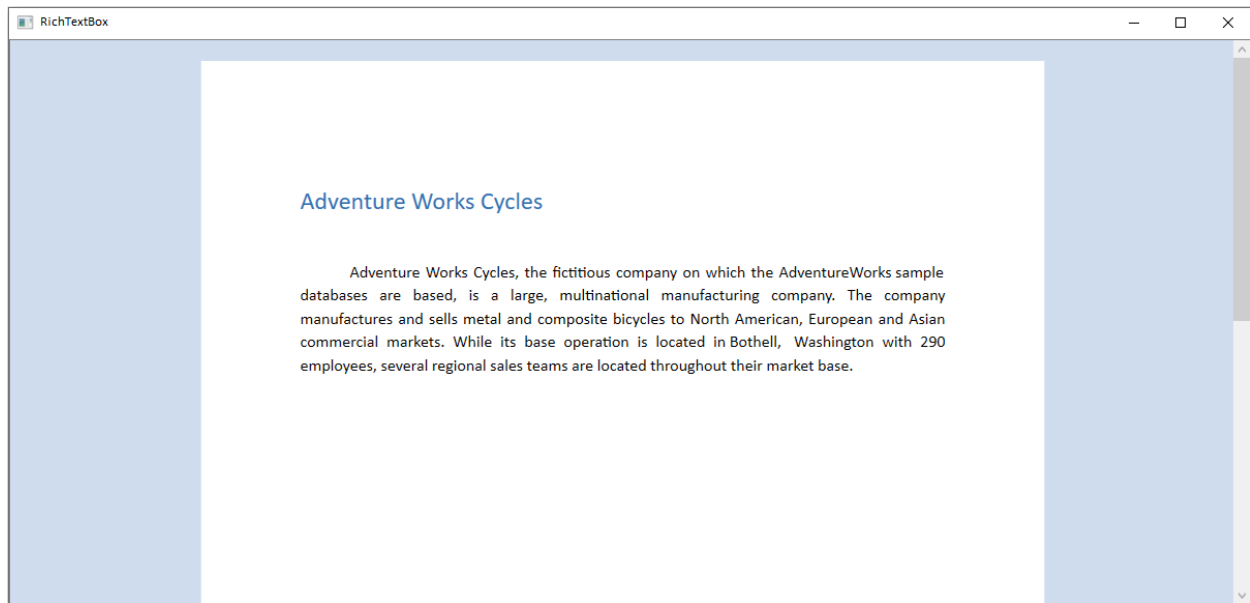

C#

```
// Initializes a new instance of RichTextBoxAdv.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
// Sets the control background color
richTextBoxAdv.Background = new SolidColorBrush(Color.FromRgb(102, 153,
204));
```

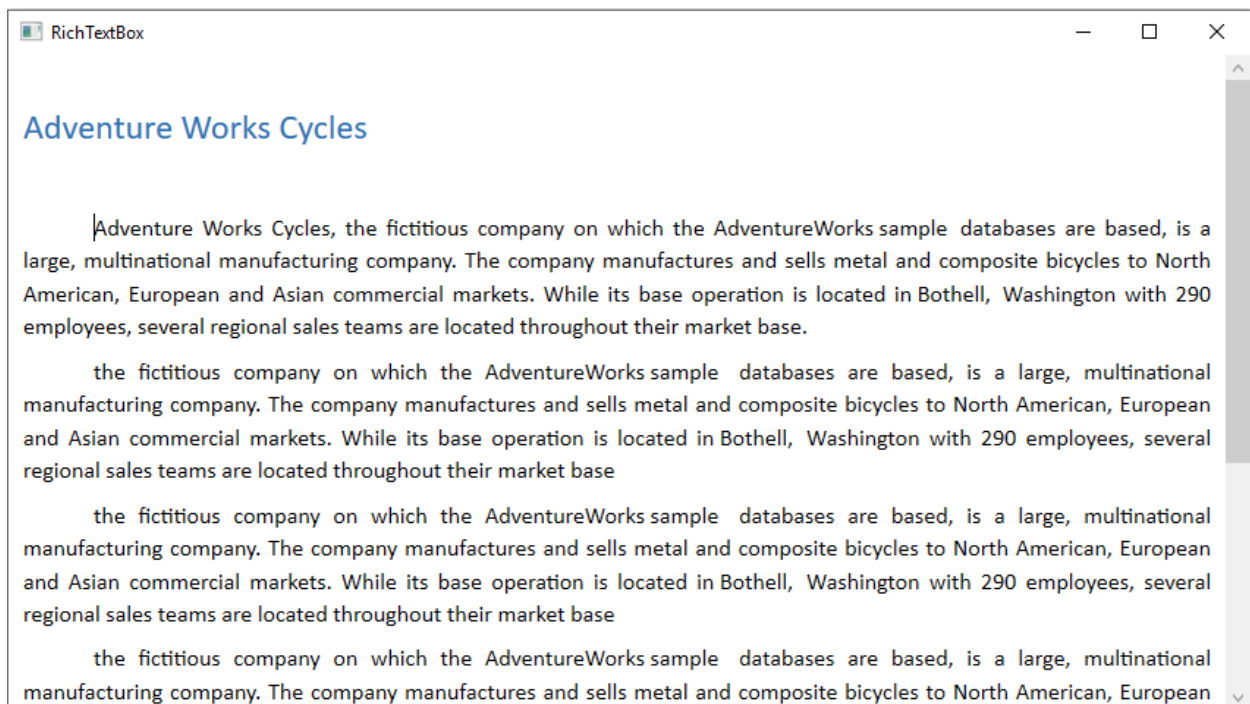

VB.NET

```
' Initializes a new instance of RichTextBoxAdv.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
' Sets the control background color.
richTextBoxAdv.Background = new SolidColorBrush(Color.FromRgb(102, 153,
204))
```

Pages layout

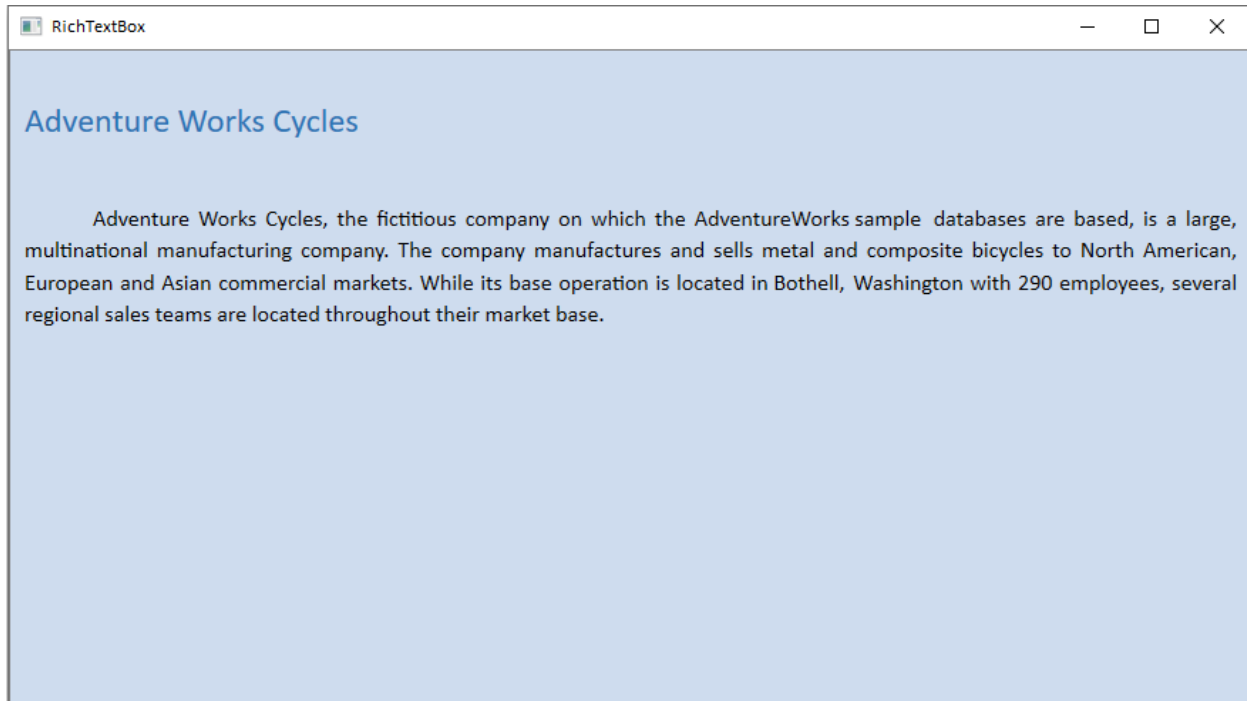

Continuous layout

Block layout

The block layout always inherits the control background color.

How to override the document background in continuous layout type?

By default, the document background properties will be applied when the `LayoutType` is continuous. You can suppress the document background and apply the control background by setting `OverridesDocumentBackground` property to true. The default value of this property is false.

Note: This property is valid only when the `LayoutType` is continuous.

The following code illustrates how to override the document background color.

XML

```
<RichTextBoxAdv:SfRichTextBoxAdv x:Name="richTextBoxAdv"
LayoutType="Continuous" Background="#6699cc"
OverridesDocumentBackground="True" />
```

C#

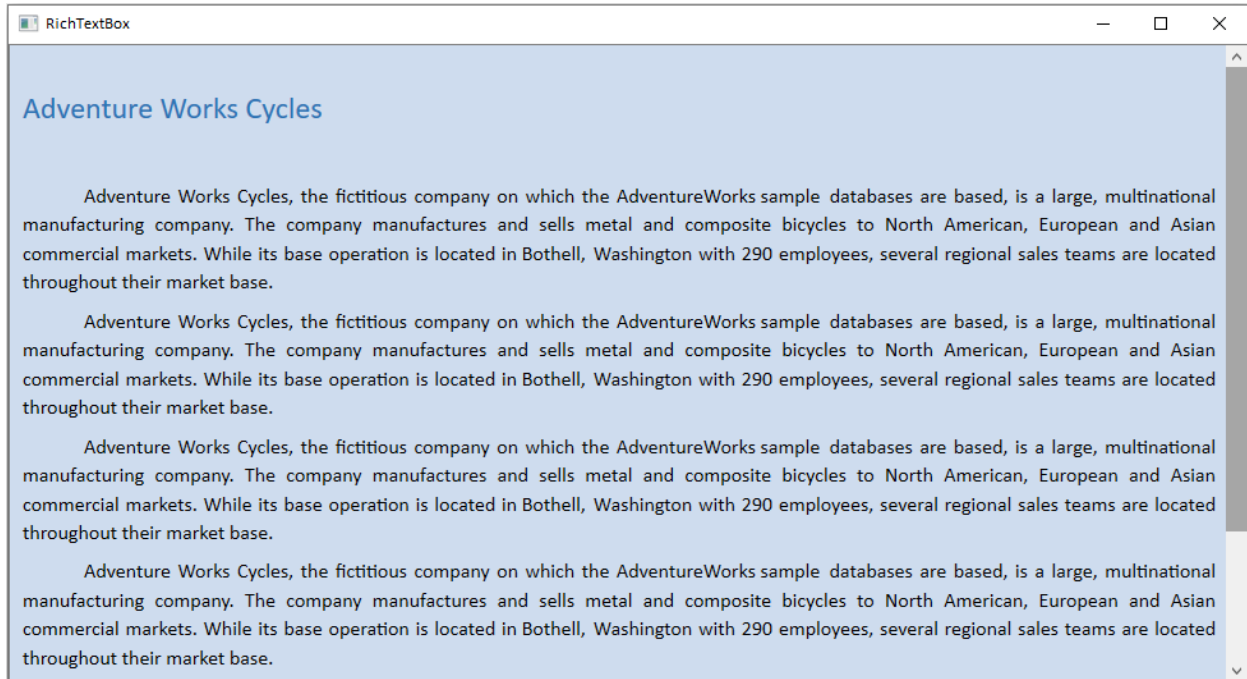

```
// Initializes a new instance of RichTextBoxAdv.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
// Sets the control background color
richTextBoxAdv.Background = new SolidColorBrush(Color.FromRgb(102, 153,
204));
// Sets the layout type as continuous
richTextBoxAdv.LayoutType = LayoutType.Continuous;
//Enable the OverridesDocumentBackground property
richTextBoxAdv.OverridesDocumentBackground = true;
```

VB.NET

```
' Initializes a new instance of RichTextBoxAdv.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
' Sets the control background color.
```

```
richTextBoxAdv.Background = new SolidColorBrush(Color.FromRgb(102, 153, 204))
' Sets the layout type as continuous
richTextBoxAdv.LayoutType = LayoutType.Continuous
' Enable the OverridesDocumentBackground property
richTextBoxAdv.OverridesDocumentBackground = true
```

Continuous layout:

Setting Background for Document Pages

The RichTextBox control allows you to change background color of the document pages. A background of a document is represented by **Background** property of **DocumentAdv** class. The default value of this property is white.

Note: 1. This property is independent for a document. So the background will change when the document is changed.

2. To maintain same background for all documents, you can reset this property in DocumentChanged event.

The following code illustrates how to apply color as background to the document pages.

C#

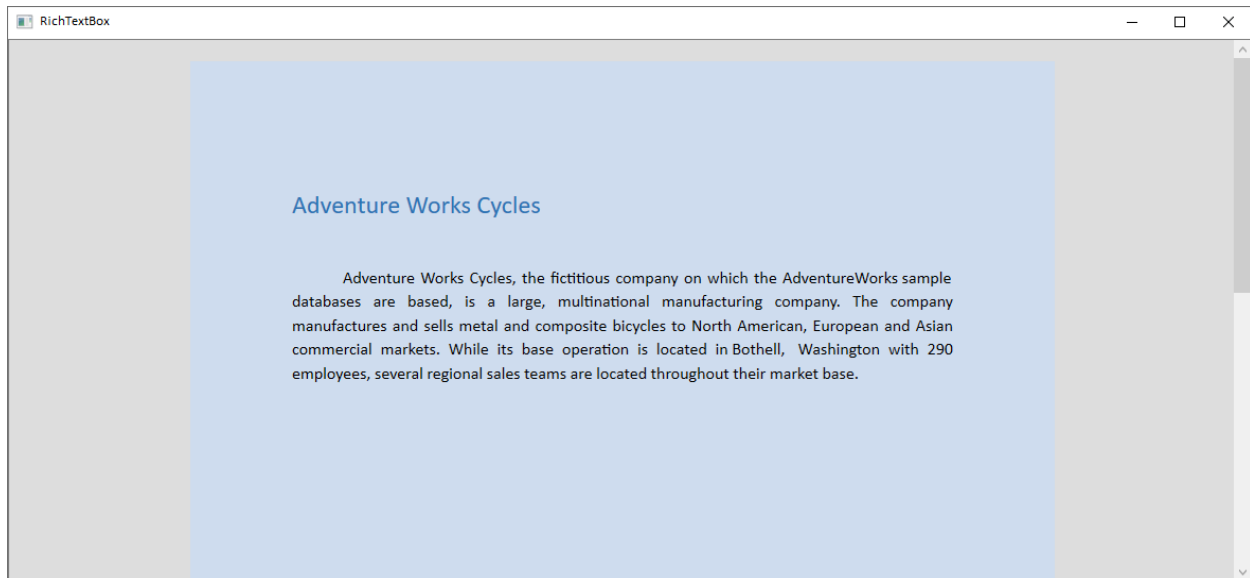

```
// Initializes a new instance of RichTextBoxAdv.
SfRichTextBoxAdv richTextBoxAdv = new SfRichTextBoxAdv();
// Sets the document background color
richTextBoxAdv.Document.Background.Color = Color.FromRgb(102, 153, 204);
```

VB.NET

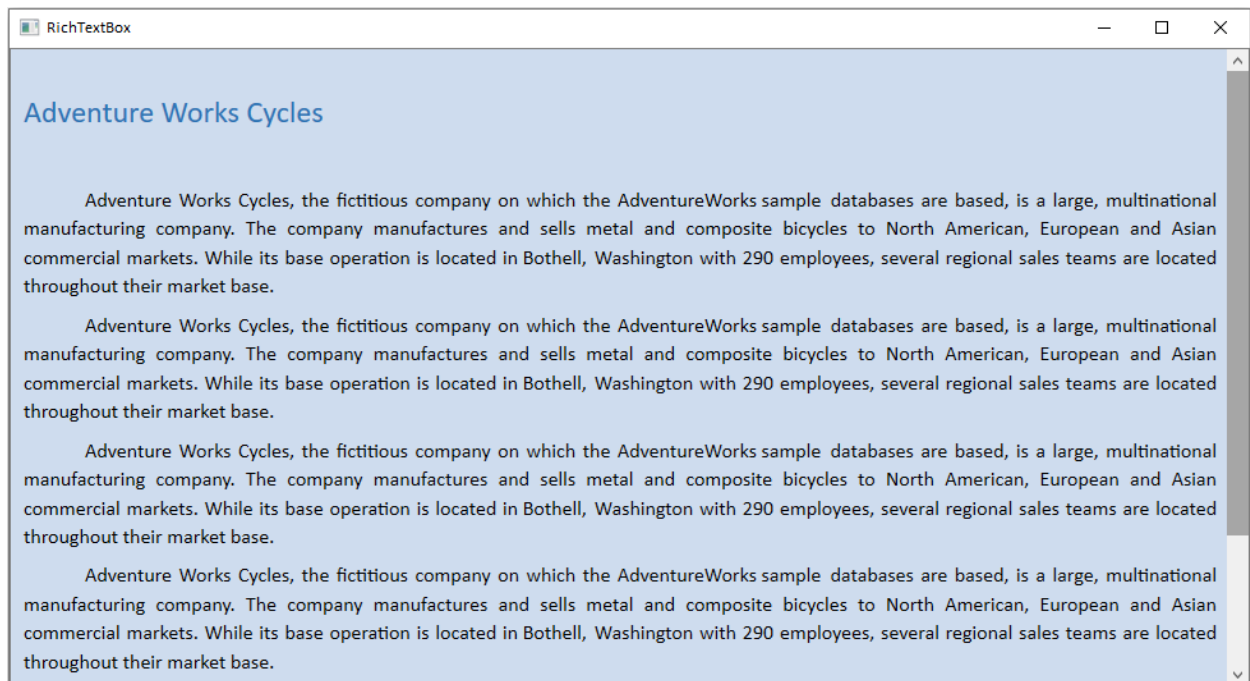

```
' Initializes a new instance of RichTextBoxAdv.
Dim richTextBoxAdv As New SfRichTextBoxAdv()
```

```
' Sets the document background color.  
richTextBoxAdv.Document.Background.Color = Color.FromRgb(102, 153, 204)
```

Pages layout:

Continuous layout:

Note: This API is supported starting from release version v17.4.0.X.

You can also explore our [WPF RichTextBox example](#) to know how to render and configure the editing tools.

FAQ Section

Opening large size documents in WPF SfRichTextBoxAdv control

This page explains Why does out of memory exception throw on opening large size documents in WPF SfRichTextBoxAdv control and more details.

Why does out of memory exception throw on opening large size documents in WPF RichTextBox (SfRichTextBoxAdv)

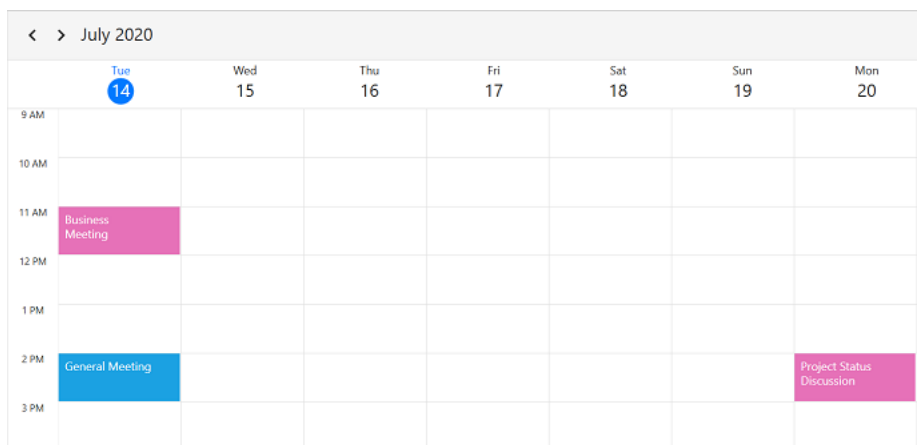

The SfRichTextBoxAdv control keeps the entire rich text content (text, images, tables, and all the other supported elements along with its formatting) of the document and its corresponding information needed for rendering in main memory. In case of opening a DOCX file, you may think that the file size is small and SfRichTextBoxAdv utilizes a very large memory; whereas it is a zip archive file with extension “docx” and SfRichTextBoxAdv control internally decompresses it and populates the content in the document object model by utilizing remarkable amount of main memory.

The SfRichTextBoxAdv control supports UI Virtualization. UI elements are created only for the contents that are visible in the viewer. The UI elements are created for the contents that become visible while scrolling the viewer. This reduces the main memory utilization and also improves UI performance. Even though UI Virtualization is handled, the main memory utilization increases with respect to the increase of content and its complexity. The main memory utilized by an instance will not be released until the instance is removed from the document. So, there is a chance for out of memory exception when the memory utilization exceeds the maximum level as the content of the document increases. In that case, split the contents to several documents or use high configuration machines with extended RAM so as to create or open large size documents comfortably.

SfScheduler

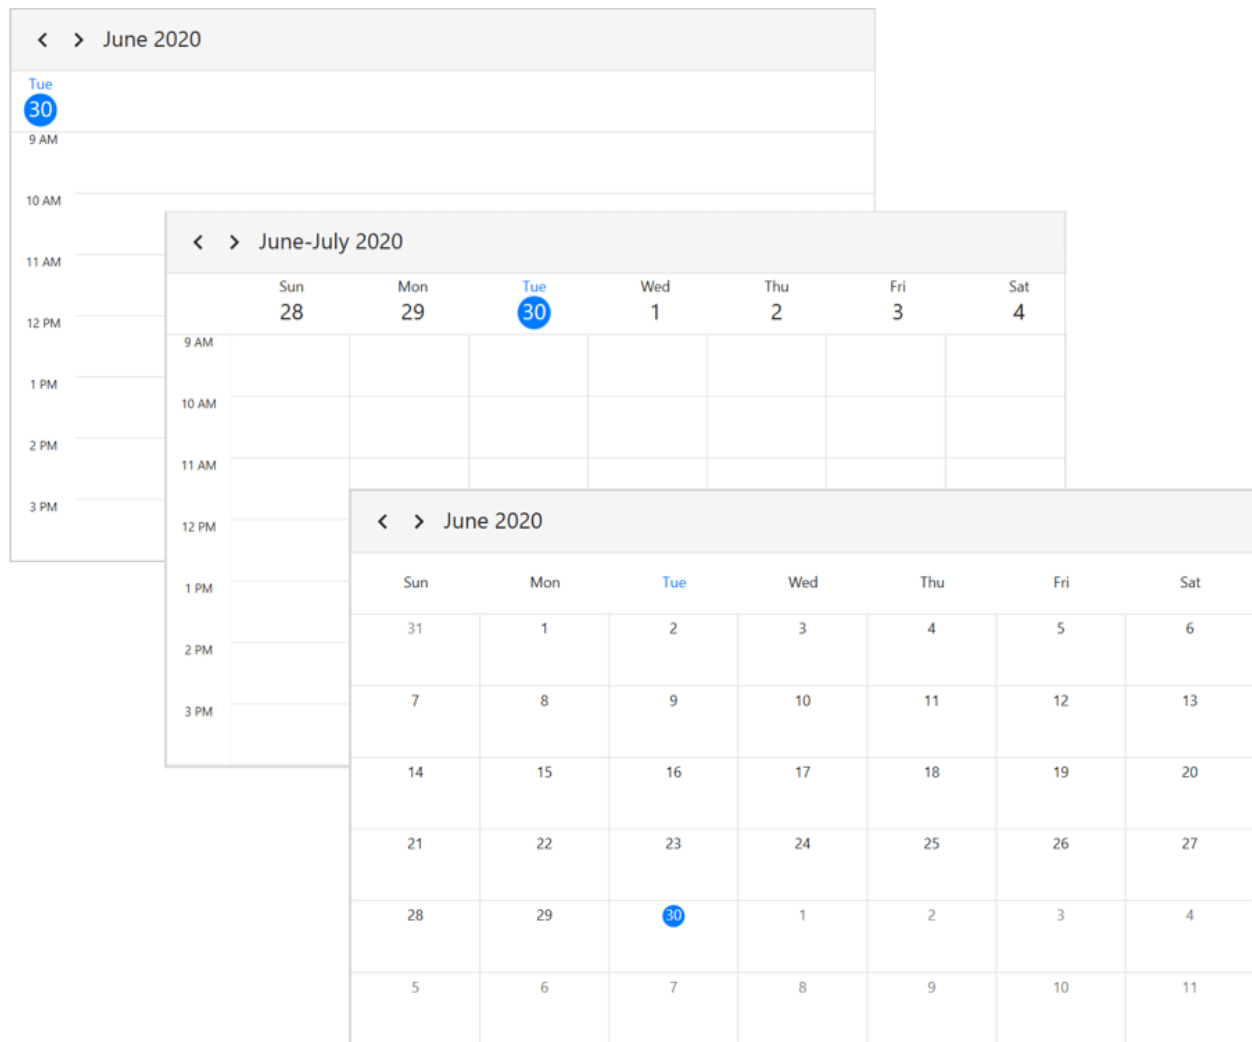

WPF Scheduler (SfScheduler) Overview

The [WPF Scheduler](#) control is used to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

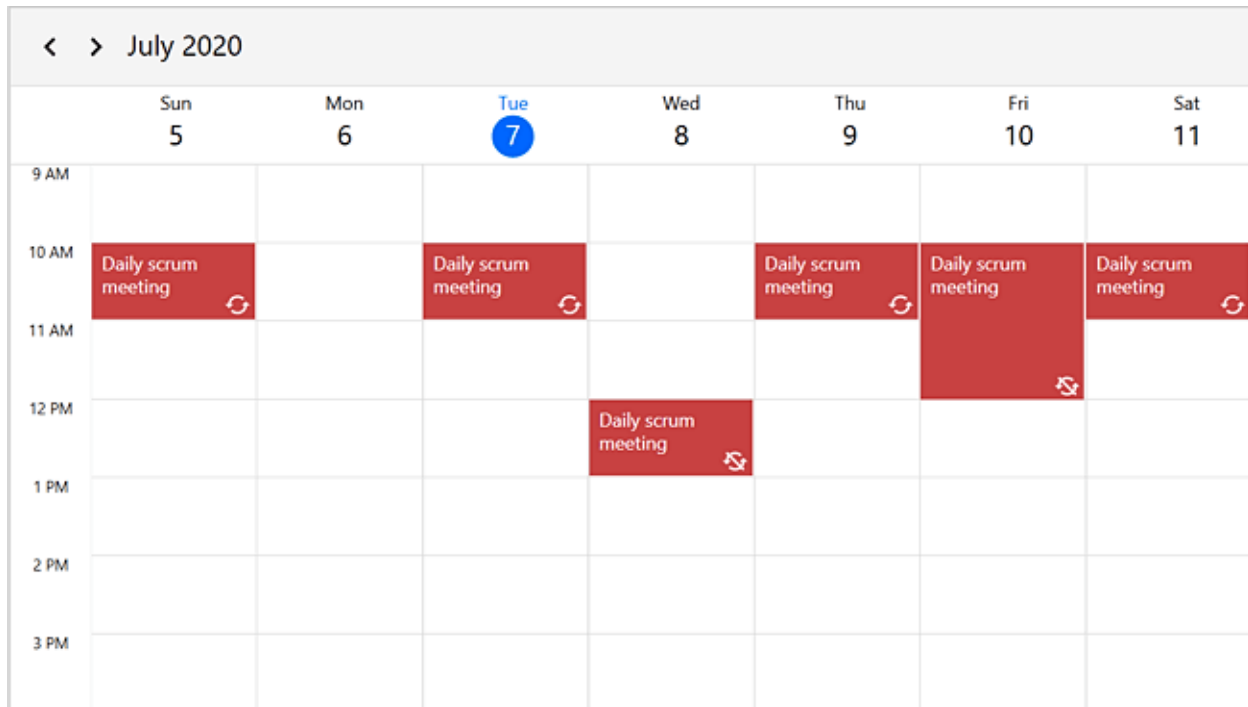

Key features

Built-in Views - The SfScheduler provides eight different types of views such as Day, WorkWeek, Week, TimelineDay, TimelineWeek, TimelineWorkWeek, TimelineMonth, and Month.

Events - Appointments contain information on events scheduled at specific times. In addition to the default appointments, the users can use their own collections to connect a business entity to an appointment by mapping their fields, such as start time, end time, subject, notes, and recurrence.

Recurrence Events — Easily configure recurring events on a daily, weekly, monthly, or yearly basis. Also skip or change the occurrence of a recurring appointment.

Appointment Mapping - SfScheduler control supports to map any collection that implements the IEnumerable interface to populate appointments.

Appointment Editor - Create, edit, or delete appointments using the built-in appointment editor.

Timezone - Display appointments created in various time zones in the system time zone. Appointment start and end times are also automatically adjusted and displayed based on the daylight savings time.

First day of the week - Customize the first day of the week as needed. The default first day is Sunday.

Flexible working days - Customize the workdays in a workweek so that the remaining days will be hidden from view.

Appearance Customization — Provide a unique look to the scheduler with the event appearance customization.

Localization — Display the current date and time by following the globalized date and time formats, and localize all available static texts in the SfScheduler.

Reminder - Use the reminders to organize the appointments in the scheduler. The Scheduler reminds about the appointment at the specified time.

LoadOnDemand - The SfScheduler supports loading appointments on-demand with loading indicator and it improves the loading performance when there are appointments range for multiple years.

Note: You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Getting Started with WPF Scheduler (SfScheduler)

This section provides an overview for working with SfScheduler for WPF and also provides a walk through to configure [WPF Scheduler](#) (SfScheduler) control in the real time scenario.

Assembly deployment

Refer to the section on [control dependencies](#) for a list of assemblies or NuGet Packages to be used as a guide for using control in any application. Further information on installing the NuGet package can be found in the following link in a WPF application: [How to install nuget packages](#) . Use [Syncfusion Reference Manager](#) to refer the scheduler's dependent assemblies.

Create simple application with SfScheduler

In this section, create WPF application with WPF Scheduler (SfScheduler) control.

- [Creating project](#)
- [Adding control via Designer](#)
- [Adding control manually in XAML](#)
- [Adding control manually in C#](#)

Creating project

In Visual Studio, create a new WPF project to show the features of the WPF Scheduler (SfScheduler) control and add the following namespace to the added assemblies.

Assembly: `Syncfusion.SfScheduler.WPF`

Namespace: `Syncfusion.UI.Xaml.Scheduler`

Adding control via Designer

[SfScheduler](#) control can be added to the application by dragging it from Toolbox and dropping it in a Designer view. The required assembly references will be added automatically.

Adding control manually in XAML

To add the control manually in XAML page, follow the given steps:

1. Add the `Syncfusion.SfScheduler.WPF` assembly reference to the project.
2. Import WPF schema `http://schemas.syncfusion.com/wpf` in the XAML page.
3. Declare the `SfScheduler` control in XAML page.

XML

```
<Window
x:Class="GettingStarted.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:local="clr-namespace:GettingStarted"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
xmlns:system="clr-namespace:System;assembly=mscorlib"
WindowStartupLocation="CenterScreen">
<Grid>
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Month"/>
</Grid>
</Window>
```

Adding control manually in C#

To add the control manually in C# page, add the `Syncfusion.SfScheduler.WPF` assembly reference to the project.

C#

```
using Syncfusion.UI.Xaml.Scheduler;
namespace GettingStarted
{
    public partial class MainWindow : Window
    {
        SfScheduler schedule = new SfScheduler();
        this.Content = schedule;
    }
}
```

Change different SfScheduler Views

The [WPF Scheduler](#) (SfScheduler) control provides five different types of views to display dates and it can be assigned to the control by using [ViewType](#) property. By default the control is assigned with `MonthView`. Current date will be displayed initially for all the Schedule views.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Month">
```

C#

```
Schedule.ViewType =SchedulerViewType.Month;
```

< > July 2020						
Sun	Mon	Tue	Wed	Thu	Fri	Sat
28	29	30	1	2	3	4
5	6	7	8	9	10	11
12	13	14	15	16	17	18
19	20	21	22	23	24	25
26	27	28	29	30	31	1
2	3	4	5	6	7	8

Appointments

[SfScheduler](#) has a built-in capability to handle the appointment arrangement internally based on the [ScheduleAppointment](#) collections. Allocate the collection generated to [Appointments](#) property.

Adding Appointments

The [ScheduleAppointment](#) is a class that includes the specific scheduled appointment. It has some basic properties such as [StartTime](#), [EndTime](#), [Subject](#), and some additional information about the appointment can be added with [Notes](#), [Location](#), and [IsAllDay](#) properties.

XML

```
<schedule:SfSchedule x:Name="schedule" ViewType="Month"/>
```

C#

```
//Creating new event
ScheduleAppointmentCollection appointmentCollection = new
ScheduleAppointmentCollection();
//Creating new event
ScheduleAppointment clientMeeting = new ScheduleAppointment();
DateTime currentDate = DateTime.Now;
DateTime startTime = new DateTime(currentDate.Year, currentDate.Month,
currentDate.Day, 10, 0, 0);
DateTime endTime = new DateTime(currentDate.Year, currentDate.Month,
currentDate.Day, 12, 0, 0);
clientMeeting.StartTime = startTime;
clientMeeting.EndTime = endTime;
clientMeeting.Subject = "ClientMeeting";
appointmentCollection.Add(clientMeeting);
Schedule.ItemsSource = appointmentCollection;
```

Download the entire source code of this demo for WPF from

here [SchedulerGettingStarted](#)

Events/Appointments data mapping

Map the custom appointments data to the scheduler.

Here are the steps to render meetings using [SfScheduler](#) control with respective custom data properties created in a class [Meeting](#).

- [Create an event Data Model](#)
- [Create view model](#)
- [Bind to SfScheduler appointment](#)
- [Bind item source for Scheduler](#)

Create an event Data Model

Create a custom class **Meeting** with mandatory fields **From**, **To** and **EventName** that is used to map the information of the appointment.

C#

```
public class Meeting : INotifyPropertyChanged
{
    DateTime from, to;
    string eventName;
    bool isAllDay;
    string startTimeZone, endTimeZone;
    Brush color;
    public Meeting()
    {
    }
    public DateTime From
    {
        get { return from; }
        set
        {
            from = value;
            RaisePropertyChanged("From");
        }
    }
    public DateTime To
    {
        get { return to; }
        set
        {
            to = value;
            RaisePropertyChanged("To");
        }
    }
    public bool IsAllDay
    {
        get { return isAllDay; }
        set
        {
            isAllDay = value;
            RaisePropertyChanged("IsAllDay");
        }
    }
    public string EventName
    {
        get { return eventName; }
        set
        {
            eventName = value;
            RaisePropertyChanged("EventName");
        }
    }
}
```

```
}  
public string StartTimeZone  
{  
    get { return startTimeZone; }  
    set  
    {  
        startTimeZone = value;  
        RaisePropertyChanged("StartTimeZone");  
    }  
}  
public string EndTimeZone  
{  
    get { return endTimeZone; }  
    set  
    {  
        endTimeZone = value;  
        RaisePropertyChanged("EndTimeZone");  
    }  
}  
public Brush Color  
{  
    get { return color; }  
    set  
    {  
        color = value;  
        RaisePropertyChanged("Color");  
    }  
}  
public event PropertyChangedEventHandler PropertyChanged;  
protected virtual void RaisePropertyChanged(string propertyName, object  
    oldValue = null)  
{  
    this.PropertyChanged?.Invoke(this, new  
        PropertyChangedEventArgs(propertyName));  
}  
}
```

Create view model

By setting **From** and **To** of the **Meeting** class, schedule the meetings for a specific day. Change the subject and color of the appointment using **EventName** and **Color** property. Define the list of custom appointments in a separate class of **ViewModel**.

C#

```
public class ScheduleViewModel  
{  
    private List<string> currentDayMeetings;  
    private List<string> minTimeMeetings;  
    private List<Brush> colorCollection;  
    public ScheduleViewModel()  
    {  
        this.Events = new ObservableCollection<Meeting>();  
        this.InitializeDataForBookings();  
        this.IntializeAppoitments();  
    }  
    public ObservableCollection<Meeting> Events
```

```

{
    get;
    set;
}
private List<Point> GettingTimeRanges()
{
    List<Point> randomTimeCollection = new List<Point>();
    randomTimeCollection.Add(new Point(9, 11));
    randomTimeCollection.Add(new Point(12, 14));
    randomTimeCollection.Add(new Point(15, 17));
    return randomTimeCollection;
}
private void InitializeDataForBookings()
{
    this.currentDayMeetings = new List<string>();
    this.currentDayMeetings.Add("General Meeting");
    this.currentDayMeetings.Add("Plan Execution");
    this.minTimeMeetings = new List<string>();
    this.minTimeMeetings.Add("Client Metting");
    this.minTimeMeetings.Add("Birthday wish alert");
    this.colorCollection = new List<Brush>();
    this.colorCollection.Add(new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF339933")));
    this.colorCollection.Add(new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF00ABA9")));
    this.colorCollection.Add(new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#FFE671B8")));
    this.colorCollection.Add(new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF1BA1E2")));
    this.colorCollection.Add(new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#FFD80073")));
}
private void IntializeAppoitments()
{
    Random randomTime = new Random();
    List<Point> randomTimeCollection = this.GettingTimeRanges();
    DateTime date;
    DateTime dateFrom = DateTime.Now.AddDays(-100);
    DateTime dateTo = DateTime.Now.AddDays(100);
    var random = new Random();
    var dateCount = random.Next(4);
    DateTime dateRangeStart = DateTime.Now.AddDays(0);
    DateTime dateRangeEnd = DateTime.Now.AddDays(1);
    for (date = dateFrom; date < dateTo; date = date.AddDays(1))
    {
        if (date.Day % 7 != 0)
        {
            for (int additionalAppointmentIndex = 0; additionalAppointmentIndex < 1;
additionalAppointmentIndex++)
            {
                Meeting meeting = new Meeting();
                int hour =
randomTime.Next((int)randomTimeCollection[additionalAppointmentIndex].X,
(int)randomTimeCollection[additionalAppointmentIndex].Y);
                meeting.From = new DateTime(date.Year, date.Month, date.Day, hour, 0, 0);
                meeting.To = meeting.From.AddHours(1);
                meeting.EventName = this.currentDayMeetings[randomTime.Next(2)];
            }
        }
    }
}

```

```

meeting.Color = this.colorCollection[randomTime.Next(2)];
meeting.IsAllDay = false;
meeting.StartTimeZone = string.Empty;
meeting.EndTimeZone = string.Empty;
this.Events.Add(meeting);
}
}
else
{
Meeting meeting = new Meeting();
meeting.From = new DateTime(date.Year, date.Month, date.Day,
randomTime.Next(9, 11), 0, 0);
meeting.To = meeting.From.AddDays(2).AddHours(1);
meeting.EventName = this.currentDayMeetings[randomTime.Next(2)];
meeting.Color = this.colorCollection[randomTime.Next(2)];
meeting.IsAllDay = true;
meeting.StartTimeZone = string.Empty;
meeting.EndTimeZone = string.Empty;
this.Events.Add(meeting);
}
}
DateTime minDate;
DateTime minDateFrom = DateTime.Now.AddDays(-2);
DateTime minDateTo = DateTime.Now.AddDays(2);
for (minDate = minDateFrom; minDate < minDateTo; minDate =
minDate.AddDays(1))
{
Meeting meeting = new Meeting();
meeting.From = new DateTime(minDate.Year, minDate.Month, minDate.Day,
randomTime.Next(9, 18), 30, 0);
meeting.To = meeting.From;
meeting.EventName = this.minTimeMeetings[randomTime.Next(0, 1)];
meeting.Color = this.colorCollection[randomTime.Next(0, 2)];
meeting.StartTimeZone = string.Empty;
meeting.EndTimeZone = string.Empty;
this.Events.Add(meeting);
}
}
}
}
}

```

Bind to SfScheduler appointment

Map those properties of the **Meeting** class with our WPF Scheduler (SfScheduler) control by using the [AppointmentMapping](#) property.

XML

```

<syncfusion:SfScheduler x:Name="Schedule">
<syncfusion:SfScheduler.AppointmentMapping>
<syncfusion:AppointmentMapping
Subject="EventName"
StartTime="From"
EndTime="To"
AppointmentBackground="Color"
IsAllDay="IsAllDay"
StartTimeZone="StartTimeZone"

```

```
EndTimeZone="EndTimeZone"/>
</syncfusion:SfScheduler.AppointmentMapping>
</syncfusion:SfScheduler>
```

C#

```
AppointmentMapping appointmentMapping = new AppointmentMapping();
appointmentMapping.IsAllDay = "AllDay";
appointmentMapping.StartTime = "From";
appointmentMapping.EndTime = "To";
appointmentMapping.Subject = "Event name";
appointmentMapping.AppointmentBackground = "color";
appointmentMapping.StartTimeZone = "StartTimeZone";
appointmentMapping.EndTimeZone = "EndTimeZone";
Schedule.AppointmentMapping = appointmentMapping;
```

Bind item source for SfScheduler

Create meetings of type `ObservableCollection<Events>` and assign those appointments collection `Events` to the `ItemsSource` property of SfScheduler.

XML

```
<Window.DataContext>
<local:ScheduleViewModel/>
</Window.DataContext>
<syncfusion:SfScheduler x:Name="Schedule"
ItemsSource="{Binding Events}"
ViewType="Month">
</syncfusion:SfScheduler>
```

C#

```
ScheduleViewModel viewModel = new ScheduleViewModel();
Schedule.ItemsSource = viewModel.Events;
```

Note: [View sample in GitHub](#)

Change first day of week

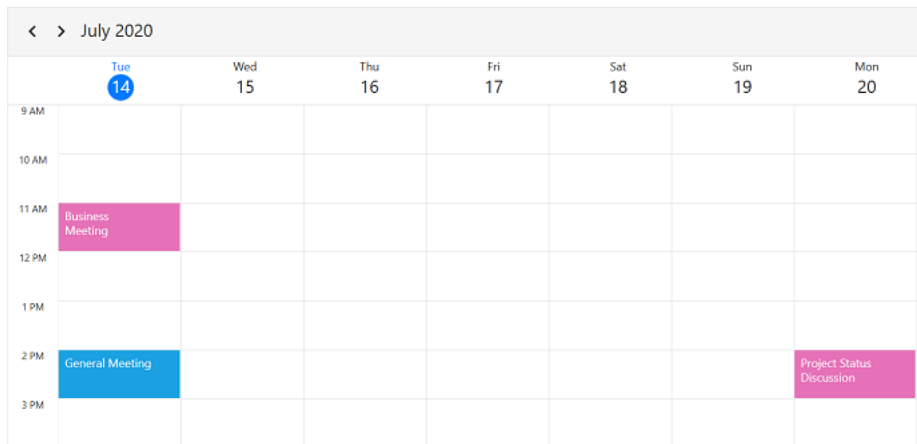

WPF Scheduler (SfScheduler) control will be rendered with `Sunday` as the first day of the week, but it can be customized to any day by using `FirstDayOfWeek` property of `SfScheduler`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" FirstDayOfWeek="Tuesday"/>
```

C#

```
//setting first day of the week
Schedule.FirstDayOfWeek = DayOfWeek.Tuesday;
```

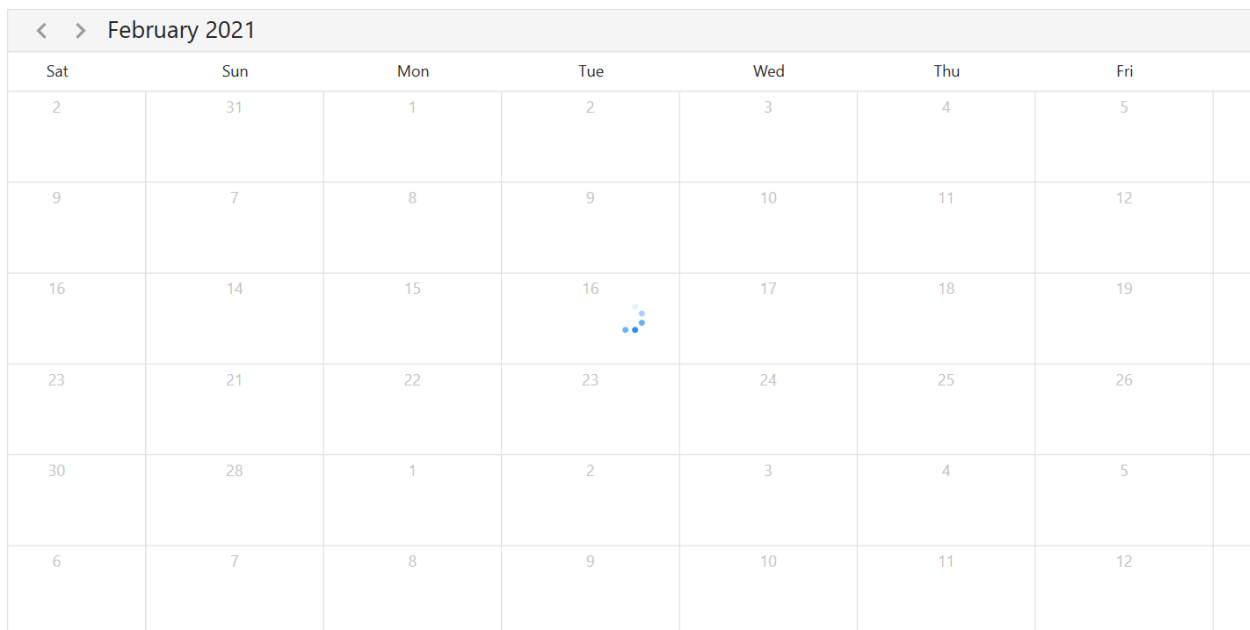

Show busy indicator

The Scheduler supports to show the busy indicator by using the [ShowBusyIndicator](#) property. The default value is set to false, if the value is set to true then the busy indicator will be loaded on view or visible date changed.

XML

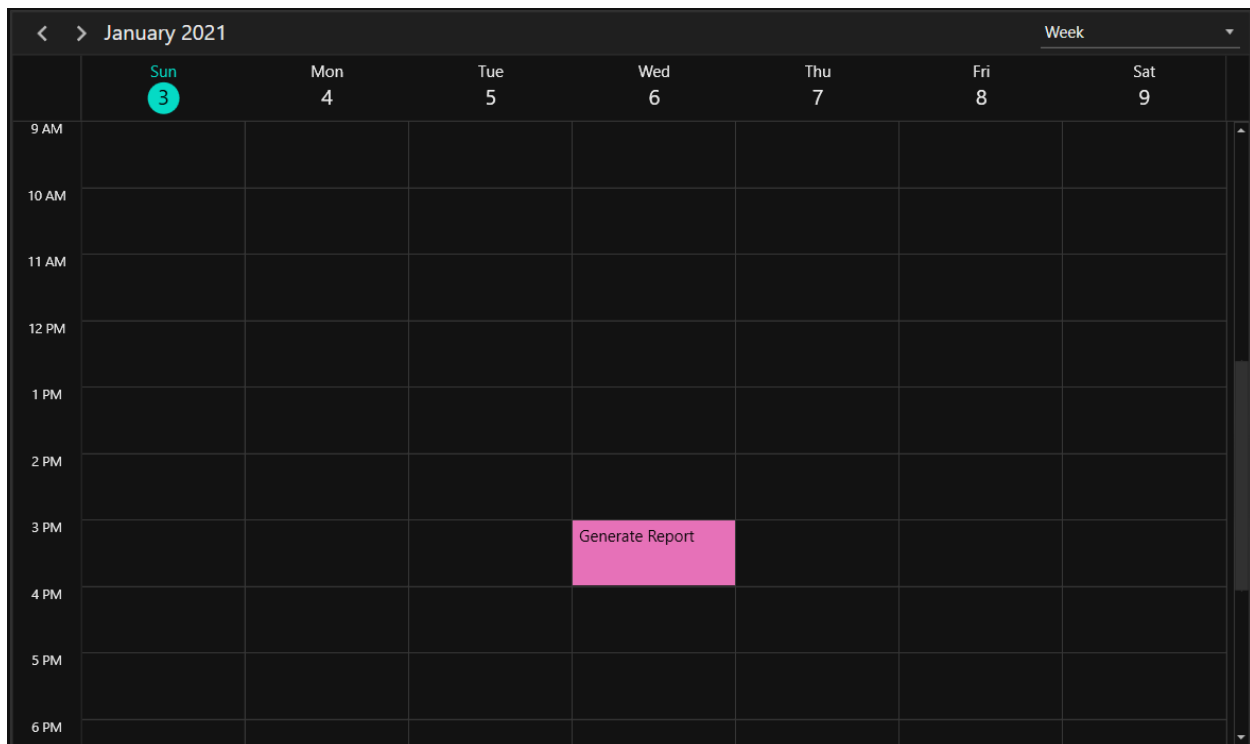

```
<syncfusion:SfScheduler x:Name="Schedule"
ShowBusyIndicator="True"
ViewType="Month">
</syncfusion:SfScheduler>
```

Theme

WPF Scheduler (SfScheduler) supports various built-in themes. Refer to the below links to apply themes for the SfScheduler,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Note: You can refer to our [WPF Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Day and Week Views in WPF Scheduler (SfScheduler)

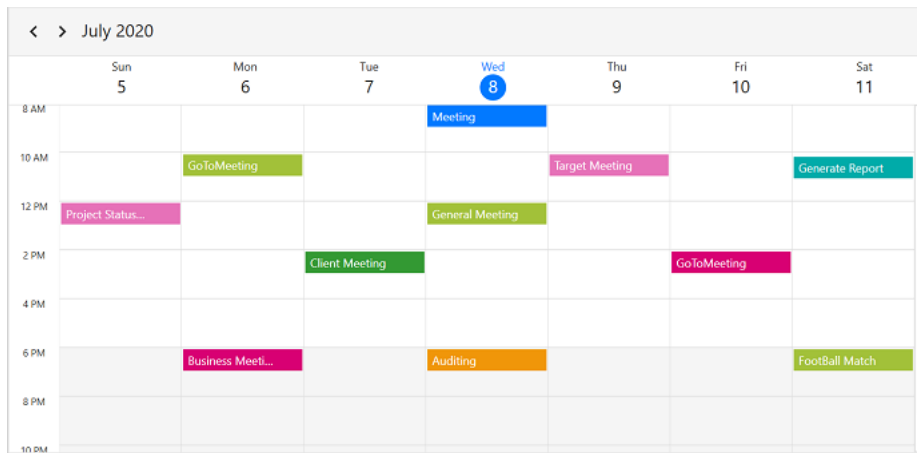

[Scheduler](#) supports to display the day, week, work week views and current day will be visible by default. Appointments on a specific day will be arranged in respective timeslots based on its duration.

Change time interval

Customize the interval of timeslots in all the day, week, work week views by using the [TimeInterval](#) property of [DaysViewSettings](#).

C#

```
Schedule.ViewType = SchedulerViewType.Week;
Schedule.DaysViewSettings.TimeInterval = new System.TimeSpan(0, 120, 0);
```

Note: If the `timeInterval` value is modified (in minutes), the time labels format needs to be changed by setting the `timeFormat` value to `hh:mm`.

Change time interval height

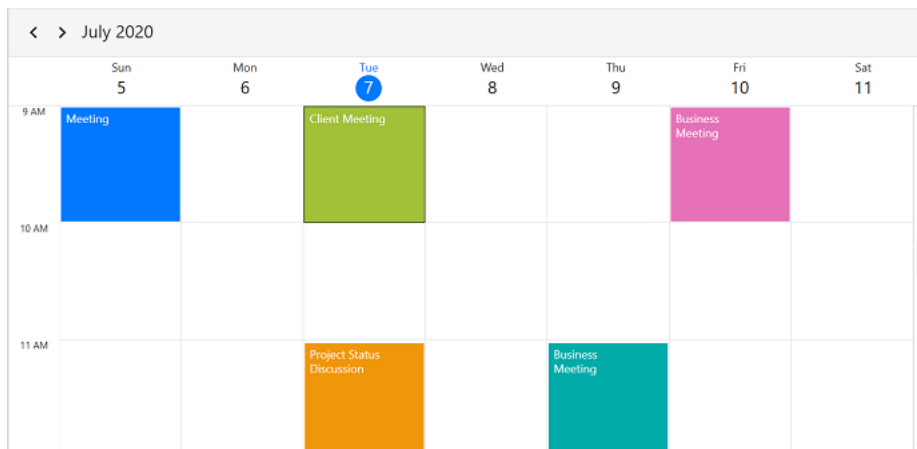

Customize the interval height of timeslots in day, week, work week views by setting `TimeIntervalSize` property of `DaysViewSettings`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
  <syncfusion:SfScheduler.DaysViewSettings>
    <syncfusion:DaysViewSettings
      TimeIntervalSize="120"/>
    </syncfusion:DaysViewSettings>
  </syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.Week;
Schedule.DaysViewSettings.TimeIntervalSize = 120;
```

Flexible working days and working hours

The default values for `StartHour` and `EndHour` are 0 and 24 to show all the timeslots in day, week and work week views. Set the `StartHour` and `EndHour` properties of `DaysViewSettings` to show only the

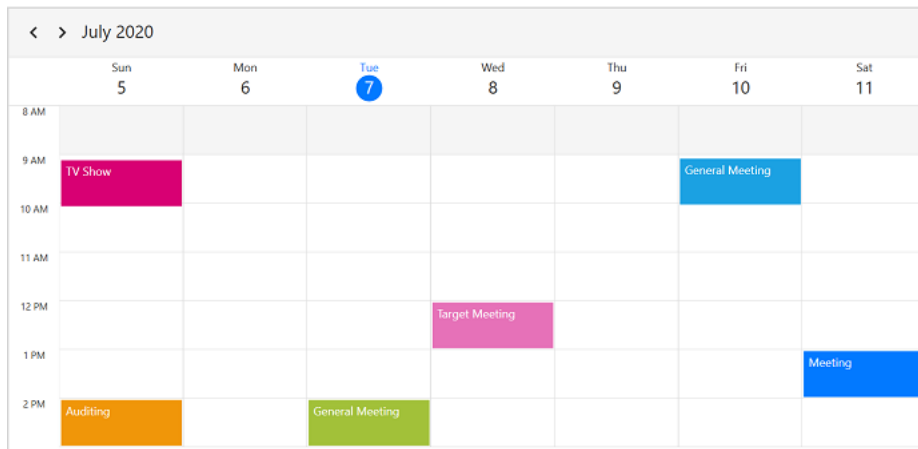

required time duration for users. Set **StartHour** and **EndHour** in time duration to show the required time duration in minutes.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
  <syncfusion:SfScheduler.DaysViewSettings>
    <syncfusion:DaysViewSettings
      StartHour="8"
      EndHour="15" />
    </syncfusion:SfScheduler.DaysViewSettings>
  </syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.Week;
Schedule.DaysViewSettings.StartHour = 8;
Schedule.DaysViewSettings.EndHour = 15;
```

Note:

- The [NonWorkingDays](#) property will be applicable only for **workWeek** and **TimelineWorkWeek** views only, and not applicable for the remaining views.
- Scheduler Appointments UI, which does not fall within the **StartHour** and **EndHour** will not be visible and if it falls partially, it will be clipped.
- No need to specify the decimal point values for **StartHour** and **EndHour**, if you don't want to set the minutes.
- The number of time slots will be calculated based on total minutes of a day and time interval (total minutes of a day ((start hour - end hour) * 60) / time interval).
- If custom **timeInterval** is given, then the number of time slots calculated based on the given **TimeInterval** should result in integer value (total minutes % **timeInterval** = 0), otherwise next immediate time interval that result in integer value when divided by total minutes of a day will be considered. For example, if **TimeInterval** = 2 Hours 15 minutes and total minutes = 1440 (24 Hours per day), then **TimeInterval** will be changed to '144' (1440%144=0) by considering (total minutes % **TimeInterval** = 0), it will return integer value for time slots rendering.

- If the custom `StartHour` and `EndHour` are given, then the number of time slots calculated based on the given `StartHour` and `EndHour` should result in integer value, otherwise next immediate `TimeInterval` will be considered until the result is integer value. For example, if `StartHour` is 9 (09:00AM), `EndHour` is 18.25 (06:15 PM), `TimeInterval` is 30 minutes, and total minutes = 555 ((18.25-9)*60), then the `TimeInterval` will be changed to '37 minutes' (555%37=0) by considering (total minutes % timeInterval = 0). It will return integer value for time slots rendering.

Special time regions

Restrict the user interaction such as selection and highlights specific regions of time in day, week, work week views by adding the `SpecialTimeRegions` property of `SfScheduler`. Set the `StartTime` and `EndTime` properties of `SpecialTimeRegion` to create a `SpecialTimeRegion`, use the `timeZone` property to set the specific timezone for Start and end time of `SpecialTimeRegion`. The `SpecialTimeRegion` will display the text or image on it that set to the text or icon property of `SpecialTimeRegion`.

Enable merges adjacent region of `SpecialTimeRegion` and show them as a single region instead of showing them separately for each day using the `CanMergeAdjacentRegions` property of `SpecialTimeRegion` in the week and workweek views. By default, its value is false.

Selection restriction in timeslots

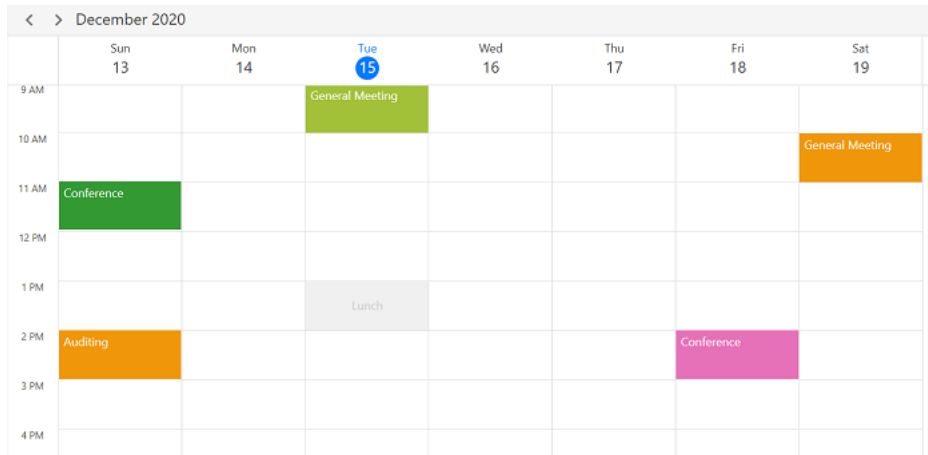

Enable or disable the touch interaction of `SpecialTimeRegion` using the `CanEdit` property of `SpecialTimeRegion`. By default, its value is true.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week" >
  <syncfusion:SfScheduler.DaysViewSettings>
    <syncfusion:DaysViewSettings>
      <syncfusion:DaysViewSettings.SpecialTimeRegions>
        <syncfusion:SpecialTimeRegion
          StartTime="2020/12/15 13:0:0"
          EndTime="2020/12/15 14:0:0"
          CanEdit="False"
          Text="Lunch"
          Background="Gray"
          Foreground="White"/>
      </syncfusion:DaysViewSettings.SpecialTimeRegions>
    </syncfusion:DaysViewSettings>
  </syncfusion:SfScheduler.DaysViewSettings>
</syncfusion:SfScheduler>
```

C#

```
Schedule.DaysViewSettings.SpecialTimeRegions.Add(new SpecialTimeRegion
{
    StartTime = new System.DateTime(2020, 12, 15, 13, 0, 0),
    EndTime = new System.DateTime(2020, 12, 15, 14, 0, 0),
    Text = "Lunch",
    CanEdit = false,
    Background = Brushes.Black,
    Foreground = Brushes.White
});
```

**Note: NOTE**

This property only restricts the interaction on region and it does not restrict the following:

- Programmatic selection (if the user updates the selected date value dynamically)
- Does not clear the selection when the user selects the region and dynamically change

the `CanEdit` property to false

- It does not restrict appointment interaction when the appointment placed

in the region

- It does not restrict the appointment rendering on a region, when appointments are loaded from data services or adding programmatically.

Recurring time region

The recurring time region on a daily, weekly, monthly, or yearly interval. The recurring special time regions can be created by setting the [RecurrenceRule](#) property in [SpecialTimeRegion](#).

Enable merges adjacent region of `SpecialTimeRegion` and show them as a single region instead of showing them separately for each day using the [CanMergeAdjacentRegions](#) property of [SpecialTimeRegion](#) in the week and workweek views. By default, its value is false.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
  <syncfusion:SfScheduler.DaysViewSettings>
    <syncfusion:DaysViewSettings>
      <syncfusion:DaysViewSettings.SpecialTimeRegions>
        <syncfusion:SpecialTimeRegion
          StartTime="2020/12/13 13:0:0"
          EndTime="2020/12/13 14:0:0"
          CanEdit="False"
          Text="Lunch"
          CanMergeAdjacentRegions="True"
          RecurrenceRule="FREQ=DAILY;INTERVAL=1"/>
        </syncfusion:DaysViewSettings.SpecialTimeRegions>
      </syncfusion:DaysViewSettings>
    </syncfusion:SfScheduler.DaysViewSettings>
  </syncfusion:SfScheduler>
```

```

</syncfusion:DaysViewSettings>
</syncfusion:SfScheduler.DaysViewSettings>
</syncfusion:SfScheduler>

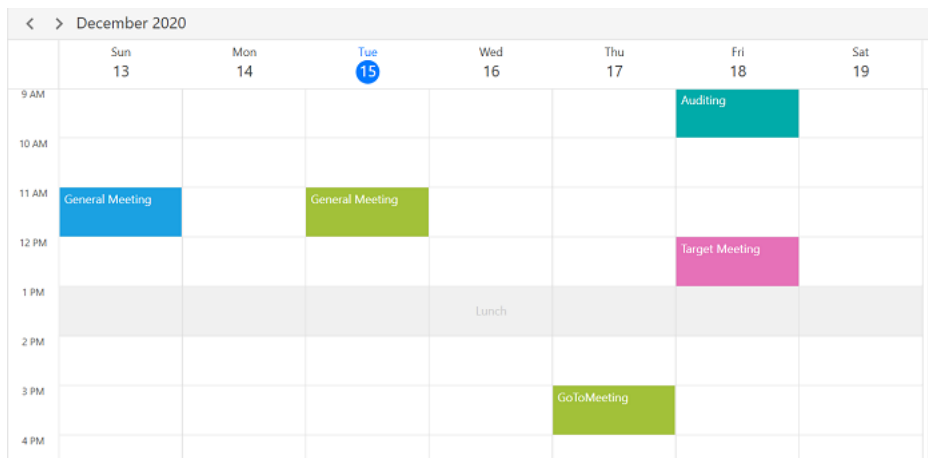

```

C#

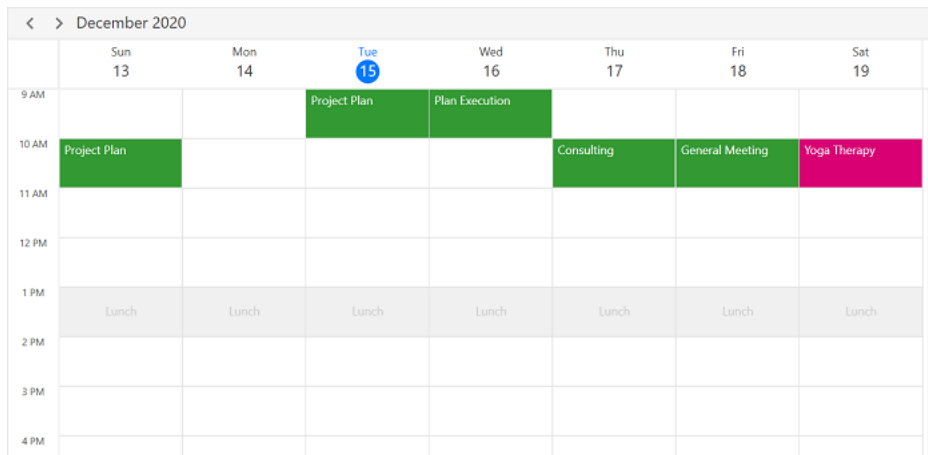

```

Schedule.ViewType = SchedulerViewType.Week;
Schedule.DaysViewSettings.SpecialTimeRegions.Add(new SpecialTimeRegion
{
    StartTime = new System.DateTime(2020, 12, 13, 13, 0, 0),
    EndTime = new System.DateTime(2020, 12, 13, 14, 0, 0),
    Text = "Lunch",
    CanEdit = false,
    Background = Brushes.Black,
    Foreground = Brushes.White,
    CanMergeAdjacentRegions=true,
    RecurrenceRule = "FREQ=DAILY;INTERVAL=1"
});

```

If the [CanMergeAdjacentRegions](#) of [SpecialTimeRegion](#) is set to false. The SpecialTimeRegion will be rendering on Date basis.

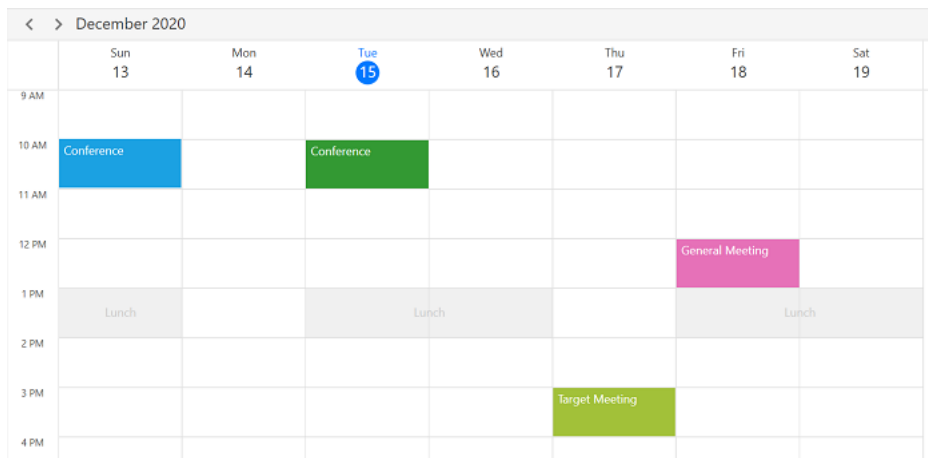

Recurrence exception dates

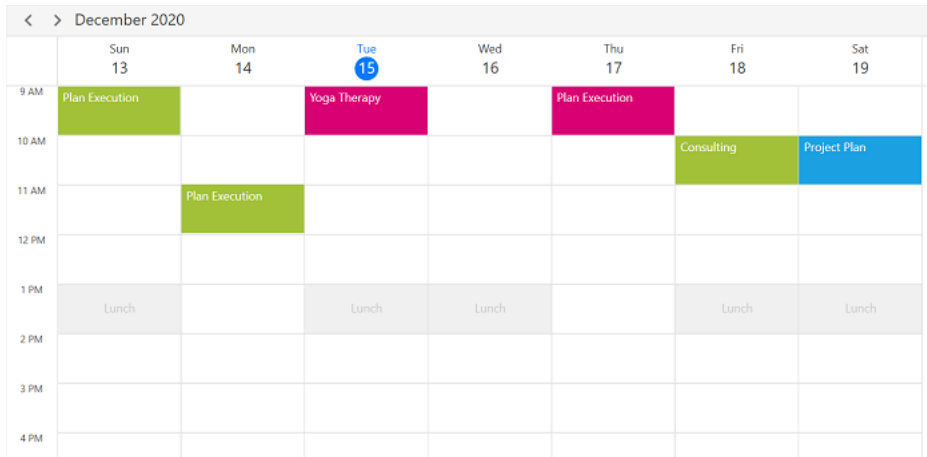

Delete any of the occurrence that is an exception from the recurrence pattern time region by using the [RecurrenceExceptionDates](#) property of [SpecialTimeRegion](#). The deleted occurrence date will be considered as a recurrence exception date.

C#

```
Schedule.ViewType = SchedulerViewType.Week;
DateTime recurrenceExceptionDates = DateTime.Now.Date.AddDays(-1);
DateTime recurrenceExceptionDates1 = DateTime.Now.Date.AddDays(2);
Schedule.DaysViewSettings.SpecialTimeRegions.Add(new SpecialTimeRegion
{
    StartTime = new System.DateTime(2020, 12, 13, 13, 0, 0),
    EndTime = new System.DateTime(2020, 12, 13, 14, 0, 0),
    Text = "Lunch",
    CanEdit = false,
    RecurrenceRule = "FREQ=DAILY; INTERVAL=1",
    CanMergeAdjacentRegions= true,
    Background = Brushes.Black,
    Foreground = Brushes.White,
    RecurrenceExceptionDates = new ObservableCollection<DateTime>()
    {
        recurrenceExceptionDates,
        recurrenceExceptionDates1,
    }
});
```

The [SpecialTimeRegion](#) in Date basis by setting the value of [CanMergeAdjacentRegions](#) is false.

Special time region customization

The `SpecialTimeRegion` background color can be customized by using the `Background` and `SpecialTimeRegionTemplate` properties of `SpecialTimeRegion` that is used to customize the text style for the image of the `SpecialTimeRegion`.

XML

```
<Window.Resources>
<DataTemplate x:Key="specialRegionTemplate">
<Grid Background="{Binding Background}"
Opacity="0.5"
HorizontalAlignment="Stretch"
VerticalAlignment="Stretch">
<Path x:Name="Fork" Data="M11,0 C11.553001,0 12,0.4469986 12,1 L12,15
C12,15.553001 11.553001,16 11,16 10.446999,16 10,15.553001 10,15 L10,7 9,7
C8.4469986,7 8,6.5530014 8,6 L8,3 C8,1.3429985 9.3429985,0 11,0 z M0,0 L1,0
1.2340002,4 1.7810001,4 2,0 3,0 3.2340002,4 3.7810001,4 4,0 5,0 5,4

HorizontalAlignment="Center" Height="16" Stretch="Fill"
VerticalAlignment="Center" Width="12"/>
</Grid>
</DataTemplate>
</Window.Resources>
```

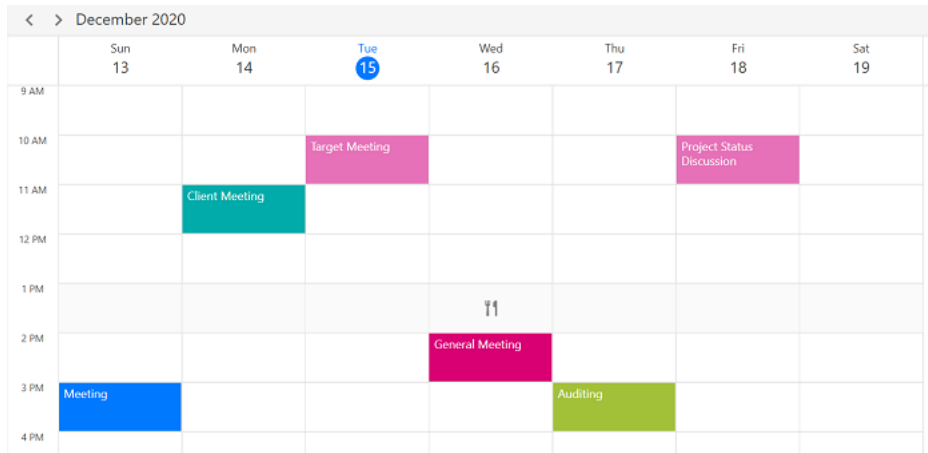

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
<syncfusion:SfScheduler.DaysViewSettings>
<syncfusion:DaysViewSettings SpecialTimeRegionTemplate="{StaticResource
specialRegionTemplate}">
<syncfusion:DaysViewSettings.SpecialTimeRegions>
<syncfusion:SpecialTimeRegion
StartTime="2020/12/13 13:0:0"
EndTime="2020/12/13 14:0:0"
CanEdit="False"
RecurrenceRule="FREQ=DAILY;INTERVAL=1"
CanMergeAdjacentRegions="True"
```

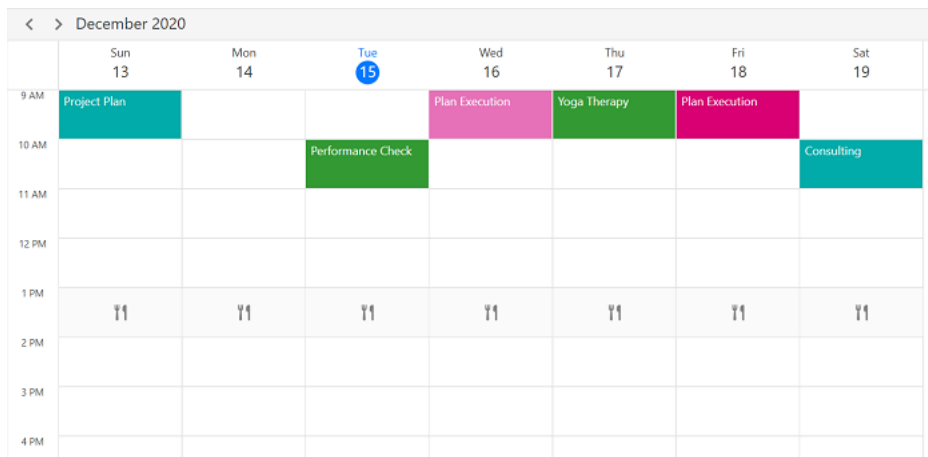

```

Foreground="Black"
Background="#FFF5F5F5"/>
</syncfusion:DaysViewSettings.SpecialTimeRegions>
</syncfusion:DaysViewSettings>
</syncfusion:SfScheduler.DaysViewSettings>

```

The [SpecialTimeRegion](#) can be customized in a Date basis by setting the value of [CanMergeAdjacentRegions](#) is false.

Full screen scheduler

Scheduler time interval height can be adjusted based on screen height by changing the value of [TimeIntervalSize](#) property to -1. It will auto-fit to the screen height and width.

XML

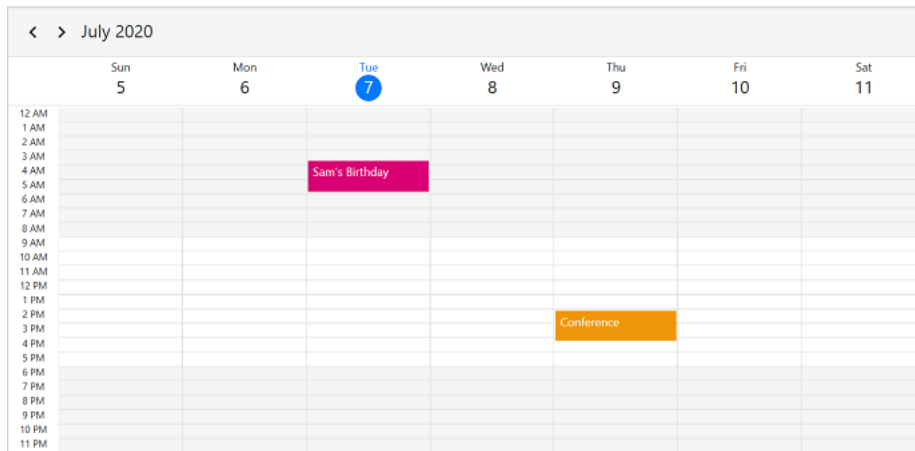

```

<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
<syncfusion:SfScheduler.DaysViewSettings>
<syncfusion:DaysViewSettings
TimeIntervalSize="-1"/>
</syncfusion:SfScheduler.DaysViewSettings>
</syncfusion:SfScheduler>

```

C#

```
Schedule.ViewType = SchedulerViewType.Week;
Schedule.DaysViewSettings.TimeIntervalSize = -1;
```

Change time ruler size

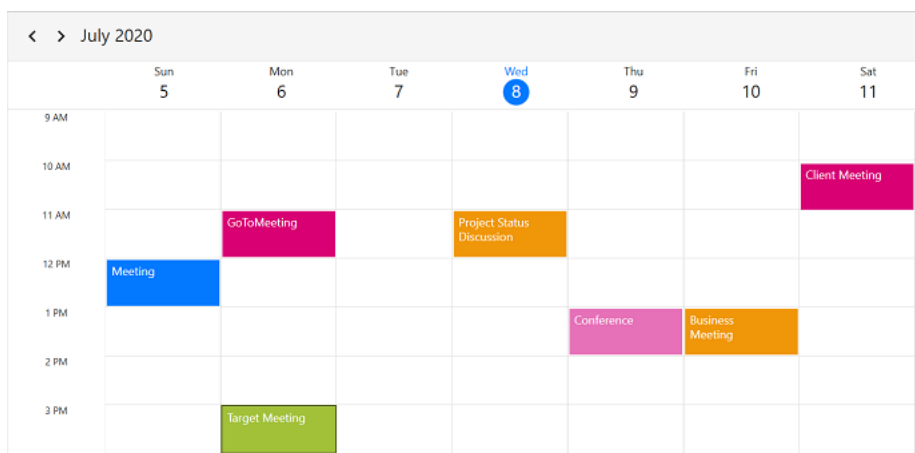

Customize the size of the time ruler view where the labels mentioning the time are placed by using the [TimeRulerSize](#) property of `DayViewSettings`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week" >
  <syncfusion:SfScheduler.DaysViewSettings>
    <syncfusion:DaysViewSettings
      TimeRulerSize="100">
    </syncfusion:DaysViewSettings>
  </syncfusion:SfScheduler.DaysViewSettings>
</syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.Week;
Schedule.DaysViewSettings.TimeRulerSize = 100;
```

Minimum appointment duration

The [MinimumAppointmentDuration](#) property in [DayViewSettings](#) is to set an arbitrary height to appointments when it has minimum duration in day, week, work week views, so that the subject can be readable.

C#

```
Schedule.ViewType = SchedulerViewType.Week;
Schedule.DaysViewSettings.MinimumAppointmentDuration = new
System.TimeSpan(0, 120, 0);
```

Note: NOTE

- The [MinimumAppointmentDuration](#) value will be set, when an appointment duration value lesser than [MinimumAppointmentDuration](#).
- Appointment duration value will be set, when the appointment duration value greater than [MinimumAppointmentDuration](#).
- [TimeInterval](#) value will be set, when [MinimumAppointmentDuration](#) greater than [TimeInterval](#) with lesser appointment duration.
- All day Appointment does not support [MinimumAppointmentDuration](#).

Minimum display appointments count in all day panel

You can customize the number of appointments displayed in an all-day panel using the [MinimumAllDayAppointmentsCount](#) property of [DaysViewSettings](#) in the Scheduler. By default, the appointment display count is 2, and all-day panels have more than 2 appointments, two appointments will be displayed and the remaining appointments will be displayed as appointment counts.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
<syncfusion:SfScheduler.DaysViewSettings>
<syncfusion:DaysViewSettings MinimumAllDayAppointmentsCount="3"/>
</syncfusion:SfScheduler.DaysViewSettings>
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.ViewType = SchedulerViewType.Week;
this.Schedule.DaysViewSettings.MinimumAllDayAppointmentsCount = 3;
```

Customize more appointments indicator in all day panel

You can customize the default appearance of more appointments indicator in the all-day panel by using the [AllDayMoreAppointmentsIndicatorTemplate](#) property of [DaysViewSettings](#).

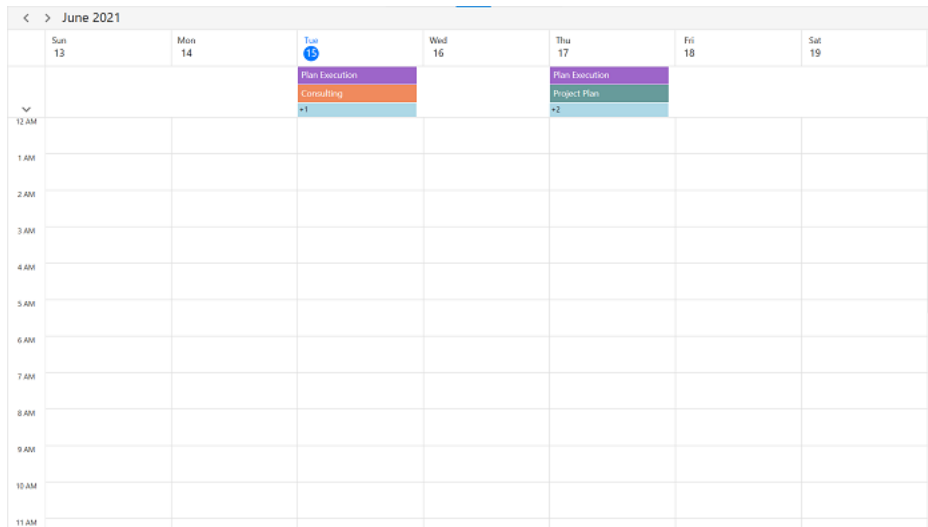

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
<syncfusion:SfScheduler.DaysViewSettings>
<syncfusion:DaysViewSettings>
<syncfusion:DaysViewSettings.AllDayMoreAppointmentsIndicatorTemplate>
<DataTemplate >
```

```

<TextBlock Text="{Binding StringFormat=+{0}}" Background="LightBlue"
Foreground="Black"
HorizontalAlignment="Stretch" TextAlignment="Left"
VerticalAlignment="Stretch" Padding="2,3,0,0">
</TextBlock>
</DataTemplate>
</syncfusion:DaysViewSettings.AllDayMoreAppointmentsIndicatorTemplate>
</syncfusion:DaysViewSettings>
</syncfusion:SfScheduler.DaysViewSettings>
</syncfusion:SfScheduler>

```

Time text formatting

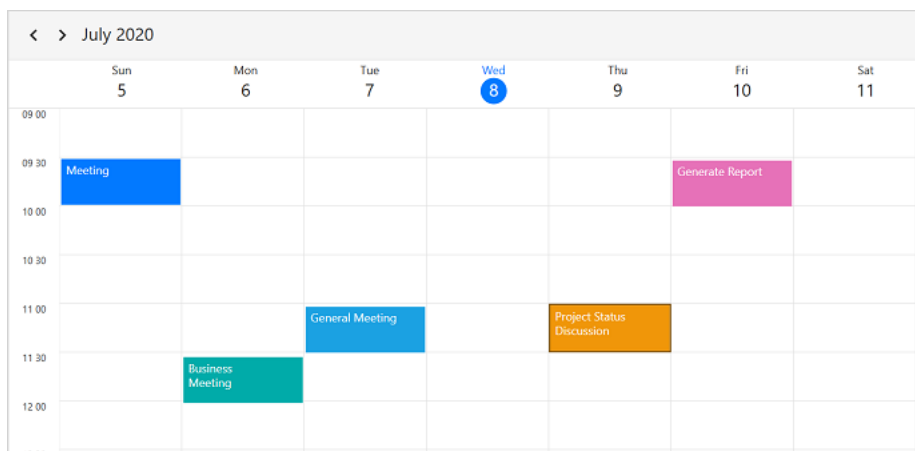

Customize the format for the labels mentioning the time, by setting the [TimeRulerFormat](#) property of [DayViewSettings](#) in [Scheduler](#).

C#

```

Schedule.ViewType = SchedulerViewType.Week;
Schedule.DaysViewSettings.TimeRulerFormat = "hh mm";
Schedule.DaysViewSettings.TimeInterval = new System.TimeSpan(0, 30, 0);

```

Note:

- You can customize the appointment editor time format based on scheduler time ruler format and culture.
- By default, the scheduler time ruler format is `h tt` and the appointment editor time picker format is `hh:mm tt`.

View header

Customize the default appearance of view header in day, week, work week views by setting [ViewHeaderDateFormat](#), [ViewHeaderHeight](#), [ViewHeaderDayFormat](#) and [ViewHeaderTemplate](#) of [DaysViewSettings](#).

View header text formatting

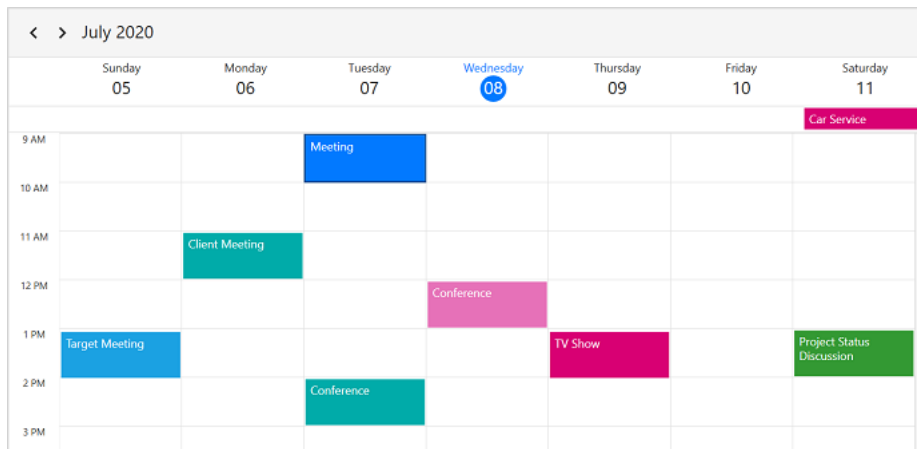

Customize the date and day format of ViewHeader by using the [ViewHeaderDateFormat](#) and [ViewHeaderDayFormat](#) properties of [DaysViewSettings](#).

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
  <syncfusion:SfScheduler.DaysViewSettings>
    <syncfusion:DaysViewSettings
      ViewHeaderDayFormat="dddd"
      ViewHeaderDateFormat="dd"/>
    </syncfusion:SfScheduler.DaysViewSettings>
  </syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.Week;
Schedule.DaysViewSettings.ViewHeaderDateFormat = "dd";
Schedule.DaysViewSettings.ViewHeaderDayFormat = "dddd";
```

View header height

Customize the height of the ViewHeader in a day, week, work week views by setting [ViewHeaderHeight](#) property of [DaysViewSettings](#) in [SfScheduler](#).

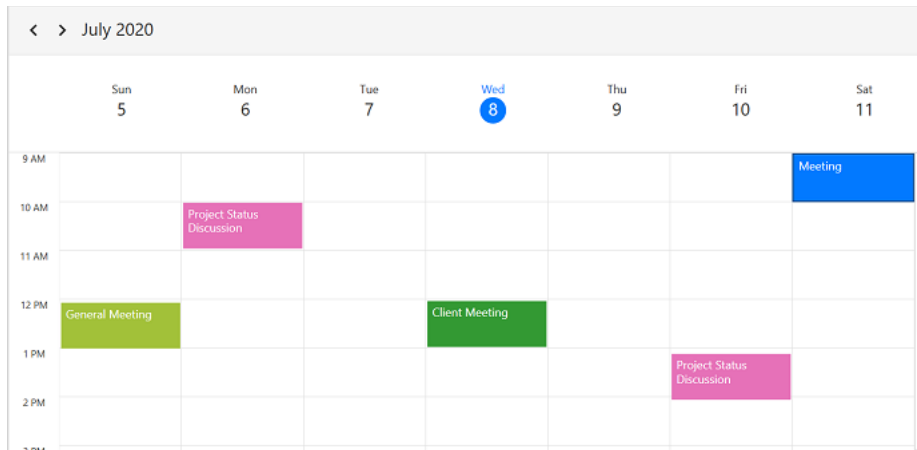

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
  <syncfusion:SfScheduler.DaysViewSettings>
```

```
<syncfusion:DaysViewSettings
ViewHeaderHeight="100"/>
</syncfusion:SfScheduler.DaysViewSettings>
</syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.Week;
Schedule.DaysViewSettings.ViewHeaderHeight = 100;
```

*View header appearance customization*

Customize the default appearance of view header by setting **ViewHeaderTemplate** property of **DaysViewSettings** in **SfScheduler**.

XML

```
<Window.Resources>
<DataTemplate x:Key="viewHeaderTemplate">
<StackPanel Background="Green"
Width="2000"
VerticalAlignment="Stretch"
HorizontalAlignment="Stretch"
Orientation="Vertical">
<TextBlock
HorizontalAlignment="Left"
Margin="20,0,0,0"
Foreground="#FFFFFF"
FontFamily="Arial"
Text="{Binding DateText}"
FontSize="25"
TextTrimming="CharacterEllipsis"
TextWrapping="Wrap" />
<TextBlock
HorizontalAlignment="Left" Margin="20,0,0,0"
Foreground="#FFFFFF"
FontFamily="Arial"
Text="{Binding DayText}"
FontSize="10"
TextTrimming="CharacterEllipsis"
TextWrapping="Wrap" />
```

```

</StackPanel>
</DataTemplate>
</Window.Resources>

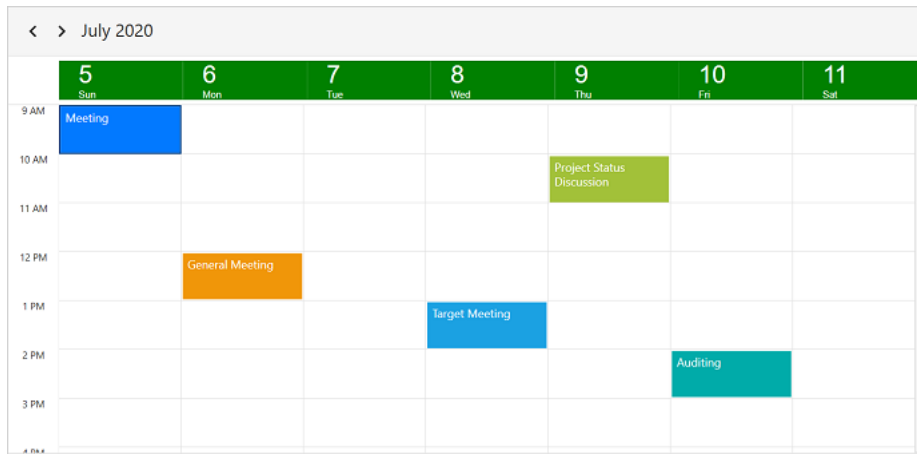

```

XML

```

<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
<syncfusion:SfScheduler.DaysViewSettings>
<syncfusion:DaysViewSettings
ViewHeaderTemplate="{StaticResource viewHeaderTemplate}" />
</syncfusion:SfScheduler.DaysViewSettings>
</syncfusion:SfScheduler>

```

Note: You can refer to our [WPF Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Timeline Views in WPF Scheduler (SfScheduler)

The **TimelineView** displays the dates in horizontal time axis with the desired day's count. Scheduler supports to display the **TimelineDay**, **TimelineWeek**, **TimelineWorkWeek**, and **TimelineMonth** views. See the past or future dates by scrolling to the right or left. Each view displays the events accurately across the time slots with an intuitive drag-and-drop feature. It provides the support to highlight the selected region of time slots and handle the interaction.

Change time interval

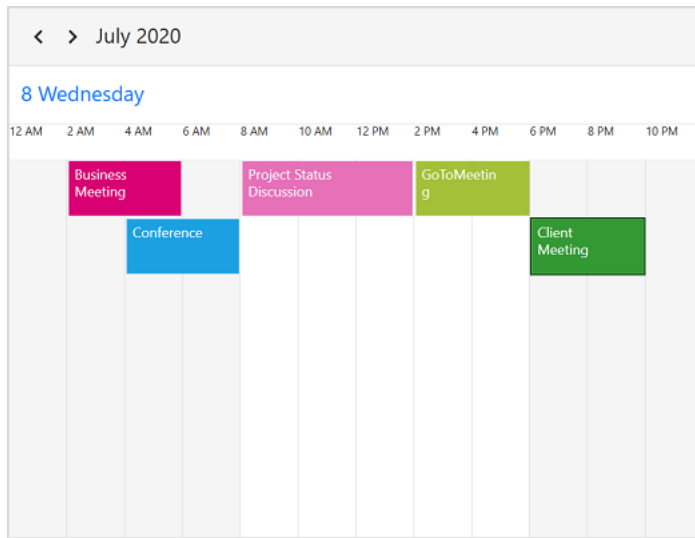

Customize the interval of timeslots in the timeline views by using the [TimeInterval](#) property of [TimelineViewSettings](#). This property will be applicable to **TimelineDay**, **TimelineWeek**, and **TimelineWorkWeek** views.

C#

```

Schedule.ViewType = SchedulerViewType.TimelineWeek;
Schedule.TimelineViewSettings.TimeInterval = new TimeSpan(0, 120, 0);

```

Note: If the `timeInterval` value (in minutes) is modified, change the time labels format by setting the `timeFormat` value to `hh:mm`.

Change time interval width

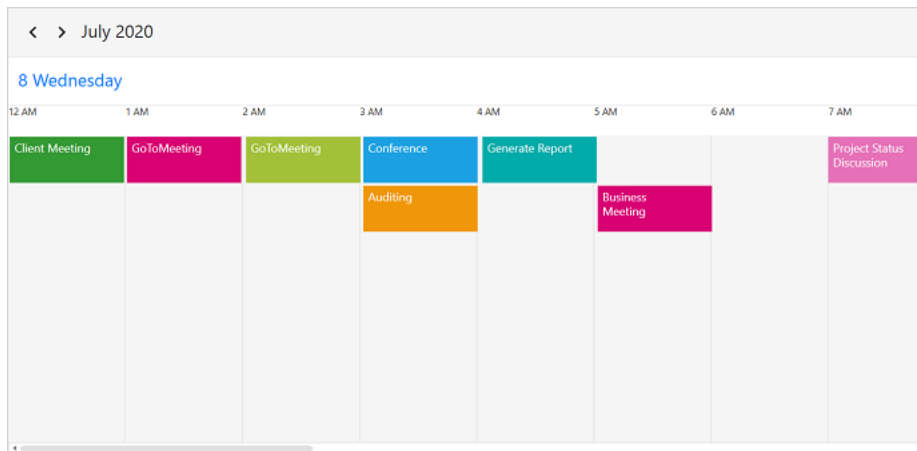

Customize the interval width of timeslots in the Timeline views by setting the [TimeIntervalSize](#) property of `TimelineViewSettings`. This property will be applicable to all timeline views. By default, its value is fifty for the `TimelineDay`, `TimelineWeek`, and `TimelineWorkWeek` views and 150 for `TimelineMonth` view.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
    ViewType="TimelineWeek">
    <syncfusion:SfScheduler.TimelineViewSettings>
    <syncfusion:TimelineViewSettings
        TimeIntervalSize="120"/>
    </syncfusion:SfScheduler.TimelineViewSettings>
</syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWeek;
Schedule.TimelineViewSettings.TimeIntervalSize = 120;
```

Flexible working days and working hours

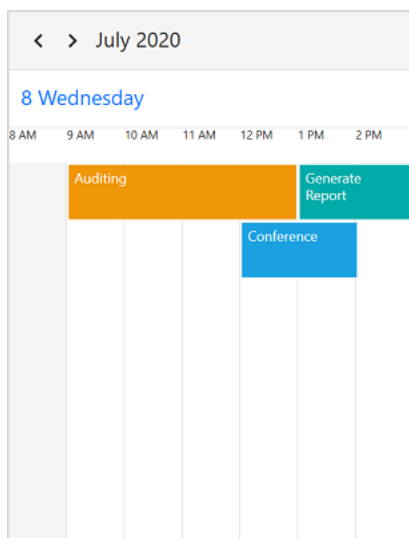

The default values for the [StartHour](#) and [EndHour](#) are 0 and 24 to show all the time slots in a timeline view. Set the [StartHour](#) and [EndHour](#) properties of [TimelineViewSettings](#) to show only the required time duration for users. Set the [StartHour](#) and [EndHour](#) in time duration to show the required time duration in minutes. The [StartHour](#) and [EndHour](#) properties are not applicable to the [TimelineMonth](#) view.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="TimelineWeek">
  <syncfusion:SfScheduler.TimelineViewSettings>
    <syncfusion:TimelineViewSettings
      StartHour="8"
      EndHour="15"/>
    </syncfusion:SfScheduler.TimelineViewSettings>
  </syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWeek;
Schedule.TimelineViewSettings.StartHour = 8;
Schedule.TimelineViewSettings.EndHour = 15;
```

**Note:**

- The [NonWorkingDays](#) property will be applicable only for `workWeek` and `TimelineWorkWeek` views only, and not applicable for the remaining views.
- Scheduler Appointments UI, which does not fall within the `StartHour` and `EndHour` will not be visible and if it falls partially, it will be clipped.
- No need to specify the decimal point values for `StartHour` and `EndHour`, if you don't want to set the minutes.
- The number of time slots will be calculated based on the total minutes of a day and time interval ($\text{total minutes of a day} ((\text{start hour} - \text{end hour}) * 60) / \text{time interval}$).
- If the custom `timeInterval` is given, then the number of time slots calculated based on the given `TimeInterval` should result in integer value ($\text{total minutes} \% \text{timeInterval} = 0$), otherwise next immediate time interval that result in the integer value divided by the total minutes of a day will be considered. For example, if `TimeInterval` = 2 Hours 15 minutes and total minutes = 1440 (24 Hours per day), then `TimeInterval` will be changed to '144' ($1440 \% 144 = 0$) by considering ($\text{total minutes} \% \text{TimeInterval} = 0$), it will return integer value for time slots rendering.
- If the custom `StartHour` and `EndHour` are given, then the number of time slots calculated based on given `StartHour` and `EndHour` should result in the integer value, otherwise next immediate `TimeInterval` will be considered until the result is the integer value. For example, if `StartHour` is 9 (09:00AM), `EndHour` is 18.25 (06:15 PM), `TimeInterval` is 30 minutes, and total minutes = 555 ($(18.25 - 9) * 60$), then the `TimeInterval` will be changed to '37 minutes' ($555 \% 37 = 0$) by considering ($\text{total minutes} \% \text{timeInterval} = 0$). It will return the integer value for time slots rendering.

Change days count

Change the day's count of timeslots in the timeline view by setting the [DaysCount](#) property of `TimelineViewSettings`. This property is only applicable for the `TimelineDay` view. By default, it's value is set to 1.

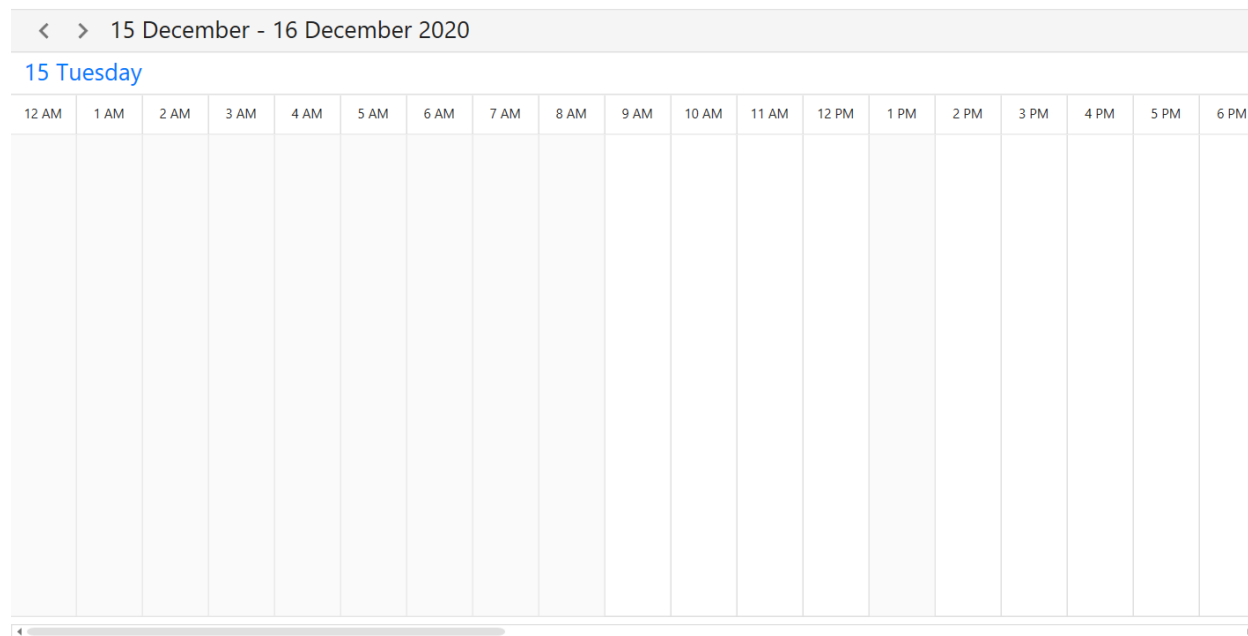

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="TimelineDay">
  <syncfusion:SfScheduler.TimelineViewSettings>
```

```
<syncfusion:TimelineViewSettings
DaysCount="2"/>
</syncfusion:SfScheduler.TimelineViewSettings>
</syncfusion:SfScheduler>
```

C#

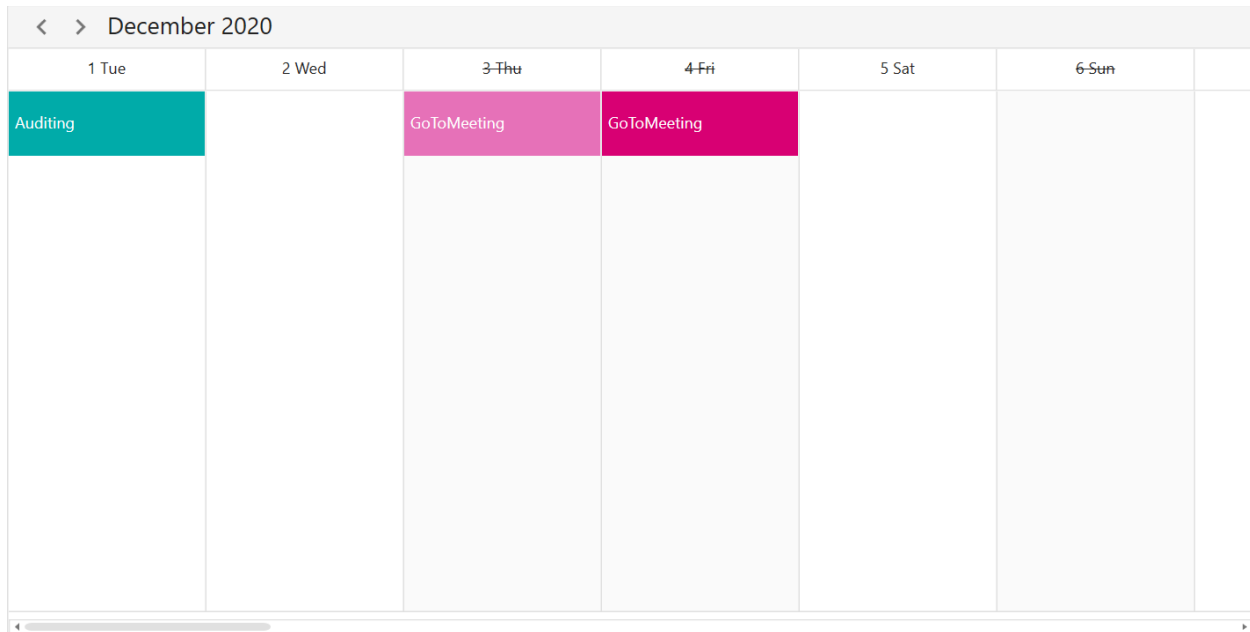

```
Schedule.ViewType = SchedulerViewType.TimelineDay;
Schedule.TimelineViewSettings.DaysCount = 2;
```

**Blackout dates**

Disable the interaction for certain dates in the scheduler **TimelineMonth** view by adding those specific dates to the [BlackoutDates](#) collection property of **SfScheduler**. Using this, allocate or restrict the specific dates for predefined events. This property is not applicable to the **TimelineDay**, **TimelineWeek**, and **TimelineWorkWeek** views.

C#

```
this.Schedule.ViewType = SchedulerViewType.Month;
this.Schedule.BlackoutDates = GetBlackoutDates();
private ObservableCollection<DateTime> GetBlackoutDates()
{
    var blackoutDateCollection = new ObservableCollection<DateTime>()
    {
        DateTime.Now.Date.AddDays(1),
        DateTime.Now.Date.AddDays(3),
        DateTime.Now.Date.AddDays(5),
        DateTime.Now.Date.AddDays(7),
        DateTime.Now.Date.AddDays(9)
    };
    return blackoutDateCollection;
}
```

Special time regions

Restrict the user interaction such as selection and highlights specific regions of time in the timeline views by adding the [SpecialTimeRegions](#) property of [SfScheduler](#). Set the [StartTime](#) and [EndTime](#) properties of [SpecialTimeRegion](#) to create a [SpecialTimeRegion](#), use the [timeZone](#) property to set the specific timezone for the start and end time of the [SpecialTimeRegion](#). The [SpecialTimeRegion](#) will display the text or image on it that is set to the text or icon property of [SpecialTimeRegion](#). This property will be applicable to the [TimelineDay](#), [TimelineWeek](#), and [TimelineWorkWeek](#) views.

Selection restriction in timeslots

Enable or disable the touch interaction of [SpecialTimeRegion](#) using the [CanEdit](#) property of [SpecialTimeRegion](#). By default, it's value is true.

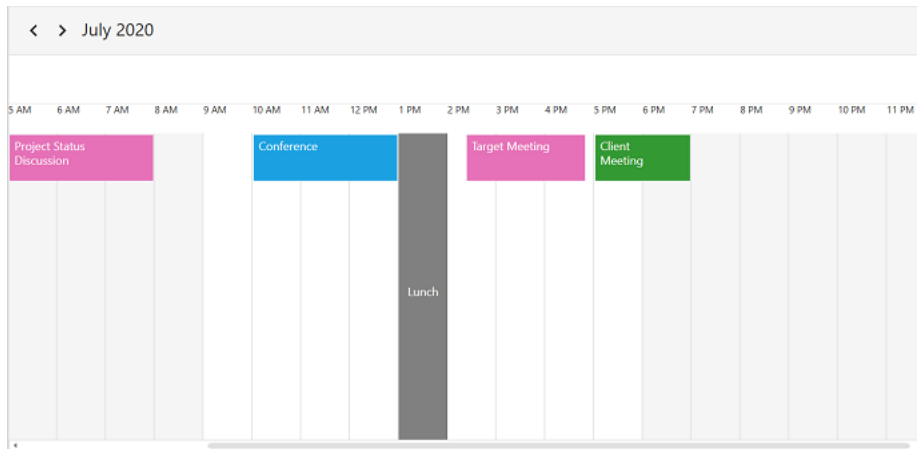

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="TimelineWeek" >
  <syncfusion:SfScheduler.TimelineViewSettings>
    <syncfusion:TimelineViewSettings>
      <syncfusion:TimelineViewSettings.SpecialTimeRegions>
        <syncfusion:SpecialTimeRegion
          StartTime="2020/07/08 13:0:0"
          EndTime="2020/07/08 14:0:0"
          CanEdit="False"
          Text="Lunch"
          Background="Black"
          Foreground="White"/>
      </syncfusion:TimelineViewSettings.SpecialTimeRegions>
    </syncfusion:TimelineViewSettings>
  </syncfusion:SfScheduler.TimelineViewSettings>
</syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWeek;
```

```
Schedule.TimelineViewSettings.SpecialTimeRegions.Add(new SpecialTimeRegion
{
    StartTime = new System.DateTime(2020, 07, 08, 13, 0, 0),
    EndTime = new System.DateTime(2020, 07, 08, 14, 0, 0),
    Text = "Lunch",
    CanEdit = false,
    Background = Brushes.Black,
    Foreground = Brushes.White
});
```

**Note:**

This property only restricts the interaction on region and it does not restrict the following:

- Programmatic selection (if the user updates the selected date value dynamically).
- Does not clear the selection when the user selects the region and dynamically change the `CanEdit` property to false.
- It does not restrict appointment interaction when the appointment is placed in the region.
- It does not restrict the appointment rendering on a region, when appointments are loaded from data services or adding programmatically.

Recurring time region

The recurring time region on a daily, weekly, monthly, or yearly interval. The recurring special time regions can be created by setting the [RecurrenceRule](#) property in `SpecialTimeRegion`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="TimelineWorkWeek" >
  <syncfusion:SfScheduler.TimelineViewSettings>
    <syncfusion:TimelineViewSettings>
      <syncfusion:TimelineViewSettings.SpecialTimeRegions>
        <syncfusion:SpecialTimeRegion
          StartTime="2020/07/08 13:0:0"
          EndTime="2020/07/08 14:0:0"
          CanEdit="False"
          Text="Lunch"
          Background="Black"
          Foreground="White"
          RecurrenceRule="FREQ=DAILY; INTERVAL=1" />
      </syncfusion:SpecialTimeRegions>
    </syncfusion:TimelineViewSettings>
  </syncfusion:SfScheduler.TimelineViewSettings>
</syncfusion:SfScheduler>
```

```
</syncfusion:TimelineViewSettings.SpecialTimeRegions>
</syncfusion:TimelineViewSettings>
</syncfusion:SfScheduler.TimelineViewSettings>
</syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWorkWeek;
Schedule.TimelineViewSettings.SpecialTimeRegions.Add(new SpecialTimeRegion
{
    StartTime = new System.DateTime(2020, 07, 08, 13, 0, 0),
    EndTime = new System.DateTime(2020, 07, 08, 14, 0, 0),
    Text = "Lunch",
    CanEdit = false,
    Background = Brushes.Black,
    Foreground = Brushes.White,
    RecurrenceRule= "FREQ=DAILY; INTERVAL=1"
});
```

Recurrence exception dates

Delete any of occurrence that is an exception from the recurrence pattern time region by using the [RecurrenceExceptionDates](#) property of [SpecialTimeRegion](#). The deleted occurrence date will be considered as a recurrence exception date.

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWeek;
DateTime recurrenceExceptionDates = new DateTime(2020, 07, 06, 10, 0, 0);
DateTime recurrenceExceptionDates1 = new DateTime(2020, 07, 08, 10, 0, 0);
DateTime recurrenceExceptionDates2 = new DateTime(2020, 07, 10, 10, 0, 0);
Schedule.TimelineViewSettings.SpecialTimeRegions.Add(new SpecialTimeRegion
{
    StartTime = new System.DateTime(2020, 05, 05, 12, 0, 0),
    EndTime = new System.DateTime(2020, 05, 05, 13, 0, 0),
    Text = "Lunch",
    CanEdit = false,
    Background = Brushes.Black,
    Foreground = Brushes.White,
    RecurrenceRule = "FREQ=DAILY; INTERVAL=1",
    RecurrenceExceptionDates = new ObservableCollection<DateTime>()
    {
        recurrenceExceptionDates,
        recurrenceExceptionDates1,
        recurrenceExceptionDates2,
    }
});
```

Special time region customization

The [SpecialTimeRegion](#) background color can be customized by using the [Background](#) and [SpecialTimeRegionTemplate](#) properties of [SpecialTimeRegion](#) that is used to customize the text style for the image of the [SpecialTimeRegion](#).

XML

```

<Window.Resources>
<DataTemplate x:Key="specialRegionTemplate">
<Grid Background="{Binding Background}"
HorizontalAlignment="Stretch"
VerticalAlignment="Stretch">
<Image x:Name="Image"
HorizontalAlignment="Center"
VerticalAlignment="Center"
Source="../../Image/Fork.png"/>
</Grid>
</DataTemplate>
</Window.Resources>

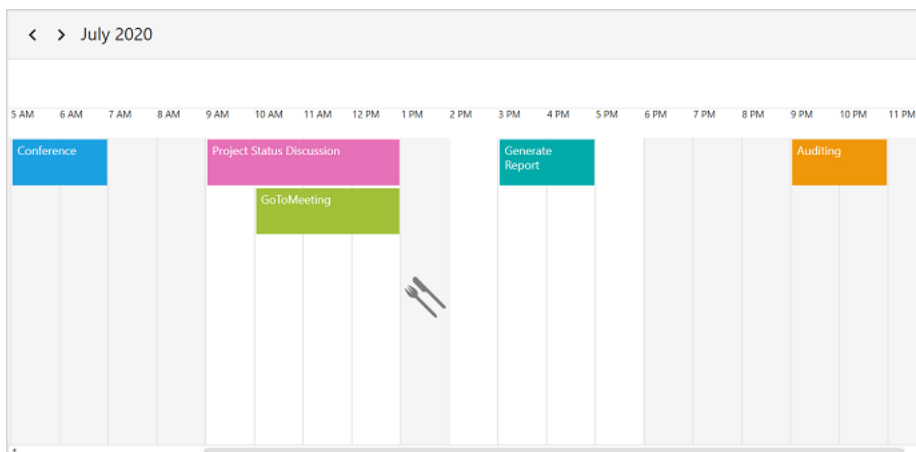

```

XML

```

<syncfusion:SfScheduler x:Name="Schedule" ViewType="TimelineWeek">
<syncfusion:SfScheduler.TimelineViewSettings>
<syncfusion:TimelineViewSettings
SpecialTimeRegionTemplate="{StaticResource specialRegionTemplate}">
<syncfusion:TimelineViewSettings.SpecialTimeRegions>
<syncfusion:SpecialTimeRegion
StartTime="01/01/2020 13:0:0"
EndTime="01/01/2020 14:0:0"
CanEdit="False"
Text="LUNCH"
RecurrenceRule="FREQ=DAILY;INTERVAL=1"
Foreground="Black"
Background="#FFF5F5F5"/>
</syncfusion:TimelineViewSettings.SpecialTimeRegions>
</syncfusion:TimelineViewSettings>
</syncfusion:SfScheduler.TimelineViewSettings>
</syncfusion:SfScheduler>

```

Full screen scheduler

Scheduler time interval height can be adjusted based on screen height by changing the value of [TimeIntervalSize](#) property to -1. It will auto-fit to the screen height and width.

XML

```

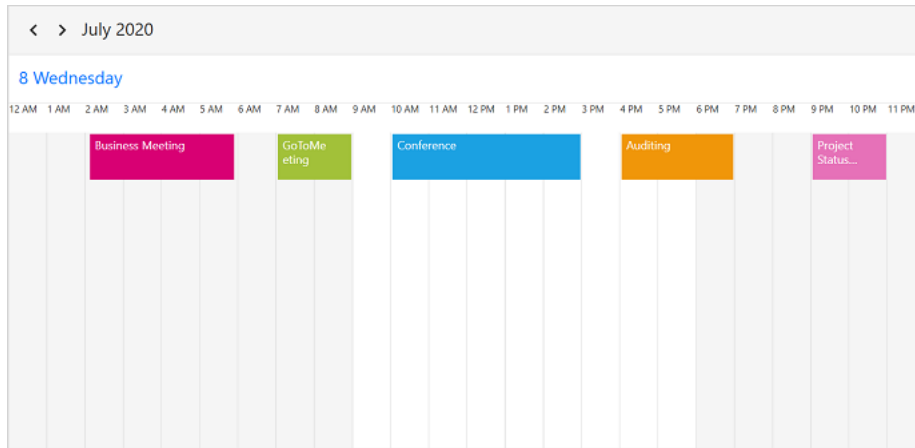

<syncfusion:SfScheduler x:Name="Schedule" ViewType="TimelineWeek">

```

```
<syncfusion:SfScheduler.TimelineViewSettings>
<syncfusion:TimelineViewSettings
TimeIntervalSize="-1"/>
</syncfusion:SfScheduler.TimelineViewSettings>
</syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWeek;
Schedule.TimelineViewSettings.TimeIntervalSize = -1;
```

**Change time ruler size**

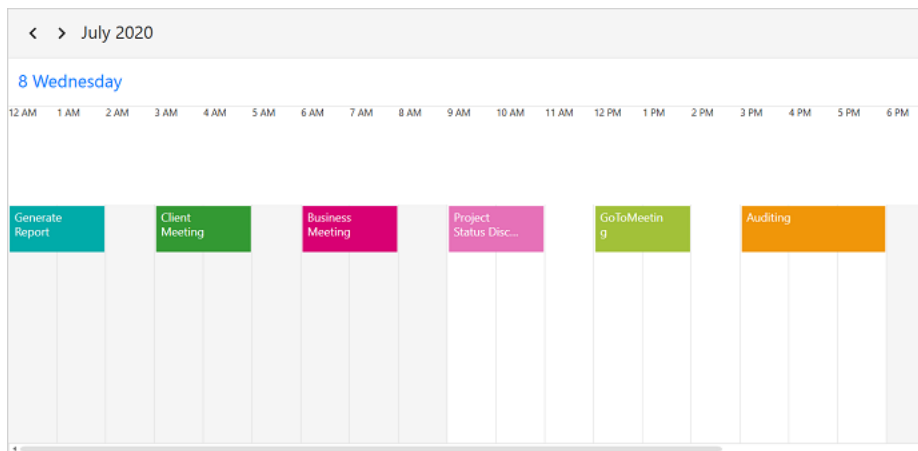

Customize the size of the time ruler view where the labels mentioning the time are placed by using the [TimeRulerSize](#) property of [TimelineViewSettings](#). This property will be applicable to [TimelineDay](#), [TimelineWeek](#), and [TimelineWorkWeek](#) views.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="TimelineWeek" >
<syncfusion:SfScheduler.TimelineViewSettings>
<syncfusion:TimelineViewSettings
TimeRulerSize="100">
</syncfusion:TimelineViewSettings>
</syncfusion:SfScheduler.TimelineViewSettings>
</syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWeek;
Schedule.TimelineViewSettings.TimeRulerSize = 100;
```

Minimum appointment duration

The [MinimumAppointmentDuration](#) property in the [TimelineViewSettings](#) is to set an arbitrary height to appointments when it has a minimum duration in timeline view so that the subject can be readable. This property will not be applicable for the [TimelineMonth](#) view.

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWeek;
Schedule.TimelineViewSettings.MinimumAppointmentDuration = new
System.TimeSpan(0, 120, 0);
```

Note:

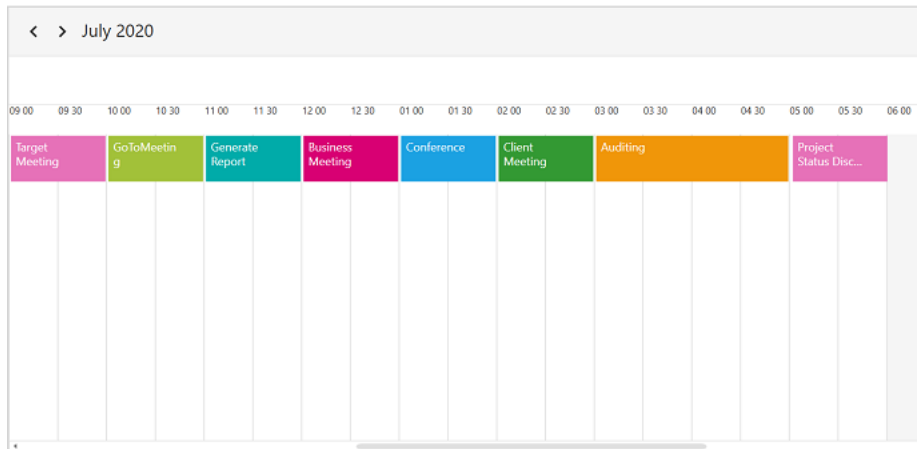

- The [MinimumAppointmentDuration](#) value will be set, when an appointment duration value is lesser than [MinimumAppointmentDuration](#).
- Appointment duration value will be set, when the appointment duration value is greater than [MinimumAppointmentDuration](#).
- [TimeInterval](#) value will be set, when [MinimumAppointmentDuration](#) is greater than [TimeInterval](#) with lesser appointment duration.
- All day Appointment does not support [MinimumAppointmentDuration](#).

Time text formatting

Customize the format for the labels mentioning the time, by setting the [TimeRulerFormat](#) property of [TimelineViewSettings](#) in the [Scheduler](#). This property will not applicable for the [TimelineMonth](#) view.

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWeek;
Schedule.TimelineViewSettings.TimeRulerFormat = "hh mm";
Schedule.TimelineViewSettings.TimeInterval = new System.TimeSpan(0, 30, 0);
```

**Note:**

- You can customize the appointment editor time format based on the scheduler time ruler format and culture.
- By default, the scheduler time ruler format is `h tt` and the appointment editor time picker format is `hh:mm tt`.

View header

Customize the default appearance of view header in the timeline views by setting the [ViewHeaderDateFormat](#), [ViewHeaderHeight](#), [ViewHeaderDayFormat](#), and [ViewHeaderTemplate](#) of `TimelineViewSettings`.

View header text formatting

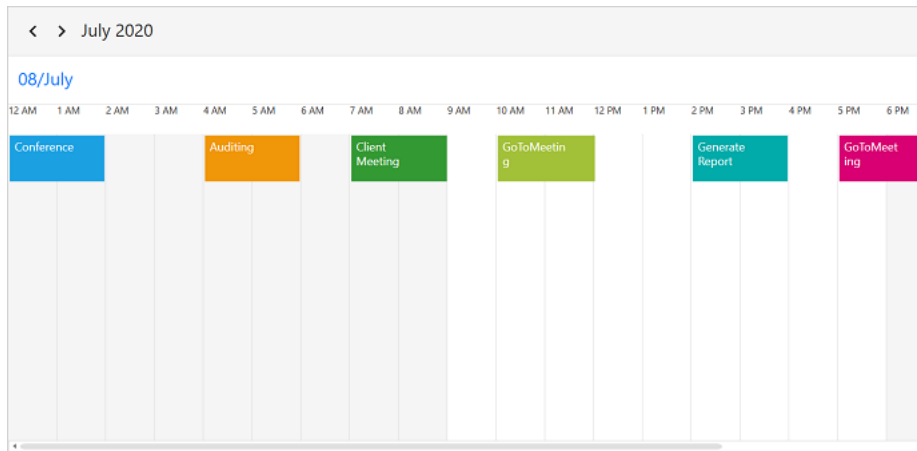

Customize the date and day format of ViewHeader by using the `ViewHeaderDateFormat` and `ViewHeaderDayFormat` properties of `TimelineViewSettings`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="TimelineWeek">
  <syncfusion:SfScheduler.TimelineViewSettings>
    <syncfusion:TimelineViewSettings
      ViewHeaderDateFormat="dd/MMMM"/>
    </syncfusion:TimelineViewSettings>
  </syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWeek;
Schedule.TimelineViewSettings.ViewHeaderDateFormat="dd/MMMM";
```

View header height

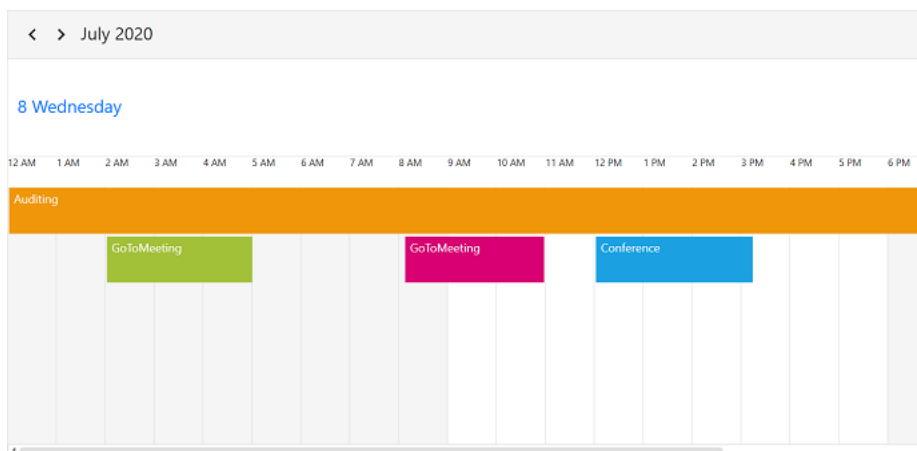

Customize the height of the ViewHeader in timeline views by setting `ViewHeaderHeight` property of `TimelineViewSettings` in `SfScheduler`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="TimelineWeek">
  <syncfusion:SfScheduler.TimelineViewSettings>
    <syncfusion:TimelineViewSettings
      ViewHeaderHeight="100"/>
    </syncfusion:TimelineViewSettings>
  </syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWeek;
Schedule.TimelineViewSettings.ViewHeaderHeight = 100;
```

View header appearance customization

Customize the default appearance of view header by setting `ViewHeaderTemplate` property of `TimelineViewSettings` in `SfScheduler`.

XML

```
<Window.Resources>
```

```

<DataTemplate x:Key="viewHeaderTemplate">
<StackPanel Background="Green"
Width="2000"
VerticalAlignment="Stretch"
HorizontalAlignment="Stretch"
Orientation="Vertical">
<TextBlock
HorizontalAlignment="Left"
Margin="20,0,0,0"
Foreground="FFFFFF"
FontFamily="Arial"
Text="{Binding DateText}"
FontSize="25"
TextTrimming="CharacterEllipsis"
TextWrapping="Wrap" />
<TextBlock
HorizontalAlignment="Left" Margin="20,0,0,0"
Foreground="FFFFFF"
FontFamily="Arial"
Text="{Binding DayText}"
FontSize="10"
TextTrimming="CharacterEllipsis"
TextWrapping="Wrap" />
</StackPanel>
</DataTemplate>
</Window.Resources>

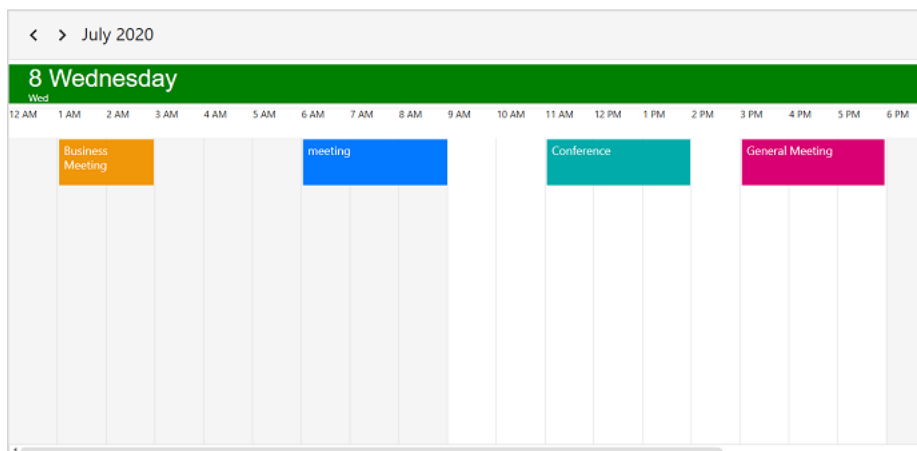

```

XML

```

<syncfusion:SfScheduler x:Name="Schedule" ViewType="TimelineWeek">
<syncfusion:SfScheduler.TimelineViewSettings>
<syncfusion:TimelineViewSettings
ViewHeaderTemplate="{StaticResource viewHeaderTemplate}" />
</syncfusion:SfScheduler.TimelineViewSettings>
</syncfusion:SfScheduler>

```

Appointment height

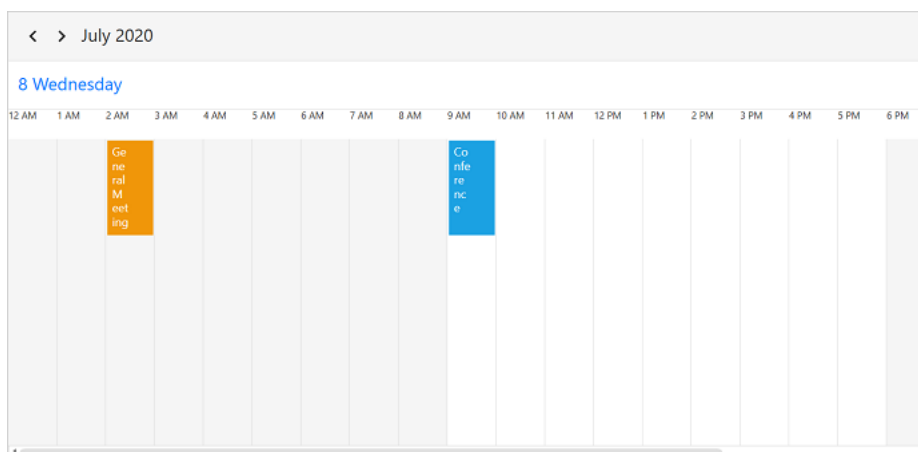

Customize the height of the appointment in `TimelineView` using the [TimelineAppointmentHeight](#) property of the `TimelineViewSettings`. By default, it's value is fifty for the `TimelineWeek`, `TimelineWorkWeek`, and `TimelineDay` views and twenty for the `TimelineMonth` view.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="TimelineWeek">
  <syncfusion:SfScheduler.TimelineViewSettings>
    <syncfusion:TimelineViewSettings
      TimelineAppointmentHeight="100">
    </syncfusion:TimelineViewSettings>
  </syncfusion:SfScheduler.TimelineViewSettings>
</syncfusion:SfScheduler>
```

C#

```
Schedule.ViewType = SchedulerViewType.TimelineWeek;
Schedule.TimelineViewSettings.TimelineAppointmentHeight = 100;
```

Note: You can refer to our [WPF Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Month View in WPF Scheduler (SfScheduler)

The month view of the scheduler displays the days of a specific month and current month, by default initially. The current date color is differentiated from other dates of the current month.

Month agenda view

The scheduler month view displays a divided agenda view that is used to show the selected date's appointments below the month. Show the agenda view by setting the [ShowAgendaView](#) property to true in the [MonthViewSettings](#).

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
  ViewType="Month" >
  <syncfusion:SfScheduler.MonthViewSettings>
    <syncfusion:MonthViewSettings ShowAgendaView="True"/>
  </syncfusion:MonthViewSettings>
</syncfusion:SfScheduler>
```

```
</syncfusion:SfScheduler.MonthViewSettings>
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.ViewType = SchedulerViewType.Month;
this.Schedule.MonthViewSettings.ShowAgendaView = true;
```

< > July 2020

2	3	4 General Meeting	5	6	7	8
Wed 08 Generate Report 09:00 AM - 10:00 AM Conference 09:00 AM - 10:00 AM						

NOTE

- An agenda view displays text as **No Selected Date** until a date is selected.
- If there is no appointment on a selected day, the agenda view displays the text as **No Events**.

Agenda view height

Customize the month agenda view height from the Scheduler by using the [AgendaViewHeight](#) property of MonthViewSettings. By default, the agenda view will occupy 30% of the Scheduler height.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month" >
<syncfusion:SfScheduler.MonthViewSettings>
<syncfusion:MonthViewSettings AppointmentDisplayMode="Indicator"
ShowAgendaView="True"
AgendaViewHeight="300"/>
</syncfusion:SfScheduler.MonthViewSettings>
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.ViewType = SchedulerViewType.Month;
```

```

this.Schedule.MonthViewSettings.AppointmentDisplayMode =
AppointmentDisplayMode.Indicator;
this.Schedule.MonthViewSettings.ShowAgendaView = true;
this.Schedule.MonthViewSettings.AgendaViewHeight = 300;

```

Mon 20	<div>Client Meeting 11:00 AM - 12:00 PM</div> <div>Project Status Discussion 03:00 PM - 04:00 PM</div>					

Appointment display mode

Handle the Scheduler month view appointment display by using the [AppointmentDisplayMode](#) property of MonthViewSettings. By default, the AppointmentDisplayMode is set to Appointment. By using the AppointmentDisplayMode, set the month view appointments display as follows.

- None: Appointment will not be displayed.
- Indicator: Appointment will be denoted as the circle.
- Appointment: Appointment subject will be displayed in the month cell.

XML

```

<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month" >
<syncfusion:SfScheduler.MonthViewSettings>
<syncfusion:MonthViewSettings AppointmentDisplayMode="Appointment"/>
</syncfusion:SfScheduler.MonthViewSettings>
</syncfusion:SfScheduler>

```

C#

```

this.Schedule.ViewType = SchedulerViewType.Month;
this.Schedule.MonthViewSettings.AppointmentDisplayMode =
AppointmentDisplayMode.Appointment;

```

23	24	25 Target Meeting Target Meeting	26	27 General Meeting	28	29
30	31	1	2	3	4	5

Appointment display count

Customize the number of appointments displayed in a month cell using the [AppointmentDisplayCount](#) property of a [MonthViewSettings](#) in the Scheduler. By default, the appointment display count is 3, and the month cell has more than 3 appointments, 3 appointments will be displayed and the remaining appointments in the month cell will be displayed as more appointments.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month" >
<syncfusion:SfScheduler.MonthViewSettings>
<syncfusion:MonthViewSettings AppointmentDisplayMode="Indicator"
AppointmentDisplayCount="4"/>
</syncfusion:SfScheduler.MonthViewSettings>
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.ViewType = SchedulerViewType.Month;
this.Schedule.MonthViewSettings.AppointmentDisplayMode =
AppointmentDisplayMode.Indicator;
this.Schedule.MonthViewSettings.AppointmentDisplayCount = 4;
```

Note:

- By clicking more option, the scheduler navigates to the day view.
- Appointment height will be changed based on the [AppointmentDisplayCount](#) property.

< > July 2020

26	27	28	29	30	31	1
2	3	4	5	6	7	8

Month navigation direction

The month view of a Scheduler can be navigated in both horizontal and vertical directions. Change the direction of the navigation using the [MonthNavigationDirection](#) property of `MonthViewSettings`. By default, the month navigation direction is set to `Horizontal`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
    ViewType="Month" >
    <syncfusion:SfScheduler.MonthViewSettings>
    <syncfusion:MonthViewSettings MonthNavigationDirection="Vertical"/>
    </syncfusion:SfScheduler.MonthViewSettings>
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.ViewType = SchedulerViewType.Month;
this.Schedule.MonthViewSettings.MonthNavigationDirection =
    MonthNavigationDirection.Vertical;
```

View header

Customize the default appearance of view header in month view by setting `ViewHeaderDayFormat`, `DateFormat`, `ViewHeaderHeight` and `ViewHeaderTemplate` of `TimelineViewSettings`.

View header text formatting

Customize the day format of the Scheduler view header by using the `ViewHeaderDayFormat` property of `MonthViewSettings`. By default, the month view header day format is `ddd`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month" >
<syncfusion:SfScheduler.MonthViewSettings>
<syncfusion:MonthViewSettings ViewHeaderDayFormat="dddd"/>
</syncfusion:SfScheduler.MonthViewSettings>
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.ViewType = SchedulerViewType.Month;
this.Schedule.MonthViewSettings.ViewHeaderDayFormat = "dddd";
```

< > July 2020

19	20	21	22	23	24	25
26	27	28	29	30	31	1
2	3	4	5	6	7	8

Leading and Trailing days visibility

Customize the leading and trailing days visibility of the scheduler month view by using the [LeadingDaysVisibility](#) and the [TrailingDaysVisibility](#) properties of `MonthViewSettings`. By default, the `LeadingDaysVisibility` and `TrailingDaysVisibility` are set to `Visible`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
    ViewType="Month" >
    <syncfusion:SfScheduler.MonthViewSettings>
    <syncfusion:MonthViewSettings
        LeadingDaysVisibility="Collapsed"
        TrailingDaysVisibility="Collapsed"/>
    </syncfusion:SfScheduler.MonthViewSettings>
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.ViewType = SchedulerViewType.Month;
this.Schedule.MonthViewSettings.LeadingDaysVisibility =
    Visibility.Collapsed;
this.Schedule.MonthViewSettings.TrailingDaysVisibility =
    Visibility.Collapsed;
```

< > July 2020						
Sun	Mon	Tue	Wed	Thu	Fri	Sat
			1	2	3	4

19	20	21	22	23	24	25
26	27	28	29	30	31	

Blackout dates

Disable the interaction for certain dates in the scheduler month view by adding those specific dates to the [BlackoutDates](#) collection property of the [SfScheduler](#). Using this, allocate or restrict specific dates for the predefined events.

C#

```
this.Schedule.ViewType = SchedulerViewType.Month;
this.Schedule.BlackoutDates = GetBlackoutDates();
private ObservableCollection<DateTime> GetBlackoutDates()
{
    var blackoutDateCollection = new ObservableCollection<DateTime>()
    {
        DateTime.Now.Date.AddDays(1),
        DateTime.Now.Date.AddDays(2),
        DateTime.Now.Date.AddDays(3),
        DateTime.Now.Date.AddDays(4),
        DateTime.Now.Date.AddDays(5)
    };
    return blackoutDateCollection;
}
```

< > July 2020						
Sun	Mon	Tue	Wed	Thu	Fri	Sat
28	29	30	1	2	3	4
5	6	7	8	9	10	11
12	13	14	15	16	17	18
19	20	21	22	23	24	25
26	27	28	29	30	31	1
2	3	4	5	6	7	8

Customize blackout dates appearance

Customize the blacked out dates (trailing, leading, normal days, and current date) by using the setting style.

XML

```
<Window.Resources>
<Style TargetType="syncfusion:MonthCell">
<Style.Triggers>
<Trigger Property="DayType" Value="NormalDay, BlockOutDay">
<Setter Property="Foreground" Value="Black"/>
<Setter Property="Background" Value="Gray"/>
</Trigger>
<Trigger Property="DayType" Value="LeadingDay, BlockoutDay">
<Setter Property="Foreground" Value="Black"/>
<Setter Property="Background" Value="Green"/>
</Trigger>
<Trigger Property="DayType" Value="TrailingDay, BlockoutDay">
<Setter Property="Foreground" Value="Red"/>
<Setter Property="Background" Value="Yellow"/>
</Trigger>
<Trigger Property="DayType" Value="Today, BlockoutDay">
<Setter Property="Foreground" Value="Red"/>
<Setter Property="Background" Value="Green"/>
</Trigger>
</Style.Triggers>
</Style>
</Window.Resources>
```

26	27	28	29	30	31	1
2	3	4	5	6	7	8

Using the DataTemplateSelector

Customize the default appearance of the month cell by using the [MonthCellTemplateSelector](#) property of MonthViewSettings.

The `DataTemplateSelector` can choose a `DataTemplate` at runtime based on the value of a data-bound to Scheduler month cell using the `MonthCellTemplate`. It allows to choose a different data template for each month's cell, customizing the appearance of a particular month cell based on certain conditions.

XML

```
<Window.Resources>
<local:MonthCellTemplateSelector x:Key="monthCellTemplateSelector"/>
</Window.Resources>
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month"
ItemsSource="{Binding Appointments}">
<syncfusion:SfScheduler.MonthViewSettings>
<syncfusion:MonthViewSettings AppointmentDisplayMode="Indicator"
MonthCellTemplateSelector="{StaticResource monthCellTemplateSelector}">
</syncfusion:MonthViewSettings>
</syncfusion:SfScheduler.MonthViewSettings>
</syncfusion:SfScheduler>
```

C#

```
public class MonthCellTemplateSelector : DataTemplateSelector
{
    public MonthCellTemplateSelector()
    {
        var mainWindow = App.Current.MainWindow as Window;
        this.MonthAppointmentTemplate =
mainWindow.Resources["monthAppointmentTemplate"] as DataTemplate;
        this.MonthCellDatesTemplate = mainWindow.Resources["monthCellTemplate"] as
DataTemplate;
    }
}
```

```

}
public DataTemplate MonthAppointmentTemplate { get; set; }
public DataTemplate MonthCellDatesTemplate { get; set; }
public override DataTemplate SelectTemplate(object item, DependencyObject container)
{
    var appointments = item as List<ScheduleAppointment>;
    var cell = container as MonthCell;
    if (cell.DateTime.Date == DateTime.Now.Date)
        cell.Foreground = Brushes.Black;
    if (appointments == null || appointments.Count == 0)
    {
        cell.DataContext = cell;
        return MonthCellDatesTemplate;
    }
    else
    {
        MonthCellViewModel monthCellViewModel = new MonthCellViewModel();
        monthCellViewModel.Foreground = cell.Foreground;
        monthCellViewModel.DateText = cell.DateText;
        monthCellViewModel.MonthCellAppointments = appointments;
        cell.DataContext = monthCellViewModel;
        return MonthAppointmentTemplate;
    }
}
}
}

```

Customize more appointments indicator in month cell

You can customize the default appearance of more appointments indicator in a month cell by using the [MoreAppointmentsIndicatorTemplate](#) property of the `MonthViewSettings`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Month">
  <syncfusion:SfScheduler.MonthViewSettings>
    <syncfusion:MonthViewSettings>
      <syncfusion:MonthViewSettings.MoreAppointmentsIndicatorTemplate>
        <DataTemplate>
          <TextBlock Text = "{Binding StringFormat=+{0}}" Background = "#EAEAEA"
            Foreground = "Black" Padding="0,5,0,0">
          </TextBlock>
        </DataTemplate>
      </syncfusion:MonthViewSettings.MoreAppointmentsIndicatorTemplate>
    </syncfusion:MonthViewSettings>
  </syncfusion:SfScheduler.MonthViewSettings>
</syncfusion:SfScheduler>
```

Note: You can refer to our [WPF Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Resource Grouping in WPF Scheduler (SfScheduler)

The [WPF Scheduler](#) resource view will allow to group appointments based on the resources or dates, arranged by the column or row in the day, week, workweek, timeline day, timeline week, timeline workweek and timeline month views. It also allows to share the events or appointments to the multiple resources and resource appointment details can be edited by using a built-in appointment editor.

Grouping by Resources

Resources can be added to the scheduler by setting the [ResourceGroupType](#) property as [Resource](#) in [SfScheduler](#). Set the [Id](#), [Name](#), [Foreground](#) and [Background](#) properties of [SchedulerResource](#) to create a resource. Add the resource to the scheduler by using the [ResourceCollection](#) property of [SfScheduler](#) and also add or remove the scheduler resources dynamically.

Note: No resource view will be displayed, even a resource added using the [ResourceCollection](#) property when the [ResourceGroupType](#) property value is set to [None](#).

C#

```
// Adding schedule resource in the scheduler resource collection.
var ResourceCollection = new ObservableCollection<SchedulerResource>()
{
    new SchedulerResource() { Name = "Sophia", Background = new
    SolidColorBrush(Colors.Red), Id = "1000" },
    new SchedulerResource() { Name = "Zoey Addison", Background = new
    SolidColorBrush(Colors.Blue), Id = "1001" },
    new SchedulerResource() { Name = "James William", Background = new
    SolidColorBrush(Colors.Yellow), Id = "1002" },
};
// Adding the scheduler resource collection to the schedule resources of
SfScheduler.
schedule.ResourceCollection = ResourceCollection;
```

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week"
ResourceGroupType="resource" ResourceCollection="{Binding
ResourceCollection}">
```

Note: [View sample in GitHub](#)

Resource Grouping types

Group the resource order by **Date** or order by **Resource** using the [ResourceGroupType](#) property of SfScheduler.

Note: Group the resource order in the day, week, work week, timeline day, timeline week, timeline workweek and timeline month views.

Resource

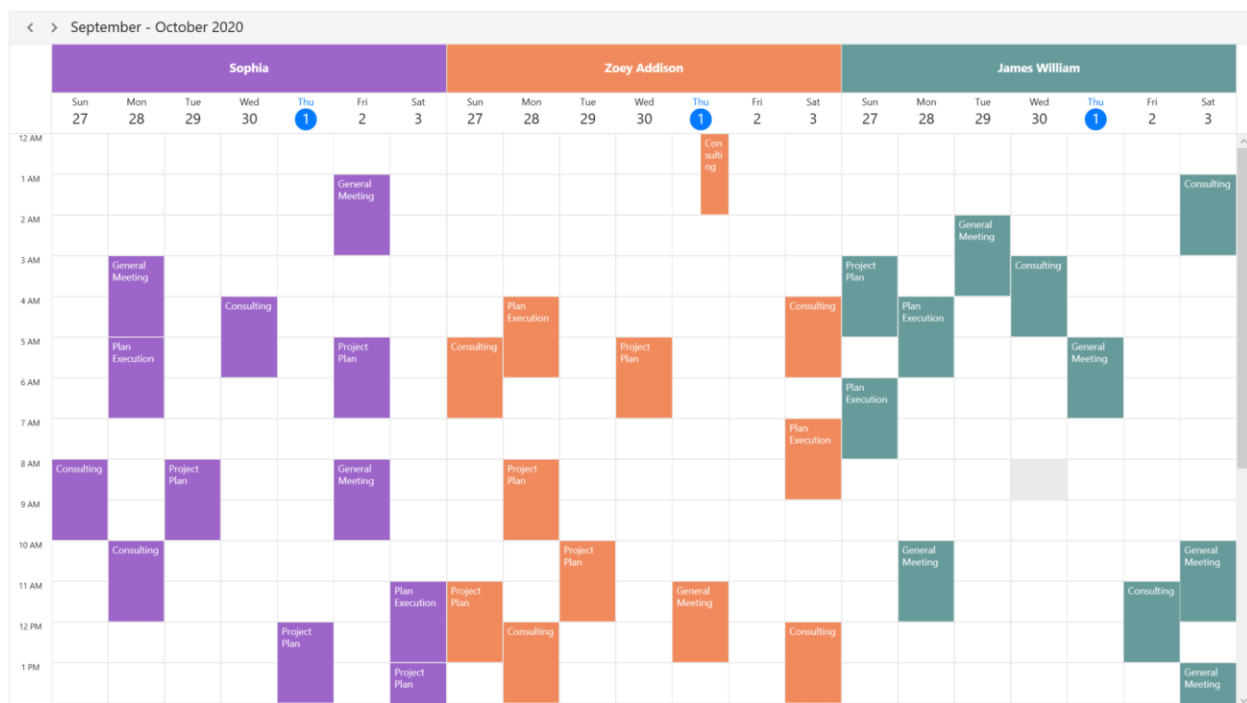

The **ResourceGroupType** is set to **Resource** to group the number of dates under each resource.

XML

```
<Schedule:SfScheduler Name="schedule" ViewType="Week"
ResourceGroupType="Resource"/>
```

C#

```
schedule.ViewType = SchedulerViewType.Week;
schedule.ResourceGroupType = ResourceGroupType.Resource;
```

Date

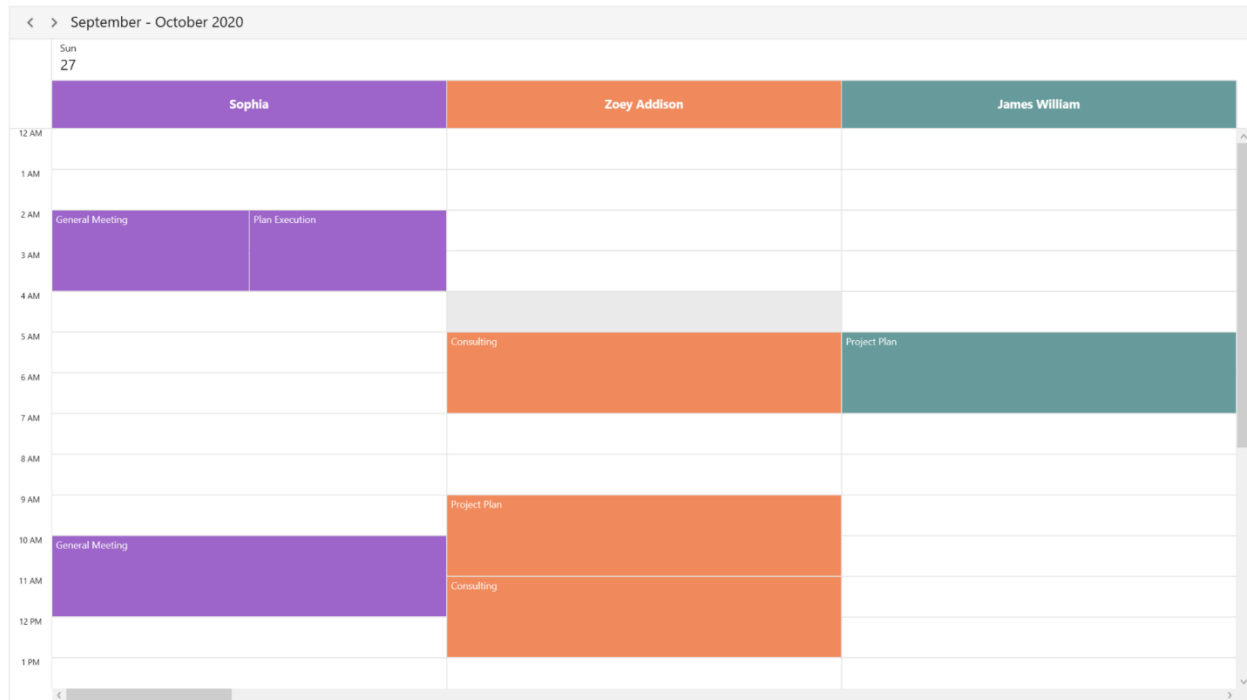

The **ResourceGroupType** is set to **Date** to group the number of resources under each date.

XML

```
<Schedule:SfScheduler Name="schedule" ViewType="Week"
ResourceGroupType="Date"/>
```

C#

```
schedule.ViewType = SchedulerViewType.Week;
schedule.ResourceGroupType = ResourceGroupType.Date;
```

Assigning resources to appointments

Appointments associated with scheduler `ResourceCollection` will be displayed when set schedule resource `Id` in the [ScheduleAppointment](#) by using the [ResourceIdCollection](#) for `ResourceGroupType` set as `Resource` or `Date`. Also assign the resources to [recurrence appointments](#).

C#

```
ScheduleAppointmentCollection scheduleAppointmentCollection = new
ScheduleAppointmentCollection();
var appointments = new ScheduleAppointment()
{
    StartTime = DateTime.Now.AddMinutes(20),
    EndTime = DateTime.Now.AddHours(2),
    Subject = "General Meeting",
    ResourceIdCollection = new ObservableCollection<object> () { "1000", "1001"
};
scheduleAppointmentCollection.Add(appointments);
this.schedule.ItemsSource = scheduleAppointmentCollection;
```

Note: • When `ResourceIdCollection` is not added to 'ScheduleAppointment' then the appointment will not be displayed in, when `ResourceGroupType` is set as `Resource` or `Date`.

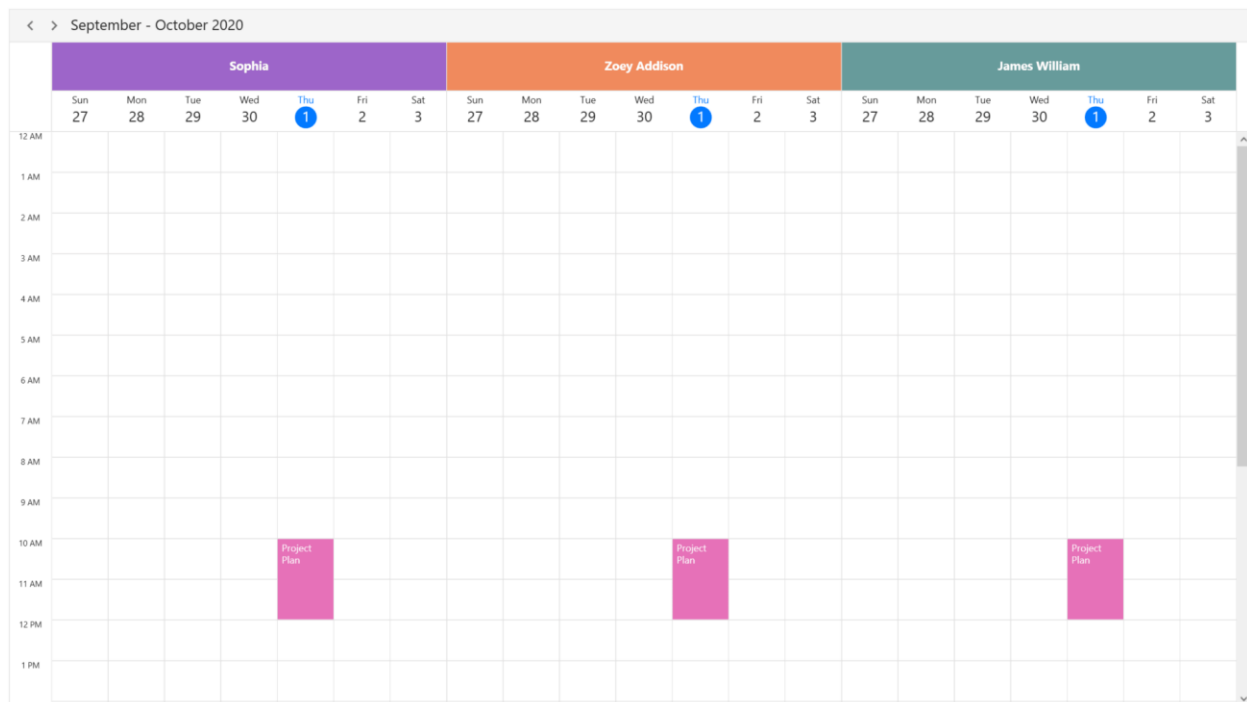

- When `ResourceGroupType` is set as `None`, resource view will be collapsed and all scheduler `DataSource` events will be displayed.
- Also add or remove the appointment resources dynamically.

Multiple resource sharing

Multiple resources can share the same events or appointments. If the appointment details are edited or updated, then the changes will reflect on all other shared instances simultaneously.

C#

```
ScheduleAppointmentCollection scheduleAppointmentCollection = new
ScheduleAppointmentCollection();
var appointments = new ScheduleAppointment()
{
    StartTime = new DateTime(2020, 10, 01, 10, 0, 0),
    EndTime = new DateTime(2020, 10, 01, 12, 0, 0),
    Subject = "Project Plan",
    ResourceIdCollection = new ObservableCollection<object>() { "1000",
    "1001", "1002" }
    AppointmentBackground = new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#FFE671B8")),
};
scheduleAppointmentCollection.Add(appointments);
this.schedule.ItemsSource = scheduleAppointmentCollection;
```

Scheduler Resource Mapping

Schedule supports full data binding to [ResourceCollection](#). Specify the [ResourceMapping](#) attribute to map the properties in the underlying data source to the schedule resource.

| Property Name | Description |

-----	-----
-----|

| Name | Maps the property name of the custom class, which is equivalent to Name in the ScheduleResource. |

| Id | Maps the property name of custom class, which is equivalent to Id in ScheduleResource. |

| Background | Maps the property name of custom class, which is equivalent to Background in ScheduleResource. |

| Foreground | Maps the property name of custom class, which is equivalent to Foreground in ScheduleResource. |

Note: Custom resource class should contain a mandatory field for resource **Id**.

Create business object for Resource

Create a custom class `Employee` with mandatory fields `Name`, `Id`, `ForegroundColor` and `BackgroundColor`. Also assign the resources to [recurrence appointments](#).

C#

```
public class Employee
{
```

```

public string Name {get; set;}
public string Id {get; set;}
public Brush BackgroundColor {get; set; }
public Brush ForegroundColor {get; set; }
}

```

Note: • Inherit this class from `INotifyPropertyChanged` for dynamic changes in custom data.

- [SchedulerResource.Data](#) property is used to get the details of the custom data.

Map the properties of `Employee` class with `SfScheduler` control using Scheduler `ResourceMapping`.

XML

```

<Schedule:SfScheduler Name="schedule" ViewType="Week"
ResourceGroupType="Resource">
<Schedule:SfScheduler.ResourceMapping>
<Schedule:ResourceMapping Id="Id" Name="Name" Background="BackgroundColor"
Foreground="ForegroundColor"/>
</Schedule:SfScheduler.ResourceMapping>
</Schedule:SfScheduler>

```

C#

```

// Schedule data mapping for custom resource.
ResourceMapping resourceMapping = new ResourceMapping();
resourceMapping.Name = "Name";
resourceMapping.Id = "Id";
resourceMapping.Background = "BackgroundColor";
resourceMapping.Foreground = "ForegroundColor";
schedule.ResourceMapping = resourceMapping;

```

Assign resource object collection

Add the resources of `Employee` collection that can be assigned to the scheduler using the `ResourceCollection` property which is of `IEnumerable` type. Also add or remove scheduler resources dynamically.

C#

```

// Creating and Adding custom resource in scheduler resource collection.
var ResourceCollection = new ObservableCollection<Employee>()
{
    new Employee () {Name = "Sophia", BackgroundColor = new
SolidColorBrush(Colors.Red), Id = "1000", ForegroundColor = new
SolidColorBrush(Colors.White) },
    new Employee () {Name = "Zoey Addison", BackgroundColor = new
SolidColorBrush(Colors.Blue), Id = "1001" , ForegroundColor = new
SolidColorBrush(Colors.Red)},
    new Employee () {Name = "James William", BackgroundColor = new
SolidColorBrush(Colors.Yellow), Id = "1002" , ForegroundColor = new
SolidColorBrush(Colors.Yellow)},
};
//Adding schedule resource collection to schedule resources.
schedule.ResourceCollection = ResourceCollection;

```

Assign the resource objects to appointment business object

Associate scheduler **ResourceMapping** to the custom appointment by mapping resource **Id** in the **ResourceIdCollection** property of **AppointmentMapping**. Custom appointments associated with the scheduler resources will be displayed when **ResourceGroupType** set as **Resource** or **Date**. Also assign resources to recurrence appointments.

C#

```

/// <summary>
/// Represents the custom data properties.
/// </summary>
public class Meeting
{
    public string EventName {get; set;}
    public DateTime From {get; set;}
    public DateTime To {get; set;}
    public ObservableCollection<object> Resources {get; set;}
}

```

Note: Inherit this class from the **INotifyPropertyChanged** for dynamic changes in custom data.

Map those properties of **Meeting** class to schedule appointment by using **AppointmentMapping** properties.

{%tabs %}

XML

```

<syncfusion:SfScheduler x:Name="Schedule" ItemsSource="{Binding
Appointments}" ViewType="Week">
  <syncfusion:SfScheduler.AppointmentMapping>
  <syncfusion:AppointmentMapping
    Subject="EventName"
    StartTime="From"
    EndTime="To"
    ResourceIdCollection ="Resources"/>
  </syncfusion:SfScheduler.AppointmentMapping>
</syncfusion:SfScheduler>

```

C#

```

//Schedule data mapping for custom appointments
AppointmentMapping dataMapping = new AppointmentMapping();
dataMapping.Subject = "EventName";
dataMapping.StartTime = "From";
dataMapping.EndTime = "To";
dataMapping.AppointmentBackground = "Color";
dataMapping.ResourceIdCollection= "Resources";
Schedule.AppointmentMapping = dataMapping;

```

Schedule meetings for a Resource by setting **From**, **To** and **Resources** of Meeting class.

{%tabs %}

C#

```

Meeting meeting = new Meeting ();
meeting.From = new DateTime(2020, 07, 01, 10, 0, 0);
meeting.To = meeting.From.AddHours(1);
meeting.EventName = "Meeting";
meeting.Resources = new ObservableCollection<object> { (Resources[0] as
Employee).Id, (Resources[1] as Employee).Id };
var Meetings = new ObservableCollection<Meeting> ();
Meetings.Add(meeting);
schedule.ItemsSource = Meetings;

```

Note: [View sample in GitHub](#)

Resource header size

Customize the resource header size in the day, week, workweek, timeline day, timeline week, timeline workweek and timeline month views by using the [ResourceHeaderSize](#) property of [DaysViewSettings](#) or [TimelineViewSettings](#) in SfScheduler.

Resource header size in days view

[DaysViewSettings](#) applicable for [Day](#), [Week](#) and [WorkWeek](#) views. By default, value of this property is set to 50.

XML

```

<Schedule:SfScheduler Name="schedule" ViewType="Week"
ResourceGroupType="Resource">
<Schedule:SfScheduler.DaysViewSettings>
<Schedule:DaysViewSettings ResourceHeaderSize="100"/>
</Schedule:SfScheduler.DaysViewSettings>
</Schedule:SfScheduler>

```

C#

```

schedule.DaysViewSettings.ResourceHeaderSize = 100;

```

Resource header size in timeline view

[TimelineViewSettings](#) applicable for timeline day, timeline week, timeline workweek and timeline month views. By default, value of this property is set to 50.

XML

```

<Schedule:SfScheduler Name="schedule" ViewType="TimelineWeek"
ResourceGroupType="Resource">
<Schedule:SfScheduler.TimelineViewSettings>
<Schedule:TimelineViewSettings ResourceHeaderSize="100"/>
</Schedule:SfScheduler.TimelineViewSettings>
</Schedule:SfScheduler>

```

C#

```

schedule.TimelineViewSettings.ResourceHeaderSize = 80;

```

Resource auto height

The resource row height gets auto-adjusted based on the number of overlapping appointments occupied on the same time range by setting [RowAutoHeight](#) property as `true` in [TimelineViewSettings](#). By default, value of this property is set to `false`.

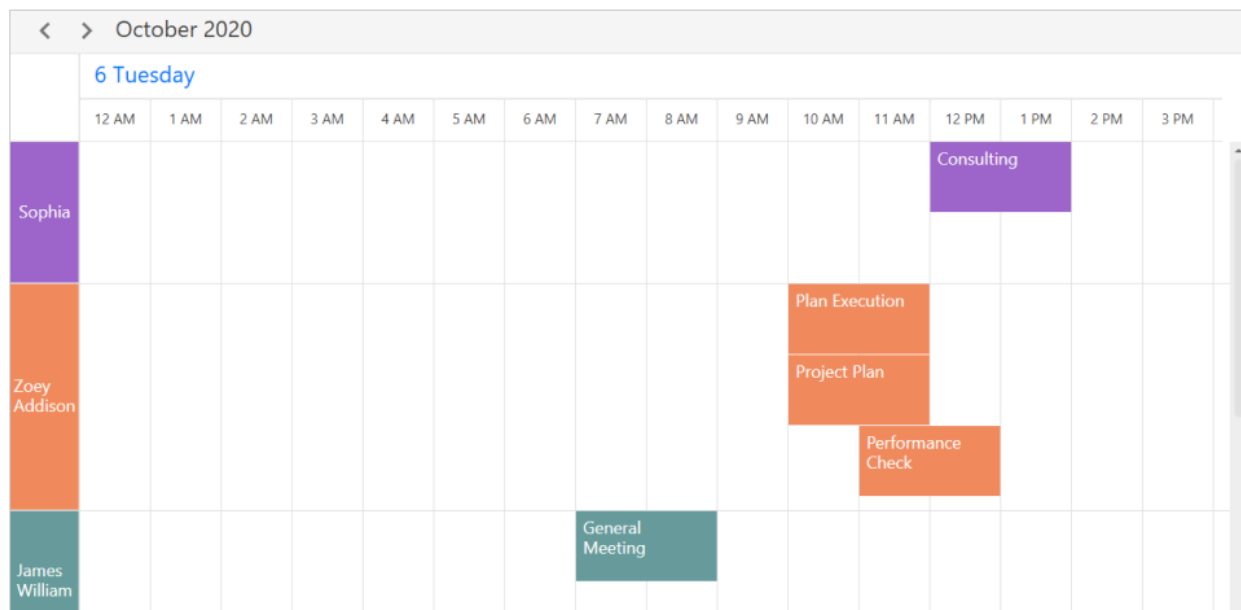

XML

```
<Schedule:SfScheduler Name="schedule"
ViewType="TimelineWeek"
ResourceGroupType="Resource">
<Schedule:SfScheduler.TimelineViewSettings>
<Schedule:TimelineViewSettings RowAutoHeight="True" />
</Schedule:SfScheduler.TimelineViewSettings>
</Schedule:SfScheduler>
```

C#

```
schedule.TimelineViewSettings.RowAutoHeight = true;
```

Note: * [View sample in GitHub](#)

Note:

- This auto row height adjustment is applicable only on all the Timeline views such as timeline day, timeline week, timeline workweek and timeline month views.
- If auto resource row height is enabled then [VisibleResourceCount](#) will not be applicable and if resources have no appointments, then [RowMinHeight](#) will be considered as default resource row height.

Resource minimum height

You can customize the minimum row height of visible resources in timeline day, timeline week, timeline workweek and timeline month views by using the [RowMinHeight](#) property of [TimelineViewSettings](#) in [SfScheduler](#). By default, value of this property is set to 50.

XML

```
<Schedule:SfScheduler Name="schedule"
ViewType="TimelineWeek"
ResourceGroupType="Resource">
<Schedule:SfScheduler.TimelineViewSettings>
<Schedule:TimelineViewSettings RowMinHeight="100" />
</Schedule:SfScheduler.TimelineViewSettings>
</Schedule:SfScheduler>
```

C#

```
schedule.TimelineViewSettings.RowMinHeight = 100;
```

Note: The minimum resource row height adjusted based on view port size and the [VisibleResourceCount](#) will not be applicable.

Visible resource count

Customize the number of visible resources in day, week, workweek, timeline day, timeline week, timeline workweek and timeline month views by using the [VisibleResourceCount](#) property of [DaysViewSettings](#) or [TimelineViewSettings](#) in [SfScheduler](#).

Note: Visible resource count exceed count of schedule [ResourceCollection](#) count then schedule [ResourceCollection](#) count will be displayed.

Visible resource count in days view

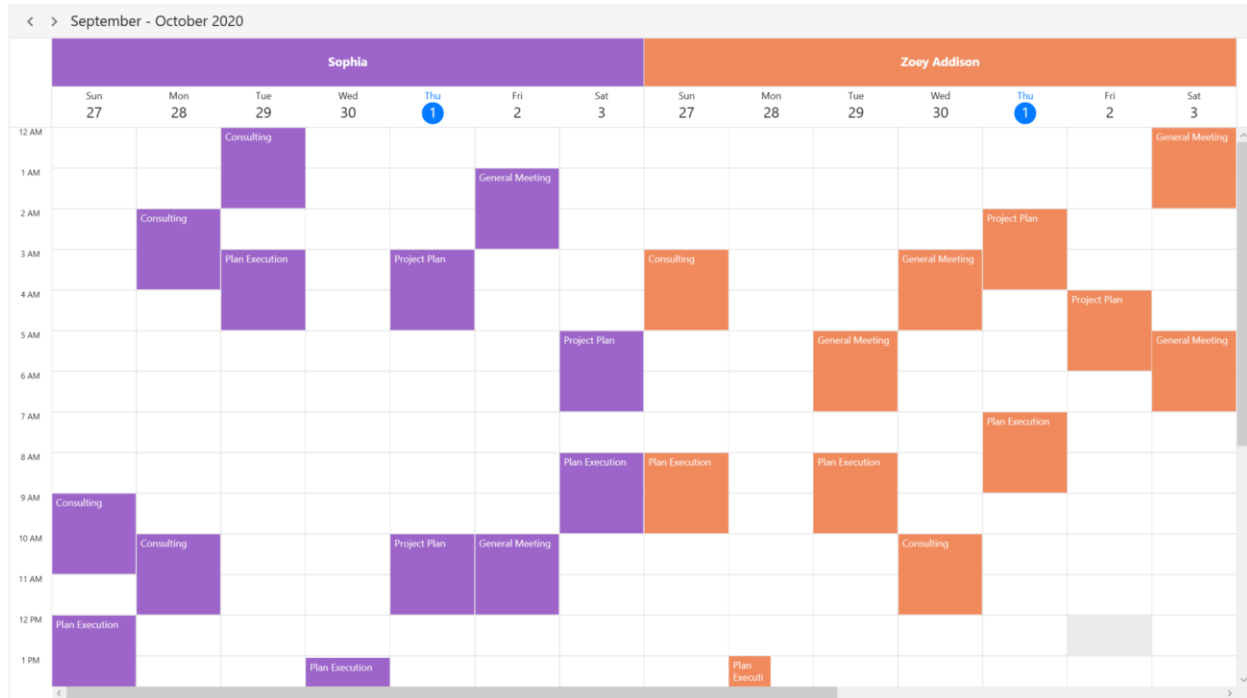

[DaysViewSettings](#) applicable for [Day](#), [Week](#) and [WorkWeek](#) views. By default, value of this property is set to 3.

XML

```
<Schedule:SfScheduler Name="schedule" ViewType="Week"
ResourceGroupType="Resource">
<Schedule:SfScheduler.DaysViewSettings>
<Schedule:DaysViewSettings VisibleResourceCount="2"/>
</Schedule:SfScheduler.DaysViewSettings>
</Schedule:SfScheduler>
```

C#

```
schedule.DaysViewSettings.VisibleResourceCount = 2;
```

Visible resource count in timeline views

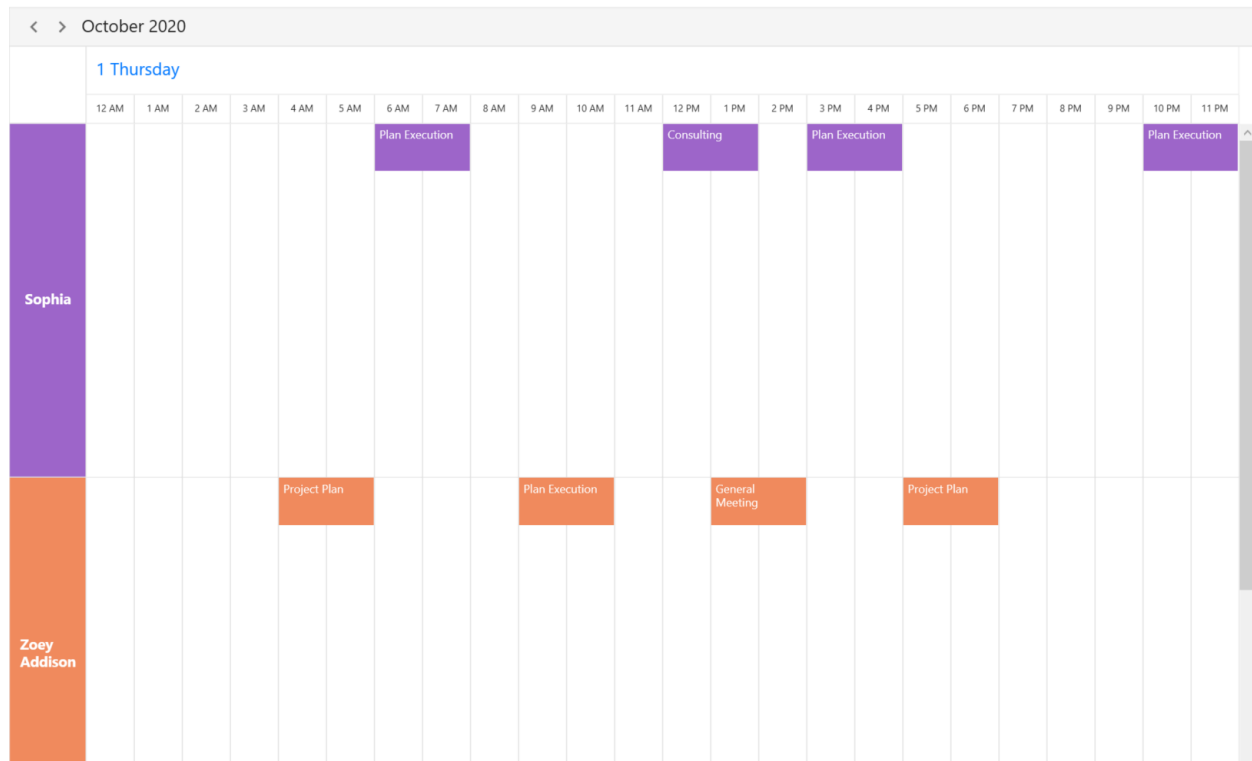

TimelineViewSettings applicable for timeline day, timeline week, timeline workweek and timeline month views. By default, value of this property is set to 3.

XML

```
<Schedule:SfScheduler Name="schedule" ViewType="TimelineDay"
ResourceGroupType="Resource">
<Schedule:SfScheduler.TimelineViewSettings>
<Schedule:TimelineViewSettings VisibleResourceCount="2"/>
</Schedule:SfScheduler.TimelineViewSettings>
</Schedule:SfScheduler>
```

C#

```
schedule.TimelineViewSettings.VisibleResourceCount = 2;
```

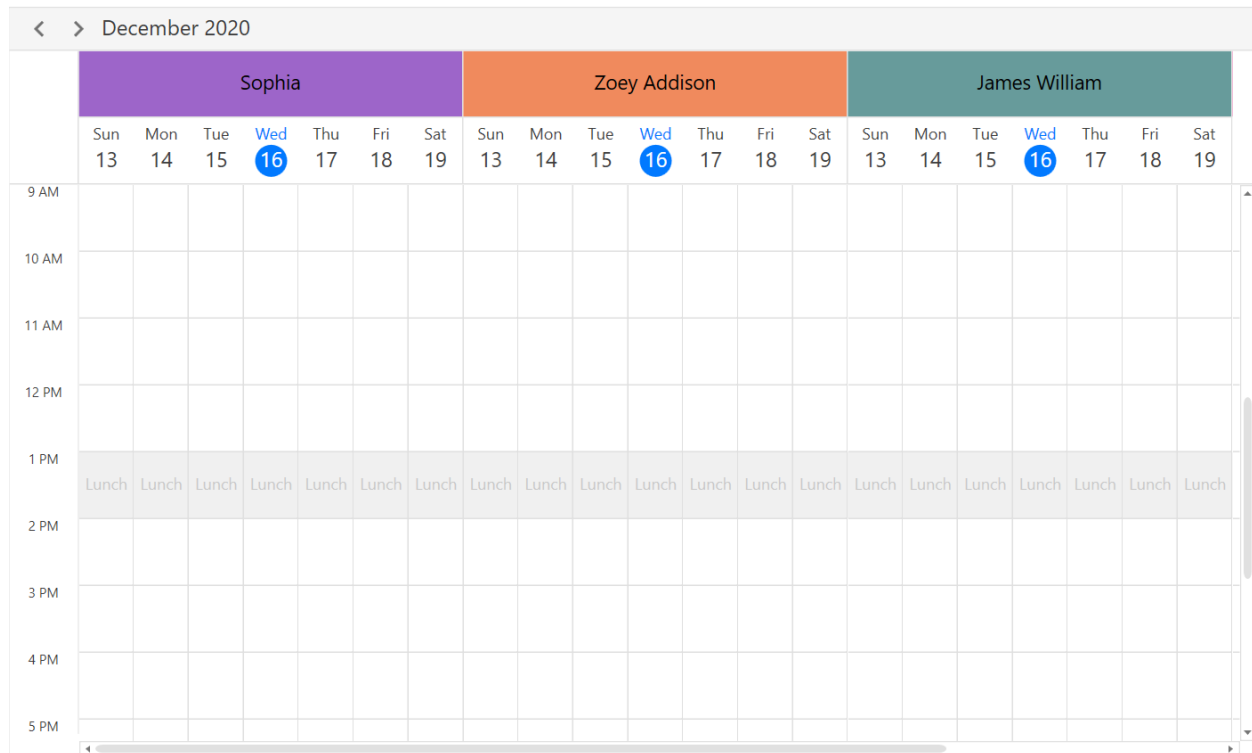

Assign resources to special time regions

Special time region can be created based on the resources in day, week, workweek, timeline day, timeline week, timeline workweek and timeline month views.

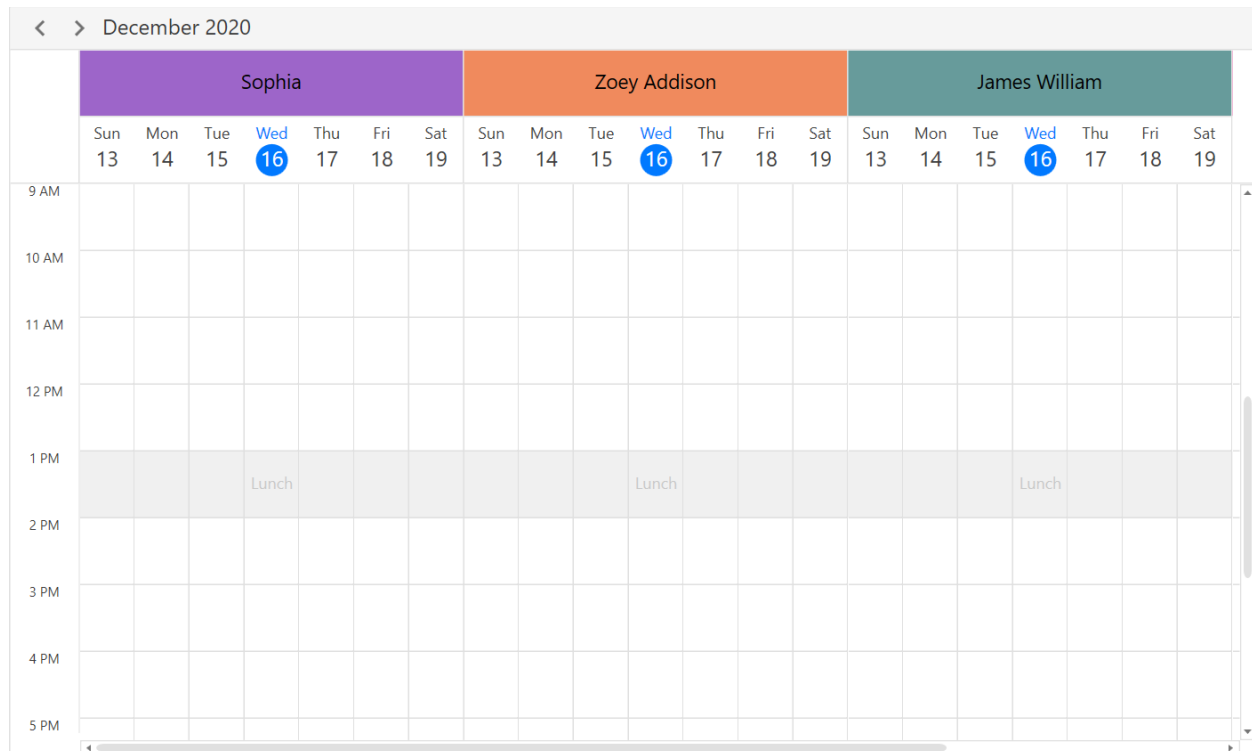

Assign resources to special time regions in days view

C#

```
Schedule.DaysViewSettings.SpecialTimeRegions.Add(new SpecialTimeRegion
{
    StartTime = new System.DateTime(2020, 12, 13, 13, 0, 0),
    EndTime = new System.DateTime(2020, 12, 13, 14, 0, 0),
    Text = "Lunch",
    CanEdit = false,
    Background = Brushes.Black,
    Foreground = Brushes.White,
    RecurrenceRule = "FREQ=DAILY;INTERVAL=1",
    CanMergeAdjacentRegions = false,
    ResourceIdCollection = new ObservableCollection<object>() { "0", "1", "2" }
});
```

The [SpecialTimeRegion](#) in a Time basis by setting the value of [CanMergeAdjacentRegions](#) to True.

Assign resources to special time regions in timeline view

C#

```

this.schedule.TimelineViewSettings.SpecialTimeRegions.Add(new
SpecialTimeRegion
{
    StartTime = new System.DateTime(2020, 09, 27, 1, 0, 0),
    EndTime = new System.DateTime(2020, 09, 27, 2, 0, 0),
    Text = "Lunch",
    CanEdit = false,
    Background = new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#D3D3D3")),
    Foreground = new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#000000")),
    RecurrenceRule = "FREQ=DAILY;INTERVAL=1",
    ResourceIdCollection = new ObservableCollection<object>() { "1001", "1002",
"1003" }
});

```

Note: [View sample in GitHub](#)

Appearance customization

Resource UI customization using a template and template selectors support.

Customize resource appearance using ResourceHeaderTemplate

XML

```

<Window.Resources>
<DataTemplate x:Key="DayViewResourceTemplate">
<Grid Background="Transparent">
<Border BorderThickness="0.3,0.3,0,0.3" BorderBrush="Gray" >
<StackPanel VerticalAlignment="Center" Orientation="Vertical">

```

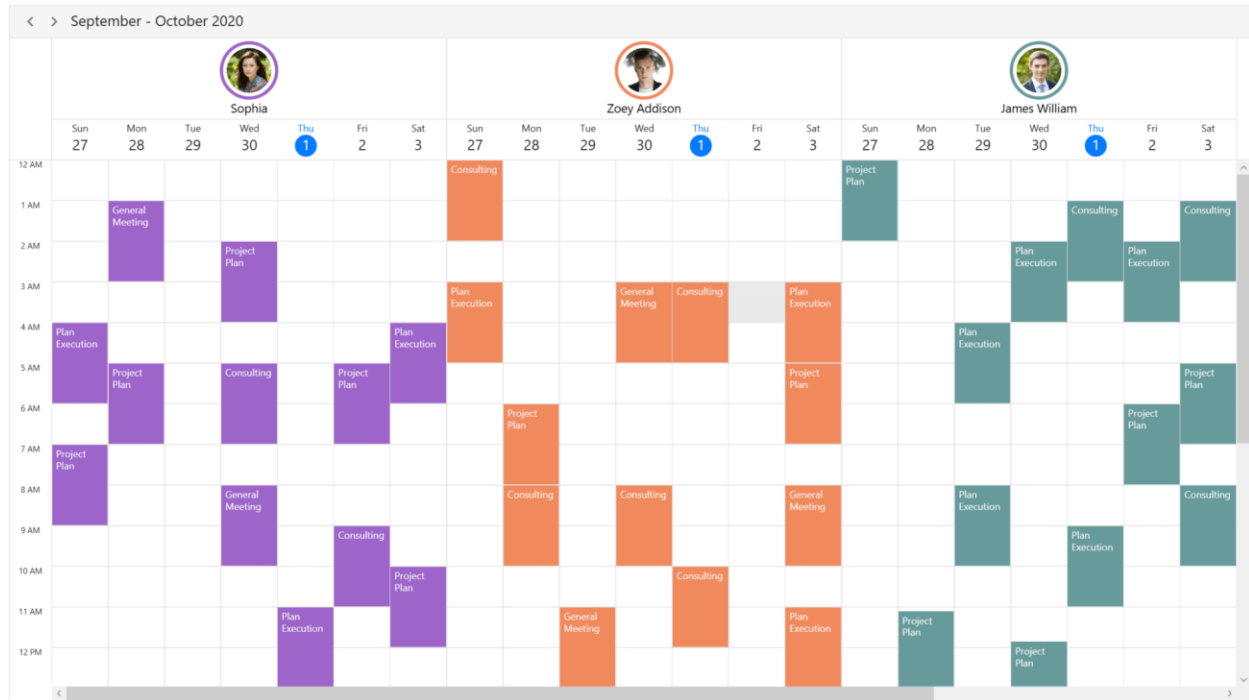

```

<Border CornerRadius="36" Height="72" Width="72" BorderThickness="4"
BorderBrush="{Binding Data.BackgroundBrush}">
<Border CornerRadius="36" Height="64" Width="64" BorderThickness="4"
BorderBrush="White">
<Image HorizontalAlignment="Center" VerticalAlignment="Center" Width="55"
Height="55" Source="{Binding Data.ImageSource}" />
</Border>
</Border>
<TextBlock HorizontalAlignment="Center" VerticalAlignment="Center"
FontSize="15"
Foreground="Black" Text="{Binding Data.Name}" />
</StackPanel>
</Border>
</Grid>
</DataTemplate>
</Window.Resources>
//used to find Image Source and Name properties
<Window.DataContext>
<local:Employee />
</Window.DataContext>
<Grid Name="grid">
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week"
ResourceGroupType="Resource" ResourceCollection="{Binding
ResourceCollection}"
ResourceHeaderTemplate="{StaticResource DayViewResourceTemplate}">
<syncfusion:SfScheduler.ResourceMapping>
<syncfusion:ResourceMapping Id="Id" Name="Name" Background="BackgroundBrush"
Foreground="ForegroundBrush"/>
</syncfusion:SfScheduler.ResourceMapping>
</syncfusion:SfScheduler>
</Grid>

```

Note

- By default, the `SchedulerResource` is set as the `DataContext` for the `ResourceHeaderTemplate` for both `SchedulerResource` and custom data object in the `ResourceCollection`.
- The custom data object can be bound in the `ResourceHeaderTemplate` by using the property of [SchedulerResource.Data](#).

Note: [View sample in GitHub](#)

Customize resource appearance using *ResourceHeaderTemplateSelector*

XML

```
<Window.Resources>
<DataTemplate x:Key="DayViewResourceTemplate">
<Grid Background="Transparent">
<Border BorderThickness="0.3,0.3,0,0.3" BorderBrush="Gray" >
<StackPanel VerticalAlignment="Center" Orientation="Vertical">
<Border CornerRadius="36" Height="72" Width="72" BorderThickness="4"
BorderBrush="{Binding Data.BackgroundBrush}">
<Border CornerRadius="36" Height="64" Width="64" BorderThickness="4"
BorderBrush="White">
<Image HorizontalAlignment="Center" VerticalAlignment="Center" Width="55"
Height="55" Source="{Binding Data.ImageSource}" />
</Border>
</Border>
<TextBlock HorizontalAlignment="Center" VerticalAlignment="Center"
FontSize="15"
Foreground="Black" Text="{Binding Data.Name}" />
</StackPanel>
</Border>
</Grid>
</DataTemplate>
<DataTemplate x:Key="TimelineViewResourceTemplate">
<Grid Background="Transparent">
<StackPanel VerticalAlignment="Center" Orientation="Vertical">
<Border CornerRadius="36" Height="72" Width="72" BorderThickness="4"
BorderBrush="{Binding Data.BackgroundBrush}">
<Border CornerRadius="36" Height="64" Width="64" BorderThickness="4"
BorderBrush="Transparent">
<Image HorizontalAlignment="Center" VerticalAlignment="Center"
```

```

Width="55"
Height="55"
Source="{Binding Data.ImageSource}" />
</Border>
</Border>
<TextBlock HorizontalAlignment="Center"
VerticalAlignment="Center"
FontSize="15"
Text="{Binding Data.Name}" />
</StackPanel>
</Grid>
</DataTemplate>
<Window.Resources>
<Grid>
<Grid.DataContext>
<local:BindingViewModel/>
</Grid.DataContext>
<Grid.Resources>
<local:ResourceTemplateSelector x:Key="resourceTemplateSelector"
DayViewResourceTemplate="{StaticResource DaysViewResourceTemplate}"
TimelineViewResourceTemplate="{StaticResource TimelineResourceTemplate}" />
</Grid.Resources>
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Week"
ResourceGroupType="Resource}"
ResourceCollection="{Binding Resources}"
ItemsSource="{Binding ResourceAppointments}" HeaderHeight="32"
DisplayDate="{Binding DisplayDate}"
ResourceHeaderTemplateSelector="{StaticResource resourceTemplateSelector}">
</Grid>

```

Creating a ResourceHeaderTemplateSelector

C#

```

public class ResourceTemplateSelector : DataTemplateSelector
{
    /// <summary>
    /// Initializes a new instance of the <see cref="ResourceTemplateSelector" /> class.
    /// </summary>
    public ResourceTemplateSelector()
    {
    }

    public DataTemplate DayViewResourceTemplate {get; set;}
    public DataTemplate TimelineViewResourceTemplate {get; set;}
    /// <summary>
    /// Template selection method
    /// </summary>
    /// <param name="item">return the object</param>
    /// <param name="container">return the bindable object</param>
    /// <returns>return the template</returns>
    public override DataTemplate SelectTemplate(object item, DependencyObject container)
    {
    }
}

```

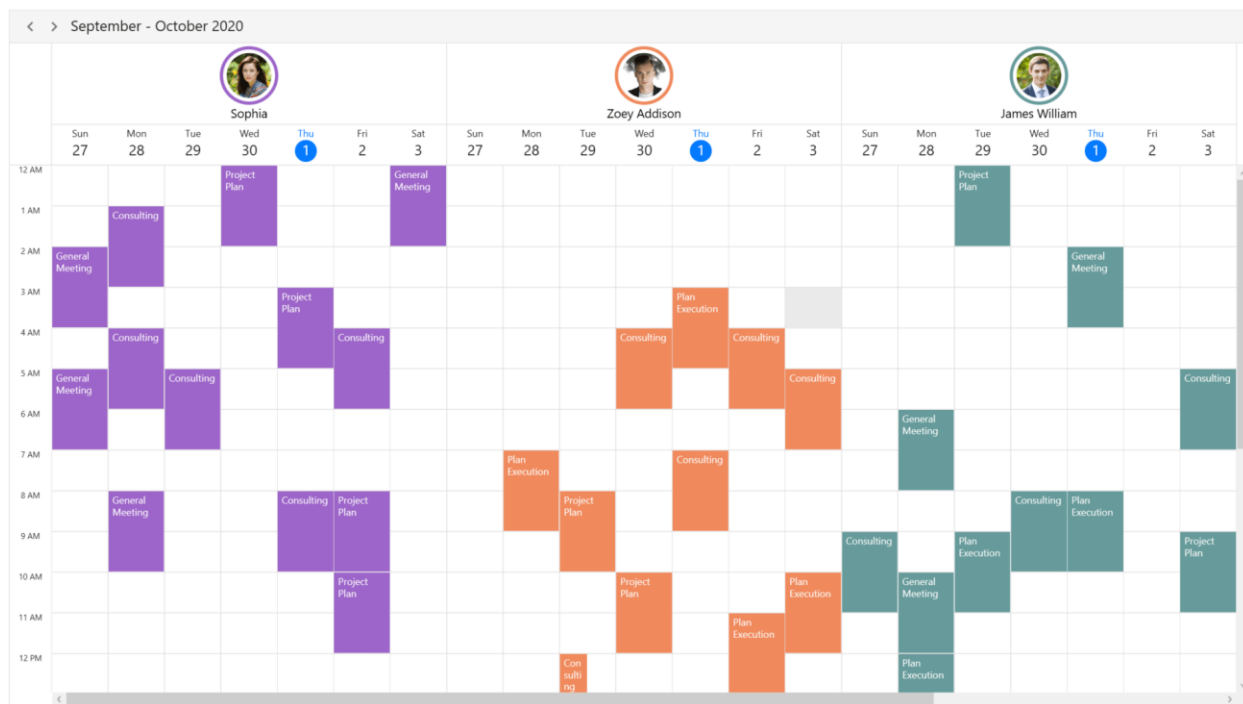

```

var schedule =
Syncfusion.Windows.Shared.VisualUtils.FindVisualParent<SfScheduler>(containe
r);
if (schedule == null)
return null;
if (schedule.ViewType == SchedulerViewType.Day || schedule.ViewType ==
SchedulerViewType.Week || schedule.ViewType == SchedulerViewType.WorkWeek)
return DayViewResourceTemplate;
else
return TimelineViewResourceTemplate;
}
}

```

Note

- By default, the **SchedulerResource** is set as the **DataContext** for the **ResourceHeaderTemplateSelector** for both **SchedulerResource** and custom data object in the **ResourceCollection**.
- The custom data object can be bound in the **ResourceHeaderTemplateSelector** by using the property of **SchedulerResource.Data**.

Note: [View sample in GitHub](#)

Appointments in WPF Scheduler (SfScheduler)

The **SfScheduler** control has a built-in capability to handle the appointment arrangement internally based on the **ScheduleAppointmentCollection**. The **WPF Scheduler** supports to render normal, all-day appointments, spanned appointment, recurring appointments, and recurrence exception dates appointments.

The [ScheduleAppointment](#) is a class that includes the specific scheduled appointment. It has some basic properties such as [StartTime](#), [EndTime](#), [Subject](#), and some additional information about the appointment can be added with [Notes](#), [Location](#), and [IsAllDay](#) properties.

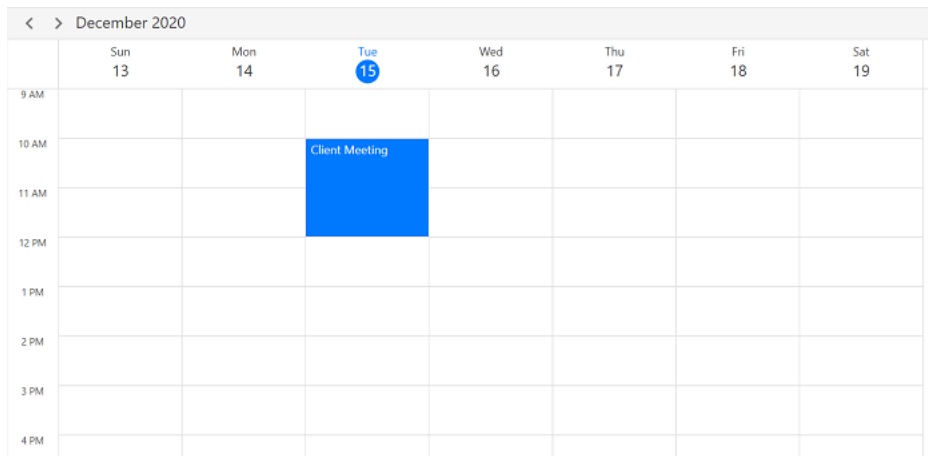

{%tabs %}

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Week"
ItemsSource="{Binding scheduleAppointmentCollection}">
</syncfusion:SfScheduler>
```

C#

```
// Creating an instance for schedule appointment collection
var scheduleAppointmentCollection = new ScheduleAppointmentCollection();
//Adding schedule appointment in the schedule appointment collection
scheduleAppointmentCollection.Add(new ScheduleAppointment()
{
    StartTime = new DateTime(2020, 12, 15, 10, 0, 0),
    EndTime = new DateTime(2020, 12, 15, 12, 0, 0),
    Subject = "Client Meeting",
    Location = "Hutchison road",
});
//Adding schedule appointment collection to the ItemSource of SfScheduler
Schedule.ItemsSource = scheduleAppointmentCollection;
```

Note:

- The Scheduler supports the functionality that arranges the appointments based on their start time and duration for the normal appointments in a day, week and workweek views.
- In an all-day panel of the day, week and workweek views, span and all day appointments are ordered and rendered based on the start date-time of an appointment that consists time duration of the appointment, followed by `IsSpanned`, `IsAllDay`, appointments respectively.
- In Timeline views, all the appointments (span, all day, and normal) are ordered and rendered based on the start date-time of an appointment that consists of the time duration of the appointment, followed by `IsSpanned`, `IsAllDay`, and normal appointments respectively.

[View sample in GitHub](#)

Scheduler item source and Mapping

The **Scheduler** supports to bind any collection that implements the **IEnumerable** interface to populate appointments. Map the properties in business object to [ScheduleAppointment](#) by configuring the [AppointmentMapping](#) property. The following table that property shows mapping property details to [ScheduleAppointment](#).

Property Name	Description
StartTime	Maps the property name of a custom class, which is equivalent to the StartTime of ScheduleAppointment .
EndTime	Maps the property name of a custom class, which is equivalent to the EndTime of ScheduleAppointment .
StartTimeZone	Maps the property name of a custom class, which is equivalent to the StartTimeZone of ScheduleAppointment .
EndTimeZone	Maps the property name of a custom class, which is equivalent to the EndTimeZone of ScheduleAppointment .
Subject	Maps the property name of a custom class, which is equivalent to the Subject of ScheduleAppointment .
Id	Maps the property name of a custom class, which is equivalent to the Id of ScheduleAppointment .
AppointmentBackground	Maps the property name of a custom class, which is equivalent to the AppointmentBackground of ScheduleAppointment .
Foreground	Maps the property name of a custom class, which is equivalent to the Foreground of ScheduleAppointment .
IsAllDay	Maps the property name of a custom class, which is equivalent to the IsAllDay of ScheduleAppointment .
RecurrenceRule	Maps the property name of a custom class, which is equivalent to the RecurrenceRule of ScheduleAppointment .
RecurrenceId	Maps the property name of a custom class, which is equivalent to the RecurrenceId of ScheduleAppointment .
Notes	Maps the property name of a custom class, which is equivalent to the Notes of ScheduleAppointment .

Location	Maps the property name of a custom class, which is equivalent to the Location of ScheduleAppointment.
RecurrenceExceptionDates	Maps the property name of a custom class, which is equivalent to the RecurrenceExceptionDates of ScheduleAppointment.
ResourceIdCollection	Maps the property name of a custom class, which is equivalent to the ResourceIdCollection of ScheduleAppointment.

Note: The CustomAppointment class should contain event start and end date time fields as mandatory

Creating business objects

Create a custom class **Meeting** with mandatory fields **From**, **To** and **EventName**.

C#

```

/// <summary>
/// Represents the custom data properties.
/// </summary>
public class Meeting
{
    public string EventName { get; set; }
    public DateTime From { get; set; }
    public DateTime To { get; set; }
    public Brush BackgroundColor { get; set; }
    public Brush ForegroundColor { get; set; }
}

```

Note: You can map those properties of the **Meeting** class to schedule appointment by using the AppointmentMapping properties.

{%tabs %}

XML

```

<syncfusion:SfScheduler x:Name="Schedule"
    ViewType="Week"
    ItemsSource="{Binding Meetings}">
    <syncfusion:SfScheduler.AppointmentMapping>
    <syncfusion:AppointmentMapping
        Subject="EventName"
        StartTime="From"
        EndTime="To"
        AppointmentBackground="BackgroundColor"
        Foreground="ForegroundColor"/>
    </syncfusion:SfScheduler.AppointmentMapping>
</syncfusion:SfScheduler>

```

C#

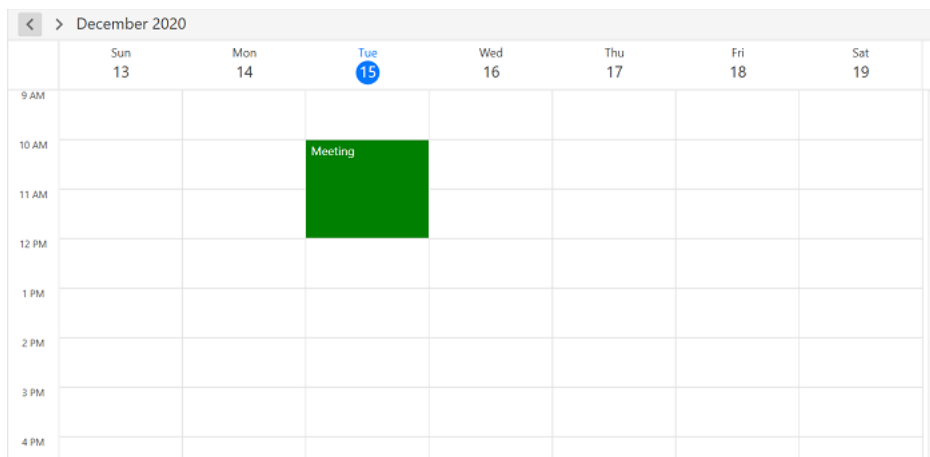

```
//Schedule data mapping for custom appointments
AppointmentMapping dataMapping = new AppointmentMapping();
dataMapping.Subject = "EventName";
dataMapping.StartTime = "From";
dataMapping.EndTime = "To";
dataMapping.AppointmentBackground = "BackgroundColor";
dataMapping.Foreground = "ForegroundColor";
Schedule.AppointmentMapping = dataMapping;
```

Schedule the meetings for a day by setting **From** and **To** of Meeting class. Create meetings of type **ObservableCollection<Meeting>** and assign those appointments collection Meetings to the **ItemsSource** property which is of **IEnumerable** type.

C#

```
//Creating an instance for the custom appointment class
Meeting meeting = new Meeting();
//Setting the start time of an event
meeting.From = new DateTime(2020, 12, 15, 10, 0, 0);
//Setting the end time of an event
meeting.To = meeting.From.AddHours(2);
//Setting the subject for an event
meeting.EventName = "Meeting";
//Setting the background color for an event
meeting.BackgroundColor = new SolidColorBrush(Colors.Green);
//Setting the foreground color for an event
meeting.ForegroundColor = new SolidColorBrush(Colors.White);
//Creating an instance for the collection of custom appointments
var Meetings = new ObservableCollection<Meeting>();
//Adding a custom appointment in the CustomAppointmentCollection
Meetings.Add(meeting);
//Adding custom appointments in the ItemsSource of SfScheduler
Schedule.ItemsSource = Meetings;
```

{% endtabs%}

Note: [View sample in GitHub](#)

Spanned appointments

Spanned Appointment is an appointment that lasts more than 24 hours. It doesn't block out the time slots in the `SfScheduler`, it will render in [AllDayAppointmentPanel](#) exclusively.

{%tabs %}

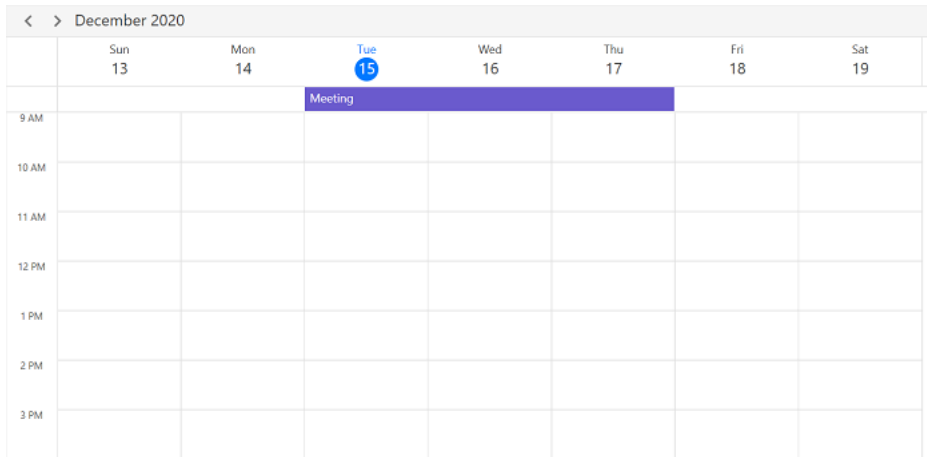

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Week"
ItemsSource="{Binding Meetings}">
<syncfusion:SfScheduler.AppointmentMapping>
<syncfusion:AppointmentMapping
Subject="EventName"
StartTime="From"
EndTime="To"
AppointmentBackground="BackgroundColor"
Foreground="ForegroundColor">
</syncfusion:AppointmentMapping>
</syncfusion:SfScheduler.AppointmentMapping>
</syncfusion:SfScheduler>
```

C#

```
// Creating an instance for the collection of custom appointments
var Meetings = new ObservableCollection<Meeting>();
// Creating an instance for the custom appointment class
Meeting meeting = new Meeting();
// Setting the start time of an event
meeting.From = new DateTime(2020, 12, 15, 10, 0, 0);
// Setting the end time of an event
meeting.To = meeting.From.AddDays(2).AddHours(1);
// Setting the subject for an event
meeting.EventName = "Meeting";
// Setting the background color for an event
meeting.BackgroundColor = new SolidColorBrush(Colors.SlateBlue);
// Setting the foreground color for an event
meeting.ForegroundColor = new SolidColorBrush(Colors.White);
// Adding a custom appointment in the CustomAppointmentCollection
Meetings.Add(meeting);
//Adding schedule appointment collection to the ItemsSource of SfSchedule
Schedule.ItemsSource = Meetings;
```

{% endtabs %}

**Note:**

- In an all-day panel of the day, week and workweek views, span and all day appointments are ordered and rendered based on the start date-time of the appointment that consists time duration of an appointment, followed by `IsSpanned`, `IsAllDay`, appointments respectively.

[View sample in GitHub](#)

All day appointments

The all-Day appointment is an appointment that is scheduled for a whole day. It can be set by using the `IsAllDay` property in the [ScheduleAppointment](#).

{%tabs %}

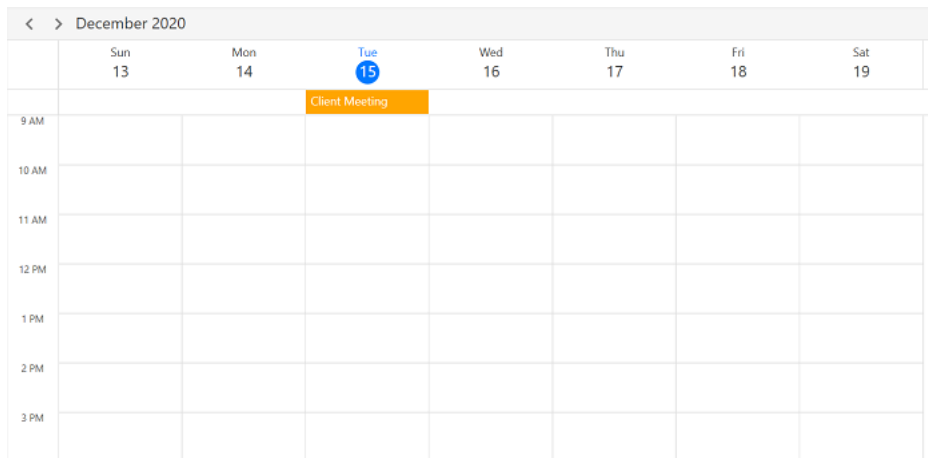

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Week"
ItemsSource="{Binding scheduleAppointmentCollection}">
</syncfusion:SfScheduler>
```

C#

```
// Creating an instance for schedule appointment collection
var scheduleAppointmentCollection = new ScheduleAppointmentCollection();
//Adding schedule appointment in the schedule appointment collection
scheduleAppointmentCollection.Add(new ScheduleAppointment()
{
    StartTime = new DateTime(2020, 12, 15, 10, 0, 0),
    EndTime = new DateTime(2020, 12, 15, 12, 0, 0),
    Subject = "Client Meeting",
    Location = "Hutchison road",
    AppointmentBackground = Brushes.Orange,
    Foreground = Brushes.White,
    IsAllDay = true,
});
//Adding the schedule appointment collection to the ItemsSource of
SfScheduler
Schedule.ItemsSource = scheduleAppointmentCollection;
```

{% endtabs%}

**Note:**

- Appointment that lasts for an entire day (exact 24 hours) will be considered as an all-day appointment without setting the `IsAllDay` property. For example: From 06/29/2020 12:00AM to 06/30/2020 12:00AM.
- In an all-day panel of the day, week and workweek views, span and all day appointments are ordered and rendered based on the start date-time of an appointment that consists time duration of the appointment, followed by `IsSpanned`, `IsAllDay`, appointments respectively.

[View sample in GitHub](#)

Recurrence Appointment

The recurring appointment on a daily, weekly, monthly, or yearly interval. Recurring appointments can be created by setting the `RecurrenceRule` property in `ScheduleAppointment`.

Recurrence rule

The `RecurrenceRule` is a string value (RRULE) that contains the details of the recurrence appointments such as repeat type - daily or weekly or monthly or yearly, how many times it needs to be repeated, the interval duration, also the time period to render the appointment, and more. The `RecurrenceRule` has the following properties and based on this property value, the recurrence appointments are rendered in the SfScheduler with its respective time period.

PropertyName	Purpose
FREQ	Maintains the Repeat type value of the appointment. (Example: Daily, Weekly, Monthly, Yearly, Every week day) Example:FREQ=DAILY;INTERVAL=1
INTERVAL	Maintains the interval value of the appointments. For example, while creating the daily appointment at an interval of 2, the appointments are rendered on the days Monday, Wednesday and Friday. (creates the appointment on all days by leaving the interval of one day gap) Example:FREQ=DAILY;INTERVAL=1
COUNT	It holds the appointment's count value. For example, when the recurrence appointment count value is 10, it means 10 appointments are created in the recurrence series. Example:FREQ=DAILY;INTERVAL=1;COUNT=10

UNTIL	This property is used to store the recurrence end date value. For example, when the end date of appointment is set as 6/30/2020, the UNTIL property holds the end date value when the recurrence actually ends. Example:FREQ=DAILY;INTERVAL=1;UNTIL=20200725
BYDAY	It holds the "DAY" values of an appointment to render. For example, while creating the weekly appointment, select the day(s) from the day options (Monday/Tuesday/Wednesday/Thursday/Friday/Saturday/Sunday). When Monday is selected, the first two letters of the selected day "MO" is stored in the "BYDAY" property. While selecting the multiple days, the values are separated by commas. Example:FREQ=WEEKLY;INTERVAL=1;BYDAY=MO,WE;COUNT=10
BYMONTHDAY	This property is used to store the date value of the Month while creating the Month recurrence appointment. For example, while creating a Monthly recurrence appointment in the date 3, it means the BYMONTHDAY holds the value 3 and creates the appointment on 3rd day of every month. Example:FREQ=MONTHLY;BYMONTHDAY=3;INTERVAL=1;COUNT=10
BYMONTH	This property is used to store the index value of the selected Month while creating the yearly appointments. For example, while creating the yearly appointment in the Month June, it means the index value for June month is 6 and it is stored in the BYMONTH field. The appointment is created on every 6th month of a year. Example:FREQ=YEARLY;BYMONTHDAY=16;BYMONTH=6;INTERVAL=1;COUNT=10
BYSETPOS	This property is used to store the index value of the week. For example, while creating the monthly appointment in second week of the month, the index value of the second week (2) is stored in BYSETPOS. Example:FREQ=MONTHLY;BYDAY=MO;BYSETPOS=2;UNTIL=20200725

Adding recurrence appointment

The SfScheduler appointment recurrenceRule is used to populate the required recurring appointment collection in a specific pattern. The RRULE can be directly set to the [RecurrenceRule](#) property of [ScheduleAppointment](#).

{%tabs %}

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Week"
ItemsSource="{Binding scheduleAppointmentCollection}">
</syncfusion:SfScheduler>
```

C#

```
// Creating an instance for schedule appointment collection
var scheduleAppointmentCollection = new ScheduleAppointmentCollection();
//Adding schedule appointment in schedule appointment collection
var scheduleAppointment = new ScheduleAppointment()
{
    Id = 1,
    StartTime = new DateTime(2020, 12, 13, 11, 0, 0),
```

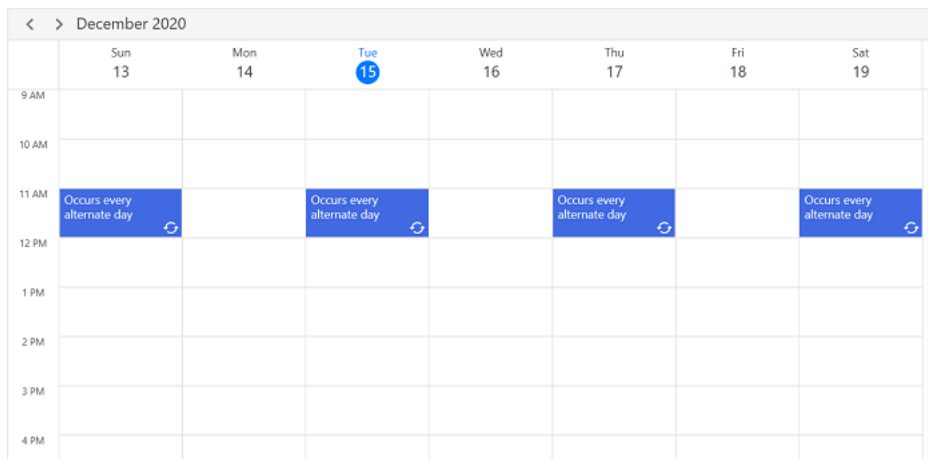

```

EndTime = new DateTime(2020, 12, 13, 12, 0, 0),
Subject = "Occurs every alternate day",
AppointmentBackground = Brushes.RoyalBlue,
Foreground = Brushes.White,
};
//Creating recurrence rule
scheduleAppointment.RecurrenceRule = "FREQ=DAILY;INTERVAL=2;COUNT=10";
//Adding schedule appointment to the schedule appointment collection
scheduleAppointmentCollection.Add(scheduleAppointment);
//Setting the schedule appointment collection to the ItemsSource of
SfScheduler
Schedule.ItemsSource = scheduleAppointmentCollection;

```

{% endtabs%}

Note: [View sample in GitHub](#)

Creating the custom recurrence appointment

For creating the custom recurrence appointment, create a custom class `Meeting` with mandatory fields `from`, `to`, and `recurrenceRule`.

C#

```

/// <summary>
/// Represents custom data properties.
/// </summary>
public class Meeting
{
    public string EventName { get; set; }
    public DateTime From { get; set; }
    public DateTime To { get; set; }
    public Brush BackgroundColor { get; set; }
    public Brush ForegroundColor { get; set; }
    public string RecurrenceRule { get; set; }
    public object Id { get; set; }
}

```

Note: Map those properties of `Meeting` class to schedule appointment by using the `AppointmentMapping` properties.

{%tabs %}

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ItemsSource="{Binding
Appointments}" ViewType="Week">
<syncfusion:SfScheduler.AppointmentMapping>
<syncfusion:AppointmentMapping
Subject="EventName"
StartTime="From"
EndTime="To"
Id="Id"
AppointmentBackground="BackgroundColor"
Foreground="ForegroundColor"
RecurrenceRule="RecurrenceRule"
IsAllDay="IsAllDay"/>
</syncfusion:SfScheduler.AppointmentMapping>
</syncfusion:SfScheduler>
```

C#

```
//Schedule data mapping for custom appointments
AppointmentMapping dataMapping = new AppointmentMapping();
dataMapping.Subject = "EventName";
dataMapping.StartTime = "From";
dataMapping.EndTime = "To";
dataMapping.Id = "Id";
dataMapping.AppointmentBackground = "BackgroundColor";
dataMapping.Foreground = "ForegroundColor";
dataMapping.RecurrenceRule = "RecurrenceRule";
Schedule.AppointmentMapping = dataMapping;
```

Schedule the recurring meetings for daily, weekly, monthly, or yearly interval by setting the [RecurrenceRule](#) of Meeting class. Create meetings of type `ObservableCollection<Meeting>` and assign those appointments collection Meetings to the [ItemsSource](#) property which is of `IEnumerable` type.

C#

```
// Creating an instance for the custom appointment class
Meeting meeting = new Meeting();
// Setting the start time of an event
meeting.From = new DateTime(2020, 12, 13, 10, 0, 0);
// Setting the end time of an event
meeting.To = meeting.From.AddHours(2);
// Setting the Id for an event
meeting.Id = 1;
// Setting the subject for an event
meeting.EventName = "Client Meeting";
// Setting the background color for an event
meeting.BackgroundColor = new SolidColorBrush(Colors.Gray);
// Setting the foreground color for an event
meeting.ForegroundColor = new SolidColorBrush(Colors.White);
// Creating recurrence rule
meeting.RecurrenceRule = "FREQ=DAILY;INTERVAL=1;COUNT=10";
// Creating an instance for collection of custom appointments
```

```
var Meetings = new ObservableCollection<Meeting>();  
// Adding a custom appointment in CustomAppointmentCollection  
Meetings.Add(meeting);  
// Adding custom appointments in ItemsSource of SfSchedule  
Schedule.ItemsSource = Meetings;
```

Note: [View sample in GitHub](#)

How to get the Recurrence editor field values from RRULE?

Get the Recurrence properties from the [RRULE](#) using the [RRuleParser](#) method of [SfScheduler](#).

C#

```
DateTime dateTime = new DateTime(2020, 6, 30, 10, 0, 0);  
RecurrenceProperties recurrenceProperties =  
RecurrenceHelper.RRuleParser("FREQ=DAILY; INTERVAL=1; COUNT=3", dateTime);
```

Recurrence properties retrieved from above method,

```
recurrenceProperties.RecurrenceType = RecurrenceType.Daily;
```

```
recurrenceProperties.Interval = 1;
```

```
recurrenceProperties.RecurrenceCount = 3;
```

```
recurrenceProperties.RecurrenceRange = RecurrenceRange.Count;
```

How to get the recurrence dates from RRULE?

Get the occurrences date-time list of recurring appointment from the RRULE using the [GetRecurrenceDateTimeCollection](#) method of [SfScheduler](#).

C#

```
DateTime dateTime = new DateTime(2020, 6, 27, 9, 0, 0);  
IEnumerable<DateTime> dateCollection =  
RecurrenceHelper.GetRecurrenceDateTimeCollection("FREQ=DAILY; INTERVAL=1; COUNT=3", dateTime);
```

The following occurrence dates can be retrieved from the given RRULE:

```
var date0 = 6/27/2020;
```

```
var date1 = 6/28/2020;
```

```
var date2 = 6/29/2020;
```

How to get pattern appointment for the specified occurrence?

Gets the pattern appointment for the specified occurrence.

To get the pattern appointment by using the following event and passing a parameter as [Scheduler](#) and Specified [Appointment](#).

C#

```
Schedule.AppointmentTapped += Schedule_AppointmentTapped;  
private void Schedule_AppointmentTapped(object sender, AppointmentTappedArgs e)  
{
```

```
if (e.Appointment != null)
{
    var patternAppointment =
    RecurrenceHelper.GetPatternAppointment(this.Schedule, e.Appointment);
}
```

Note:

- For custom appointment, pass e.Appointment.Data as a param and get the custom appointment details from the Data property of ScheduleAppointment.
- If a specified occurrence is changed, the GetPatternAppointment method returns the pattern appointment of exception appointment.

How to get occurrence appointment at the specified date?

Gets an occurrence at the specified date within a series of recurring appointments.

To get a specific appointment by using the following event and passing a parameter as Scheduler, Specified Appointment and specified DateTime.

C#

```
Schedule.AppointmentTapped += Schedule_AppointmentTapped;
private void Schedule_AppointmentTapped(object sender, AppointmentTappedArgs e)
{
    if (e.Appointment != null)
    {
        var occurrenceAppointment =
        RecurrenceHelper.GetOccurrenceAppointment(this.Schedule, e.Appointment, new
        DateTime(2020, 12, 20));
    }
}
```

Note: If an occurrence at the specified date is deleted or not present, then the GetOccurrenceAppointment method returns null.

Recurrence pattern exceptions

Delete or change any recurrence pattern appointment by handling exception dates and exception appointments to that recurring appointment.

Recurrence exception dates

Delete any occurrence appointment, which is exception from the recurrence pattern appointment by adding exception dates to the recurring appointment.

Recurrence exception appointment

Change any occurrence appointment which is exception from recurrence pattern appointment by adding the recurrence exception appointment in the SfScheduler [ItemsSource](#).

Creating the recurrence exceptions for schedule appointment

Add the recurrence exception appointments and recurrence exception dates to ScheduleAppointment or remove them from the [ScheduleAppointment](#) by using its [RecurrenceExceptionDates](#) property.

Delete occurrence from recurrence pattern appointment or adding exception dates to recurrence pattern appointment

Delete any of occurrence which is exception from recurrence pattern appointment by using the `RecurrenceExceptionDates` property of `ScheduleAppointment`. The deleted occurrence date will be considered as recurrence exception date.

{%tabs %}

XML

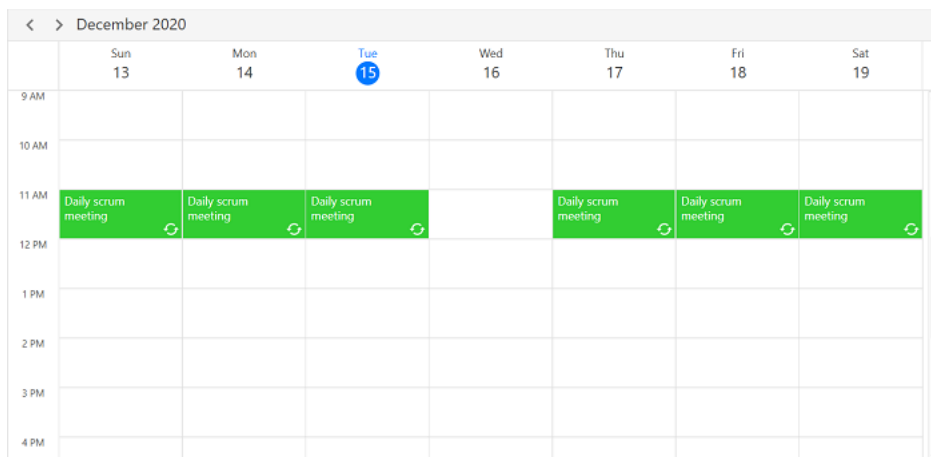

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Week"
ItemsSource="{Binding scheduleAppointmentCollection}">
</syncfusion:SfScheduler>
```

C#

```
// Creating an instance for schedule appointment collection
var scheduleAppointmentCollection = new ScheduleAppointmentCollection();
// Recurrence and exception appointment
var scheduleAppointment = new ScheduleAppointment
{
    Id = 1,
    Subject = "Daily scrum meeting",
    StartTime = new DateTime(2020, 12, 13, 11, 0, 0),
    EndTime = new DateTime(2020, 12, 13, 12, 0, 0),
    AppointmentBackground = new SolidColorBrush(Colors.LimeGreen),
    Foreground = new SolidColorBrush(Colors.White),
    RecurrenceRule = "FREQ=DAILY; INTERVAL=1; COUNT=10"
};
//Adding the recurring or pattern appointment to the Schedule
AppointmentCollection.
scheduleAppointmentCollection.Add(scheduleAppointment);
//Add the ExceptionDates to avoid occurrence on specific dates.
DateTime exceptionDate = scheduleAppointment.StartTime.AddDays(3).Date;
scheduleAppointment.RecurrenceExceptionDates = new
ObservableCollection<DateTime>()
{
    exceptionDate,
};
//Setting AppointmentCollection as ItemSource of SfScheduler.
Schedule.ItemsSource = scheduleAppointmentCollection;
```

Note: [View sample in GitHub](#)

Note: Exception dates should be Universal Time Coordinates (UTC) time zone.

Add exception appointment to the recurrence pattern

Add an exception appointment which is changed or modified occurrence of the recurrence pattern appointment to the [ItemsSource](#) of Scheduler. To add a changed occurrence, ensure to set the [RecurrenceId](#) of that occurrence and add the date of that occurrence to the [RecurrenceExceptionDates](#) of recurrence pattern appointment. The [RecurrenceId](#) of changed occurrence should hold the exact recurrence pattern appointment [Id](#).

{%tabs %}

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Week"
ItemsSource="{Binding scheduleAppointmentCollection}">
</syncfusion:SfScheduler>
```

C#

```
// Creating an instance for schedule appointment collection
var appointmentCollection = new ScheduleAppointmentCollection();
// Recurrence and exception appointment
var scheduleAppointment = new ScheduleAppointment
{
    Id = 1,
    Subject = "Daily scrum meeting",
    StartTime = new DateTime(2020, 12, 13, 11, 0, 0),
    EndTime = new DateTime(2020, 12, 13, 12, 0, 0),
    AppointmentBackground = new
        SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF00BFFF")),
    Foreground = new
        SolidColorBrush((Color)ColorConverter.ConvertFromString("#FFFFFF")),
    RecurrenceRule = "FREQ=DAILY;INTERVAL=1;COUNT=10"
};
//Adding the recurring or pattern appointment to the AppointmentCollection.
appointmentCollection.Add(scheduleAppointment);
//Add ExceptionDates to avoid occurrence on specific dates.
DateTime changedExceptionDate =
    scheduleAppointment.StartTime.AddDays(3).Date;
scheduleAppointment.RecurrenceExceptionDates = new
    ObservableCollection<DateTime>()
```

```

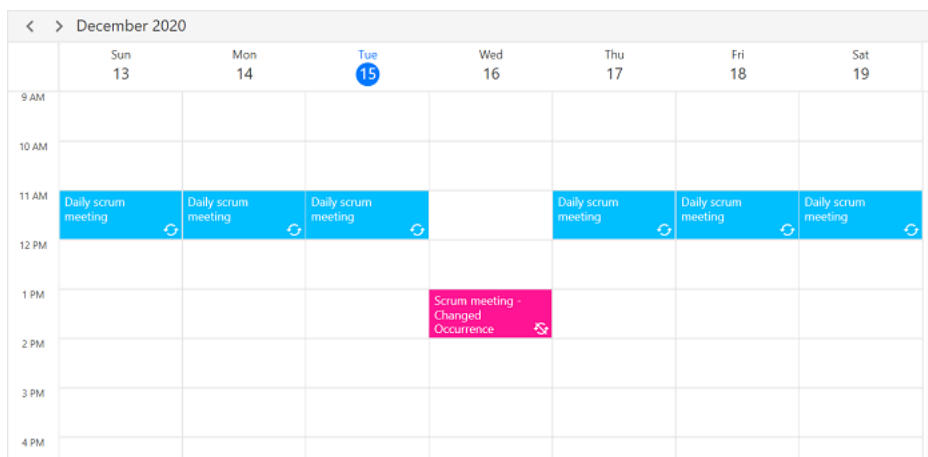

{
    changedExceptionDate,
};
//Creating an exception occurrence appointment by changing the start time or
end time.
// RecurrenceId is set to 1, so it will be the changed occurrence for the
above-created pattern appointment.
var exceptionAppointment = new ScheduleAppointment()
{
    Id = 2,
    Subject = "Scrum meeting - Changed Occurrence",
    StartTime = new DateTime(changedExceptionDate.Year,
        changedExceptionDate.Month, changedExceptionDate.Day, 13, 0, 0),
    EndTime = new DateTime(changedExceptionDate.Year,
        changedExceptionDate.Month, changedExceptionDate.Day, 14, 0, 0),
    AppointmentBackground = new
    SolidColorBrush((Color)ColorConverter.ConvertFromString("#FFFF1493")),
    Foreground = new
    SolidColorBrush((Color)ColorConverter.ConvertFromString("#FFFFFF")),
    RecurrenceId = 1
};
// Adding an exception occurrence appointment to the AppointmentCollection.
appointmentCollection.Add(exceptionAppointment);
//Setting the AppointmentCollection as a ItemSource of SfScheduler.
Schedule.ItemsSource = appointmentCollection;

```

Note: • The `RecurrenceId` of an exception appointment and the `Id` of its pattern appointment should have the same value.

- The Exception recurrence appointment does not have the `RecurrenceRule`, so for an exception appointment, it will be reset to empty.
- The exception appointment should have different `Id` with original pattern appointment `Id`.
- The exception appointment should be a normal appointment and should not be created as recurring appointment, since its occurrence is from recurrence pattern.
- The recurrenceExceptionDates should be in a Universal Time Coordinates (UTC) time zone.

Note: [View sample in GitHub](#)

Create recurrence exceptions for custom appointment

Add the recurrence exception appointments and recurrence exception dates to the CustomAppointment or remove them from CustomAppointment, create a custom class `Meeting` with mandatory fields [RecurrenceExceptionDates](#) and [RecurrenceId](#).

Delete occurrence from the recurrence pattern appointment or adding exception dates to recurrence pattern appointment

Delete any occurrence which is an exception from the recurrence pattern appointment by using the [RecurrenceExceptionDates](#) property of [AppointmentMapping](#) class which is used to map the exception dates to the schedule recurrence appointment. The deleted occurrence date will be considered as recurrence exception date.

To add the exception dates in the recurrence series of custom appointment, add the `RecurrenceExceptionDates`, `EventName`, `From`, `To`, `Color`, `RecurrenceRule` properties to the custom class `Meeting`.

C#

```
public class Meeting
{
    public ObservableCollection<DateTime> RecurrenceExceptions { get; set; } =
    new ObservableCollection<DateTime>();
    public string EventName { get; set; }
    public DateTime From { get; set; }
    public DateTime To { get; set; }
    public object Id { get; set; }
    public Brush BackgroundColor { get; set; }
    public Brush ForegroundColor { get; set; }
    public string RecurrenceRule { get; set; }
    public object RecurrenceId { get; set; }
}
```

Map this custom property `RecurrenceExceptionDates` of custom class with the `RecurrenceExceptionDates` property of `AppointmentMapping` class to map the exception dates to the scheduled appointment.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Week"
ItemsSource="{Binding customAppointmentCollection}>
<syncfusion:SfScheduler.AppointmentMapping>
<syncfusion:AppointmentMapping
Subject="EventName"
StartTime="From"
EndTime="To"
Id="Id"
AppointmentBackground="BackgroundColor"
Foreground="ForegroundColor"
IsAllDay="IsAllDay"
StartTimeZone="StartTimeZone"
RecurrenceRule="RecurrenceRule"
RecurrenceExceptionDates="RecurrenceExceptions"
EndTimeZone="EndTimeZone"
RecurrenceId="RecurrenceId"/>
```

```
</syncfusion:SfScheduler.AppointmentMapping>
</syncfusion:SfScheduler>
```

C#

```
// Creating an instance for custom appointment collection
ObservableCollection<Meeting> customAppointmentCollection = new
ObservableCollection<Meeting>();
// data mapping for custom appointments.
AppointmentMapping dataMapping = new AppointmentMapping();
dataMapping.RecurrenceExceptionDates = "RecurrenceExceptionDates";
// Create the new exception date.
var exceptionDate = new DateTime(2020, 07, 09);
//Adding custom appointment in the custom appointment collection
var recurrenceAppointment = new Meeting()
{
    From = new DateTime(2020, 07, 05, 10, 0, 0),
    To = new DateTime(2020, 07, 05, 11, 0, 0),
    EventName = "Occurs Daily",
    BackgroundColor = new SolidColorBrush(Colors.LightSeaGreen),
    ForegroundColor = new SolidColorBrush(Colors.White),
    Id = 1
};
// Creating recurrence rule
recurrenceAppointment.RecurrenceRule = "FREQ=DAILY;COUNT=20";
// Add RecurrenceExceptionDates to appointment.
recurrenceAppointment.RecurrenceExceptions = new
ObservableCollection<DateTime>()
{
    exceptionDate
};
//Adding custom appointment in the custom appointment collection
customAppointmentCollection.Add(recurrenceAppointment);
//Adding custom appointment collection to the ItemsSource of SfScheduler
Schedule.ItemsSource = customAppointmentCollection;
```

Note: Exception dates should be Universal Time Coordinates (UTC) time zone.

Note: [View sample in GitHub](#)

Add an exception appointment to the recurrence pattern

Add an exception appointment which is changed or modified occurrence of the recurrence pattern appointment to the [ItemsSource](#) of Scheduler. To add the changed occurrence, ensure to set the [RecurrenceId](#) of that occurrence and add the date of that occurrence to [RecurrenceExceptionDates](#) of recurrence pattern appointment. The [RecurrenceId](#) of changed occurrence should hold the exact recurrence pattern appointment [Id](#)

Map the equivalent properties of [Id](#), [RecurrenceId](#) and [RecurrenceExceptionDates](#) properties from the business object to the [Id](#) and [RecurrenceExceptionDates](#) properties of [AppointmentMapping](#).

Add the created exception recurrence appointment to the SfScheduler `ItemsSource`.

C#

```
//// Creating an instance for schedule appointment collection
public ObservableCollection<Meeting> RecursiveAppointmentCollection
{
    get;
    set;
}
```

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Week"
ItemsSource="{Binding RecursiveAppointmentCollection}">
<syncfusion:SfScheduler.AppointmentMapping>
<syncfusion:AppointmentMapping
Subject="EventName"
StartTime="From"
EndTime="To"
Id="Id"
AppointmentBackgroundColor="BackgroundColor"
ForegroundColor="ForegroundColor"
RecurrenceRule="RecurrenceRule"
RecurrenceId="RecurrenceId"/>
</syncfusion:SfScheduler.AppointmentMapping>
</syncfusion:SfScheduler>
```

C#

```
this.RecursiveAppointmentCollection = new ObservableCollection<Meeting>();
//Adding custom appointment in the custom appointment collection
Meeting dailyEvent = new Meeting
{
    EventName = "Daily scrum meeting",
    From = new DateTime(2020, 12, 13, 11, 0, 0),
    To = new DateTime(2020, 12, 13, 12, 0, 0),
    BackgroundColor = new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF00BFFF")),
    ForegroundColor = new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#FFFFFF")),
    RecurrenceRule = "FREQ=DAILY;INTERVAL=1;COUNT=10",
    Id = 1
};
```

```

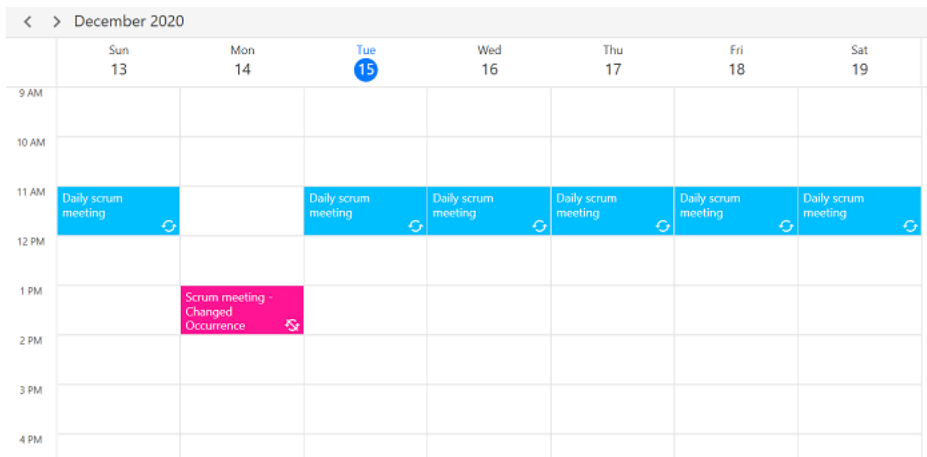

//Adding custom appointment in the custom appointment collection
RecursiveAppointmentCollection.Add(dailyEvent);
//Add ExceptionDates to avoid occurrence on specific dates.
DateTime changedExceptionDate = DateTime.Now.AddDays(-1).Date;
dailyEvent.RecurrenceExceptions = new ObservableCollection<DateTime>()
{
    changedExceptionDate
};
//Change start time or end time of an occurrence.
Meeting changedEvent = new Meeting
{
    EventName = "Scrum meeting - Changed Occurrence",
    From = new DateTime(changedExceptionDate.Year, changedExceptionDate.Month,
        changedExceptionDate.Day, 13, 0, 0),
    To = new DateTime(changedExceptionDate.Year, changedExceptionDate.Month,
        changedExceptionDate.Day, 14, 0, 0),
    BackgroundColor = new
        SolidColorBrush((Color)ColorConverter.ConvertFromString("#FFFF1493")),
    ForegroundColor = new
        SolidColorBrush((Color)ColorConverter.ConvertFromString("#FFFFFF")),
    RecurrenceRule = "FREQ=DAILY; INTERVAL=1; COUNT=10",
    Id = 2,
    RecurrenceId = 1
};
RecursiveAppointmentCollection.Add(changedEvent);
//Adding custom appointment collection to the ItemsSource of SfScheduler
Schedule.ItemsSource = RecursiveAppointmentCollection;

```

Note: The **RecurrenceId** of exception appointment and the **Id** of its pattern appointment should have same value.

- The Exception recurrence appointment does not have the **RecurrenceRule**, so for an exception appointment, it will be reset to empty.
 - The exception appointment should have different **Id** with original pattern appointment **Id**.
 - The exception appointment should be a normal appointment and should not be created as recurring appointment, since its occurrence from the recurrence pattern.
 - The recurrenceExceptions should be in a Universal Time Coordinates (UTC) time zone.
-

Note: [View sample in GitHub](#)

Appearance customization

The default appearance of schedule appointment can be customized in all the views by using the [AppointmentTemplate](#) and [AppointmentTemplateSelector](#) properties of [ViewSettingsBase](#). Use the [AllDayAppointmentTemplate](#) property of [DaysViewSettings](#) to customize the appearance of all day appointments in day, week and work week views.

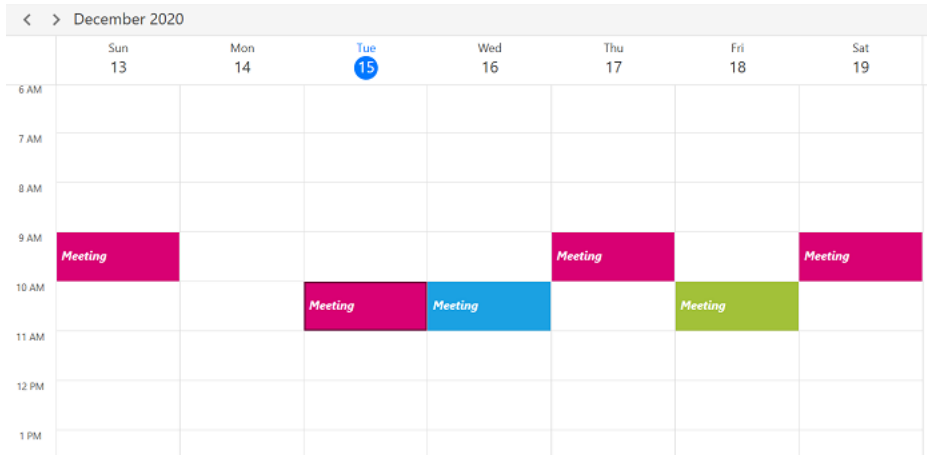

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week"
ItemsSource="{Binding Appointments}">
<syncfusion:SfScheduler.DaysViewSettings>
<syncfusion:DaysViewSettings>
<syncfusion:DaysViewSettings.AppointmentTemplate>
<DataTemplate>
<StackPanel Background="{Binding Data.BackgroundColor}"
VerticalAlignment="Stretch"
HorizontalAlignment="Stretch"
Orientation="Horizontal">
<TextBlock Margin="5"
VerticalAlignment="Center"
Text="Meeting"
TextTrimming="CharacterEllipsis"
Foreground="{Binding Data.ForegroundColor}" TextWrapping="Wrap"
FontStyle="Italic"
TextAlignment="Left"
FontWeight="Bold"/>
</StackPanel>
</DataTemplate>
</syncfusion:DaysViewSettings.AppointmentTemplate>
</syncfusion:DaysViewSettings>
</syncfusion:SfScheduler.DaysViewSettings>
</syncfusion:SfScheduler>
```

Note

- By default, the `ScheduleAppointment` is set as the `DataContext` for the `AppointmentTemplate` and `AppointmentTemplateSelector` for both `ScheduleAppointment` and custom data object in the `ItemsSource` of `SfScheduler`.

- The custom data object can be bound in the `AppointmentTemplate` and `AppointmentTemplateSelector` by using the property of [ScheduleAppointment.Data](#).

Note: [View sample in GitHub.](#)

Appointment selection border brush

You can customize the appointment selection border brush by using the [SelectionBorderBrush](#) property in the [AppointmentControl](#). If the `AppointmentControl` has default style, the appointment selection border color will be updated based on the selected appointment background color.

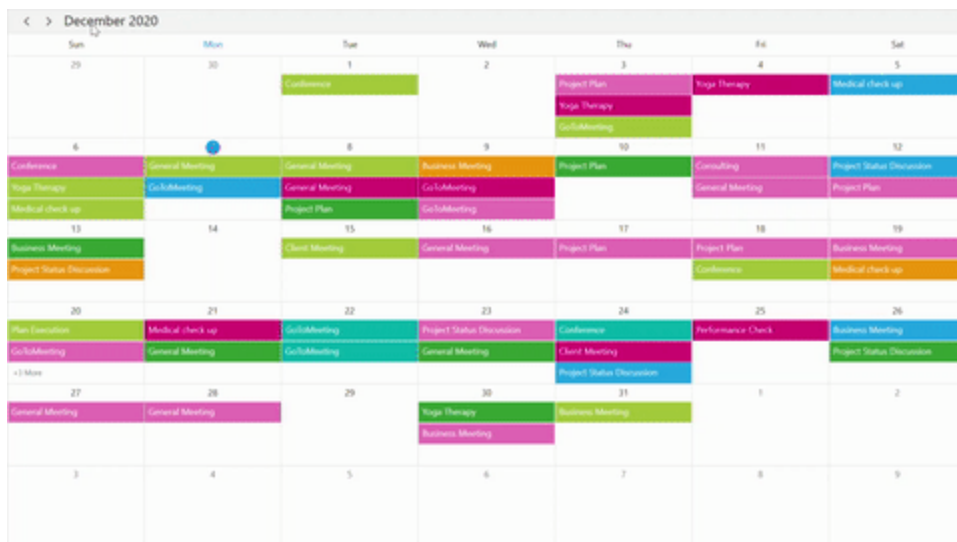

XML

```
<Window.Resources>
<Style TargetType="syncfusion:AppointmentControl">
<Setter Property="BorderBrush" Value="Blue" />
<Setter Property="SelectionBorderBrush" Value="Red" />
<Setter Property="BorderThickness" Value="2" />
</Style>
</Window.Resources>
```

Note: [View sample in GitHub](#)

Load On Demand in WPF Scheduler (SfScheduler)

The [WPF Scheduler](#) supports to load appointment on demand with loading indicator and it improves the loading performance when there are appointments range for multiple years.

QueryAppointments event

The [QueryAppointments](#) event is used to load appointments in on-demand for the visible date range. Start and stop the loading indicator animation before and after the appointments loaded using the [ShowBusyIndicator](#).

The [QueryAppointmentsEventArgs](#) has the following members which provides information for the [QueryAppointments](#) event.

[VisibleDateRange](#) - Gets the current visible date range of scheduler that is used to load the appointments.

XML

```
<syncfusion:SfScheduler x:Name="Scheduler"
    ViewType="Month" QueryAppointments="Scheduler_QueryAppointments">
</syncfusion:SfScheduler>
```

C#

```
Scheduler.QueryAppointments += Scheduler_QueryAppointments;
private void Scheduler_QueryAppointments(object sender,
    QueryAppointmentsEventArgs e)
{
    Scheduler.ShowBusyIndicator = true;
    Scheduler.ItemsSource =
    this.GenerateSchedulerAppointments(e.VisibleDateRange);
    Scheduler.ShowBusyIndicator = false;
}
private IEnumerable GenerateSchedulerAppointments(DateRange dateRange)
{
    Random ran = new Random();
    int daysCount = (dateRange.ActualEndDate - dateRange.ActualStartDate).Days;
    var appointments = new ObservableCollection<SchedulerModel>();
    for (int i = 0; i < 50; i++)
    {
        var startTime = dateRange.ActualStartDate.AddDays(ran.Next(0, daysCount +
            1)).AddHours(ran.Next(0, 24));
        appointments.Add(new SchedulerModel
```

```

{
    From = startTime,
    To = startTime.AddHours(1),
    EventName = subjectCollection[ran.Next(0, subjectCollection.Count)],
    Color = brush[ran.Next(0, brush.Count)],
});
}
return appointments;
}

```

The [QueryAppointments](#) will be raised once any one of the following action is taken.

- Once the [ViewChanged](#) event is raised, the [QueryAppointments](#) will be raised.
- If the appointment has been added, removed, or changed (Resize, drag, and drop) in the current time visible date range, then the [QueryAppointments](#) event will not be triggered. Since the appointments for that visible date range have been loaded already.
- The [QueryAppointments](#) event is triggered when the Schedule [ResourceCollection](#) is updated to load appointments based on the changed resource collection.
- The [QueryAppointments](#) event will be triggered when the [ResourceGroupType](#) is changed.

Load On Demand command

The Scheduler notifies by [LoadOnDemandCommand](#) when the user changes the visible date range. Get a visible date range from the [QueryAppointmentsEventArgs](#). The default value for this [ICommand](#) is null. The [QueryAppointmentsEventArgs](#) passed as a command parameter.

Define a ViewModel class that implements command and handle it by the CanExecute and Execute methods to check and execute on-demand loading. In the execute method, perform the following operations,

- Start and stop the loading indicator animation before and after the appointments loaded using the [ShowBusyIndicator](#).
- Once the appointment collection is got, load into the scheduler items source.

XML

```

<syncfusion:SfScheduler x:Name="Scheduler"
    ViewType="Month"
    ShowBusyIndicator="{Binding ShowBusyIndicator}"
    LoadOnDemandCommand="{Binding LoadOnDemandCommand}"
    ItemsSource="{Binding Events}">
</syncfusion:SfScheduler>

```

C#

```

public class LoadOnDemandViewModel : NotificationObject
{
    public ICommand LoadOnDemandCommand { get; set; }
    private IEnumerable events;
    public IEnumerable Events
    {
        get { return events; }
    }
}

```

```

set
{
events = value;
this.RaisePropertyChanged("Events");
}
}
private bool showBusyIndicator;
public bool ShowBusyIndicator
{
get { return showBusyIndicator; }
set
{
showBusyIndicator = value;
this.RaisePropertyChanged("ShowBusyIndicator");
}
}
public SchedulerViewModel()
{
this.LoadOnDemandCommand = new DelegateCommand(ExecuteOnDemandLoading,
CanExecuteOnDemandLoading);
}
public event PropertyChangedEventHandler PropertyChanged;
public async void ExecuteOnDemandLoading(object parameter)
{
this.ShowBusyIndicator = true;
await Task.Delay(1000);
await
Application.Current.MainWindow.Dispatcher.BeginInvoke(DispatcherPriority.App
licationIdle, new Action(() =>
{
this.Events = this.GenerateSchedulerAppointments((parameter as
QueryAppointmentsEventArgs).VisibleDateRange);
}));
this.ShowBusyIndicator = false;
}
private bool CanExecuteOnDemandLoading(object sender)
{
return true;
}
private IEnumerable GenerateSchedulerAppointments(DateRange dateRange)
{
Random ran = new Random();
int daysCount = (dateRange.ActualEndDate - dateRange.ActualStartDate).Days;
var appointments = new ObservableCollection<SchedulerModel>();
for (int i = 0; i < 50; i++)
{
var startTime = dateRange.ActualStartDate.AddDays(ran.Next(0, daysCount +
1)).AddHours(ran.Next(0, 24)); appointments.Add(new SchedulerModel
{
From = startTime,
To = startTime.AddHours(1),
EventName = subjectCollection[ran.Next(0, subjectCollection.Count)],
Color = brush[ran.Next(0, brush.Count)],
});
}
return appointments;
}

```

```
}

```

The [LoadOnDemandCommand](#) will be invoked once any one of the following actions is taken.

- Once the [ViewChanged](#) event is raised, the [LoadOnDemandCommand](#) will also be raised.
- If the appointment has been added, removed, or changed (Resize, drag, and drop) in the current time visible date range, then the [LoadOnDemandCommand](#) will not be triggered. Since the appointments for that visible date range have been loaded already.
- The [LoadOnDemandCommand](#) is triggered when the Scheduler [ResourceCollection](#) is updated to load the appointments based on the changed resource collection.
- The [LoadOnDemandCommand](#) will be triggered when the [ResourceGroupType](#) is changed.

Load On Demand for recurring appointment

The scheduler will add the occurrences of recurrence series based on the visible date range, use the [RecurrenceHelper.GetRecurrenceDateTimeCollection](#) to compare and load the recurrence appointment on demand in the ItemsSource.

- The recurrence appointment should be added to the Scheduler [ItemsSource](#) until the date of recurrence ends.
- If [RecurrenceRule](#) added with count or end date, use the [RecurrenceHelper.GetRecurrenceDateTimeCollection](#) method to get the recurrence date collection and compare recursive dates in the current visible date range. Then add the recurrence appointment in the scheduler [ItemsSource](#) If the recursive dates are in the current visible date range.
- If the [RecurrenceRule](#) is added without an end date, then the recurrence appointment should be added in the scheduler [ItemsSource](#) when all the visible dates changed from the recurrence start date.

Note: [View sample in GitHub](#)

Appointment Editing in WPF Scheduler (SfScheduler)

This section explains how to handle appointment editing in [WPF scheduler](#) and also explains about the appointment resizing.

Adding appointments

Scheduler supports to add a new appointment by using the [Appointment Editor](#) UI window. Open this window by double-clicking on a time cell or month cell or view header.

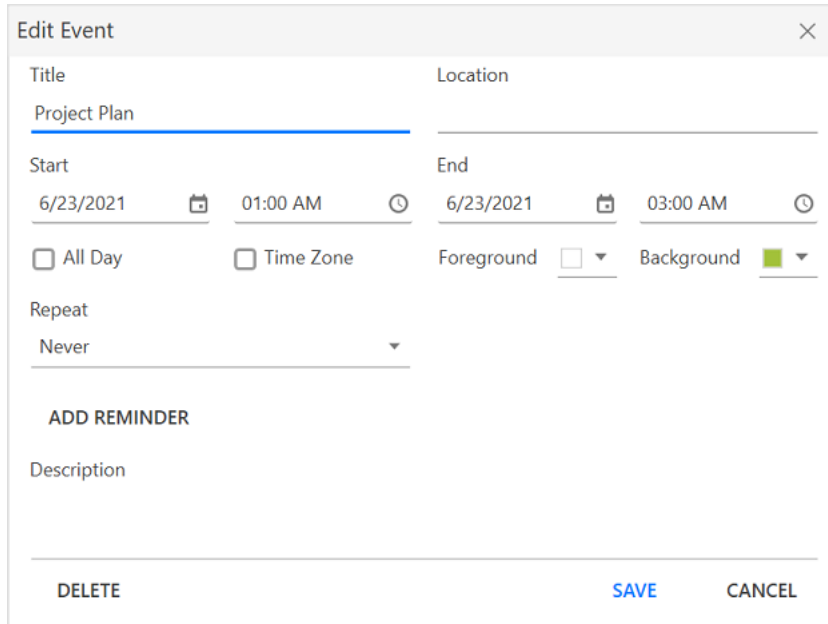

Note:

- If [AllowViewNavigation](#) is true, the current view should be navigated to the respective day or timeline day views by single-clicking on the date in the view header. Other than the date by double-clicking on the view header cell, the appointment editor window will be opened, and by default, the [AllDay](#) checkbox will be checked in the appointment editor window.
- All-day appointments can be created by double-clicking on the view header and not applicable for the month view header.

Editing appointment

Scheduler supports to edit the appointment by using **Appointment Editor** UI window. Open this window by double clicking on the appointment.

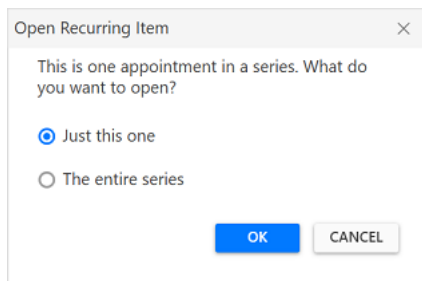

Appointment editor window

Edit the appointments in appointment editor window. This changes will be saved back in appointment and mapped data object when using data binding.

Edit recurring appointment

Scheduler supports to edit the recurrence appointment. The following window will appear when the recurrence appointment is edited to select, whether to edit only the particular occurrence or appointment series.

Handle the opening of recurrence popup window using [RecurringAppointmentEditMode](#) property in [AppointmentEditorOpeningEventArgs](#) by handling [AppointmentEditorOpening](#) event.

AppointmentEditorOpening event

When the appointment editor UI window is opened to add or update appointment, then Scheduler notifies by [AppointmentEditorOpening](#) event.

[AppointmentEditorOpeningEventArgs](#) has following members which provides the information for [AppointmentEditorOpening](#) event.

[Appointment](#) - Gets the selected appointment details which is being updated. It will be null when adding new appointment through appointment editor.

[DateTime](#) - Get the DateTime of time slot or month cell where user double clicked.

[Cancel](#) - To avoid the default appointment editor showing by enabling this property.

[RecurrenceEditMode](#) - Get or Sets the edit mode to perform the edit option to edit the occurrence or series for recurrence appointment. The default value of [RecurrenceEditMode](#) is [User](#).

- [User](#) - Default window dialog will appear when editing a recurrence appointment to select the edit option from the end-user itself.
- [Occurrence](#) - Edit the particular occurrence alone in recurrence appointment. Default window dialog will not appear.
- [Series](#) - Edit the entire series in recurrence appointment. Default window dialog will not appear.

For example, To use custom appointment editor window instead of default appointment editor window, handle [AppointmentEditorOpening](#) event.

C#

```
this.Schedule.AppointmentEditorOpening += Schedule_AppointmentEditorOpening;
private void Schedule_AppointmentEditorOpening(object sender,
AppointmentEditorOpeningEventArgs e)
{
    //To handle the default appointment editor window by setting the e.Cancel
    value as true.
    e.Cancel = true;
    if (e.Appointment != null)
    {
        //Display the custom appointment editor window to edit the appointment
    }
    else
    {
        //Display the custom appointment editor window to add new appointment
    }
}
```

- [Resource](#) - gets the resource of an appointment under which the appointment is located.

Visible/Collapse the built-in editors in appointment editor window

Programmatically visible or collapse the editors by setting the [AppointmentEditorOptions](#) property in [SchedulerAppointmentEditorWindow](#). By default, the value of [AppointmentEditorOptions](#) is set to [AppointmentEditorOptions.All](#) in the [SchedulerAppointmentEditorWindow](#) that displays all the appointment editors. The following code shows how to collapse the [Reminder](#) and [Resource](#) editors by handling the [AppointmentEditorOpening](#) event.

C#

```
this.Schedule.AppointmentEditorOpening += Schedule_AppointmentEditorOpening;
private void Schedule_AppointmentEditorOpening(object sender,
AppointmentEditorOpeningEventArgs e)
{

```

```
e.AppointmentEditorOptions = AppointmentEditorOptions.All |
(~AppointmentEditorOptions.Background & ~AppointmentEditorOptions.Foreground
& ~AppointmentEditorOptions.Reminder & ~AppointmentEditorOptions.Resource);
}
```

Note:

- The basic editors such that **Subject**, **Location**, **Start Hour** and **End Hour** of the scheduler appointment editor will not be collapsed.

AppointmentEditorClosing event

When the appointment editor window is closed after adding or editing the schedule appointment, Scheduler notifies by [AppointmentEditorClosing](#) event.

[AppointmentEditorClosingEventArgs](#) has the following members which provides the information for [AppointmentEditorClosing](#) event.

Handled - Gets or sets a value that indicates whether the scheduler can update the underlying appointments collection or appointment based on the action performed in the appointment editor. If the value is true, scheduler does not perform the action so the code has to be written in the handler and perform the action. The default value of Handled is **false**.

Appointment - Gets the details of updated or newly added appointment.

Cancel - To avoid the default appointment editor closing by enabling this property.

Action - Gets the action of appointment which is Add, Edit, Delete or Cancel.

- Add - Specifies that the appointment is newly added through appointment editor.
- Edit - Specifies that the appointment is edited through appointment editor.
- Delete - Specifies that the appointment is deleted through appointment editor.
- Cancel - Specifies that the appointment editing is canceled through appointment editor.

For example, to handle the appointment adding for today's date, user can handle the `AppointmentEditorClosing` event.

C#

```
this.Schedule.AppointmentEditorClosing += Schedule_AppointmentEditorClosing;
private void Schedule_AppointmentEditorClosing(object sender,
AppointmentEditorClosingEventArgs e)
{
    var appointment = e.Appointment as ScheduleAppointment;
    if (appointment != null)
    {
        if (appointment.StartTime.Day == DateTime.Now.Day)
        e.Handled = true;
    }
}
```

- `Resource` - gets the resource collection of edited appointment.

Disable appointment editing

To disable appointment editing functionality, Set `AppointmentEditFlag` property to `None`. In this case, add, edit, resize and drag & drop the appointments cannot be able performed.

XML

```
<syncfusion:SfScheduler
x:Name="Schedule"
AppointmentEditFlag="None">
</syncfusion:SfScheduler>
```

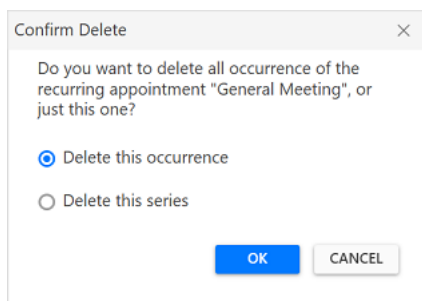

Delete appointments

Scheduler supports two ways to remove the selected appointment.

1. Pressing delete key.
2. Using appointment editor window.

Delete recurring appointment

Scheduler supports to delete the recurrence appointment. The following window will appear when the user deletes the recurrence appointment. Select the delete option to make the changes for occurrence or appointment series.

AppointmentDeleting event

Scheduler notifies by [AppointmentDeleting](#) event, when user deletes the appointment.

[AppointmentDeletingEventArgs](#) has following members which provides information for [AppointmentDeleting](#) event.

[Appointment](#) - Gets the selected appointment to delete.

[Cancel](#) - To avoid appointment deleting by enabling this property.

[RecurrenceEditMode](#) - Gets or sets whether to delete series or occurrence, when delete a recurrence appointment. The default value of RecurrenceEditMode is [User](#).

- User - Default window dialog will appear when deleting a recurrence appointment to select the edit option from the end-user itself.
- Occurrence - Delete the particular occurrence alone in recurrence appointment. Default window dialog will not appear.
- Series - Delete the entire series in recurrence appointment. Default window dialog will not appear.

C#

```
Schedule.AppointmentDeleting += Schedule_AppointmentDeleting;  
private void Schedule_AppointmentDeleting(object sender,  
AppointmentDeletingEventArgs e)  
{  
    //To notify when restrict appointment delete  
    e.Cancel = true;  
}
```

Appointment Resizing

Scheduler has support to resize the selected appointment. This support is available for all views except 'Month' view.

Disable appointment resize

Scheduler supports to disable the appointment resizing by setting [AppointmentEditFlag](#) property except [Resize](#). In this case, appointment resizing cannot be performed.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"  
AppointmentEditFlag="Add, DragDrop, Edit">  
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.AppointmentEditFlag = AppointmentEditFlag.Add |  
AppointmentEditFlag.DragDrop | AppointmentEditFlag.Edit;
```

AppointmentResizing event

Scheduler notifies by [AppointmentResizing](#) event when user resize an appointment.

[AppointmentResizingEventArgs](#) has following members which provides information for [AppointmentResizing](#) event.

[Appointment](#) - Gets the appointment being resized.

[Action](#) - Gets the current action being performed while resizing an appointment.

- **Starting** - Denotes the event occurred when the user mouse over the appointment to resize an appointment (before showing resize cursor).
- **Progressing** - Denotes the event occurred when the user resizing an appointment.
- **Committing** - Denotes the event occurred when the user ends the resizing by releasing pointer to commit the changed to underlying appointment.
- **Canceling** - Denotes the event occurred before canceling the resize operation, when the user press `Esc` key when resizing operation in progress.

[StartTime](#) - Gets the updated start time of the appointment in resizing operation.

[EndTime](#) - Gets the updated end time of the appointment in resizing operation.

[CanContinueResize](#) - Gets or sets a value indicating whether resizing the operation should be continued or canceled. Set this property when Action is Starting, Progressing, Canceling. This property won't have any effect for when Action is Committing.

[CanCommit](#) - Gets or sets a value indicating whether to update underlying appointment when resizing operation is completed. Set this property when Action is Canceling and Committing. This property won't have any effect for when Action is Starting and Progressing.

C#

```
this.Schedule.AppointmentResizing += Schedule_AppointmentResizing;
private void Schedule_AppointmentResizing(object sender,
AppointmentResizingEventArgs e)
{
    //To notify when resizing the appointment.
}
```

- **Resource** - gets the resource of an appointment under which the appointment is located.

Note: You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Reminder in WPF Scheduler (SfScheduler)

[WPF Scheduler](#) alerts you for a particular appointment with a reminder window when enabling the [EnableReminder](#) property. Reminder window supports to **Dismiss** or **DismissAll** or set the **SnoozeTime** for the reminder appointments.

Enable reminder

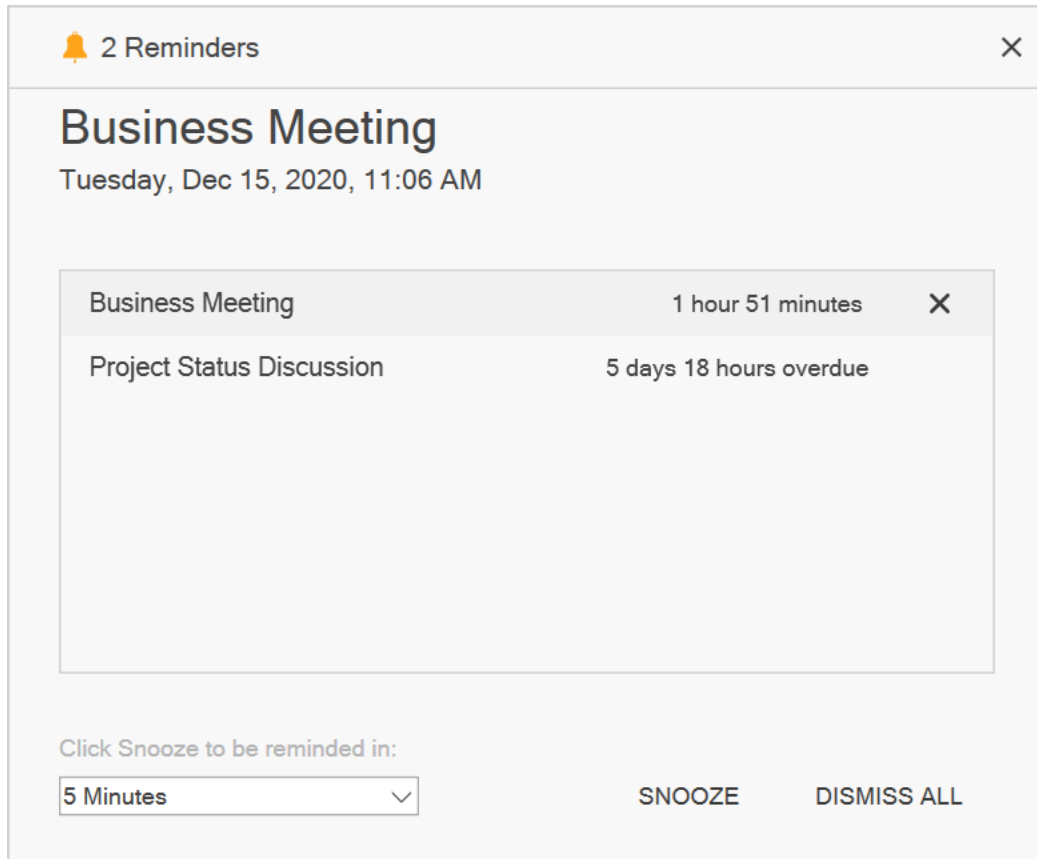

Reminder can be set by setting the [EnableReminder](#) property to **true**. The reminder time can be set using the [Reminders](#) property of [ScheduleAppointment](#).

XML

```
<syncfusion:SfScheduler x:Name="Scheduler">
```

```
ViewType="Week"
EnableReminder="True" >
</syncfusion:SfScheduler>
```

Adding reminders

Configure the appointment reminders with [SchedulerReminder](#). The `SchedulerReminder` has the following properties for reminder alert,

Properties	Description
ReminderTimeInterval	Gets or sets the time interval that decides to open the reminder alert window before the appointment's start time.
ReminderAlertTime	Gets the reminder time that decides when to show a reminder alert of the appointment.
Appointment	Gets the appointment details for which the reminder is created.
Data	Gets the reminder data object associated with the <code>SchedulerReminder</code> .
IsDismissed	Gets or sets whether the reminder is dismissed.

XML

```
<Grid.DataContext>
<local:ReminderViewModel/>
</Grid.DataContext>
<syncfusion:SfScheduler x:Name="Schedule"
ItemsSource="{Binding Events}"
EnableReminder="True">
</syncfusion:SfScheduler>
```

C#

```
public class ReminderViewModel
{
    ...
    public ScheduleAppointmentCollection Events { get; set; } = new
ScheduleAppointmentCollection();
    this.Events.Add(new ScheduleAppointment()
    {
        StartTime = DateTime.Now,
        EndTime = DateTime.Now.AddHours(1),
        AppointmentBackground = new
SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF339933")),
        Subject = "Conference",
        Reminders = new ObservableCollection<SchedulerReminder>
        {
            new SchedulerReminder { ReminderTimeInterval = new TimeSpan(0)},
        }
    });
}
```

Note: [View sample in GitHub](#)

Creating business object for reminder

Reminders supports to map the custom object with the [ScheduleAppointment.Reminders](#).

C#

```
/// <summary>
/// Represents custom data properties.
/// </summary>
public class Event
{
    public Event()
    {
    }

    public DateTime From { get; set; }
    public DateTime To { get; set; }
    public bool IsAllDay { get; set; }
    public string EventName { get; set; }
    public string Notes { get; set; }
    public string StartTimeZone { get; set; }
    public string EndTimeZone { get; set; }
    public Brush Color { get; set; }
    public object RecurrenceId { get; set; }
    public object Id { get; set; }
```

```

public string RecurrenceRule { get; set; }
public ObservableCollection<DateTime> RecurrenceExceptions { get; set; }
public ObservableCollection<Reminder> Reminders { get; set; }
}

```

The [ReminderMapping](#) provides the mapping information about the [SchedulerReminder](#) properties to the [Data](#) object. ReminderMapping has the following properties for reminder alert,

- [ReminderTimeInterval](#) - Maps the property name of custom class, which is equivalent for the SchedulerReminder.ReminderTimeInterval.
- [IsDismissed](#) - Maps the property name of custom class, which is equivalent for the SchedulerReminder.IsDismissed.

C#

```

/// <summary>
/// Represents custom data properties.
/// </summary>
public class Reminder
{
    /// <summary>
    /// Gets or sets the value indicating whether the reminder is dismissed or not.
    /// </summary>
    public bool Dismissed { get; set; }
    /// <summary>
    /// Gets or sets the value to display reminder alert before appointment start time.
    /// </summary>
    public TimeSpan TimeInterval { get; set; }
}

```

Map those properties of the [Meeting](#) class with the [SfScheduler](#) control by using the [AppointmentMapping](#) and map [CustomReminder](#) properties with [SchedulerReminder](#) by using the [ReminderMapping](#).

XML

```

<syncfusion:SfScheduler x:Name="Schedule"
ItemsSource="{Binding Events}"
EnableReminder="True">
<syncfusion:SfScheduler.AppointmentMapping>
<syncfusion:AppointmentMapping
Subject="EventName"
StartTime="From"
EndTime="To"
AppointmentBackground="Color"
IsAllDay="IsAllDay"
StartTimeZone="StartTimeZone"
EndTimeZone="EndTimeZone"
RecurrenceExceptionDates="RecurrenceExceptions"
RecurrenceRule="RecurrenceRule"
RecurrenceId="RecurrenceId"

```

```

Reminders="Reminders">
<syncfusion:AppointmentMapping.ReminderMapping>
<syncfusion:ReminderMapping IsDismissed="Dismissed"
ReminderTimeInterval="TimeInterval"/>
</syncfusion:AppointmentMapping.ReminderMapping>
</syncfusion:AppointmentMapping>
</syncfusion:SfScheduler.AppointmentMapping>
</syncfusion:SfScheduler>

```

C#

```

public class ReminderViewModel
{
    ...
    public ObservableCollection<Event> Events { get; set; } = new
    ObservableCollection<Event>();
    this.Events.Add(new Event()
    {
        From = DateTime.Now,
        To = DateTime.Now.AddHours(1),
        Color = new
        SolidColorBrush((Color)ColorConverter.ConvertFromString("#FF339933")),
        EventName = "Conference",
        Reminders = new ObservableCollection<Reminder>
        {
            new Reminder { TimeInterval = new TimeSpan(0)},
        }
    });
}

```

Note: [View sample in GitHub](#)

ReminderAlertOpening event

Scheduler notifies by the [ReminderAlertOpening](#) event when appearing in the reminder window. The [ReminderAlertOpeningEventArgs](#) has following properties,

- [Reminders](#) - Gets a list of reminders that are used to display the appointment reminders in the reminder alert window.
- [Cancel](#) - To avoid the reminder window opening by enabling this property.

C#

```

scheduler.ReminderAlertOpening += Scheduler_ReminderAlertOpening;
private void Scheduler_ReminderAlertOpening(object sender,
ReminderAlertOpeningEventArgs e)
{
    var reminders = e.Reminders;
    var appointment = e.Reminders[0].Appointment;
}

```

ReminderAlertActionChanged events

The Scheduler notifies by the [ReminderAlertActionChangedEvent](#) when appointment reminders' dismiss, dismiss all, or snooze action is changed in the Scheduler reminder alert window.

The [ReminderAlertActionChangedEventArgs](#) has following properties which provides information for the `ReminderAlertActionChanged` event.

[ReminderAction](#) - Gets the appointment reminder actions such as dismiss, dismiss all, and snooze performed in the reminder alert window and specifies the appointment reminder that was dismissed in the reminder alert window, the reminders for all appointments were dismissed in the reminder alert window and the appointment reminder is snoozed in the reminder alert window.

[Reminders](#) - Gets the reminders collection where dismiss, dismiss all, or snooze action is performed in the reminder alert window.

[SnoozeTime](#) - Gets the snooze time value of an appointment in the reminder alert window.

C#

```
this.Schedule.ReminderAlertActionChanged +=
OnScheduleReminderAlertActionChanged;
private void OnScheduleReminderAlertActionChanged(object sender,
Syncfusion.UI.Xaml.Scheduler.ReminderAlertActionChangedEventArgs e)
{
    if (e.ReminderAction == ReminderAction.Dismiss)
    {
        var reminder = e.Reminders[0];
    }
    else if (e.ReminderAction == ReminderAction.DismissAll)
    {
        var reminders = e.Reminders;
    }
    else if (e.ReminderAction == ReminderAction.Snooze)
    {
        var reminder = e.Reminders[0];
        var snoozeTime = e.SnoozeTime;
    }
}
```

Note: You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Appointment drag and drop in WPF Scheduler (SfScheduler)

The [WPF Scheduler](#) supports to reschedule the appointment by performing the drag and drop operation.

Disable drag and drop

The Scheduler supports to disable the appointment drag and drop by setting [AppointmentEditFlag](#) property except `DragDrop`. In this case, appointment drag & drop will not be able to perform.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
AppointmentEditFlag="Add,Edit,Resize">
</syncfusion:SfScheduler>
```

C#

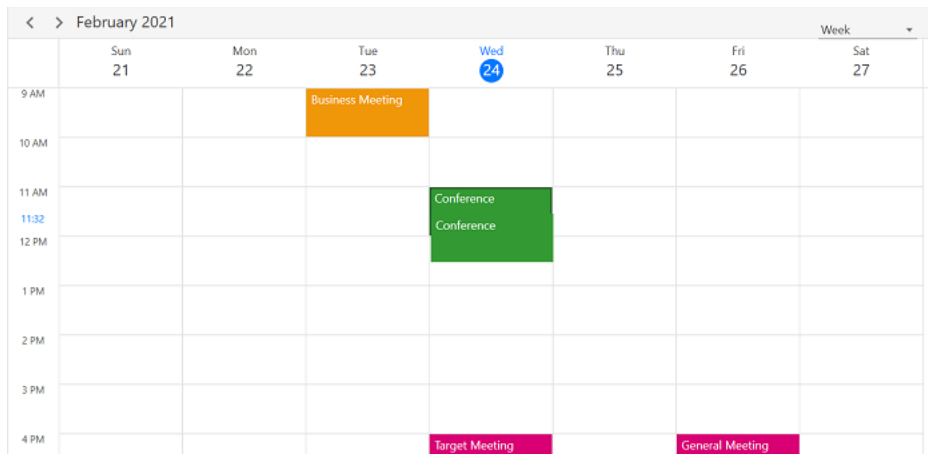

```
this.Schedule.AppointmentEditFlag = AppointmentEditFlag.Add |
AppointmentEditFlag.Edit | AppointmentEditFlag.Resize;
```

Show/Hide the time indicator on appointment dragging

Show or hide the time indicator at a specific time when to drag the appointment by using the [ShowTimeIndicator](#) property of [DragDropSettings](#) is set to true.

C#

```
Schedule.ViewType = SchedulerViewType.Week;
Schedule.DragDropSettings.ShowTimeIndicator = true;
```

Note:

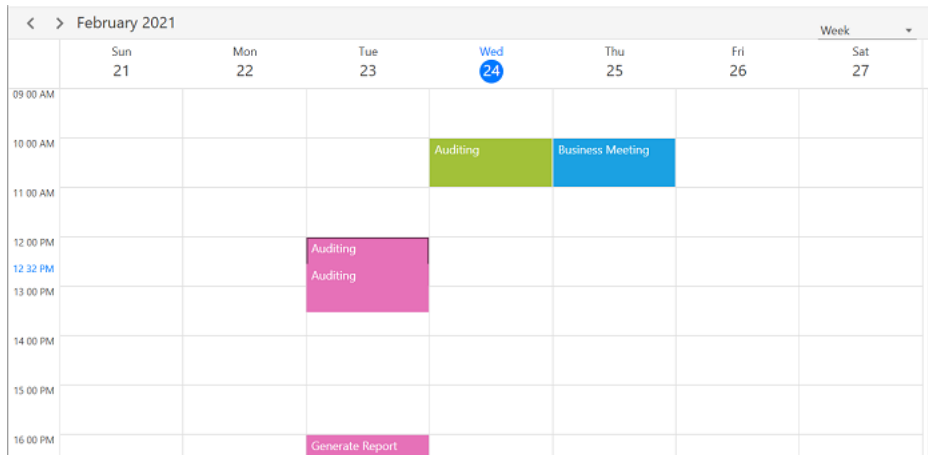

- Not applicable for Month and Timeline Month views.
- If the [TimeRulerSize](#) property value is zero to collapse the time ruler labels, then drag time indicator will not be shown.

Appointment dragging time indicator text formatting

Customize the format for the appointment dragging time indicator format by setting the [TimeIndicatorFormat](#) property of [DragDropSettings](#) in Scheduler.

C#

```
Schedule.ViewType = SchedulerViewType.Week;
Schedule.DragDropSettings.TimeIndicatorFormat = "HH mm tt";
```

**Note:**

- When dragging the appointment, the time indicator overlaps with the time ruler label position in the day, week and workweek views.

AppointmentDragOver event

Scheduler notifies by [AppointmentDragOver](#) while dragging the appointment.

[AppointmentDragOverEventArgs](#) has following members which provides information for AppointmentDragOver event.

[Appointment](#) - Gets the Appointment that is dragging.

[DraggingPoint](#) - Gets the dragging point of schedule appointment UI.

[DraggingTime](#) - Gets the dragging time of the dragging appointment object.

[SourceResource](#) - Gets the [SchedulerResource](#) where the appointment was located before starting the dragging.

[TargetResource](#) - Gets the [SchedulerResource](#) where the appointment is currently being dragged over.

C#

```
this.Schedule.AppointmentDragOver += Schedule_AppointmentDragOver;
private void Schedule_AppointmentDragOver(object sender,
AppointmentDragEventArgs e)
{
    //To notify when dragging the appointment.
}
```

AppointmentDragStarting event

Scheduler notifies by [AppointmentDragStarting](#) when start to drag the appointment.

[AppointmentDragStartingEventArgs](#) has following members which provides information for AppointmentDragStarting event.

[Appointment](#) - Get the selected appointment.

[Cancel](#) - To avoid appointment dragging by enabling this property.

[Resource](#) - Gets the resource of an appointment under which the appointment is located.

C#

```

this.Schedule.AppointmentDragStarting += Schedule_AppointmentDragStarting;
private void Schedule_AppointmentDragStarting(object sender,
AppointmentDragStartingEventArgs e)
{
    //To notify when start to drag the appointment.
}

```

AppointmentDropping event

Scheduler is notified by [AppointmentDropping](#) when the appointment is dropped.

[AppointmentDroppingEventArgs](#) has following members which provides information for [AppointmentDropping](#) event.

[Appointment](#) - Gets the selected appointment that is dragged and dropped.

[DropTime](#) - Gets the dropped time of the dragged appointment.

[Cancel](#) - To avoid appointment dropping by enabling this property.

[SourceResource](#) - Gets the [SchedulerResource](#) where the appointment was located before starting the dragging.

[TargetResource](#) - Gets the [SchedulerResource](#) where the appointment is currently being dragged over.

C#

```

this.Schedule.AppointmentDropping += Schedule_AppointmentDropping;
private void Schedule_AppointmentDropping(object sender,
AppointmentDroppingEventArgs e)
{
    //To notify when the appointment is dropping.
}

```

Note: You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Time Zone in WPF Scheduler (SfScheduler)

[WPF Scheduler](#) allows to create appointments in various time zones and display them in the respective time zone or any other time zone. Use the time zone in the following four different ways:

- Create appointments in different time zones.
- Display appointments based on the client's time zone.
- Display appointments based on scheduler time zone.
- Display appointments at the same time everywhere regardless of client's time zone.

The following Time Zone's respective countries are added to cover all the time zone regions. Use any of the time zones from the following list for scheduler time zone.

Time Zone	Region	UTC Offset
Samoa Standard Time	Pacific/Apia	UTC - 13:00

Dateline Standard Time	Etc/GMT+12	UTC - 12:00
UTC-11	Pacific/Midway	UTC - 11:00
Hawaiian Standard Time	Pacific/Honolulu	UTC - 10:00

Create appointments in different time zones

Create appointments at different time zones using the [StartTimeZone](#) and [EndTimeZone](#) properties of [ScheduleAppointment](#). An appointment's start time and end time are calculated based on the given time zone information for the start time and end time. Set different time zones to the StartTimeZone and EndTimeZone properties.

Use the [StartTime](#) and [EndTime](#) properties of [ScheduleAppointment](#) to get the exact start time and end time of an appointment. By using the [ActualStartTime](#) and [ActualEndTime](#) properties, get the exact appointment rendering time.

C#

```
var appointments = new ScheduleAppointmentCollection();
appointments.Add(new ScheduleAppointment()
{
    Subject = "Meeting",
    StartTime = DateTime.Now,
    EndTime = DateTime.Now.AddHours(1),
    StartTimeZone = "India Standard Time",
    EndTimeZone = "India Standard Time"
});
```

NOTE

- If the recurring appointment is converted to another time zone, then the whole sequence will be recalculated according to the new time zone information.
- If an all-day appointment is created, its start time and end time will be set to 12 A.M. and 12 A.M. by default, so time zone is not applicable for all-day appointments.
- Scheduler supports daylight saving time.
- The time zone support is applicable for custom appointments too, so map the corresponding property.
- Use [TimeZone](#) for custom appointments by mapping the [StartTimeZone](#) and [EndTimeZone](#) custom properties of [AppointmentMapping](#).

Display Appointments based on client's time zone

Display the appointments based on the client's local time zone in scheduler. For example, consider a scenario that you are in North Carolina and you want to set up a meeting at 10 A.M. on North Carolina time. You have colleagues in London and Chennai, and they also need to participate. The time for this meeting will be 3 P.M. (15:00) in London and 5.30 A.M. in Chennai. When each view your Scheduler, you need to see the appointment displayed relative to your local time zones 5.30 A.M., 10 A.M., and 3 P.M., respectively. It can be achieved by setting schedule time zone to default (it will consider your device's local time zone as schedule time zone) and appointment's time zone to **Eastern Standard Time (North Carolina)** [as you are in North Carolina and its time zone is Eastern Standard Time].

Display appointments based on Scheduler time zone

Set the specific time zone to schedule using the [TimeZone](#) property of scheduler. On this scenario, the appointments will be displayed in UTC time when the [StartTimeZone](#) and [EndTimeZone](#) properties of [ScheduleAppointment](#) are set to null. The appointments will be displayed in UTC time based on the given scheduler time zone.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
    TimeZone="Central America Standard Time"/>
```

C#

```
this.Schedule.TimeZone = "Central America Standard Time";
```

Display appointments at same time everywhere regardless of client's time zone

Display the appointments at the same time everywhere without considering the time zone while setting the [TimeZone](#) property of the scheduler, the [StartTimeZone](#) and [EndTimeZone](#) properties of [ScheduleAppointment](#) to null. The appointments will be displayed based on the given [StartTime](#) and [EndTime](#) of appointment everywhere without considering the time zone.

Updating StartTime and EndTime after drag and drop appointment based on time zone.

After rescheduling an appointment using drag and drop, appointment's start and end time value will be updated based on scheduler time zone and appointment's time zone.

For an example, consider the local time zone is **India Standard Time**, if you drag an appointment from 9 AM and drop this on 1 PM and the scheduler's [TimeZone](#) is not set and the appointment's [StartTimeZone](#) and [EndTimeZone](#) has set as **AUS Central Standard Time (Darwin)** then

appointment's start time and end time value will be converted from Local time zone to appointment time zone and the appointment's start time will be saved at 9 AM.

If you set scheduler's `TimeZone` as `AUS Central Standard Time (Darwin)` and the appointment's `StartTimeZone` and `EndTimeZone` as `Central Standard Time (Mexico)` then the appointment's start time and end time value has converted from scheduler's time zone to appointment time zone and the appointment's start time will be saved at 3.30 AM of next day.

If you set scheduler's `TimeZone` as `AUS Central Standard Time (Darwin)` and appointment's time zone was not set then the appointment's start time and end time value converted from scheduler time zone to `UTC` time zone and the appointment's start time will be saved at 10.30 PM.

Note: You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Date Navigations in WPF Scheduler (SfScheduler)

Range for visible dates

Visible dates can be restricted between certain range of dates, using [MaximumDate](#) and [MinimumDate](#) properties in [SfScheduler](#). It is applicable in all the schedule views.

Minimum display date

`MinimumDate` will restrict date navigations features of backward, and also it doesn't allow to swipe the control using touch gesture beyond the minimum date range. The dates before the minimum date will be disabled in the schedule.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
    MinimumDate="2020-05-05 10:0:0">
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.MinimumDate = new DateTime(2020, 05, 05, 10, 0, 0);
```

Maximum display date

`MaximumDate` will restrict date navigations features of forward, and also it doesn't allow to swipe the control using touch gesture beyond the maximum date range. The dates beyond the maximum date will be disabled in the schedule.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
    MaximumDate="2020-10-05 10:0:0">
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.MaximumDate = new DateTime(2020, 10, 05, 10, 0, 0);
```

Programmatic date navigation

Programmatically navigate the dates in scheduler by using the [DisplayDate](#) property of `SfScheduler`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
    DisplayDate="2020-07-05 10:0:0">
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.DisplayDate = new DateTime(2020, 07, 05, 10, 0, 0);
```

Note: Date navigation before the minimum date will be reset to the scheduler minimum date and date navigation beyond the maximum date will be reset to the scheduler maximum date.

Programmatic date selection

Programmatically select the dates in scheduler by using the [SelectedDate](#) property of SfScheduler.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
    SelectedDate="2020-07-10 10:0:0">
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.SelectedDate = new DateTime(2020, 07, 10, 10, 0, 0);
```

Note: Selection before minimum dates and beyond maximum dates using the [SelectedDate](#) is not possible.

Programmatically change to adjacent dates

By default, the date can be navigated to next and previous views using touch gesture, by swiping the control from right to left and left to right direction. The view can be also changed programmatically using the [Forward](#) and [Backward](#) methods available in SfScheduler.

Forward

Use the [Forward](#) method of SfScheduler for viewing the next immediate visible dates in the scheduler. It will move to the next month if the scheduler view is month, similarly it will move to the next week for week view and the next day for day view.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
    MaximumDate="2020-10-05 10:0:0">
</syncfusion:SfScheduler>
<Button x:Name="Forward"
    Content="fwd"
    Click="Forward_Click">
</Button>
```

C#

```
private void Forward_Click(object sender, RoutedEventArgs e)
{
```

```
Schedule.Forward();  
}
```

Backward

Use the **Backward** method of SfScheduler for viewing the previous immediate visible dates in the scheduler. It will move to the previous month if the scheduler view is month, similarly it will move to the previous week for week view and previous day for day view.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"  
MinimumDate="2020-05-05 10:0:0">  
</syncfusion:SfScheduler>  
<Button x:Name="Backward"  
Content="bwd"  
Click="Backward_Click">  
</Button>
```

C#

```
private void Backward_Click(object sender, RoutedEventArgs e)  
{  
    Schedule.Backward();  
}
```

Allow view navigation

You can quickly navigate to the respective day or timeline day view by single-clicking on the date in month cell or view header of the following scheduler views such as week, work week, month, timeline week, timeline work week, and timeline month views by using the [AllowViewNavigation](#) property of the scheduler.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"  
ViewType="Week"  
AllowViewNavigation="True">  
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.ViewType = SchedulerViewType.Week;  
this.Schedule.AllowViewNavigation = true;
```

Note:

- The **AllowViewNavigation** is not applicable for day and timeline day views.
- If the [ShowAgendaView](#) is true in a month view, the month view should navigate to the day view by single-clicking on the agenda date view header, otherwise, the month view should navigate to the day view by single-clicking on the date in a month cell.

Show date picker

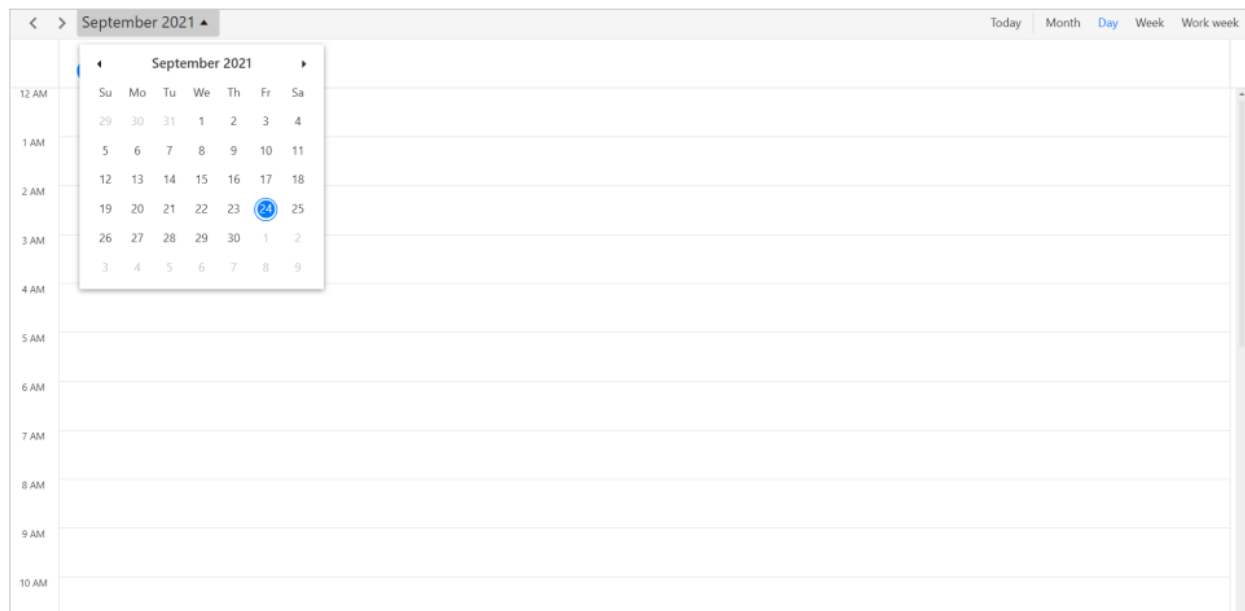

You can enable the date picker for the scheduler by using the [ShowDatePickerButton](#) property in the [SfScheduler](#), which displays the date picker and Today button in the header view. It allows you to quickly navigate to today and different scheduler views.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Week"
ShowDatePickerButton="True">
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.ViewType = SchedulerViewType.Week;
this.Schedule.ShowDatePickerButton = true;
```

Note: The header DatePicker will not be shown if [CalendarIdentifier](#) is specified other than [GregorianCalendar](#).

Allowed views

You can quickly navigate to the different scheduler views by using the [AllowedViewTypes](#) property in the [SfScheduler](#). The views set to this property will display as a view button in the scheduler header view. This UI will be responsive as showing more icons and will be updated based on the window size change.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Week"
AllowedViewTypes="Month,Week,WorkWeek,Day,TimelineDay,TimelineWeek,TimelineW
orkWeek,TimelineMonth" >
```

C#

```
this.Schedule.ViewType = SchedulerViewType.Week;
this.Schedule.AllowedViewTypes = AllowedSchedulerViewTypes.Week |
AllowedSchedulerViewTypes.WorkWeek | AllowedSchedulerViewTypes.Day |
AllowedSchedulerViewTypes.Month | AllowedSchedulerViewTypes.TimelineDay |
AllowedSchedulerViewTypes.TimelineMonth |
AllowedSchedulerViewTypes.TimelineWeek |
AllowedSchedulerViewTypes.TimelineWorkWeek;
```

Note: [View sample in GitHub](#)

Header in WPF Scheduler (SfScheduler)

Change the header height, date format and appearance of [SfScheduler](#).

Header height

Change the scheduler header height by using [HeaderHeight](#) property of SfScheduler. By default, the header height is 50.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
HeaderHeight="100" >
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.HeaderHeight = 100;
```

< > July 2020						
Sun	Mon	Tue	Wed	Thu	Fri	Sat
28	29	30	1	2	3	4
5	6	7	8	9	10	11
12	13	14	15	16	17	18
19	20	21	22	23	24	25
26	27	28	29	30	31	1
2	3	4	5	6	7	8

Header date format

Change the Scheduler header date format of scheduler by using the [HeaderDateFormat](#) property of SfScheduler. By default, the header date format is `MMMM yyyy`.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
HeaderDateFormat="MMM/yyyy">
</syncfusion:SfScheduler>
```

C#

```
this.Schedule.HeaderDateFormat = "MMM/yyyy";
```

< > Jul/2020

26	27	28	29	30	31	1
2	3	4	5	6	7	8

Appearance customization

Customize header appearance using Style

Style the Scheduler header appearance using [SchedulerHeaderControl](#) in scheduler. Change the background color, textStyle, and borderBrush etc. by setting style property for SchedulerHeaderControl.

XML

```
<Style TargetType="syncfusion:SchedulerHeaderControl">
<Setter Property="Background" Value="LightCyan"/>
<Setter Property="Foreground" Value="Red"/>
<Setter Property="FontStyle" Value="Italic"/>
<Setter Property="BorderBrush" Value="LightCoral"/>
<Setter Property="BorderThickness" Value="2"/>
</Style>
```

26	27	28	29	30	31	1
2	3	4	5	6	7	8

Note: You can refer to our [WPF Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Events in WPF Scheduler (SfScheduler)

CellTapped

The [CellTapped](#) event occurs when the user clicks or touches the cell in Scheduler.

This event receives two arguments namely `this` that handles `SfScheduler` and [CellTappedEventArgs](#) as objects.

The [CellTappedEventArgs](#) object contains the following properties:

- [Appointment](#) - returns Tapped appointment values.
 1. If [ItemsSource](#) added with custom business object then tapped custom Appointment details can get by using Appointment [Data](#) property in Cell tapped arguments.
 2. The tapped appointment is a Recurrence appointment it will return the parent recurrence appointment values.
 3. The appointment details get for month view if [AppointmentDisplaymode](#) as [Appointment](#), or else it will be null for month view.
- [Appointments](#)- returns Tapped Month cell appointments values if AppointmentDisplayMode as indicator. Tapped Month Cell has a Recurrence appointment it will return the parent recurrence appointment values. It will be null for Day or Week or WorkWeek views.
- [IsMoreAppointments](#)- specifies whether more appointments are tapped or not in month view. It will be applicable only for Month view which has AppointmentDisplaymode as Appointment.
- [CancelNavigation](#)- specifies whether day view navigation should be disabled when clicking more appointments in month view. It will be applicable for month view which has AppointmentDisplaymode as Appointment and click the More appointments in month cell.
- [DateTime](#)- gets the date-time of the tapped cell.
- [TimeInterval](#)- gets the date-time interval of the tapped cell. It is not applicable for month view.

- [Resource](#) - gets the resource associated with the timeslot cell where user tapped.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month"
CellTapped="Scheduler_CellTapped" >
</syncfusion:SfScheduler>
```

C#

```
private void Scheduler_CellTapped(object sender, CellTappedEventArgs e)
{
    var dateTime = e.DateTime.ToString();
}
```

CellDoubleTapped

The [CellDoubleTapped](#) event occurs when the user double clicks the cell in Scheduler. This event receives two arguments namely `this` that handles `SfScheduler` and [CellDoubleTappedEventArgs](#) as objects. The base class of the [CellDoubleTappedEventArgs](#) is [CellTappedEventArgs](#)

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month"
CellDoubleTapped="Scheduler_CellDoubleTapped">
</syncfusion:SfScheduler>
```

C#

```
private void Scheduler_CellDoubleTapped(object sender,
CellDoubleTappedEventArgs e)
{
    var dateTime = e.DateTime.ToString();
}
```

CellLongPressed

The [CellLongPressed](#) event occurs when the user long presses the cell in Scheduler. This event receives two arguments namely `this` that handles `SfScheduler` and [CellLongPressedEventArgs](#) as objects. The base class of the [CellLongPressedEventArgs](#) is [CellTappedEventArgs](#)

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month"
CellLongPressed="Schedule_CellLongPressed">
</syncfusion:SfScheduler>
```

C#

```
private void Schedule_CellLongPressed(object sender,
CellLongPressedEventArgs e)
{
}
```

```
var dateTime = e.DateTime.ToString();  
}
```

SelectionChanged

The [SelectionChanged](#) event occurs after the selection is changed in Scheduler. This event receives two arguments namely `this` that handles `SfScheduler` and [SelectionChangedEventArgs](#) as objects.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"  
ViewType="Month"  
SelectionChanged="Schedule_SelectionChanged">  
</syncfusion:SfScheduler>
```

C#

```
private void Schedule_SelectionChanged(object sender,  
SelectionChangedEventArgs e)  
{  
var newdate = e.NewValue.ToString();  
var olddate = e.OldValue.ToString();  
}
```

The [SelectionChangedEventArgs](#) object contains the following properties:

- [OldValue](#) - gets an old selected date.
- [NewValue](#)- gets a new selected date.

SelectionChanging

The [SelectionChanging](#) event occurs when the selection gets changing in Scheduler. This event receives two arguments namely `this` that handles `SfScheduler` and [SelectionChangingEventArgs](#) as objects.

The [SelectionChanging](#) object contains the following properties:

- [OldValue](#) - gets an old selected date.
- [NewValue](#)- gets a new selected date.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"  
ViewType="Month"  
SelectionChanging="Schedule_SelectionChanging">  
</syncfusion:SfScheduler>
```

C#

```
private void Schedule_SelectionChanging(object sender,  
SelectionChangingEventArgs e)  
{  
var newdate = e.NewValue.ToString();  
var olddate = e.OldValue.ToString();  
}
```

ViewHeaderCellTapped

The [ViewHeaderCellTapped](#) event occurs when the user clicks or touches the view header in Scheduler. This event receives two arguments namely `this` that handles `SfScheduler` and [ViewHeaderCellTappedEventArgs](#) as objects.

The [ViewHeaderCellTappedEventArgs](#) object contains the following properties:

- [DateTime](#) - gets the corresponding date time.
- [Resource](#) - gets the resource when tapped on view header in day, week, work week and timeline views.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month"
ViewHeaderCellTapped="Schedule_ViewHeaderCellTapped">
</syncfusion:SfScheduler>
```

C#

```
private void Schedule_ViewHeaderCellTapped(object sender,
ViewHeaderCellTappedEventArgs e)
{
    var dateTime = e.DateTime.ToString();
}
```

HeaderTapped

The [HeaderTapped](#) event occurs when the user clicks or touches the Scheduler header. This event receives two arguments namely `this` that handles `SfScheduler` and [HeaderTappedEventArgs](#) as objects.

The [HeaderTappedEventArgs](#) object contains the following properties:

- [DateTime](#) - gets the corresponding date time.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month"
HeaderTapped="Schedule_HeaderTapped">
</syncfusion:SfScheduler>
```

C#

```
private void Schedule_HeaderTapped(object sender, HeaderTappedEventArgs e)
{
    var dateTime = e.DateTime.ToString();
}
```

WeekNumberTapped

The [WeekNumberTapped](#) event occurs when the user clicks or touches the week number in month view. This event receives two arguments namely [this](#) that handles [SfScheduler](#) and [WeekNumberTappedEventArgs](#) as objects.

The [WeekNumberTappedEventArgs](#) object contains the following properties:

- [Month](#)- gets the corresponding month.
- [WeekNumber](#)- gets the corresponding week number.
- [Year](#)- gets the corresponding year.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month"
WeekNumberTapped="Schedule_WeekNumberTapped">
</syncfusion:SfScheduler>
```

C#

```
private void Schedule_WeekNumberTapped(object sender,
WeekNumberTappedEventArgs e)
{
var weeknumber = e.WeekNumber.ToString();
}
```

AppointmentTapped

The [AppointmentTapped](#) event occurs when schedule appointments get tapped in all views. This event receives two arguments namely [this](#) that handles [SfScheduler](#) and [AppointmentTappedArgs](#) as objects.

The [AppointmentTappedArgs](#) object contains the following properties:

- [Appointment](#)- gets the custom appointment details
- [SelectedDate](#)- gets the SelectedDate details
- [Resource](#) - gets the resource details under which the appointment is located.

XML

```
<syncfusion:SfScheduler x:Name="Schedule"
ViewType="Month"
AppointmentTapped="Schedule_AppointmentTapped">
</syncfusion:SfScheduler>
```

C#

```
private void Schedule_AppointmentTapped(object sender, AppointmentTappedArgs
e)
{
var appointment = e.Appointment.ToString();
}
```

Note: You can refer to our [WPF Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

ContextMenu and Commands in WPF Scheduler (SfScheduler)

The [WPF Scheduler](#) has support to define a context menu for appointments, time slots, and month cells are right-clicked. It will also have the built-in `RoutedUICommands` support for handling the context menu to add, edit, and delete appointments. There are two types of `ContextMenu`.

- [CellContextMenu](#)
- [AppointmentContextMenu](#)

Note: [View sample in GitHub](#)

Cell context menu

Set the context menu for time slot and month cells by using the [SfScheduler.CellContextMenu](#) property. The `CellContextMenu` will appear only when the time slot or month cells are right-clicked.

Note:

- The menu items which bind the [SchedulerCommands.Edit](#) and [SchedulerCommands.Delete](#) built-in commands will be disabled in the `CellContextMenu`.
- While binding the menu item using the `CommandBinding`, get the command parameter as

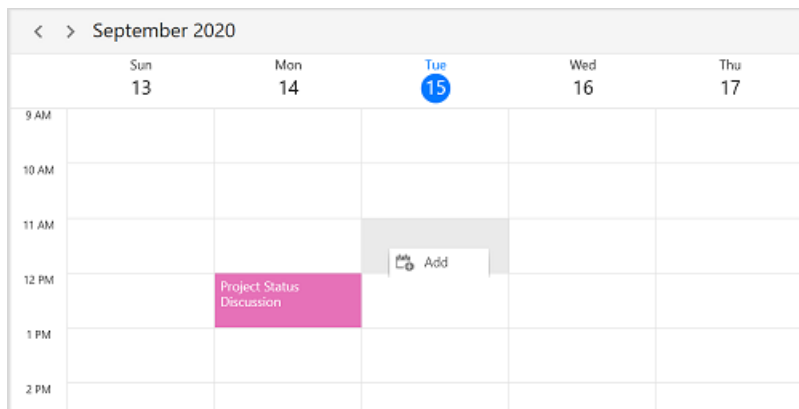

[SchedulerContextMenuInfo](#)

that contains the Appointment or DateTime of the corresponding cell.

- By default, the cell context menu will be opened when holding on any timeslot or month cell. The appointment context menu will be opened by holding, only if the appointment's drag and drop is disabled using the [AppointmentEditFlag](#) property.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
  <syncfusion:SfScheduler.CellContextMenu>
    <ContextMenu>
      <MenuItem Command="{Binding Source={x:Static
Member=syncfusion:SchedulerCommands.Add}}" CommandParameter="{Binding}"
CommandTarget="{Binding ElementName=Schedule}" Header="Add">
    </MenuItem>
  </ContextMenu>
</syncfusion:SfScheduler.CellContextMenu>
</syncfusion:SfScheduler>
```

Appointment context menu

Set the context menu for schedule appointments by using the [SfScheduler.AppointmentContextMenu](#) property. The [AppointmentContextMenu](#) will be displayed only on appointments that are right-clicked.

NOTE

- The menu item which binds the [SchedulerCommands.Add](#) command, will be disabled in the [SfScheduler.AppointmentContextMenu](#).
- While binding the menu item using the CommandBinding, get the command parameter as

[SchedulerContextMenuInfo](#)

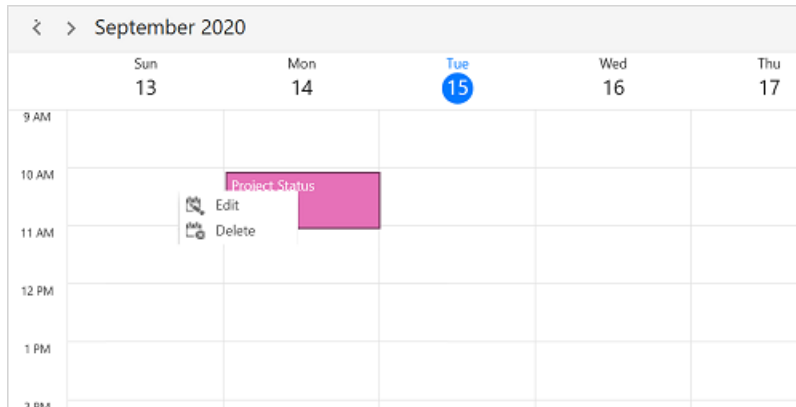

that contains the Appointment or DateTime of the corresponding cell.

- In the month view, the [AppointmentContextMenu](#) opens when the [MonthViewSettings.AppointmentDisplayMode](#) is set to [AppointmentDisplayMode.Appointment](#).
- To enable the touch context menu for appointments in the scheduler, by disabling the appointment drag and drop by setting the [AppointmentEditFlag](#) property except for DragDrop. In this case, the appointment drag & drop cannot be performed. The [AppointmentContextMenu](#) will be displayed only on appointments and the appointment selection, should be performed.

XML

```
<syncfusion:SfScheduler x:Name="Schedule" ViewType="Week">
  <syncfusion:SfScheduler.AppointmentContextMenu>
    <ContextMenu>
      <MenuItem Command="{Binding Source={x:Static
Member=syncfusion:SchedulerCommands.Edit}}"
CommandParameter="{Binding}" CommandTarget="{Binding ElementName=Schedule}"
Header="Edit">
    </MenuItem>
      <MenuItem Command="{Binding Source={x:Static
Member=syncfusion:SchedulerCommands.Delete}}"
CommandParameter="{Binding}"
Header="Delete">
    </MenuItem>
    </ContextMenu>
  </AppointmentContextMenu>
</SfScheduler>
```

```
</syncfusion:SfScheduler.AppointmentContextMenu>
</syncfusion:SfScheduler>
```

SchedulerContextMenuOpening event

The [SchedulerContextMenuInfo](#) event occurs while opening the [AppointmentContextMenu](#) or [CellContextMenu](#) in the SfScheduler.

[SchedulerContextMenuOpeningEventArgs](#) has the following members which provides the information about the [SchedulerContextMenuOpening](#) event.

- **MenuInfo** – Returns the [SchedulerContextMenuInfo](#) which contains the information about date time, appointment of the element opens the context menu. The [AppointmentContextMenu](#) and [CellContextMenu](#) received this information as a [DataContext](#).
- **MenuType** – Gets the element type for which the context menu opens.
- **ContextMenu** – It represents a shortcut context menu that is being opened.

Note: You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Calendar Types in WPF Scheduler (SfScheduler)

This section describes how to change the calendar types of scheduler control using the [CalendarIdentifier](#).

Types of Calendar

The scheduler control supports the different types of calendars such as Gregorian, Korean, Hebrew, and more. You can change the calendar types by using the [CalendarIdentifier](#) property in [Scheduler](#). The default value of the [CalendarIdentifier](#) property is [GregorianCalendar](#).

Supported Calendars	Unsupported Calendars
<i>GregorianCalendar</i> <i>HebrewCalendar</i> <i>HijriCalendar</i> <i>KoreanCalendar</i> <i>TaiwanCalendar</i> <i>ThaiCalendar</i>	<i>JulianCalendar</i> <i>JapaneseCalendar</i> * Lunar type calendars

UmAlQuraCalendar PersianCalendar	
-------------------------------------	--

Note:

- When the [CalendarIdentifier](#) and [FlowDirection](#) properties are set, the [FlowDirection](#) property is given higher precedence. If you want to override this behavior set [FlowDirection](#) after [CalendarIdentifier](#).
- The scheduler uses the [CalendarIdentifier](#) property to determine which calendar to use to localize and format the header date, view header day, and date, time ruler, and DatePicker, and TimePicker in the appointment editor.
- By default, the scheduler uses the [GregorianCalendar](#) for the app's preferred language.
- The Scheduler Time mode (12 hour or 24 hour) does not change depending on the calendar type; however, the time format can be changed depending on the calendar type by using [Day view time text formatting](#) and [Timeline view time text formatting](#).

XML

```
<scheduler:SfScheduler x:Name="Schedule"
CalendarIdentifier="HijriCalendar" />
```

C#

```
this.Schedule.CalendarIdentifier = "HijriCalendar";
```

Today								1443 صفر < >
الأحد	الاثنين	الثلاثاء	الأربعاء	الخميس	الجمعة	السبت		
19	20	21	22	23	24	25		
ص 12								
ص 1								
ص 2								
ص 3								
ص 4								
ص 5								
ص 6								
ص 7								
ص 8								
ص 9								
ص 10								

DateTime values in Calendar types

All the DateTime values can be given such as [DisplayDate](#), [SelectedDate](#), [BlackoutDates](#), Appointment [StartTime](#), and [EndTime](#), SpecialTimeRegion [StartTime](#) and [EndTime](#) values in two ways when calendar identifier is specified other than [GregorianCalendar](#).

- Create an appointment with a start and end time value by declaring the calendar type and relevant calendar type date.

C#

```
// Creating an instance for the schedule appointment collection.
var appointments = new ScheduleAppointmentCollection();
// Adding schedule appointment in the schedule appointment collection.
appointments.Add(new ScheduleAppointment()
{
    Subject = "Meeting",
    // StartTime and EndTime value specified with calendar type and respective
    // calendar date.
    StartTime = new DateTime(1443, 02, 22, 10, 0, 0, new HijriCalendar()),
    EndTime = new DateTime(1443, 02, 22, 11, 0, 0, new HijriCalendar()),
});
// Adding the schedule appointment collection to the ItemsSource.
this.scheduler.ItemsSource = appointments;
```

- Create an appointment with a start and end time by declaring the local system date; in that case, the system date will be converted to the relevant calendar type date.

C#

```
// Creating an instance for the schedule appointment collection.
var appointments = new ScheduleAppointmentCollection();
// Adding schedule appointment in the schedule appointment collection.
appointments.Add(new ScheduleAppointment()
{
    Subject = "Meeting",
    // StartTime and EndTime values specified with local system date will be
    // converted to the Hijiri calendar mentioned.
    StartTime = new DateTime(2021, 09, 29, 10, 0, 0, 0),
    EndTime = new DateTime(2021, 09, 29, 11, 0, 0, 0),
});
// Adding the schedule appointment collection to the ItemsSource.
this.scheduler.ItemsSource = appointments;
```

Note: [View sample in GitHub](#)

Localization in WPF Scheduler (SfScheduler)

Localization is the process of customizing the user interface, based on a culture specific to a particular country or region in order to display the regional data. The culture is represented by a unique string, for example, —en-US || for U.S. English and — fr-FR || for French (common).

Localization is the key feature that provides solutions to global customers with the help of localized resource files provided by the control. The Scheduler supports localization, and creates a resource file for any culture to be applied in the scheduler.

Set Current UI Culture to the Application

Application culture can be changed by setting [CurrentUICulture](#).

C#

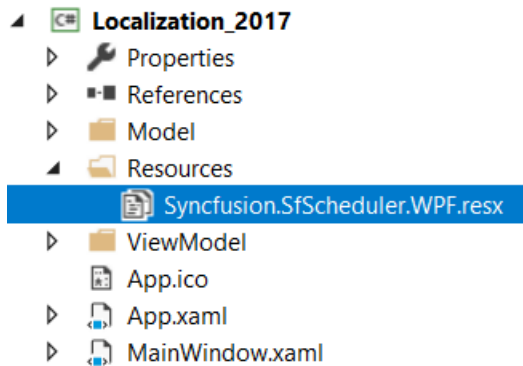

```
public MainWindow()  
{  
    this.InitializeComponent();  
    System.Threading.Thread.CurrentThread.CurrentUICulture = new  
    System.Globalization.CultureInfo("fr-FR");  
}
```

Localization using Resource file

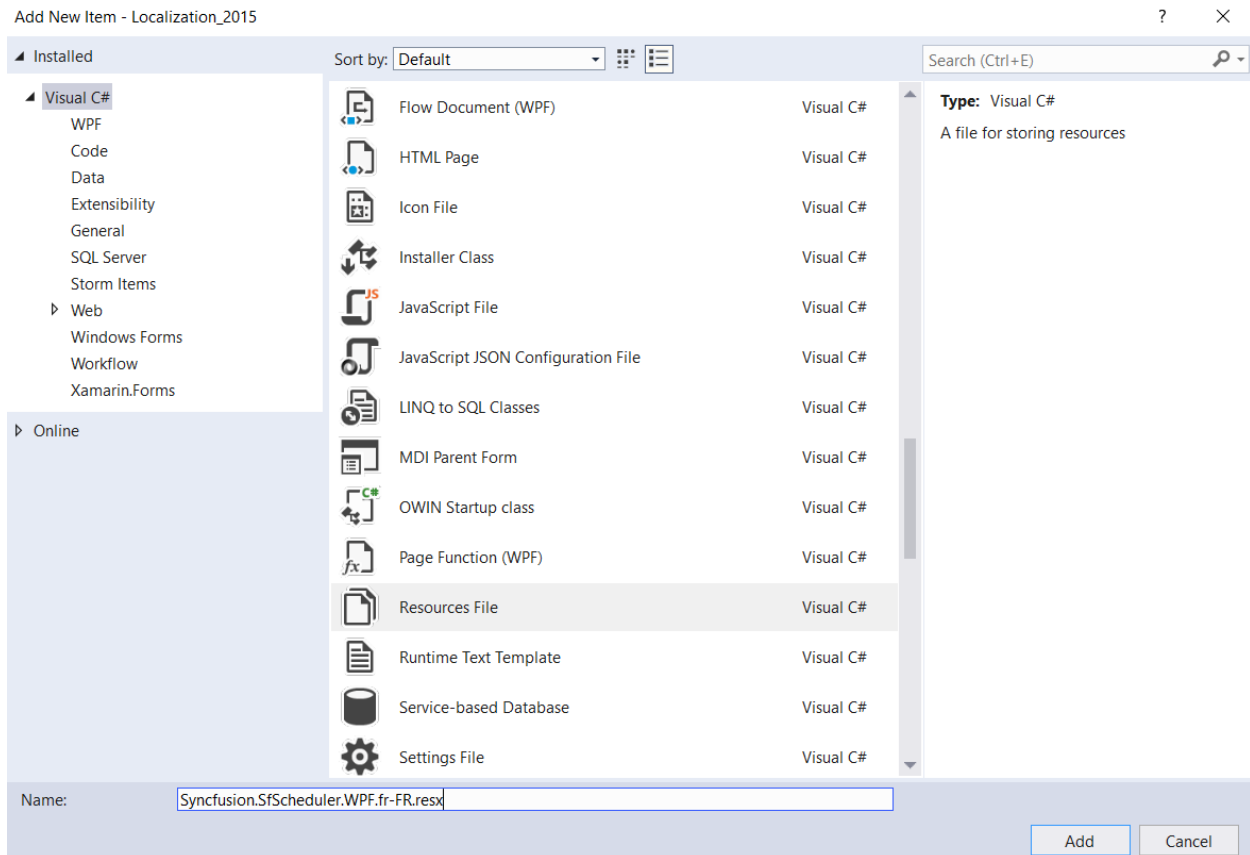

To localize the Scheduler based on `CurrentUICulture` using resource files, follow the below steps.

1. Create new folder, named as **Resources** in the application.
2. Add the default resource file of Scheduler into **Resources** folder.

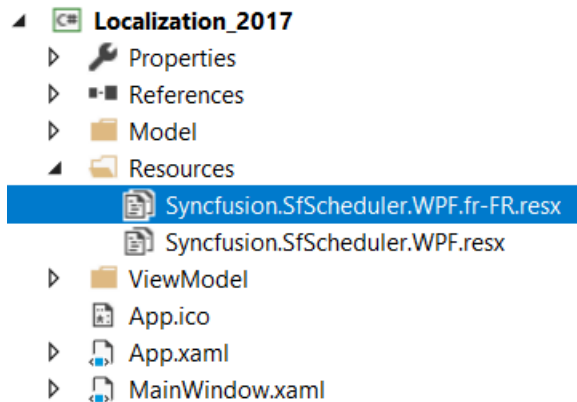

Note: [View Syncfusion.SfScheduler.WPF.resx in GitHub](#)

3. Right-click on the Resources folder, select **Add** and then **NewItem**.
4. In **Add New Item** wizard, select the **Resource File** option and name the filename as **Syncfusion.SfScheduler.WPF.<culture name>.resx**. For example, give the name as **Syncfusion.SfScheduler.WPF.de.resx** for German culture.
5. The culture name that indicates the name of language and country.

6. Now, select **Add** option to add the resource file in **Resources** folder.

7. Add the Name/Value pair in Resource Designer of **Syncfusion.SfScheduler.WPF.fr-FR.resx** file and change its corresponding value to corresponding culture.

Syncfusion.SfScheduler.WPF.fr-FR.resx

Strings Add Resource Remove Resource Access Modifier: No code gen

Accessibility Support in WPF Scheduler (SfScheduler)

Screen reader support

The `WPF Scheduler` can easily be accessed by the screen readers. Please find the following table to get the spoken feedback about the inner element contents of the screen.

Month view

View	Accessibility Format	Example
Month cell	dddd, MMMM d, yyyy	Sunday, May 30, 2021
ViewHeader	dddd	Sunday
Appointment (all-day)	Subject All-day	Meeting All day
Appointment	Subject h:mm t - h:mm tt dddd, MMMM d, yyyy	General Meeting 10:00 AM-11:00 AM Tuesday, June 8, 2021
Spanning Appointment	Subject dddd, MMMM d, yyyy h:mm:ss tt - dddd, MMMM d, yyyy h:mm:ss tt	Plan Execution Friday, May 28, 2021 10:00:00 AM-Sunday, May 30, 2021 11:00:00 AM
Week number	Week number	Week Number 22
Month agenda view with No date selected	No Date Selected	No Date Selected
Month Agenda view with No events	dddd, MMMM d, yyyy No Events	Wednesday, June 2, 2021 No Events
Month Agenda view list appointment	dddd, dddd, MMMM d, yyyy	Thursday, June 24, 2021
BlackoutDates	Blackout Day dddd, MMMM d, yyyy	Blackout Day-Saturday, June 26, 2021

Day, week and workweek views

View	Accessibility Format	Example
Timeslot cell	dddd, MMMM d, yyyy h:mm:ss tt	Sunday, June 20, 2021 12:00:00 AM
ViewHeader	dddd, MMMM d, yyyy	Sunday, June 20, 2021
Appointment (all-day)	Subject All-day	Meeting All day
Appointment	Subject h:mm t - h:mm tt dddd, MMMM d, yyyy	General Meeting 10:00 AM-11:00 AM Tuesday, June 8, 2021

Spanning Appointment	Subject dddd, MMMM d, yyyy h:mm:ss tt - dddd, MMMM d, yyyy h:mm:ss tt	Plan Execution Friday, May 28, 2021 10:00:00 AM-Sunday, May 30, 2021 11:00:00 AM
Time ruler	Time ruler	12 AM

Timeline views

View	Accessibility Format	Example
Timeslot cell	dddd, MMMM d, yyyy h:mm:ss tt	Sunday, June 20, 2021 12:00:00 AM
ViewHeader	dddd, MMMM d, yyyy	Sunday, June 20, 2021
Appointment (all-day)	Subject All-day	Meeting All day
Appointment	Subject h:mm t - h:mm tt dddd, MMMM d, yyyy	General Meeting 10:00 AM-11:00 AM Tuesday, June 8, 2021
Spanning Appointment	Subject dddd, MMMM d, yyyy h:mm:ss tt - dddd, MMMM d, yyyy h:mm:ss tt	Plan Execution Friday, May 28, 2021 10:00:00 AM-Sunday, May 30, 2021 11:00:00 AM
Time ruler	Time ruler	12 AM

Scheduler header

View	Accessibility Format	Example
Day, Week, Work week, Month, Timeline day and Timeline month	MMMM yyyy	June 2021
Timeline week and Timeline work week	MMMM yyyy - MMMM yyyy	28 June - 2 July 2021
Previous navigation button	Previous navigation button	Previous navigation button
Next navigation button	Next navigation button	Next navigation button

Scheduler resource header

View	Accessibility Format	Example
Resource header	Name Id	Sophia 1000

Appointment editor window

View	Accessibility Format	Example
Add appointment	Title	New event
Edit appointment	Title	Edit event
Title textbox	Title Edit Subject Text Enter line	Title Edit Meeting Enter line
Location textbox	Title Edit Location Text Enter line	Location Edit Chennai Enter line
Notes textbox	Title Edit NotesText Enter line	Notes Edit (description) Enter line
Save button	Save button	Save button
Cancel button	Cancel button	Cancel button
Delete button	Delete button	Delete button
Timezone/All-day check box	All day checkbox	All day checkbox checked/Unchecked
Date/time picker	Date/time value edit	12/1/2021 edit
Combo box	Combobox content	Custom

Recurrence editing window

View	Accessibility Format	Example
Editing or Deleting an recurrence appointment	Title	Open Recurring Item / Confirm Delete
Radio button	Content ControlType	Just this one RadioButton / Delete this occurrence
Button	Content ControlType	OK button / Cancel button

Reminder window

View	Accessibility Format	Example
Reminder window	Title	4 reminders
Dismiss all button	Dismiss all button	Dismiss all button

Snooze button	Snooze button	Snooze button
Dismiss button	Dismiss button	Dismiss button
Reminder appointments selected	subject Selected appointment index out of over all index.	Conference 1 of 4

Keyboard navigation

The **SfScheduler** supports selection using keyboard interactions.

Day, Week and WorkWeek views

Navigation Shortcut Keys	Descriptions
Right arrow	Moves selection to the same time slot on the next day.
Left arrow	Moves selection to the same time slot on the previous day.
Down arrow	Moves selection to the next time slot directly below the currently selected time slot.
Up arrow	Moves selection to the previous time slot directly above the currently selected time slot.

Timeline views

Navigation Shortcut Keys	Descriptions
Right arrow	Moves selection to the next time slot of the currently selected time slot.
Left arrow	Moves selection to the previous time slot of the currently selected time slot.

Month view

Navigation Shortcut Keys	Descriptions
Right arrow	Moves selection to the next date of the currently selected date.
Left arrow	Moves selection to the previous date of the currently selected date.
Down arrow	Moves selection to the date directly below the currently selected date on the next row.
Up arrow	Moves selection to the date directly above the currently selected date on the previous row.

Appointments

Navigation Shortcut Keys	Descriptions
Tab	Moves selection to the next appointment of the currently selected appointment.
Shift + Tab	Moves selection to the previous appointment of the currently selected appointment.
Delete	Deletes the selected appointment from appointments collection.

View navigations

Ctrl + Alt + 1 => DayView	Moves the view to day view.
Ctrl + Alt + 2 => WeekView	Moves the view to week view.
Ctrl + Alt + 3 => WorkWeekView	Moves the view to work week view.
Ctrl + Alt + 4 => MonthView	Moves the view to work week view.
Ctrl + Alt + 5 => TimelineDayView	Moves the view to Timeline day view.
Ctrl + Alt + 6 => TimelineWeekView	Moves the view to Timeline week view.
Ctrl + Alt + 7 => TimelineWorkWeekView	Moves the view to Timeline work week view.
Ctrl + Alt + 8 => TimelineMonthView	Moves the view to Timeline month view.

Note: You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

Migrating from SfSchedule to SfScheduler in WPF Scheduler

SfScheduler is a new Scheduler control introduced in 18.2.0.45 Version. The SfScheduler control is used to schedule and manage the appointments through an intuitive user interface, similar to the Outlook calendar. This section helps to identify the equivalent SfSchedule features or APIs in the SfScheduler.

Adding Reference

SfSchedule Assembly Name: Syncfusion.SfSchedule.WPF

SfSchedule Namespace Name: Syncfusion.UI.Xaml.Schedule

SfScheduler Assembly Name: Syncfusion.SfScheduler.WPF

SfScheduler Namespace Name: Syncfusion.UI.Xaml.Scheduler

The following code example shows xmlns namespace for SfScheduler control. Include the Syncfusion schema in WPF and both the charts are available in the WPF schema.

SfSchedule

XML

```
xmlns:schedule="http://schemas.syncfusion.com/wpf"
```

SfScheduler

XML

```
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
(or)
xmlns:syncfusion="clr-
namespace:Syncfusion.UI.Xaml.Scheduler;assembly=Syncfusion.SfScheduler.WPF"
```

Initialization

Both [SfSchedule](#) and [SfScheduler](#) almost have the same set of features. But the SfScheduler control offers a rich set of features over SfSchedule.

Major improvements of SfScheduler

- Improved the scheduler control rendering performance.
- Improved the performance on switching the views such as day, week, work week, month, and timeline views.
- Performance has been improved while loading more events or appointments.
- Schedule view or date swiping and scrolling interaction improved.
- Schedule elements easily customized using the Style and Template according to the WPF standard such as events or appointments, month cell.
- Support Recurrence pattern exception dates and exception appointments.
- Support special time region for Timeslot views.

Note: In the future, new features & enhancements will be added only in **SfScheduler**. It is recommended to use the **SfScheduler**.

The following table shows the API comparison between SfSchedule and SfScheduler.

SfSchedule	SfScheduler	Description
ScheduleType	ViewType	Gets or sets a value which determines Scheduler ViewType.
FirstDayOfWeek	FirstDayOfWeek	Gets or sets the day of the week in Schedule.
NonWorkingDays	NonWorkingDays	Gets or sets the non working days.
Appointments , ItemsSource	ItemsSource	Gets or sets a items source to the scheduler.
ScheduleAppointment	ScheduleAppointment	Gets or sets the appointments data in schedule control.

AppointmentMapping	AppointmentMapping	Gets or sets the mapping to the appointment.
Resource	ResourceCollection	Gets or sets the Resource grouping for schedule.

The following table compares the [ScheduleAppointment](#) APIs,

SfSchedule(ScheduleAppointment)	SfScheduler(ScheduleAppointment)	Description
Subject	Subject	Gets or sets the subject for the appointment.
Notes	Notes	Gets or sets the notes for an appointment.
Location	Location	Gets or sets the location for an appointment.
AppointmentBackground	AppointmentBackground	Gets or sets the appointment color.
StartTime	StartTime	Gets or sets the start date and time of the appointment.
EndTime	EndTime	Gets or sets the end date and time of the appointment.
-	ActualStartTime	Gets the internal start time which is converted based on start time zone applied.
-	ActualEndTime	Gets the internal end time which is converted based on start time zone applied.
StartTimeZone	StartTimeZone	Gets or sets time zone for the start time of the appointment.
EndTimeZone	EndTimeZone	Gets or sets time zone for the end time of the appointment.
IsRecursive	IsRecursive	Gets a value indicating whether the appointment is recurrence appointment or not.
AllDay	IsAllDay	Gets or sets a value indicating whether the appointment's duration is equal to one day or not.

RecurrenceRule	RecurrenceRule	Gets or sets a value indicating whether the appointment should be recursive.
RecursiveExceptionDates	RecurrenceExceptionDates	Gets or sets the properties for maintaining recurrence rule exception Dates.
-	RecurrenceId	Gets or sets an unique ID for referring recurrence appointment.
-	Data	Gets the data object associated with appointment.
-	Type	Gets the type of appointment.

The following table compares the [AppointmentMapping](#) APIs,

SfSchedule(AppointmentMapping)	SfScheduler(AppointmentMapping)	Description
SubjectMapping	Subject	Gets or sets the Subject property for mapping to the schedule appointment.
NotesMapping	Notes	Gets or sets the Notes property for mapping to the schedule appointment.
LocationMapping	Location	Gets or sets the Location property for mapping to the schedule appointment.
AppointmentBackgroundMapping	AppointmentBackground	Gets or sets the AppointmentBackground property for mapping to the schedule appointment.
StartTimeMapping	StartTime	Gets or sets the StartTime property for mapping to the schedule appointment.
EndTimeMapping	EndTime	Gets or sets the EndTime property for mapping to the schedule appointment.
StartTimeZoneMapping	StartTimeZone	Gets or sets the StartTimeZone property for mapping to the schedule appointment.

EndTimeZoneMapping	EndTimeZone	Gets or sets the EndTimeZone property for mapping to the schedule appointment.
AllDayMapping	IsAllDay	Gets or sets the IsAllDay property for mapping to the schedule appointment.
RecurrenceRuleMapping	RecurrenceRule	Gets or sets the RecurrenceRule property for mapping to the schedule appointment.
RecursiveExceptionDatesMapping	RecurrenceExceptionDates	Gets or sets the RecurrenceExceptionDates property for mapping to the schedule appointment.
-	RecurrenceId	Gets or sets the RecurrenceId property for mapping to the schedule appointment.

See the list of the rich set of features in [SfScheduler](#) over [SfSchedule](#) as follows:

Rich set of features in [SfScheduler](#) over [SfSchedule](#).

Feature	Description
Events	Appointments contain information on events scheduled at specific times. In addition to default appointments, the users can use their own collections to connect a business entity to an appointment by mapping their fields, such as start time, end time, subject, notes, and recurrence.
Data Binding	The scheduler control supports to bind any collection that implements the IEnumerable interface to populate appointments.
Recurring Events	Easily configure recurring events on a daily, weekly, monthly, or yearly basis. Also skip or change the occurrence of a recurring appointment.

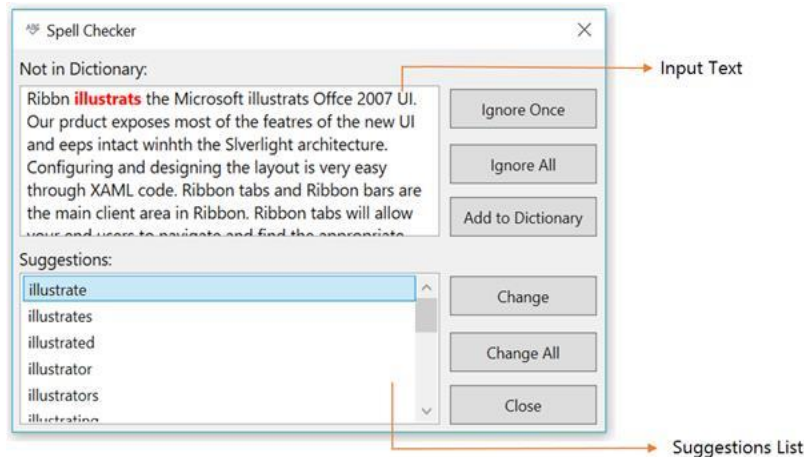

Note: You can refer to our [WPF Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Scheduler example](#) to know how to schedule and manage appointments through an intuitive user interface, similar to the Outlook calendar.

SfSpellChecker

WPF SpellChecker (SfSpellChecker) Overview

[SfSpellChecker](#) control provides a simple and intuitive interface to check for spelling errors in text editor controls. You can perform spell checking on text editor control and it will also provide suggestions for the misspelled words through dialog and context menu. You can use spell check for any language(culture) input text and custom dictionary supports.

Control structure

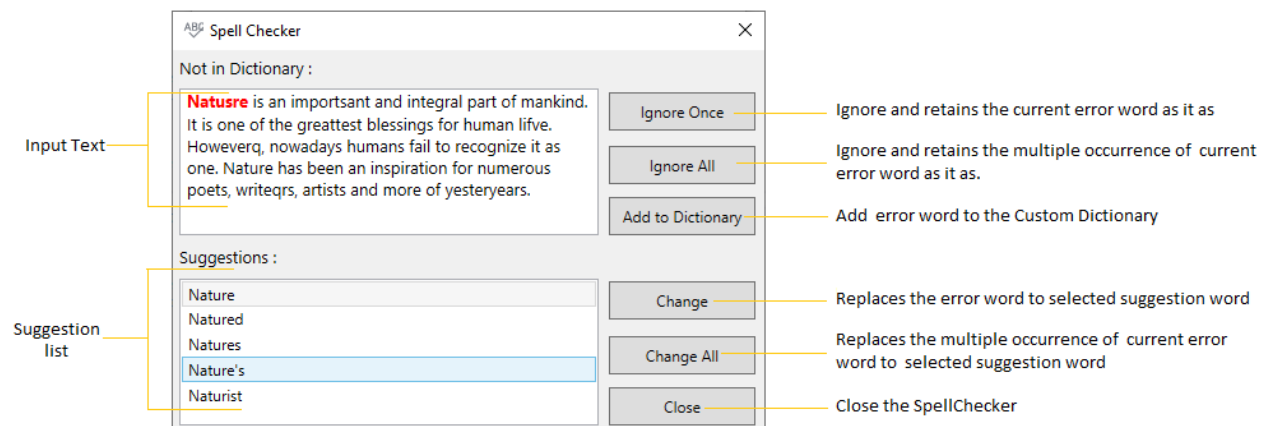

Features

- Supports Context Menu suggestion.
- Supports spell check for any language(culture)
- Supports Custom Dictionary to provide suggestions.
- Provide built-in options to Ignore, Ignore All, Replace, Replace All for error words in spell checker dialog.
- Support to Ignore Email, URL, Numbers, Mixed and Upper case words from spell check.
- Highlights the error words.

Getting Started with WPF SpellChecker (SfSpellChecker)

This section explains how to create a [WPF SpellChecker](#) (SfSpellChecker) and spell check the text.

Control Structure

Assembly deployment

Refer to the [control dependencies](#) section to get the list of assemblies or NuGet package that needs to be added as reference to use the control in any application.

You can find more details about installing the NuGet package in a WPF application in the following link:

[How to install nuget packages](#)

Adding WPF SfSpellChecker to an application

Spell checking operation can be done on text editor controls through **SfSpellChecker** in WPF application.

You can add the **SfSpellChecker** to an application by the following steps,

1. Create a WPF project in Visual Studio and include following assembly.
 - o Syncfusion.SfSpellChecker.WPF
2. Add **TextBox** control and set [SfSpellChecker.SpellChecker](#) attached property to perform spell check.

XML

```
<Grid>
<StackPanel>
<TextBox
Text="Natusre is an importsant and integral part of mankind. It is one of
the greatest blessings for human lifve. Howeverq, nowadays humans fail to
recognize it as one. Nature has been an inspiration for numerous poets,
writeqrs, artists and more of yesteryears."
Name="textbox"
TextWrapping="Wrap">
<!--Adding Spellchecker to the TextBox-->
<syncfusion:SfSpellChecker.SpellChecker>
<syncfusion:SfSpellChecker
x:Name="spellChecker"
EnableSpellCheck="True"/>
</syncfusion:SfSpellChecker.SpellChecker>
</TextBox>
<Button
Content="Spell Check"
Click="SpellCheck_ButtonClick"
HorizontalAlignment="Center"></Button>
</StackPanel>
</Grid>
```

C#

```
//Creating a spell checker instance
SfSpellChecker spellChecker = new SfSpellChecker();
//Enabling the spell check
spellChecker.EnableSpellCheck = true;
//Assigning a spellchecker to the TextBox
SfSpellChecker.SetSpellChecker(textbox, spellChecker);
```

3. If you want to open the **SfSpellChecker** while clicking on the **Spell Check** button, call the [PerformSpellCheckUsingDialog](#) method inside the **SpellCheck ButtonClick** method.

C#

```
//Call SpellCheck method to open SpellCheck on button click
private void SpellCheck_ButtonClick(object sender, RoutedEventArgs e) {
```

```
spellChecker.PerformSpellCheckUsingDialog();  
}
```

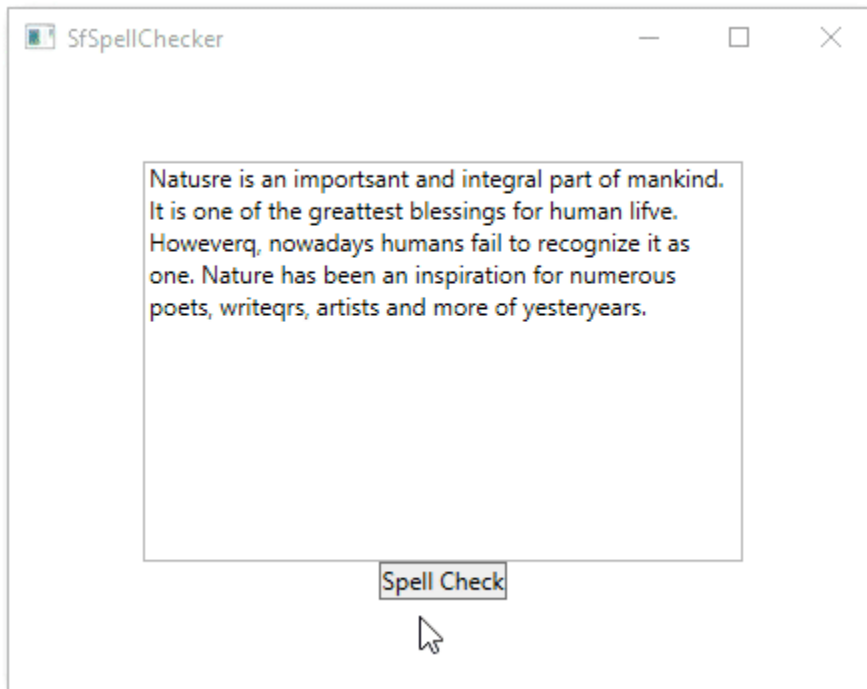

Natusre is an importantsant and integral part of mankind.
It is one of the greatestest blessings for human lifve.
Howeverq, nowadays humans fail to recognize it as
one. Nature has been an inspiration for numerous
poets, writeqrs, artists and more of yesteryears.

Spell Check

Note: View [Sample](#) in GitHub

Fix spelling mistakes using spell check dialog

1. You can open a SfSpellChecker by clicking Spell Check button and then SpellChecker opened as pop-up with TextSpellEditor.
2. The error words are highlight with Red foreground.
3. You can replace error words with correct words by double click the suitable word listed in the suggestion listbox or select the suggestion word from the listbox and then press the Change button.

Note: View [Sample](#) in GitHub

Fix spelling mistakes using context menu

You can simply correct the spell error words by choosing the correct option from listed suggestions from the ContextMenu. You can get the suggestion words by right click on the error word. The Error words are differentiated by red underlining. You can disable the context menu suggestion by using the `EnableContextMenu` property value as `false`. The default value of `EnableContextMenu` property is `true`.

XML

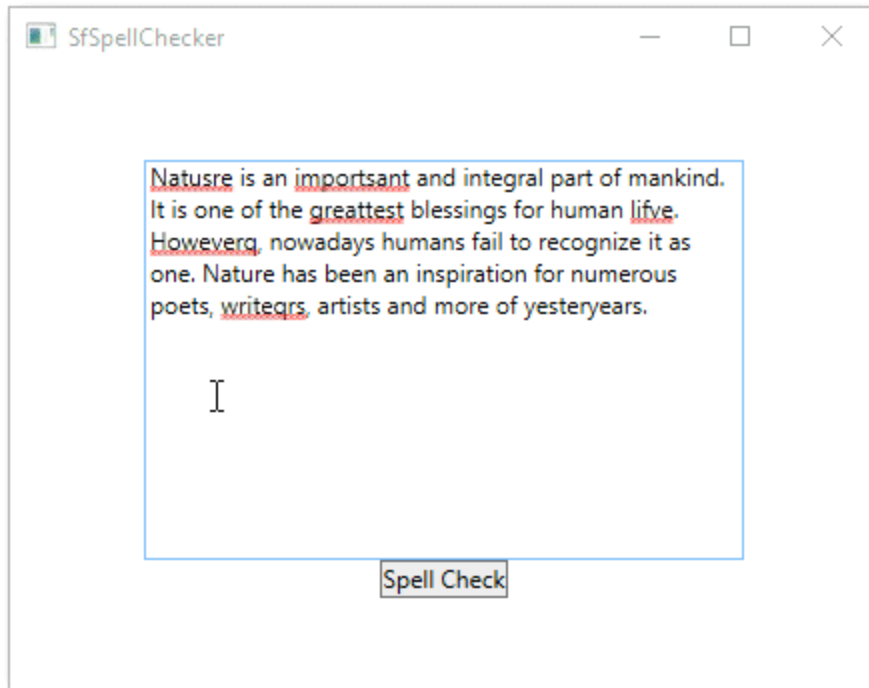

```
<Grid>
<StackPanel>
<TextBox
Text="Natusre is an importsant and integral part of mankind. It is one of
the greatest blessings for human lifve. Howeverq, nowadays humans fail to
recognize it as one. Nature has been an inspiration for numerous poets,
writeqrs, artists and more of yesteryears."
Name="textbox"
TextWrapping="Wrap"
VerticalContentAlignment="Top">
<!--Adding Spellchecker to the TextBox-->
<syncfusion:SfSpellChecker.SpellChecker>
<syncfusion:SfSpellChecker
x:Name="spellChecker"
<!--Enable Contextmenu to spellcheck-->
EnableContextMenu="True"
EnableSpellCheck="True"/>
</syncfusion:SfSpellChecker.SpellChecker>
</TextBox>
<Button
Content="Spell Check"
Click="SpellCheck_ButtonClick"
HorizontalAlignment="Center"></Button>
</StackPanel>
</Grid>
```

C#

```
//Enable Contextmenu to spellcheck
spellChecker.EnableContextMenu = true;
spellChecker.EnableSpellCheck = true;
```

C#

```
//Call SpellCheck method to open SpellCheck on button click
private void SpellCheck_ButtonClick(object sender, RoutedEventArgs e) {
spellChecker.PerformSpellCheckUsingDialog();
}
```

Note: View [Sample](#) in GitHub

Disable spell checking

If you want to disable the spell check operation, use the `EnableSpellCheck` property value as `false`. If the `EnableSpellCheck` property value is `false`, you will not be able to use both the context menu and SpellCheck dialogue to perform spell checking operations. The default value of `EnableSpellCheck` property is `true`.

XML

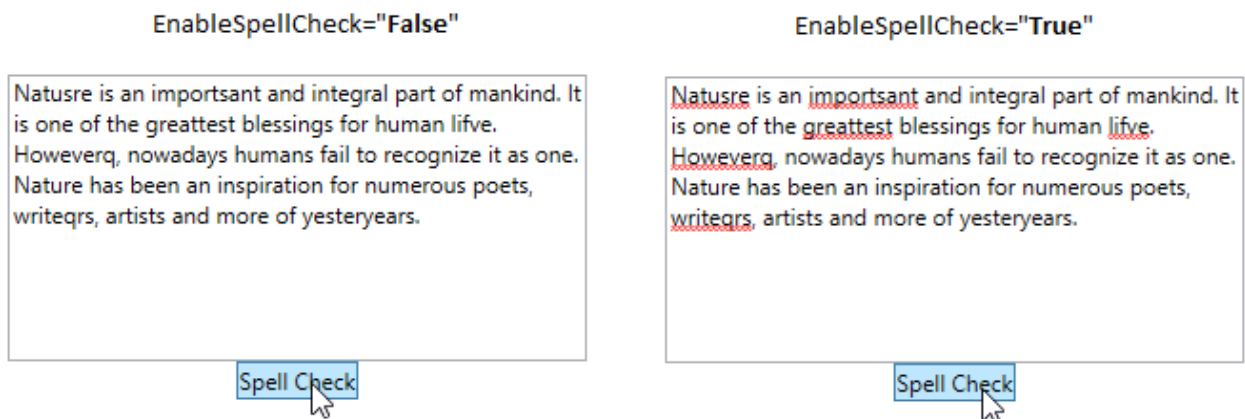

```
<Grid>
  <StackPanel>
    <TextBox
      Text="Natusre is an importants and integral part of mankind. It is one of
      the greatttest blessings for human lifve. Howeverq, nowadays humans fail to
      recognize it as one. Nature has been an inspiration for numerous poets,
      writeqrs, artists and more of yesteryears."
      Name="textbox"
      TextWrapping="Wrap">
      <!--Adding Spellchecker to the TextBox-->

Get suggestions for misspelled word

You can get the suggestion list by passing the error word in the below methods.

- [GetSuggestions](#) - To get a list of suggestion words for an error word
- [GetPhoneticWords](#) - To get a list of phonetic words for an error word
- [GetAnagrams](#) - To get a list of anagram words for an error word

XML

```

}

```

Ignore SpellCheck for particular types of text

If you want to ignore the error words such as a format like email id's and link addresses, HTML tags, combination of words and numbers, combination of upper and lower case words, use the respective property value as **true** from the following table,

Property | Description | Example

IgnoreEmailAddress | Specifies whether or not to ignore email address during Spell Check. The Default value is False. | Ex: john@abc.com

IgnoreHtmlTags | Specifies whether or not to ignore HTML tags during Spell Check. The Default value is False. | Ex: < html></ html>

IgnoreUrl | Specifies whether or not to ignore Internet address during Spell Check. The Default value is False. | Ex: https://help.syncfusion.com

IgnoreMixedCaseWords | Specifies whether or not to ignore mixed case words during Spell Check. The Default value is False. | Ex: AbCDeFH

IgnoreUpperCaseWords | Specifies whether or not to ignore uppercase words during Spell Check. The Default value is False. | Ex: ABCDE >

IgnoreAlphaNumericWords | Specifies whether or not to Spell Check numbers or words with numbers during Spell Check. The Default value is False. | Ex: A*	ACe&981

XML

IgnoreUpperCaseWords="True"
IgnoreAlphaNumericWords="True"
IgnoreEmailAddress="True"
IgnoreMixedCaseWords="True"
IgnoreHtmlTags="True"/>
</syncfusion:SfSpellChecker.SpellChecker>
</TextBox>
<Button
Content="Spell Check"
Click="SpellCheck_ButtonClick"
HorizontalAlignment="Center"></Button>
</StackPanel>
</Grid>

```

C#

```

spellChecker.IgnoreUrl = true;
spellChecker.IgnoreUpperCaseWords = true;
spellChecker.IgnoreAlphaNumericWords = true;
spellChecker.IgnoreEmailAddress = true;
spellChecker.IgnoreMixedCaseWords = true;
spellChecker.IgnoreHtmlTags = true;

```

C#

```

//Call SpellCheck method to open SpellCheck on button click
private void SpellCheck_ButtonClick(object sender, RoutedEventArgs e) {
spellChecker.PerformSpellCheckUsingDialog();
}

```

SpellCheck for any language(culture)

You can spell check any language(culture) by adding the respective culture to the [SfSpellChecker.Culture](#) property and add the dictionaries which contains the basic word file and grammar file to the [SfSpellChecker.Dictionaries](#) collection.

The following dictionary types are used for spell-checking,

- Hunspell
- Ispell
- OpenOffice

Note: Refer the [Load your own dictionaries for any language](#) page to know more about how to add and use the Dictionary for any culture to an application.

Add custom words to dictionary

If you want to add words that is not available in existing dictionary, you can add it using **CustomDictionary**. This dictionary does not has a grammar file, it accepts only dictionary file that contains a list of words. Users can also add words to this custom dictionary by clicking **Add to Dictionary** button available in dialog or context menu.

Note: Refer the [Adding Custom Dictionary](#) page to know more about how to add and use the custom dictionary to an application.

Event to notify when spell check is completed

By default, when the spell check is completed, it will be notified by using the message box that showing the **Spell check is completed** message. If you want to restrict that message box, you can handle the [SpellCheckCompleted](#) event and set the [SpellCheckCompletedEventArgs.ShowMessageBox](#) to **false**.

Theme

WPF SpellChecker (SfSpellChecker) supports various built-in themes. Refer to the below links to apply themes for the SfSpellChecker,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Custom Dictionary in WPF SpellChecker (SfSpellChecker)

You can use a default and custom dictionaries to spell check the document based on your need. You can also spell check for any culture and languages using various dictionaries.

Default SpellCheck Dictionary

[SfSpellChecker](#) provides built-in dictionary for **English** language and it provides suitable suggestion of the error words.

Load your own dictionaries for any language

You can add your own dictionary to [SfSpellChecker.Dictionaries](#) collection. **SfSpellChecker** support 3 standard dictionary file format:

- 1.Hunspell
- 2.IsPELL
- 3.OpenOffice

Note: Built-in dictionary will be disabled once custom dictionary is added to SfSpellChecker

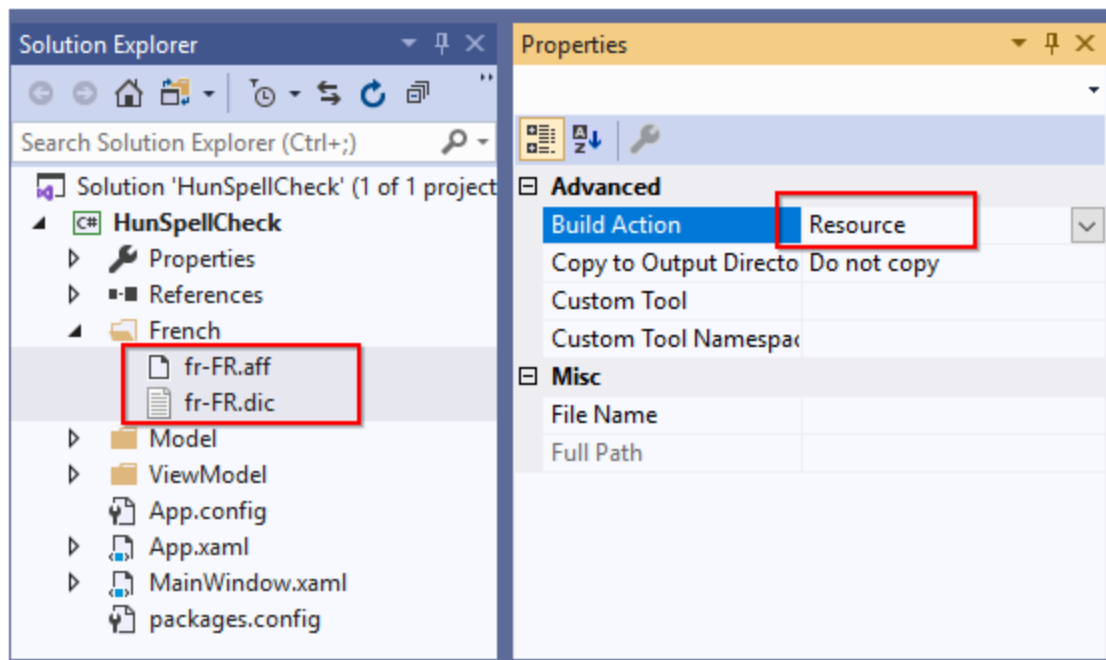

SpellCheck using Hunspell dictionary

You can check spelling mistakes using **Hunspell** dictionary format. This format contains files as follows,

- Affix file with grammar rules- ***.aff**,
- Basic Words file - ***.dic** file.

Adding Hunspell Dictionary

1. Add your [HunspellDictionary](#)'s required culture **.aff and .dic** files and add them as **Resource** into the application.

2. Create a `HunspellDictionary` instance and add the basic word & grammar file path to the `HunspellDictionary.DictionaryUri` & `HunspellDictionary.GrammarUri` properties and add the culture to the `HunspellDictionary.Culture` property.
3. Add the `HunspellDictionary` into the `SfSpellChecker.Dictionaries` collection
4. Setting the required culture to the `SfSpellChecker.Culture` property.

Note: The following code snippets shows how to add Hunspell dictionary to the SpellChecker. Please refer [Adding SfSpellChecker to an application](#) to know how to configure SfSpellChecker.

XML

```
<Grid>
  <StackPanel>
    <TextBox
      Text="Nous sommes heureux de vous avochir ici"
      Name="textbox"
      TextWrapping="Wrap">
      <!--Adding Spellchecker to the TextBox-->
      <syncfusion:SfSpellChecker.SpellChecker>
        <syncfusion:SfSpellChecker
          Culture="fr-FR"
          x:Name="spellChecker"
          EnableSpellCheck="True">
          <syncfusion:SfSpellChecker.Dictionaries>
            <!--Adding French cultured Hunspell dictionary-->
            <syncfusion:HunspellDictionary
              DictionaryUri="/HunSpellCheck;component/French/fr-FR.dic"
              GrammarUri="/HunSpellCheck;component/French/fr-FR.aff"
              Culture="fr-FR"/>
            </syncfusion:SfSpellChecker.Dictionaries>
          </syncfusion:SfSpellChecker>
        </syncfusion:SfSpellChecker.SpellChecker>
      </syncfusion:SfSpellChecker.SpellChecker>
    </StackPanel>
  </Grid>
```

```
</TextBox>
<Button
Content="Spell Check"
Click="SpellCheck_ButtonClick"
HorizontalAlignment="Center"></Button>
</StackPanel>
</Grid>
```

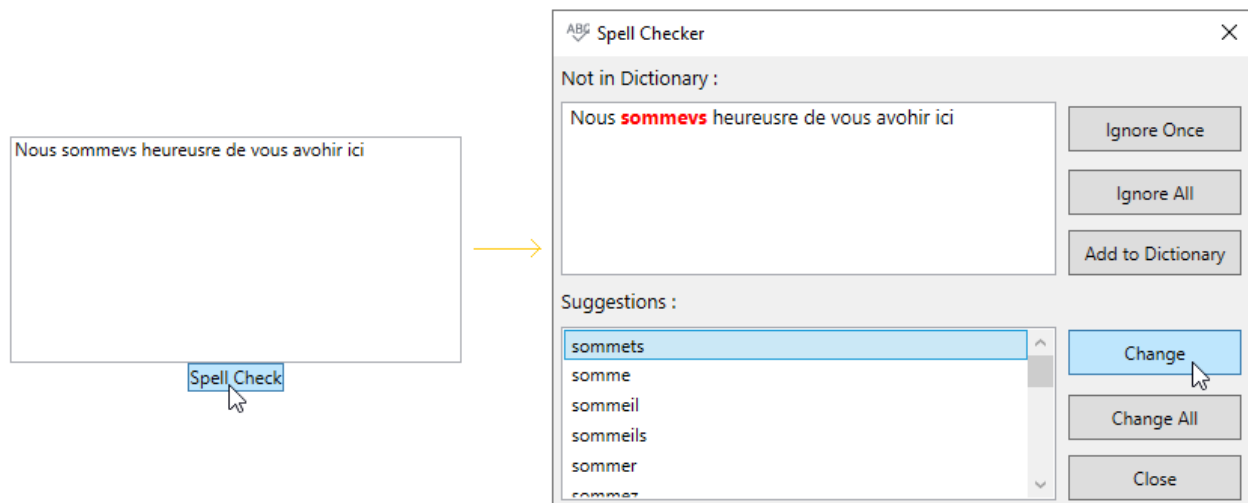

C#

```
//Creating a culture instance
CultureInfo culture = new CultureInfo("fr-FR");
SfSpellChecker spellChecker = new SfSpellChecker();
// Adding Hunspell dictionaries in Dictionaries collection
spellChecker.Dictionaries = new DictionaryCollection();
//Add French culture Hunspell dictionary
spellChecker.Dictionaries.Add(
new HunspellDictionary()
{
Culture = culture,
GrammarUri = new Uri("/HunSpellCheck;component/French/fr-FR.aff",
UriKind.Relative),
DictionaryUri = new Uri("/HunSpellCheck;component/French/fr-FR.dic",
UriKind.Relative)
}
);
//Setting a French culture for SpellChecker
spellChecker.Culture = culture;
//Assigning a spellchecker to the TextBox
SfSpellChecker.SetSpellChecker(textbox, spellChecker);
```

C#

```
//Call SpellCheck method to open SpellCheck on button click
private void SpellCheck_ButtonClick(object sender, RoutedEventArgs e) {
spellChecker.PerformSpellCheckUsingDialog();
}
```

Note: You can add multiple `HunspellDictionary` with various culture files into the `SfSpellChecker.Dictionaries` collection. Based on the `SfSpellChecker.Culture` respective `HunspellDictionary` is used for spell check.

SpellCheck using Ispell dictionary

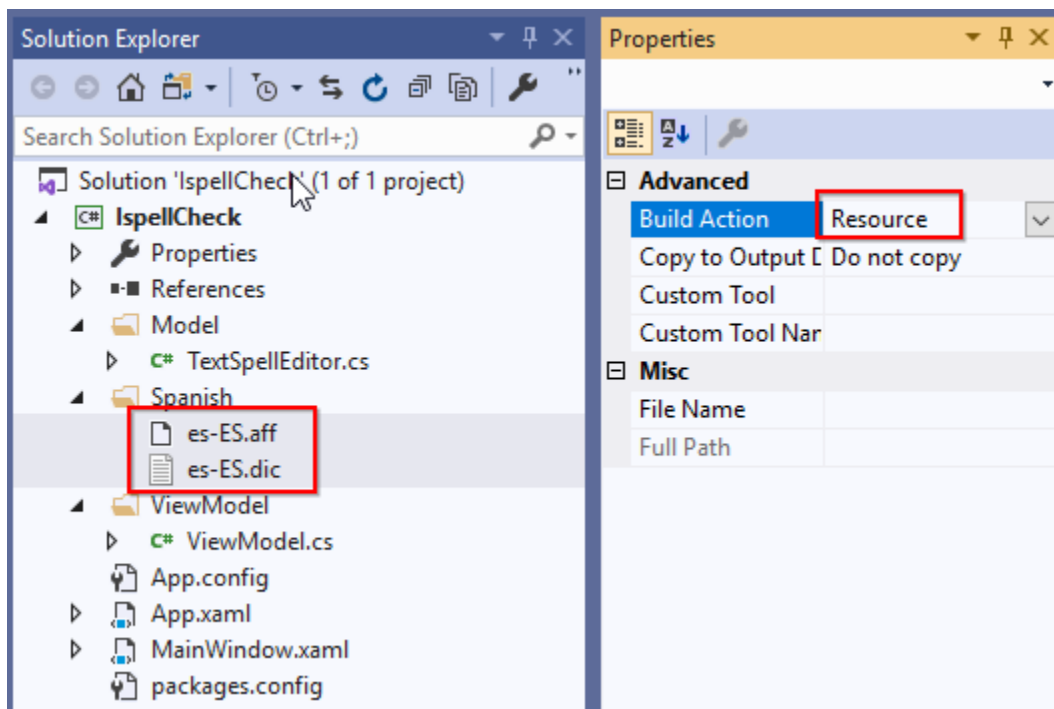

You can check spelling mistakes using **Ispell** dictionary format. This format contains files as follows,

Ispell dictionary contains two files as follows,

- Affix file with grammar rules- *.aff,
- Basic Words file - .xlg or .dic file.

Adding Ispell Dictionary

1. Add your **IspellDictionary**'s required culture **.aff and .dic** files and add them as **Resource** into the application.

2. Create a `IspellDictionary` instance and add the basic word & grammar file path to the `IspellDictionary.DictionaryUri` & `IspellDictionary.GrammarUri` properties and add the culture to the `IspellDictionary.Culture` property.
3. Add the `IspellDictionary` into the `SfSpellChecker.Dictionaries` collection
4. Setting the required culture to the `SfSpellChecker.Culture` property.

XML

```
<Grid>
<StackPanel>
<TextBox
Text="gracsq por venizr por favor ven de nuevoq"
Name="textbox"
TextWrapping="Wrap">
<!--Adding Spellchecker to the TextBox-->
<syncfusion:SfSpellChecker.SpellChecker>
<syncfusion:SfSpellChecker
Culture="es-ES"
x:Name="spellChecker"
EnableSpellCheck="True">
<syncfusion:SfSpellChecker.Dictionaries>
<!--Adding Spanish cultured Ispell dictionary-->
<syncfusion:IspellDictionary
DictionaryUri="/IspellCheck;component/Spanish/es-ES.dic"
GrammarUri="/IspellCheck;component/Spanish/es-ES.aff"
Culture="es-ES"/>
</syncfusion:SfSpellChecker.Dictionaries>
</syncfusion:SfSpellChecker>
</syncfusion:SfSpellChecker.SpellChecker>
</TextBox>
<Button
Content="Spell Check"
Click="SpellCheck_ButtonClick"
HorizontalAlignment="Center"></Button>
</StackPanel>
</Grid>
```

C#

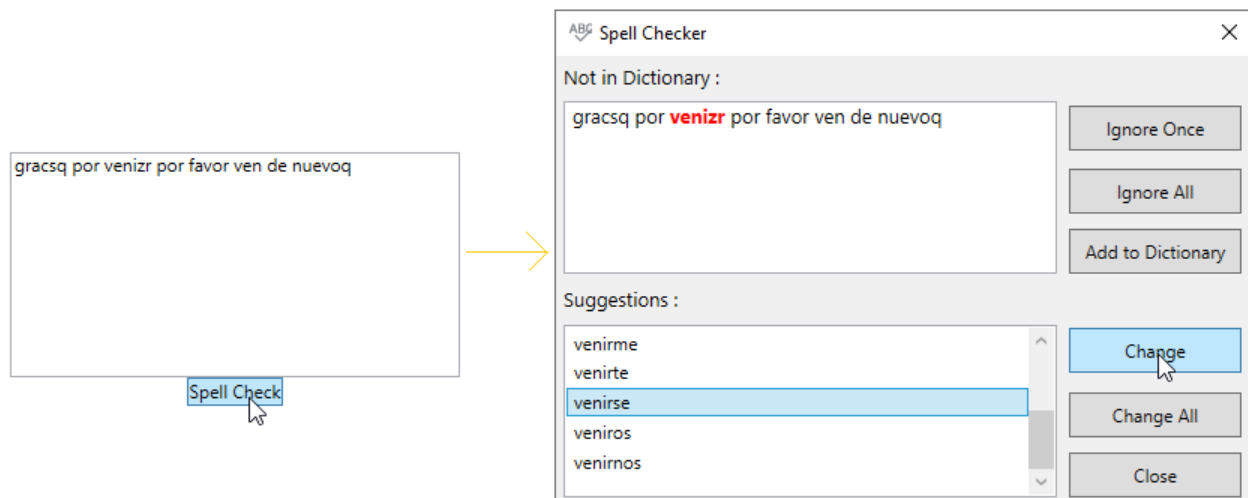

```
//Creating a culture instance
CultureInfo culture = new CultureInfo("es-ES");
SfSpellChecker spellChecker = new SfSpellChecker();
// Adding Ispell dictionaries in Dictionaries collection
spellChecker.Dictionaries = new DictionaryCollection();
//Add Spanish culture Ispell dictionary
spellChecker.Dictionaries.Add(
new IspellDictionary()
{
Culture = culture,
GrammarUri = new Uri("/IspellCheck;component/Spanish/es-ES.aff",
UriKind.Relative),
DictionaryUri = new Uri("/IspellCheck;component/Spanish/es-ES.dic",
UriKind.Relative)
}
);
```

```
//Setting a Spanish culture for SpellChecker
spellChecker.Culture = culture;
//Assigning a spellchecker to the TextBox
SfSpellChecker.SetSpellChecker(textbox, spellChecker);
```

C#

```
//Call SpellCheck method to open SpellCheck on button click
private void SpellCheck_ButtonClick(object sender, RoutedEventArgs e) {
    spellChecker.PerformSpellCheckUsingDialog();
}
```

Note: You can add multiple `IspellDictionary` with various culture files into the `SfSpellChecker.Dictionaries` collection. Based on the `SfSpellChecker.Culture` respective `IspellDictionary` is used for spell check.

SpellCheck using OpenOffice dictionary

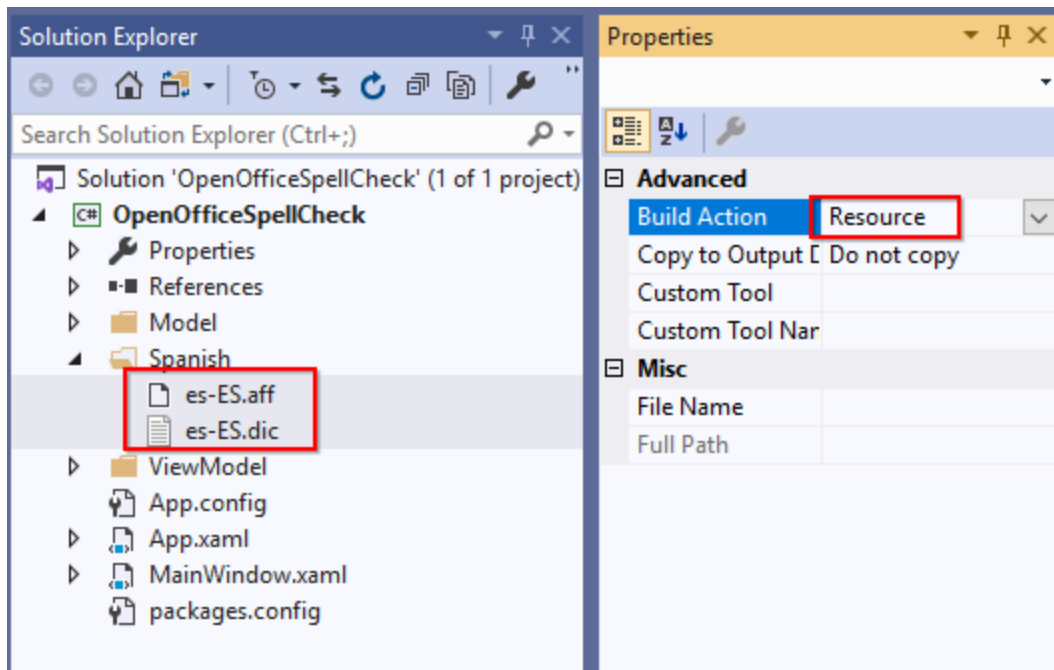

You can check spelling mistakes using `OpenOffice` dictionary format. This format contains files as follows,

`OpenOffice` dictionary contains two files as follows,

- Affix file with grammar rules- `*.aff`,
- Basic Words file - `*.dic` file.

Adding OpenOffice Dictionary

1. Add your `OpenOfficeDictionary`'s required culture `.aff and .dic` files and add them as `Resource` into the application.

2. Create a `OpenOfficeDictionary` instance and add the basic word & grammar file path to the `OpenOfficeDictionary.DictionaryUri` & `OpenOfficeDictionary.GrammarUri` properties and add the culture to the `OpenOfficeDictionary.Culture` property.
3. Add the `OpenOfficeDictionary` into the `SfSpellChecker.Dictionaries` collection
4. Setting the required culture to the `SfSpellChecker.Culture` property.

XML

```
<Grid>
<StackPanel>
<TextBox
Text="gracsq por venizr por favor ven de nuevoq"
Name="textbox"
TextWrapping="Wrap">
<!--Adding Spellchecker to the TextBox-->
<syncfusion:SfSpellChecker.SpellChecker>
<syncfusion:SfSpellChecker
Culture="es-ES"
x:Name="spellChecker"
EnableSpellCheck="True">
<syncfusion:SfSpellChecker.Dictionaries>
<!--Adding Spanish cultured OpenOffice dictionary-->
<syncfusion:OpenOfficeDictionary
DictionaryUri="/OpenOfficeSpellCheck;component/Spanish/es-ES.dic"
GrammarUri="/OpenOfficeSpellCheck;component/Spanish/es-ES.aff"
Culture="es-ES"/>
</syncfusion:SfSpellChecker.Dictionaries>
</syncfusion:SfSpellChecker>
</syncfusion:SfSpellChecker.SpellChecker>
</TextBox>
<Button
Content="Spell Check"
```

```
Click="SpellCheck_ButtonClick"
HorizontalAlignment="Center"></Button>
</StackPanel>
</Grid>
```

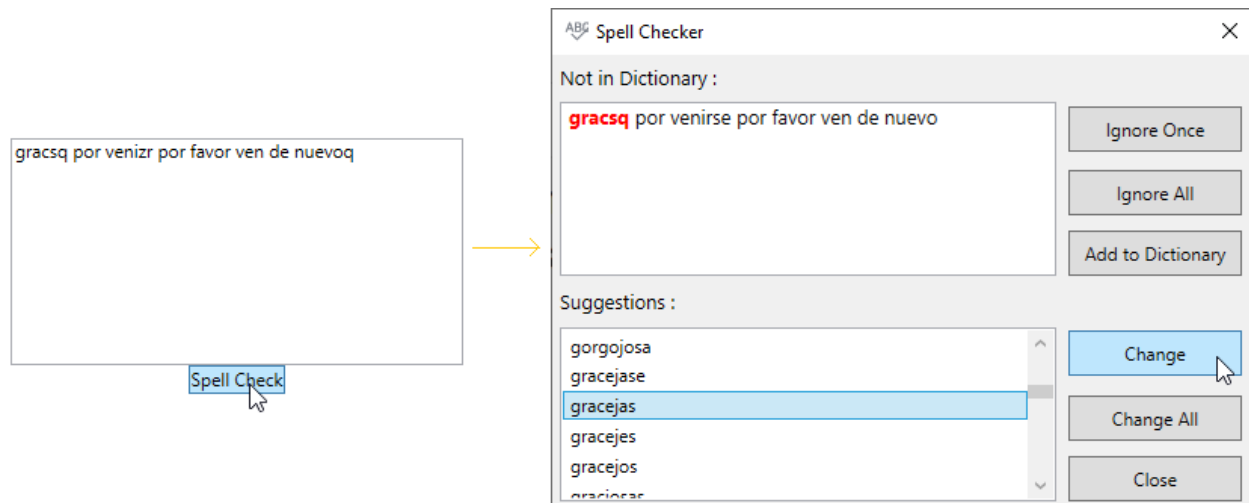

C#

```
//Creating a Spanish culture instance
CultureInfo culture = new CultureInfo("es-ES");
SfSpellChecker spellChecker = new SfSpellChecker();
// Adding OpenOffice dictionaries in Dictionaries collection
spellChecker.Dictionaries = new DictionaryCollection();
//Add Spanish culture OpenOffice dictionary
spellChecker.Dictionaries.Add(
new OpenOfficeDictionary()
{
    Culture = culture,
    GrammarUri = new Uri("/OpenOfficeSpellCheck;component/Spanish/es-ES.aff",
    UriKind.Relative),
    DictionaryUri = new Uri("/OpenOfficeSpellCheck;component/Spanish/es-ES.dic",
    UriKind.Relative)
}
);
//Setting a Spanish culture for SpellChecker
spellChecker.Culture = culture;
//Assigning a spellchecker to the TextBox
SfSpellChecker.SetSpellChecker(textbox, spellChecker);
```

C#

```
//Call SpellCheck method to open SpellCheck on button click
private void SpellCheck_ButtonClick(object sender, RoutedEventArgs e) {
    spellChecker.PerformSpellCheckUsingDialog();
}
```

Note: You can add multiple `OpenOfficeDictionary` with various culture files into the `SfSpellChecker.Dictionaries` collection. Based on the `SfSpellChecker.Culture` respective `OpenOfficeDictionary` is used for spell check.

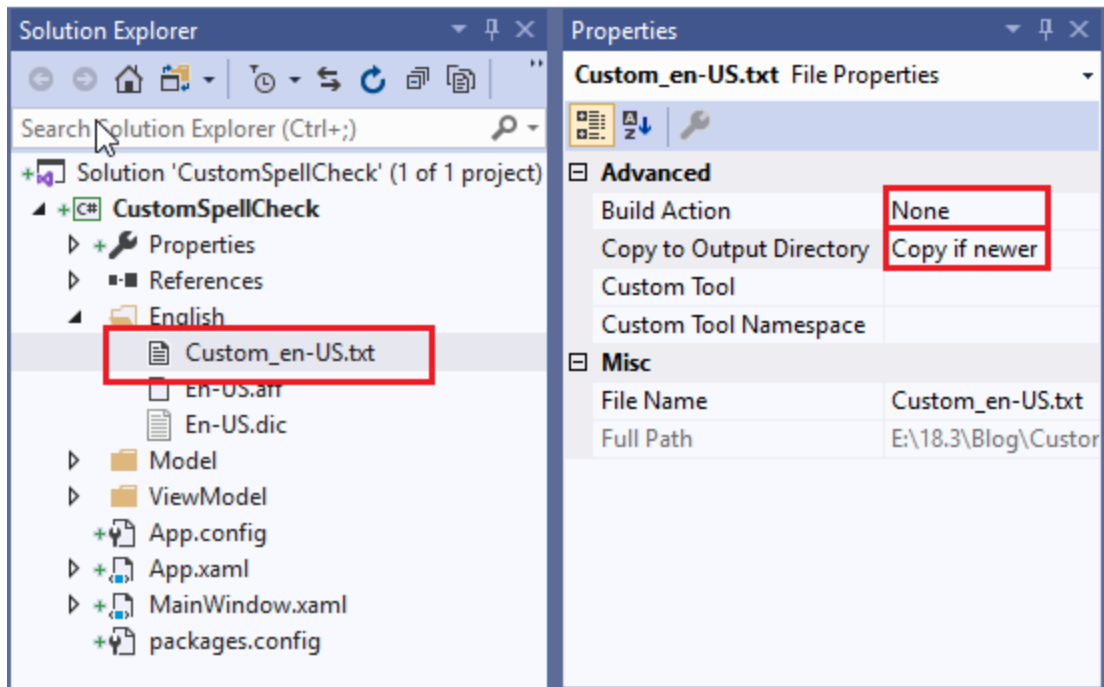

Add custom words to dictionary

If you want to add words that is not available in existing dictionary, you can add it using [CustomDictionary](#). This dictionary does not has a grammar file, it accepts only dictionary file that contains a list of words. Users can also add words to this custom dictionary by clicking **Add to Dictionary** button available in dialog or context menu.

You can add multiple **CustomDictionary** for each culture using **SfSpellChecker.Dictionaries** collection. If you load the **SfSpellChecker** with **en-US** culture, then you can add your custom words only on **en-US** cultured **CustomDictionary**.

Adding Custom Dictionary

1. Create a custom dictionary text file, set build action as **None** and set **Copy to Output Directory** to **Copy if newer**.

2. Create a `CustomDictionary` instance and add the custom word file path to the `CustomDictionary.DictionaryUri` property and add the culture to the `CustomDictionary.Culture` property.
3. Add the `CustomDictionary` into the `SfSpellChecker.Dictionaries` collection
4. Setting the required culture to the `SfSpellChecker.Culture` property.

XML

```
<Grid>
<StackPanel>
<TextBox
Text="Ribbn illustrats the Microsoft illustrats Office 2007 UI. Our prduct
exposes most of the featres of the new UI and eeps intact winhth the
Slverlight architecture. Configuring and designing the layout is very easy
through XAML code. Ribbon tabs and Ribbon bars are the main client area in
Ribbon. Ribbon tabs will allow your end users to navigate and find the
appropriate tools for the task at hand. The Ribbon bars will contain the
Ribbon tools."
Name="textbox"
TextWrapping="Wrap">
<!--Adding Spellchecker to the TextBox-->
<syncfusion:SfSpellChecker.SpellChecker>
<syncfusion:SfSpellChecker
Culture="en-US"
x:Name="spellChecker"
EnableSpellCheck="True">
<syncfusion:SfSpellChecker.Dictionaries>
<!--Adding english cultured custom dictionary-->
<syncfusion:CustomDictionary
DictionaryUri="E:/SpellcheckerDemo/bin/Debug/English/Custom_en-US.txt"
Culture="en-US"/>

```

```
<!--Adding english cultured OpenOffice dictionary-->
<syncfusion:OpenOfficeDictionary
DictionaryUri="/CustomSpellCheck;component/US/en-US.dic"
GrammarUri="/CustomSpellCheck;component/US/en-US.aff"
Culture="en-US"/>
</syncfusion:SfSpellChecker.Dictionaries>
</syncfusion:SfSpellChecker>
</syncfusion:SfSpellChecker.SpellChecker>
</TextBox>
<Button
Content="Spell Check"
Click="SpellCheck_ButtonClick"
HorizontalAlignment="Center"></Button>
</StackPanel>
</Grid>
```

C#

```
//Creating a culture instance
CultureInfo culture = new CultureInfo("en-US");
SfSpellChecker spellChecker = new SfSpellChecker();
// Get the current PROJECT directory
Uri CustomDict_uri= new Uri(Directory.GetCurrentDirectory()+
@"\English\Custom_en-US.txt", UriKind.Absolute);
//Add Custom dictionary for US culture
spellChecker.Dictionaries.Add(
new CustomDictionary()
{
Culture = culture,
DictionaryUri = CustomDict_uri
}
);
//Add US culture OpenOffice dictionary
spellChecker.Dictionaries.Add(
new OpenOfficeDictionary()
{
Culture = culture,
GrammarUri = new Uri("/CustomSpellCheck;component/US/en-US.aff",
UriKind.Relative),
DictionaryUri = new Uri("/CustomSpellCheck;component/US/en-US.dic",
UriKind.Relative)
}
//Setting a US culture for SpellChecker
spellChecker.Culture = culture;
//Assigning a spellchecker to the TextBox
SfSpellChecker.SetSpellChecker(textbox, spellChecker);
```

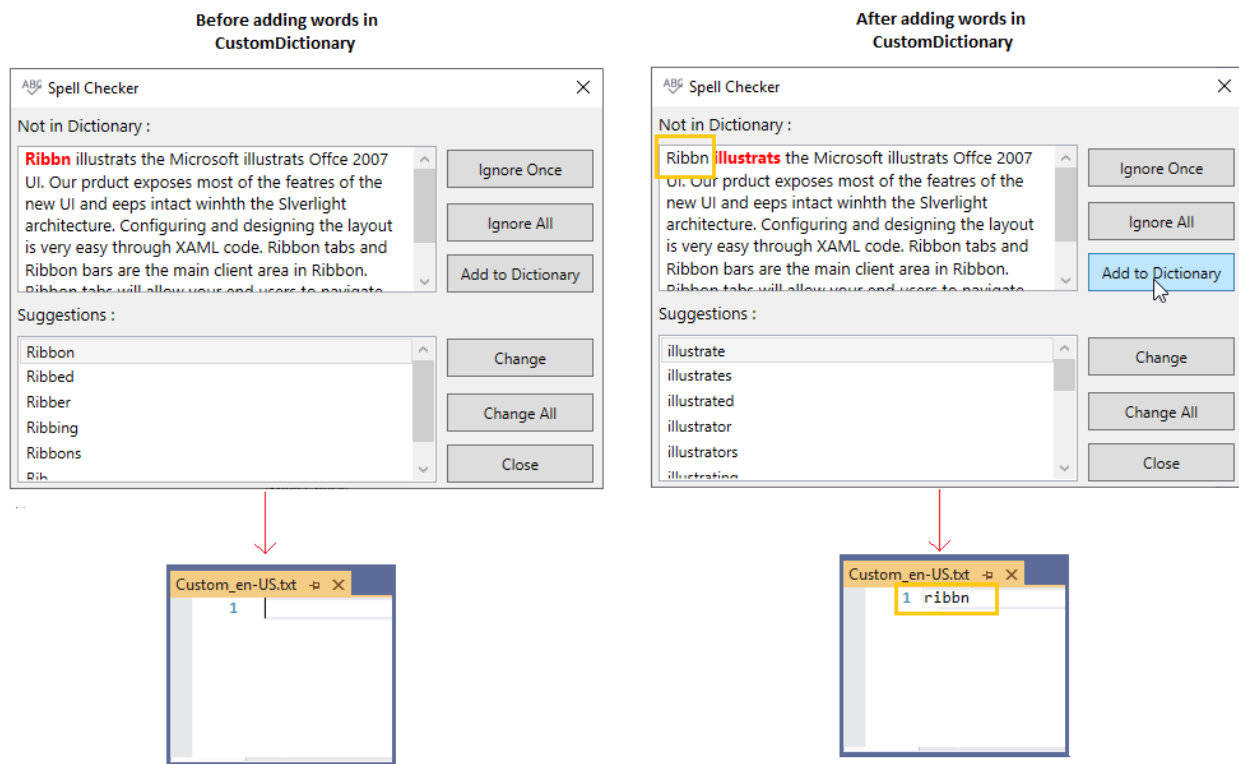

C#

```
//Call SpellCheck method to open SpellCheck on button click
private void SpellCheck_ButtonClick(object sender, RoutedEventArgs e) {
spellChecker.PerformSpellCheckUsingDialog();
}
```

Note: As custom dictionary hold extra words that is not available in standard dictionary, it is always used in conjunction with standard dictionary.

Note: If you use the custom dictionary without standard dictionary, all words that are not included in the dictionary will be shown as error words.

Note: You can add multiple CustomDictionary with various culture word files into the SfSpellChecker.Dictionaries collection. Based on the SfSpellChecker.Culture respective CustomDictionary is used for spell check.

Note: [View Sample in GitHub](#)

Switch language(Culture) at runtime

You can add Hunspell, Ispell, or OpenOffice dictionaries one or more times with various culture into the SfSpellChecker.Dictionaries collection. You can change the spell check culture at runtime by changing the SfSpellChecker.Culture property. Based on the current SfSpellChecker.Culture respective dictionary is used to spell check.

XML

```
<Grid>
<StackPanel>
<TextBox
Text="Nous sommevs heureuxre de vous avochir ici"
Name="textbox"
TextWrapping="Wrap">
<!--Adding Spellchecker to the TextBox-->
<syncfusion:SfSpellChecker.SpellChecker>
<syncfusion:SfSpellChecker
Culture="fr-FR"
```

```

x:Name="spellChecker"
EnableSpellCheck="True">
<syncfusion:SfSpellChecker.Dictionaries>
<!--Adding French cultured Hunspell dictionary-->
<syncfusion:HunspellDictionary
DictionaryUri="/HunSpellCheck;component/French/fr-FR.dic"
GrammarUri="/HunSpellCheck;component/French/fr-FR.aff"
Culture="fr-FR"/>
<!--Adding Spanish cultured Hunspell dictionary-->
<syncfusion:HunspellDictionary
DictionaryUri="/HunSpellCheck;component/Spanish/es-ES.dic"
GrammarUri="/HunSpellCheck;component/Spanish/es-ES.aff"
Culture="es-ES"/>
!--Adding english cultured Hunspell dictionary-->
<syncfusion:HunspellDictionary
DictionaryUri="/HunSpellCheck;component/US/en-US.dic"
GrammarUri="/HunSpellCheck;component/US/en-US.aff"
Culture="en-US"/>
</syncfusion:SfSpellChecker.Dictionaries>
</syncfusion:SfSpellChecker>
</syncfusion:SfSpellChecker.SpellChecker>
</TextBox>
<Button
Content="Spell Check"
Click="SpellCheck_ButtonClick"
HorizontalAlignment="Center"></Button>
</StackPanel>
</Grid>

```

C#

```

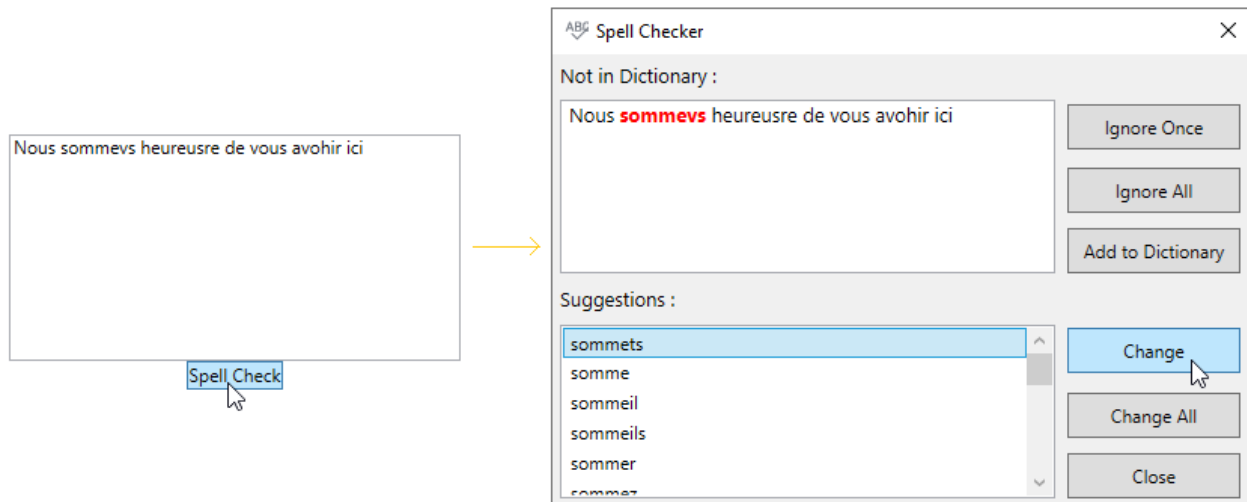

SfSpellChecker spellChecker = new SfSpellChecker();
// Adding Hunspell dictionaries in Dictionaries collection
spellChecker.Dictionaries = new DictionaryCollection();
//Add French culture Hunspell dictionary
spellChecker.Dictionaries.Add(
new HunspellDictionary()
{
Culture = new CultureInfo("fr-FR"),
GrammarUri = new Uri("/HunSpellCheck;component//French/fr-FR.aff",
UriKind.Relative),
DictionaryUri = new Uri("/HunSpellCheck;component//French/fr-FR.dic",
UriKind.Relative)
}
);
//Add Spanish culture Hunspell dictionary
spellChecker.Dictionaries.Add(
new HunspellDictionary()
{
Culture = new CultureInfo("es-ES"),
GrammarUri = new Uri("/HunSpellCheck;component//Spanish/es-ES.aff",
UriKind.Relative),
DictionaryUri = new Uri("/HunSpellCheck;component//Spanish/es-ES.dic",
UriKind.Relative)
}
);

```

```
//Add US culture Hunspell dictionary
spellChecker.Dictionaries.Add(
new HunspellDictionary()
{
Culture = new CultureInfo("en-US"),
GrammarUri = new Uri("/HunSpellCheck;component//US/en-US.aff",
UriKind.Relative),
DictionaryUri = new Uri("/HunSpellCheck;component//US/en-US.dic",
UriKind.Relative)
}
);
//Setting a required dictionary's french culture for SpellChecker
spellChecker.Culture = spellChecker.Dictionaries[0].Culture;;
//Assigning a spellchecker to the TextBox
SfSpellChecker.SetSpellChecker(textbox, spellChecker);
```

C#

```
//Call SpellCheck method to open SpellCheck on button click
private void SpellCheck_ButtonClick(object sender, RoutedEventArgs e) {
spellChecker.PerformSpellCheckUsingDialog();
}
```

Here, `SpellChecker.Culture` is `fr-FR` culture. So, `fr-FR` cultured `Hunspell` dictionary is used as speck check dictionary.

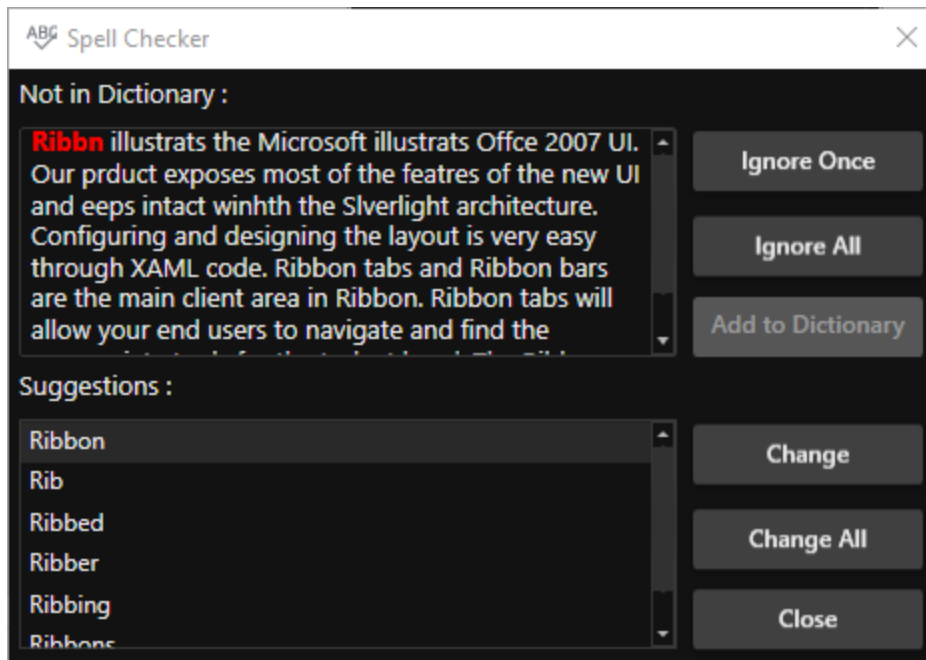

Appearance in WPF SpellChecker (SfSpellChecker)

This section explains different theming options available in [SfSpellChecker](#) control.

Theme

`SfSpellChecker` supports various built-in themes. Refer to the below links to apply themes for the `SfSpellChecker`,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

SplitButton

WPF Split Button Overview

The split button is a combination of a button and a menu control. The button itself provides a default selection or when the arrow is clicked, displays a dropdown list for other possible selections.

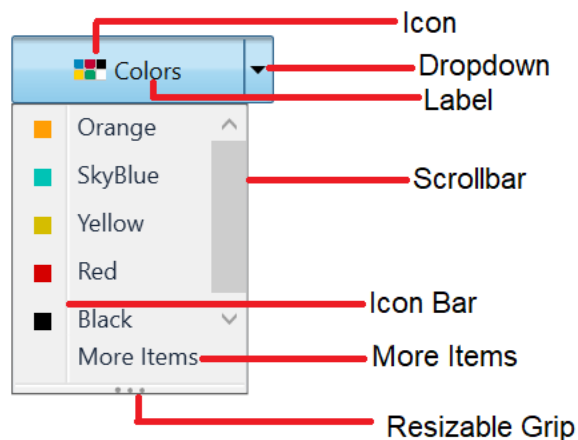

Key features

- **Data Binding** - Data binding allows the flow of data between UI elements and data object on user interface.
- **Size Mode** - Predefined sizes, such as small, normal and large, can be set to the button.
- **Image** - Provides options for loading image in button.
- **Command Binding** - Provides support to execute any action on clicking the instance.
- **Drop Direction** - The direction of the drop-down popup can be changed in a number of ways.
- **Resizing** - Use re-sizing gripper to increase or decrease pop-up height and width.
- **Multiline** - Provides support for displaying multiple lines of text in large button.
- **Localization** - Provides support to customize the text in the user interface based on the local culture.
- **Right-to-left (RTL)** - The text direction and layout of the control can be displayed in the right-to-left direction.
- **Custom Items** - Provides support to add custom items to dropdown menu group.

Getting Started with WPF Split Button

This section provides an overview of how to work with WPF Split Button control. It describes the control structure, the control initialization and the image setting for the control and add items to the control.

Control structure

Assembly deployment

Refer [SplitButtonAdv](#) control dependencies section to get the list of assemblies or [NuGet package](#) needs to be added as reference to use the SplitButtonAdv control in any application.

Creating simple application with SplitButton

In this walk through, you will create WPF application that contains Split Button control. By the following ways, one can add the controls:

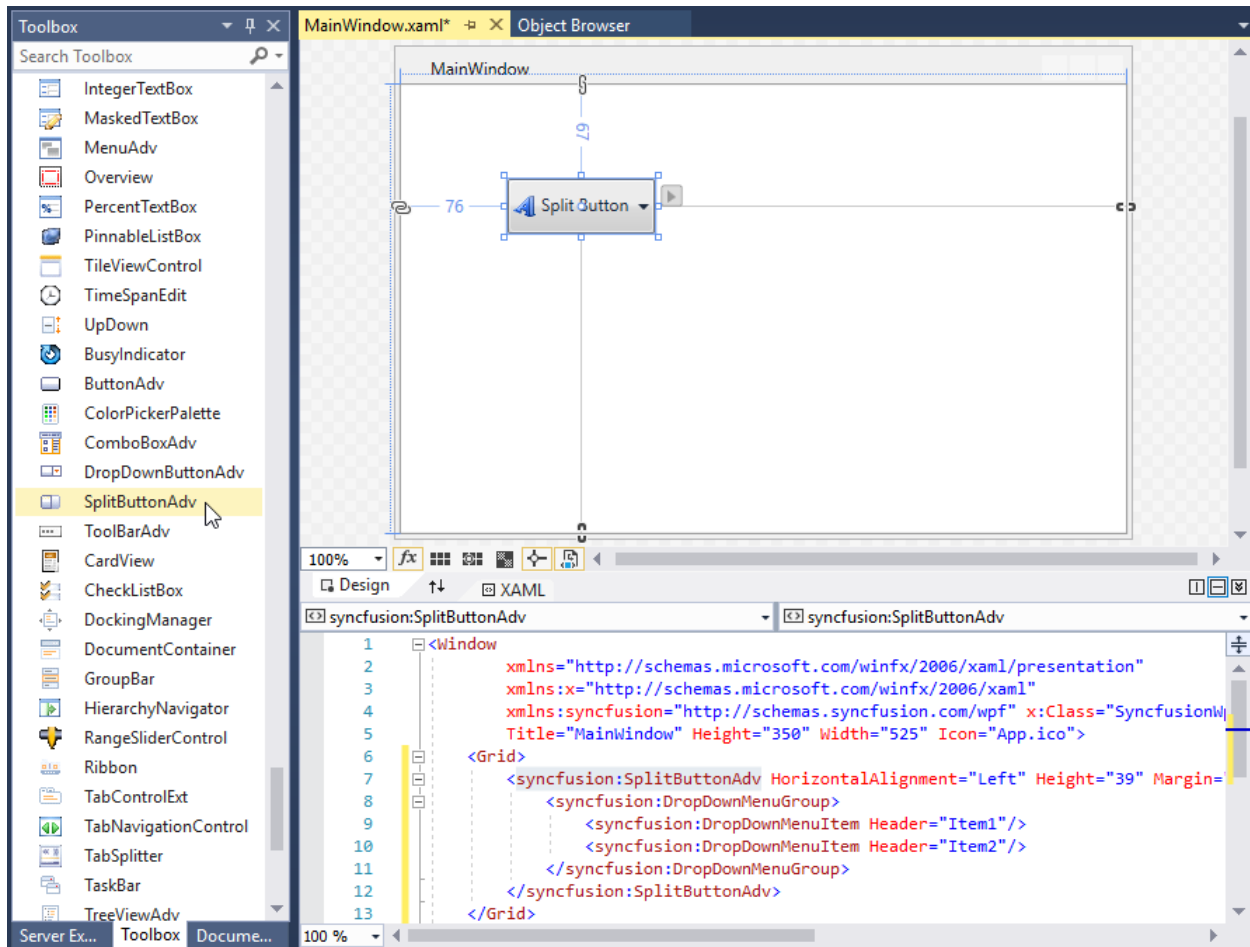

1. [Adding control via designer](#)
2. [Adding control manually in XAML](#)
3. [Adding control manually in C#](#)

Adding control via designer

WPF Split Button control can be added to the application by dragging **SplitButtonAdv** from toolbox and dropping it in designer view. After dropping the controls in designer view, the assemblies such as **Syncfusion.Shared.WPF** gets added into the project automatically. The following code snippets will be added into the XAML.

XML

```
<syncfusion:SplitButtonAdv x:Name="splitButtonAdv" Label="Split Button"/>
```

Note: **syncfusion** in XAML is an auto generated namespace.

Adding control manually in XAML

In order to add the control manually in XAML, follow the below steps.

1. Add the below required assembly reference to the project.
 - o Syncfusion.Shared.WPF
2. Import Syncfusion WPF schema <http://schemas.syncfusion.com/wpf> or the control namespace **Syncfusion.Windows.Tools.Controls** in XAML page.
3. Declare SplitButtonAdv control in XAML page.

XAML

```
<Window xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:local="clr-namespace:SplitButtonadv_GetStart_Sample"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
xmlns:Syncfusion="http://schemas.microsoft.com/netfx/2009/xaml/presentation"
mc:Ignorable="d"
Title="MainWindow" Height="450" Width="800">
<Grid>
<syncfusion:SplitButtonAdv Height="44" VerticalAlignment="Center"
HorizontalAlignment="Center" Width="162"/>
</Grid>
</Window>
```

```
</Grid>
</Window>
```

Adding control manually in C#

In order to add control manually in C#, do the below steps.

1. Add the below required assembly references to the project.
 - Syncfusion.Shared.WPF
2. Import the `Syncfusion.Windows.Tools.Controls` namespace.
3. Create `SplitButtonAdv` control instance and add it to the window.

XML

```
<Window xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:local="clr-namespace:SplitButtonadv_GetStart_Sample"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
xmlns:Syncfusion="http://schemas.microsoft.com/netfx/2009/xaml/presentation"
mc:Ignorable="d"
Title="MainWindow" Height="450" Width="800">
<Grid x:Name="Root">
</Grid>
</Window>
```

C#

```
using Syncfusion.Windows.Tools.Controls;
namespace ButtonSample
{
    public partial class MainWindow : Window
    {
        public MainWindow()
        {
            InitializeComponent();
            SplitButtonAdv splitButtonAdv = new SplitButtonAdv();
            splitButtonAdv.Height=44;
            splitButtonAdv.Width=31;
            Root.Children.Add(splitButtonAdv);
        }
    }
}
```

Setting label

The label on the button is a text that explains its action to the end-user. Apply the text by using the [Label](#) property.

XML

```
<syncfusion:SplitButtonAdv Label="Colors" SmallIcon="Images\color.png"/>
```

C#

```
SplitButtonAdv button = new SplitButtonAdv();
```

```
button.Label = "Colors";  
button.SmallIcon = new BitmapImage(new Uri("Images\colors.png",  
UriKind.RelativeOrAbsolute));
```

Setting size mode

Size mode is used to render Split Button control in different pre-defined sizes based on application demand. Apply the size mode by setting the [SizeMode](#) property.

The **SizeMode** is an enumeration which contains the following values:

- Small
- Normal
- Large

Small mode

When the mode is set to small, the control is displayed without the label. Only icon will be present in it.

XML

```
<syncfusion:SplitButtonAdv SizeMode="Small" SmallIcon="Images\color.png"  
Label="Colors"/>
```

C#

```
SplitButtonAdv button = new SplitButtonAdv();  
button.Label = "Colors";  
button.SizeMode = SizeMode.Small;  
button.SmallIcon = new BitmapImage(new Uri("Images\colors.png",  
UriKind.RelativeOrAbsolute));
```

Normal mode

In a normal size button, a small image with the text on the side will be displayed.

XML

```
<syncfusion:SplitButtonAdv SizeMode="Normal" SmallIcon="Images\color.png"  
Label="Colors"/>
```

C#

```
SplitButtonAdv button = new SplitButtonAdv();  
button.Label = "Colors";  
button.SizeMode = SizeMode.Normal;  
button.SmallIcon = new BitmapImage(new Uri("Images\colors.png",  
UriKind.RelativeOrAbsolute));
```

Large mode

In a large size button, a large image along with the text at the bottom will be displayed.

XML

```
<syncfusion:SplitButtonAdv SizeMode="Large" LargeIcon="Images\color.png"
Label="Colors"/>
```

C#

```
SplitButtonAdv button = new SplitButtonAdv();
button.Label = "Colors";
button.SizeMode = SizeMode.Large;
button.LargeIcon = new BitmapImage(new Uri("Images\colors.png",
UriKind.RelativeOrAbsolute));
```

Setting icon template

The [IconTemplate](#) property provides support for setting up any type of image such as path data, font icons, etc. to the SplitButtonAdv. The icon will automatically resize the template content according to its size provided in the data template.

XML

```
<Window x:Class="SplitButtonAdv_IconTemplate.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:SplitButtonAdv_IconTemplate"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
mc:Ignorable="d"

        }
        return base.SelectTemplate(item, container);
    }
}
```

Note: The [SplitButtonAdv](#) loads the icon in the following priority order.

- [IconTemplateSelector](#)
- [IconTemplate](#)
- [LargeIcon](#)
- [SmallIcon](#)

Setting image

The image option helps to provide pictorial representation of the button. Image can be added either using the [SmallIcon](#) or [LargeIcon](#) property.

- **SmallIcon** — This property will be used to set the image when size mode is **Normal** or **Small**.
- **LargeIcon** — This property will be used to set the image when size mode is **Large**.

The **SmallIcon** property can be set as follows:

XML

```
<syncfusion:SplitButtonAdv SizeMode="Small" Label="Syncfusion"
    SmallIcon="Images\syncfusion.png"/>
```

C#

```
SplitButtonAdv button = new SplitButtonAdv();
button.Label = "Syncfusion";
button.SizeMode = SizeMode.Small;
button.SmallIcon = new BitmapImage(new Uri("Images\\syncfusion.png",
    UriKind.RelativeOrAbsolute));
```

The **SmallIcon** property can be set even when the sizeMode is **Normal**.

XML

```
<syncfusion:SplitButtonAdv SizeMode="Normal"
    SmallIcon="Images\Syncfusion.png" Label="Syncfusion"/>
```

C#

```
SplitButtonAdv button = new SplitButtonAdv();
button.Label = "Syncfusion";
button.SizeMode = SizeMode.Normal;
button.SmallIcon = new BitmapImage(new Uri("Images\\syncfusion.png",
    UriKind.RelativeOrAbsolute));
```

The **LargeIcon** property can be set as follows:

XML

```
<syncfusion:SplitButtonAdv SizeMode="Large"
    LargeIcon="Images\Syncfusion.png" Label="Syncfusion"/>
```

C#

```
SplitButtonAdv button = new SplitButtonAdv();
button.Label = "Syncfusion";
button.SizeMode = SizeMode.Large;
button.LargeIcon = new BitmapImage(new Uri("Images\\syncfusion.png",
    UriKind.RelativeOrAbsolute));
```

Setting icon width and height

Icon width and icon height can be set using [IconWidth](#) and [IconHeight](#) properties respectively.

XML

```
<syncfusion:SplitButtonAdv SizeMode="Normal" IconHeight="20" IconWidth="20"
    Label="Syncfusion" SmallIcon="Images\\syncfusion.png" />
```

C#

```
SplitButtonAdv splitbutton = new SplitButtonAdv();
```

```
splitbutton.Label = "Syncfusion";
splitbutton.IconWidth=20;
splitbutton.IconHeight=20;
splitbutton.SmallIcon = new BitmapImage(new Uri("Images\\syncfusion.png",
UriKind.RelativeOrAbsolute));
```

**XML**

```
<syncfusion:SplitButtonAdv x:Name="splitbutton" SizeMode="Normal"
IconHeight="30" IconWidth="30" Label="Syncfusion"
SmallIcon="Images\\syncfusion.png" />
```

C#

```
SplitButtonAdv splitbutton = new SplitButtonAdv();
splitbutton.Label = "Syncfusion";
splitbutton.IconWidth=30;
splitbutton.IconHeight=30;
splitbutton.SmallIcon = new BitmapImage(new Uri("Images\\syncfusion.png",
UriKind.RelativeOrAbsolute));
```

Note: View [sample](#) in GitHub. This sample showcases how to add split button control and its basic features like image sizing options and size modes.

IsDefault mode

The [IsDefault](#) property indicates whether the SplitButtonAdv is a Default button and is used to activate the SplitButtonAdv by pressing using Enter key. When setting the IsDefault property to true, the user can invoke the button by pressing the **Enter** key.

XML

```
<syncfusion:SplitButtonAdv x:Name="defaultButton" Label="Default"
Grid.Column="1" Grid.Row="1" VerticalAlignment="Top"
HorizontalAlignment="Center" Click="SplitButtonAdv_Click" IsDefault="True"
/>
```

Adding items to Split Button

The DropDownMenuGroup acts as a container for the Split Button control. It provides options to add menu items and also options like header name, re-sizing and scrollbar.

Note: For more information on how to bind data with command actions for Split Button please refer to the topics [Data Binding](#) and [Command Binding](#).

            Name = "Germany",  
            Flag = new BitmapImage(new Uri("/Images/germany.png",  
            UriKind.RelativeOrAbsolute))  
        });  
    }  
}
```

Note: View [sample](#) in GitHub.

Theme

Split Button supports various built-in themes. Refer to the below links to apply themes for the Split Button,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Data Binding in WPF Split Button

Data binding provides an easier way to assign, visualize and interact with the collection of predefined data. The data binding can be achieved by populating the [DropDownMenuGroup.ItemsSource](#) property.

Creating model

Create a class that holds the model properties of the menu items. For example, `Country` class has been created with properties `Name` and `Flag`.

C#

```
public class Country
{
    private string name;
    public string Name
    {
        get
        {
            return name;
        }
        set
        {
            name = value;
        }
    }
    private BitmapImage flag;
    public BitmapImage Flag
    {
        get
        {
            return flag;
        }
        set
        {
            flag = value;
        }
    }
}
```

Creating view model

Create a class that populates the list of model object representing dropdown menu items. For example, `CountryViewModel` class has been created with property [DropDownItems](#) with return type `List<Country>`.

C#

```
public class CountryViewModel
{
    private List<Country> dropDownItems;
    public List<Country> DropDownItems
    {
        get
```

```

{
    return dropDownItems;
}
set
{
    dropDownItems = value;
}
}
public CountryViewModel()
{
    DropDownItems = new List<Country>();
    DropDownItems.Add(new Country()
    {
        Name = "India",
        Flag = new BitmapImage(new Uri("Images/india.png",
        UriKind.RelativeOrAbsolute))
    });
    DropDownItems.Add(new Country()
    {
        Name = "France",
        Flag = new BitmapImage(new Uri("Images/france.png",
        UriKind.RelativeOrAbsolute))
    });
    DropDownItems.Add(new Country()
    {
        Name = "Germany",
        Flag = new BitmapImage(new Uri("Images/germany.png",
        UriKind.RelativeOrAbsolute))
    });
}
}

```

Bind data from view model

Bind the list of menu items to [DropDownMenuGroup.ItemsSource](#) property of [DropDownMenuGroup](#) and also set the [DataContext](#) with ViewModel instance. For example, [CountryViewModel](#) instance has been set as [DataContext](#).

XML

```

<syncfusion:SplitButtonAdv Label="Country" SmallIcon="Images\flagsmall.png"
>
<syncfusion:DropDownMenuGroup ItemsSource="{Binding DropDownItems}">
<syncfusion:DropDownMenuGroup.ItemTemplate>
<DataTemplate>
<syncfusion:DropDownMenuItem Header="{Binding Name}">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="{Binding Flag}"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
</DataTemplate>
</syncfusion:DropDownMenuGroup.ItemTemplate>
</syncfusion:DropDownMenuGroup>
</syncfusion:SplitButtonAdv>

```

C#

```
public partial class MainWindow:Window
{
    public MainWindow()
    {
        InitializeComponent();
        this.DataContext = new CountryViewModel();
    }
}
```

Bind command from view model

Bind the command to [DropDownMenuItem.Command](#) property of [DropDownMenuItem](#). For example, `ClickCommand` has been bounded to `DropDownMenuItem`.

Note: For more information on Command Binding, please refer [Command Binding](#)

Command Binding in WPF Split Button

The command and command parameter properties allow to execute any action on clicking either the button or the dropdown menu items.

- **Command** - The [Command](#) property accept all commands derived from interface [ICommand](#).
- **CommandParameter** - The [CommandParameter](#) property allows the user to provide additional data required in the command handler in-order to perform any operation.

Note: View [sample](#) in GitHub. This sample showcases how to provide command binding for SplitButtonAdv control.

Dropdown Menu Items in WPF Split Button

Setting icon for dropdown menu items

The icon option helps to provide pictorial representation of the dropdown menu item. One can apply the icon by setting the [Icon](#) property value to an image source.

XML

```
<syncfusion:SplitButtonAdv Label="Country" x:Name="splitbutton"
DropDirection="BottomRight" SizeMode="Normal"
SmallIcon="Images\country.png">
<syncfusion:DropDownMenuGroup>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="India">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images\india.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="France"/>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Germany"/>
</syncfusion:DropDownMenuGroup>
</syncfusion:SplitButtonAdv>
```

C#

```
SplitButtonAdv splitbutton = new SplitButtonAdv();
DropDownMenuGroup menu = new DropDownMenuGroup();
DropDownMenuItem Item1 = new DropDownMenuItem() { Header="India", Icon=new
BitmapImage(new Uri("Images\india.png")), HorizontalAlignment="Left"};
DropDownMenuItem Item2 = new DropDownMenuItem() { Header ="France",
HorizontalAlignment="Left" };
DropDownMenuItem Item3 = new DropDownMenuItem() { Header ="Germany",
HorizontalAlignment="Left" };
menu.Items.Add(Item1);
menu.Items.Add(Item2);
menu.Items.Add(Item3);
splitbutton.Content = menu;
splitbutton.Label = "Country";
splitbutton.DropDirection = DropDirection.BottomRight;
splitbutton.SizeMode = SizeMode.Normal;
splitbutton.SmallIcon = new BitmapImage(new Uri("Images\country.png"));
```

Setting icon bar visibility

The icon bar option helps to enable/disable the vertical bar next to the Dropdown menu item icon. One can change the icon bar visibility by setting the [IconBarEnabled](#) property to **true** or **false**.

Note: The default value of [IconBarEnabled](#) is **false**.

XML

```
<syncfusion:SplitButtonAdv Label="Country" DropDirection="BottomRight"
x:Name="splitbutton" SizeMode="Normal" SmallIcon="Images\country.png">
<syncfusion:DropDownMenuGroup IconBarEnabled="True">
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="India">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images\india.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="France"/>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Germany"/>
</syncfusion:DropDownMenuGroup>
</syncfusion:SplitButtonAdv>
```

C#

```
SplitButtonAdv splitbutton = new SplitButtonAdv();
DropDownMenuGroup menu = new DropDownMenuGroup();
DropDownMenuItem Item1 = new DropDownMenuItem() { Header="India", Icon=new
BitmapImage(new Uri("Images\india.png")), HorizontalAlignment="Left"};
DropDownMenuItem Item2 = new DropDownMenuItem() { Header ="France",
HorizontalAlignment="Left" };
DropDownMenuItem Item3 = new DropDownMenuItem() { Header ="Germany",
HorizontalAlignment="Left" };
menu.Items.Add(Item1);
menu.Items.Add(Item2);
menu.Items.Add(Item3);
menu.IconBarEnabled =true;
splitbutton.Content = menu;
splitbutton.Label = "Country";
splitbutton.SizeMode = SizeMode.Normal;
splitbutton.DropDirection = DropDirection.BottomRight;
splitbutton.SmallIcon = new BitmapImage(new Uri("Images\country.png"));
```

Setting scrollbar visibility

The dropdown menu group supports built-in scrollbar to show large number of menu items in a compact view. One can enable the visibility of scroll bar by setting the [ScrollBarVisibility](#) property to **Visible**.

XML

```
<syncfusion:SplitButtonAdv Label="Country" DropDirection="BottomRight"
x:Name="splitbutton" SizeMode="Normal" SmallIcon="Images\country.png">
<syncfusion:DropDownMenuGroup MaxHeight="111" ScrollBarVisibility="Visible">
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="India">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images/india.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
```

```

<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="France">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images\france.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Germany" >
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images\germany.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Canada">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images\canada.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="China">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images\china.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="United
States"/>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Italy"/>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Japan"/>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Spain"/>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Pakistan"/>
</syncfusion:DropDownMenuGroup>
</syncfusion:SplitButtonAdv>

```

C#

```

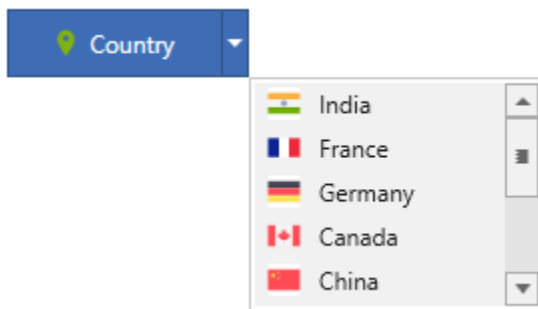

SplitButtonAdv splitbutton = new SplitButtonAdv();
DropDownMenuGroup menu = new DropDownMenuGroup();
DropDownMenuItem Item1 = new DropDownMenuItem() { Header="India",Icon=new
BitmapImage(new Uri("Images\india.png")), HorizontalAlignment="Left"};
DropDownMenuItem Item2 = new DropDownMenuItem() { Header ="France", Icon=new
BitmapImage(new Uri("Images\france.png")), HorizontalAlignment="Left"};
DropDownMenuItem Item3 = new DropDownMenuItem() { Header ="Germany",
Icon=new BitmapImage(new Uri("Images\germany.png")),
HorizontalAlignment="Left"};
DropDownMenuItem Item4 = new DropDownMenuItem() { Header ="Canada", Icon=new
BitmapImage(new Uri("Images\canada.png")), HorizontalAlignment="Left"};
DropDownMenuItem Item5 = new DropDownMenuItem() { Header ="China", Icon=new
BitmapImage(new Uri("Images\china.png")), HorizontalAlignment="Left"};
DropDownMenuItem Item6 = new DropDownMenuItem() { Header ="United State",
HorizontalAlignment="Left"};
DropDownMenuItem Item7 = new DropDownMenuItem() { Header ="Italy",
HorizontalAlignment="Left"};
DropDownMenuItem Item8 = new DropDownMenuItem() { Header ="Japan",
HorizontalAlignment="Left"};
DropDownMenuItem Item9 = new DropDownMenuItem() { Header ="Spain",
HorizontalAlignment="Left"};
DropDownMenuItem Item10 = new DropDownMenuItem() { Header ="Pakistan",
HorizontalAlignment="Left"};
menu.Items.Add(Item1);
menu.Items.Add(Item2);

```

```

menu.Items.Add(Item3);
menu.Items.Add(Item4);
menu.Items.Add(Item5);
menu.Items.Add(Item6);
menu.Items.Add(Item7);
menu.Items.Add(Item8);
menu.Items.Add(Item9);
menu.Items.Add(Item10);
menu.MaxHeight=111;
menu.ScrollBarVisibility = ScrollBarVisibility.Visible;
splitbutton.Content = menu;
splitbutton.Label = "Country";
splitbutton.SizeMode = SizeMode.Normal;
splitbutton.DropDirection = DropDirection.BottomRight;
splitbutton.SmallIcon = new BitmapImage(new Uri("Images\country.png"));

```

Checkable dropdown menu items

The checkable option helps to check/uncheck the dropdown menu item on selection by setting the [IsCheckable](#) property to **true**.

XML

```

<syncfusion:SplitButtonAdv Label="Country" DropDirection="BottomRight"
x:Name="splitbutton" SizeMode="Normal" SmallIcon="Images\country.png">
<syncfusion:DropDownMenuGroup>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="India"
IsChecked="True" IsCheckable="True"/>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="France"
IsChecked="True" IsCheckable="True"/>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Germany"/>
</syncfusion:DropDownMenuGroup>
</syncfusion:SplitButtonAdv>

```

C#

```

SplitButtonAdv splitbutton = new SplitButtonAdv();
DropDownMenuGroup menu = new DropDownMenuGroup();
DropDownMenuItem Item1 = new DropDownMenuItem() { Header="India",
IsChecked=true, IsCheckable=true, HorizontalAlignment="Left"};
DropDownMenuItem Item2 = new DropDownMenuItem() { Header ="France",
IsChecked=true, IsCheckable=true, HorizontalAlignment="Left"};
DropDownMenuItem Item3 = new DropDownMenuItem() { Header ="Germany",
HorizontalAlignment="Left"};
menu.Items.Add(Item1);

```

```

menu.Items.Add(Item2);
menu.Items.Add(Item3);
splitbutton.Content = menu;
splitbutton.DropDirection = DropDirection.BottomRight;
splitbutton.Label = "Country";
splitbutton.SizeMode = SizeMode.Normal;
splitbutton.SmallIcon = new BitmapImage(new Uri("Images\country.png"));

```

Resizing dropdown menu

The dropdown menu group popup height can be increased or decreased using the resizing gripper. One can enable the resizing behavior by setting the [IsResizable](#) property to **true**.

XML

```

<syncfusion:SplitButtonAdv Label="Country" x:Name="splitbutton"
    SmallIcon="images\country.png">
    <syncfusion:DropDownMenuGroup IsResizable="True">
    <syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="India">
    <syncfusion:DropDownMenuItem.Icon>
    <Image Source="images\india.png"/>
    </syncfusion:DropDownMenuItem.Icon>
    </syncfusion:DropDownMenuItem>
    <syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="France">
    <syncfusion:DropDownMenuItem.Icon>
    <Image Source="images\france.png"/>
    </syncfusion:DropDownMenuItem.Icon>
    </syncfusion:DropDownMenuItem>
    <syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Germany">
    <syncfusion:DropDownMenuItem.Icon>
    <Image Source="images\germany.png"/>
    </syncfusion:DropDownMenuItem.Icon>
    </syncfusion:DropDownMenuItem>
    </syncfusion:DropDownMenuGroup>
    </syncfusion:SplitButtonAdv>

```

C#

```

SplitButtonAdv splitbutton = new SplitButtonAdv();
DropDownMenuGroup menu = new DropDownMenuGroup();
DropDownMenuItem Item1 = new DropDownMenuItem() { Header="India", Icon =new
BitmapImage(new Uri("images\india.png")), HorizontalAlignment="Left"};
DropDownMenuItem Item2 = new DropDownMenuItem() { Header ="France", Icon
=new BitmapImage(new Uri("images\france.png")), HorizontalAlignment="Left"};
DropDownMenuItem Item3 = new DropDownMenuItem() { Header ="Germany", Icon
=new BitmapImage(new Uri("images\germany.png")),
HorizontalAlignment="Left"};
menu.Items.Add(Item1);

```

```
menu.Items.Add(Item2);
menu.Items.Add(Item3);
menu.IsResizable = true;
splitbutton.Content = menu;
splitbutton.Label = "Colors";
splitbutton.SmallIcon = new BitmapImage(new Uri("images\country.png"));
```

Note: View [sample](#) in GitHub. This sample showcases how to set the drop-down item icon, icon bar visibility, scrollbar visibility, and checkable support.

Adding custom dropdown menu items

The dropdown menu group has option to load custom items apart from actual dropdown menu items. One can populate the custom items using the [MoreItems](#) property.

Note: The **MoreItems** property has return type `ObservableCollection<UIElement>`, so it can accept any `UIElement` as its child items.

XML

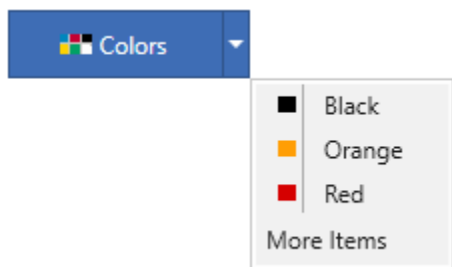

```
<Window x:Class="SplitButton_Custom_Items.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:SplitButton_Custom_Items"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
mc:Ignorable="d"
Title="MainWindow" Height="450" Width="800">
<Window.DataContext>
<local:ColorViewModel/>
</Window.DataContext>
<Grid>
<syncfusion:SplitButtonAdv Label="Colors" SizeMode="Normal"
SmallIcon="Images\colors.png">
<syncfusion:DropDownMenuGroup IconBarEnabled="True" MoreItems="{Binding
Items}" IsMoreItemsIconTrayEnabled="False">
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Black">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images\black.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Orange">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images\orange.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Red">
<syncfusion:DropDownMenuItem.Icon>
```

```
<Image Source="Images\red.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
</syncfusion:DropDownMenuGroup>
</syncfusion:SplitButtonAdv>
</Grid>
</Window>
```

C#

```
using Syncfusion.Windows.Shared;
using System;
using System.Collections.ObjectModel;
using System.Windows;
using System.Windows.Controls;
namespace SplitButton_Custom_Items
{
    public class ColorViewModel : NotificationObject
    {
        public ObservableCollection<UIElement> items = new
        ObservableCollection<UIElement>();
        public ObservableCollection<UIElement> Items
        {
            get { return items; }
            set { items = value; RaisePropertyChanged("Items"); }
        }
        public ColorViewModel()
        {
            Items.Add(new Label() { Content = "More Items" });
        }
    }
}
```

Setting icon bar visibility for custom dropdown menu items

The custom dropdown menu items icon visibility can be enabled/disabled by setting the [IsMoreItemsIconTrayEnabled](#) property either to **true** or **false**.

XML

```
<Window x:Class="SplitButton_Custom_Items.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"

xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:SplitButton_Custom_Items"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
```

```

mc:Ignorable="d"
Title="MainWindow" Height="450" Width="800">
<Window.DataContext>
<local:ColorViewModel/>
</Window.DataContext>
<Grid>
<syncfusion:SplitButtonAdv Label="Colors" x:Name="splitbutton"
SizeMode="Normal" SmallIcon="Images\colors.png">
<syncfusion:DropDownMenuGroup IconBarEnabled="True" MoreItems="{Binding
Colors}" IsMoreItemsIconTrayEnabled="True">
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Black">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images\black.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Orange">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images\orange.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Red">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="Images\red.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
</syncfusion:DropDownMenuGroup>
</syncfusion:SplitButtonAdv>
</Grid>
</Window>

```

C#

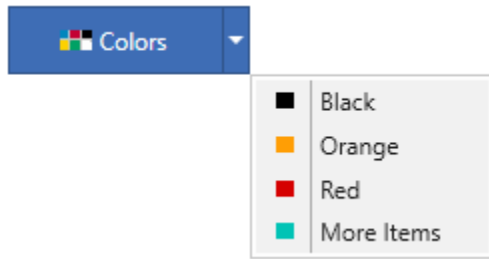

```

using Syncfusion.Windows.Shared;
using Syncfusion.Windows.Tools.Controls;
using System;
using System.Collections.ObjectModel;
using System.Windows;
using System.Windows.Media.Imaging;
namespace SplitButton_Custom_Items
{
public class ColorViewModel : NotificationObject
{
public ObservableCollection<UIElement> color = new
ObservableCollection<UIElement>();
public ObservableCollection<UIElement> Colors
{
get { return color; }
set { color = value; RaisePropertyChanged("Colors"); }
}
public ColorViewModel()
{
Colors.Add(new DropDownMenuItem() { Header = "More Items", Icon = new
Image() { Source = new BitmapImage(new Uri("/Images/skyblue.png",
UriKind.RelativeOrAbsolute)) } });
}
}
}

```

```
}

```

Note: View [sample](#) in GitHub. This sample showcases how to add custom dropdown menu items and handle visibility of custom items icon bar in split button control.

Dropdown Direction in WPF Split Button

Dropdown direction is used to change the position of the popup being loaded while pressing dropdown arrow. The direction can be changed using the [DropDirection](#) enumeration.

The [DropDirection](#) enumeration comprises of following values:

- Left
- Right
- BottomLeft
- BottomRight
- TopLeft
- TopRight

Note: The default value is **BottomLeft**.

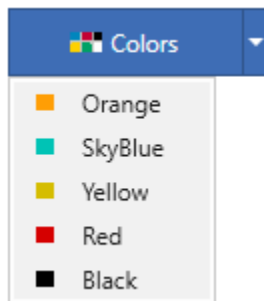

XML

```
<syncfusion:SplitButtonAdv DropDirection="BottomLeft"
    SmallIcon="images\colors.png" Label="Colors">
    <syncfusion:DropDownMenuGroup>
    <syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Orange">
    <syncfusion:DropDownMenuItem.Icon>
    <Image Source="images\orange.png"/>
    </syncfusion:DropDownMenuItem.Icon>
    </syncfusion:DropDownMenuItem>
    <syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="SkyBlue">
    <syncfusion:DropDownMenuItem.Icon>
    <Image Source="images\skyblue.png"/>
    </syncfusion:DropDownMenuItem.Icon>
    </syncfusion:DropDownMenuItem>
    <syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Yellow">
    <syncfusion:DropDownMenuItem.Icon>
    <Image Source="images\yellow.png"/>
    </syncfusion:DropDownMenuItem.Icon>
    </syncfusion:DropDownMenuItem>
    <syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Red">
    <syncfusion:DropDownMenuItem.Icon >
    <Image Source="images\red.png"/>
    </syncfusion:DropDownMenuItem.Icon>
    </syncfusion:DropDownMenuItem>
    </syncfusion:DropDownMenuGroup>
    </syncfusion:SplitButtonAdv>
```

```
<syncfusion:DropDownMenuItem HorizontalAlignment="Left" Header="Black">
<syncfusion:DropDownMenuItem.Icon>
<Image Source="images\black.png"/>
</syncfusion:DropDownMenuItem.Icon>
</syncfusion:DropDownMenuItem>
</syncfusion:DropDownMenuGroup>
</syncfusion:SplitButtonAdv>
```

C#

```
SplitButtonAdv splitbutton = new SplitButtonAdv();
splitbutton.Label = "Colors";
splitbutton.DropDirection = DropDirection.BottomLeft;
splitbutton.SmallIcon = new BitmapImage(new Uri("images\colors.png"));
DropDownMenuGroup menu = new DropDownMenuGroup();
DropDownMenuItem Item1 = new DropDownMenuItem() { Header="Orange", Icon=new
BitmapImage(new Uri("images\orange.png")), HorizontalAlignment="Left"};
DropDownMenuItem Item2 = new DropDownMenuItem() { Header = "Skyblue",
Icon=new BitmapImage(new Uri("images\skyblue.png")),
HorizontalAlignment="Left"};
DropDownMenuItem Item3 = new DropDownMenuItem() { Header = "Yellow", Icon=new
BitmapImage(new Uri("images\yellow.png")), HorizontalAlignment="Left"};
DropDownMenuItem Item4 = new DropDownMenuItem() { Header = "Red", Icon=new
BitmapImage(new Uri("images\red.png")), HorizontalAlignment="Left"};
DropDownMenuItem Item5 = new DropDownMenuItem() { Header = "Black", Icon=new
BitmapImage(new Uri("images\black.png")), HorizontalAlignment="Left"};
menu.Items.Add(Item1);
menu.Items.Add(Item2);
menu.Items.Add(Item3);
menu.Items.Add(Item4);
menu.Items.Add(Item5);
splitbutton.Content=menu;
```

Multiline Text in WPF Split Button (SplitButtonAdv)

Multiline text support is used to render text content of the Split Button control in multiple lines for precise view. One can apply the multiline text by using the [IsMultiLine](#) property.

Note: This property is only applicable for large size mode of the Split Button.

XML

```
<syncfusion:SplitButtonAdv Label="Sign in with your Syncfusion Account"  
LargeIcon="image\userlarge.png" SizeMode="Large" IsMultiLine="True"/>
```

C#

```
SplitButtonAdv splitbutton = new SplitButtonAdv();
splitbutton.Label = "Sign in with your Syncfusion Account";
splitbutton.IsMultiLine = true;
splitbutton.SizeMode = SizeMode.Large;
splitbutton.SmallIcon = new BitmapImage(new Uri("image\\userlarge.png"));
```

**Events in WPF Split Button**

The Split Button comprises of various pre-defined events to perform any required action that are illustrated below.

DropDownOpening

The event occurs before opening the dropdown menu popup and any action can be handled in the respective event handler.

XML

```
<syncfusion:SplitButtonAdv x:Name="splitbutton"
    DropDownOpening="splitbutton_DropDownOpening"/>
```

C#

```
SplitButtonAdv splitbutton = new SplitButtonAdv();
splitbutton.DropDownOpening += new
CancelEventHandler(splitbutton_DropDownOpening);
private void splitbutton_DropDownOpening(object sender,
System.ComponentModel.CancelEventArgs e)
{
}
```

DropDownOpened

The event occurs after opening the dropdown menu popup and any action can be handled in respective event handler.

XML

```
<syncfusion:SplitButtonAdv x:Name="splitbutton"
    DropDownOpened="splitbutton_DropDownOpened"/>
```

C#

```
SplitButtonAdv splitbutton = new SplitButtonAdv();
splitbutton.DropDownOpened += new
RoutedEventHandler(splitbutton_DropDownOpened);
private void splitbutton_DropDownOpened(object sender, RoutedEventArgs e)
```

```
{  
}
```

DropDownClosing

The event occurs before closing the dropdown menu popup and any action can be handled in respective event handler.

XML

```
<syncfusion:SplitButtonAdv x:Name="splitbutton"  
    DropDownClosing="splitbutton_DropDownClosing"/>
```

C#

```
SplitButtonAdv splitbutton = new SplitButtonAdv();  
splitbutton.DropDownClosing += new  
    CancelEventHandler(splitbutton_DropDownClosing);  
private void splitbutton_DropDownClosing(object sender,  
    System.ComponentModel.CancelEventArgs e)  
{  
}
```

DropDownClosed

The event occurs before closing the dropdown menu popup and any action can be handled in respective event handler.

XML

```
<syncfusion:SplitButtonAdv x:Name="splitbutton"  
    DropDownClosed="splitbutton_DropDownClosed"/>
```

C#

```
SplitButtonAdv splitbutton = new SplitButtonAdv();  
splitbutton.DropDownClosed += new  
    RoutedEventHandler(splitbutton_DropDownClosed);  
private void splitbutton_DropDownClosed(object sender, RoutedEventArgs e)  
{  
}
```

Click

The events occurs when the Split Button control is clicked and any action can be handled in the respective event handler.

XML

```
<syncfusion:SplitButtonAdv x:Name="splitbutton" Click="splitbutton_Click"/>
```

C#

```
SplitButtonAdv splitbutton = new SplitButtonAdv();  
splitbuttonbutton.Click += new RoutedEventHandler(splitbuttonbutton_Click);  
private void splitbuttonbutton_Click(object sender, RoutedEventArgs e)
```

```
{
}
```

Events for dropdown menu items

Click

The events occurs when the dropdown menu item is clicked and any action can be handled in respective event handler.

XML

```
<syncfusion:DropDownMenuItem x:Name="dropDownMenuItem"
Click="dropDownMenuItem_Click"/>
```

C#

```
DropDownMenuItem dropDownMenuItem = new DropDownMenuItem();
dropDownMenuItem.Click +=new RoutedEventHandler(dropDownMenuItem_Click);
private void dropDownMenuItem_Click(object sender, RoutedEventArgs e)
{
}
```

IsCheckedChanged

The events occur when the dropdown menu item is checked or unchecked, that is, only when [IsCheckable](#) property is set to **true**. Any action can be handled in the respective event handler.

XML

```
<syncfusion:DropDownMenuItem x:Name="dropDownMenuItem" IsCheckable="True"
IsCheckedChanged="DropDownMenuItem_IsCheckedChanged"/>
```

C#

```
DropDownMenuItem dropDownMenuItem = new DropDownMenuItem();
dropDownMenuItem.IsCheckable=true;
dropDownMenuItem.IsCheckedChanged +=new
RoutedEventHandler(dropDownMenuItem_IsCheckedChanged);
private void dropDownMenuItem_IsCheckedChanged(DependencyObject d,
DependencyPropertyChangedEventArgs e)
{
}
```

Styles and Templates in WPF Split Button

WPF styles and templates is a suite of features that allow developers and designers to create visual compelling effects and consistent appearance of the products.

This document provides information to change the visual appearance of the Split Button control. In addition, one can edit the structure of the Split Button control by using Blend and Visual Studio that helps to customize their appearances.

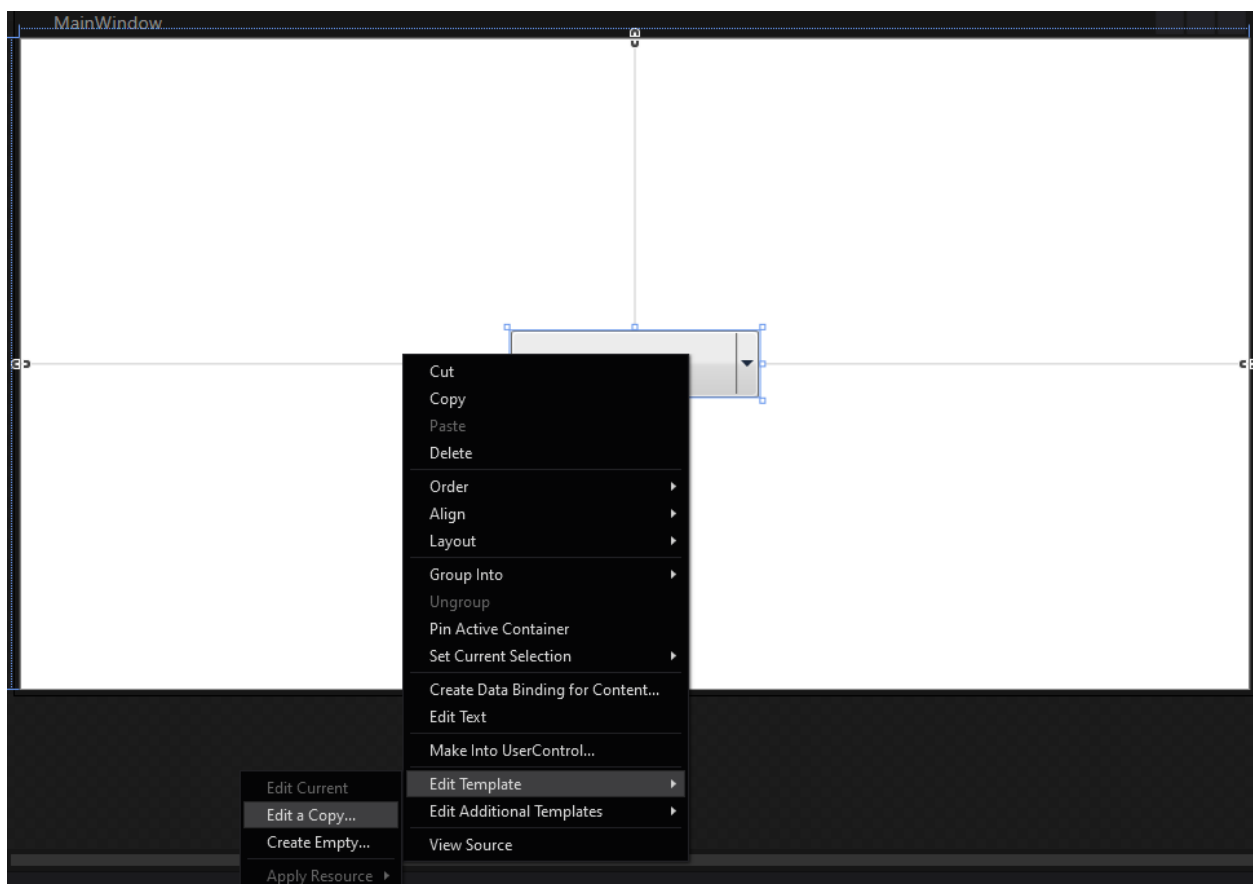

Edit appearance in Expression Blend

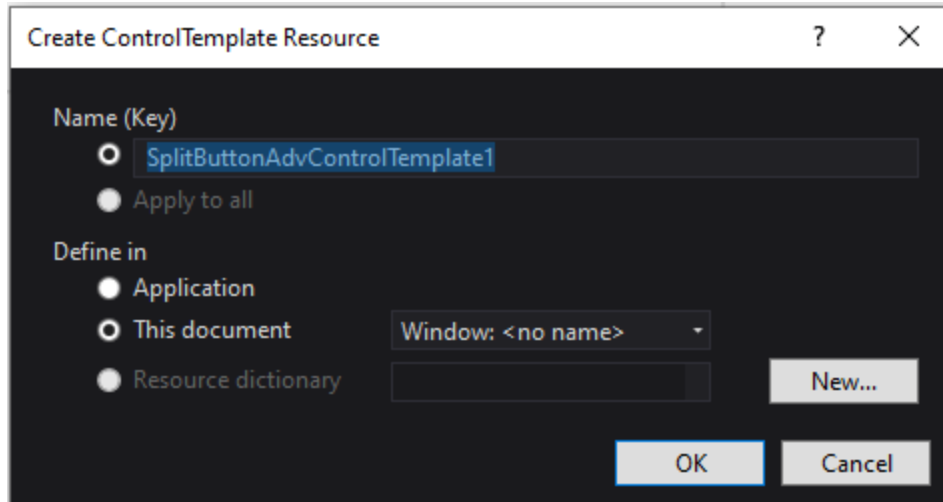

- Open the application in Expression Blend.

- Select the Split Button control from the window.

- Right click on the Split Button control and choose the menu option **Edit Template**. It will comprise of following two options.
- **Edit a Copy...** – Edit a copy of the default style. When selecting this option, a new dialog opens as follows.

The **Create ControlTemplate Resource** dialog allows to enter the name or change the control template name, as well as choose the location for the template. When **OK** is pressed, the Split Button control template is generated by the Expression Blend in the **Resource** section. The generated XAML can be edited in XAML view or in Visual Studio.

- **Create Empty...** - Creates an empty Split Button template. Selecting this option will open the **Create ControlTemplate Resource** dialog which allows the user to enter the name or change the control template name, as well as choose the location for the template.

All resources will be displayed on the XAML file of the application after performing above steps. These resources can be edited to create a new Style.

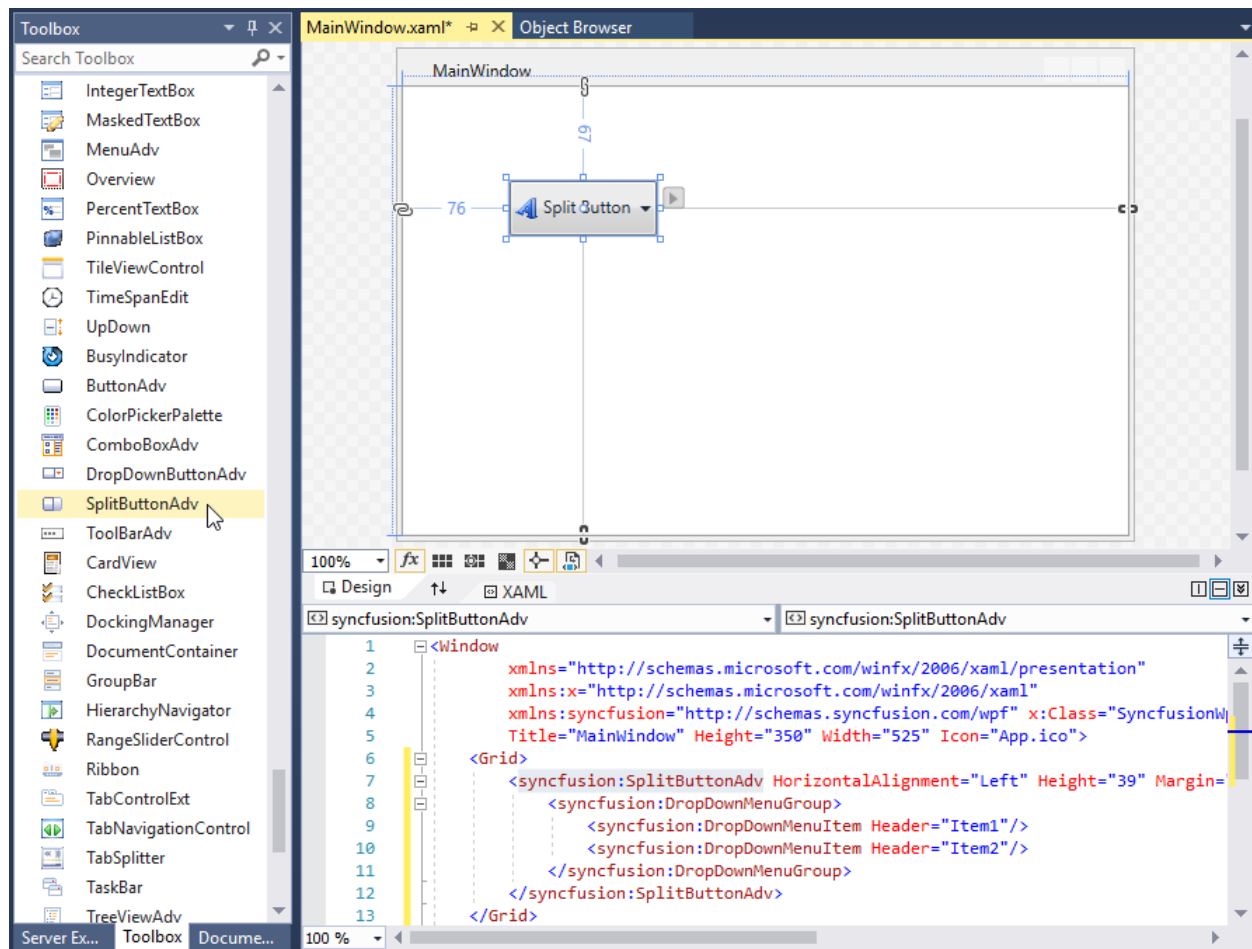

```
<Window.Resources>
  <ControlTemplate x:Key="SplitButtonAdvControlTemplate1" TargetType="{x:Type Syncfusion:SplitButtonAdv}"...>
</Window.Resources>
```

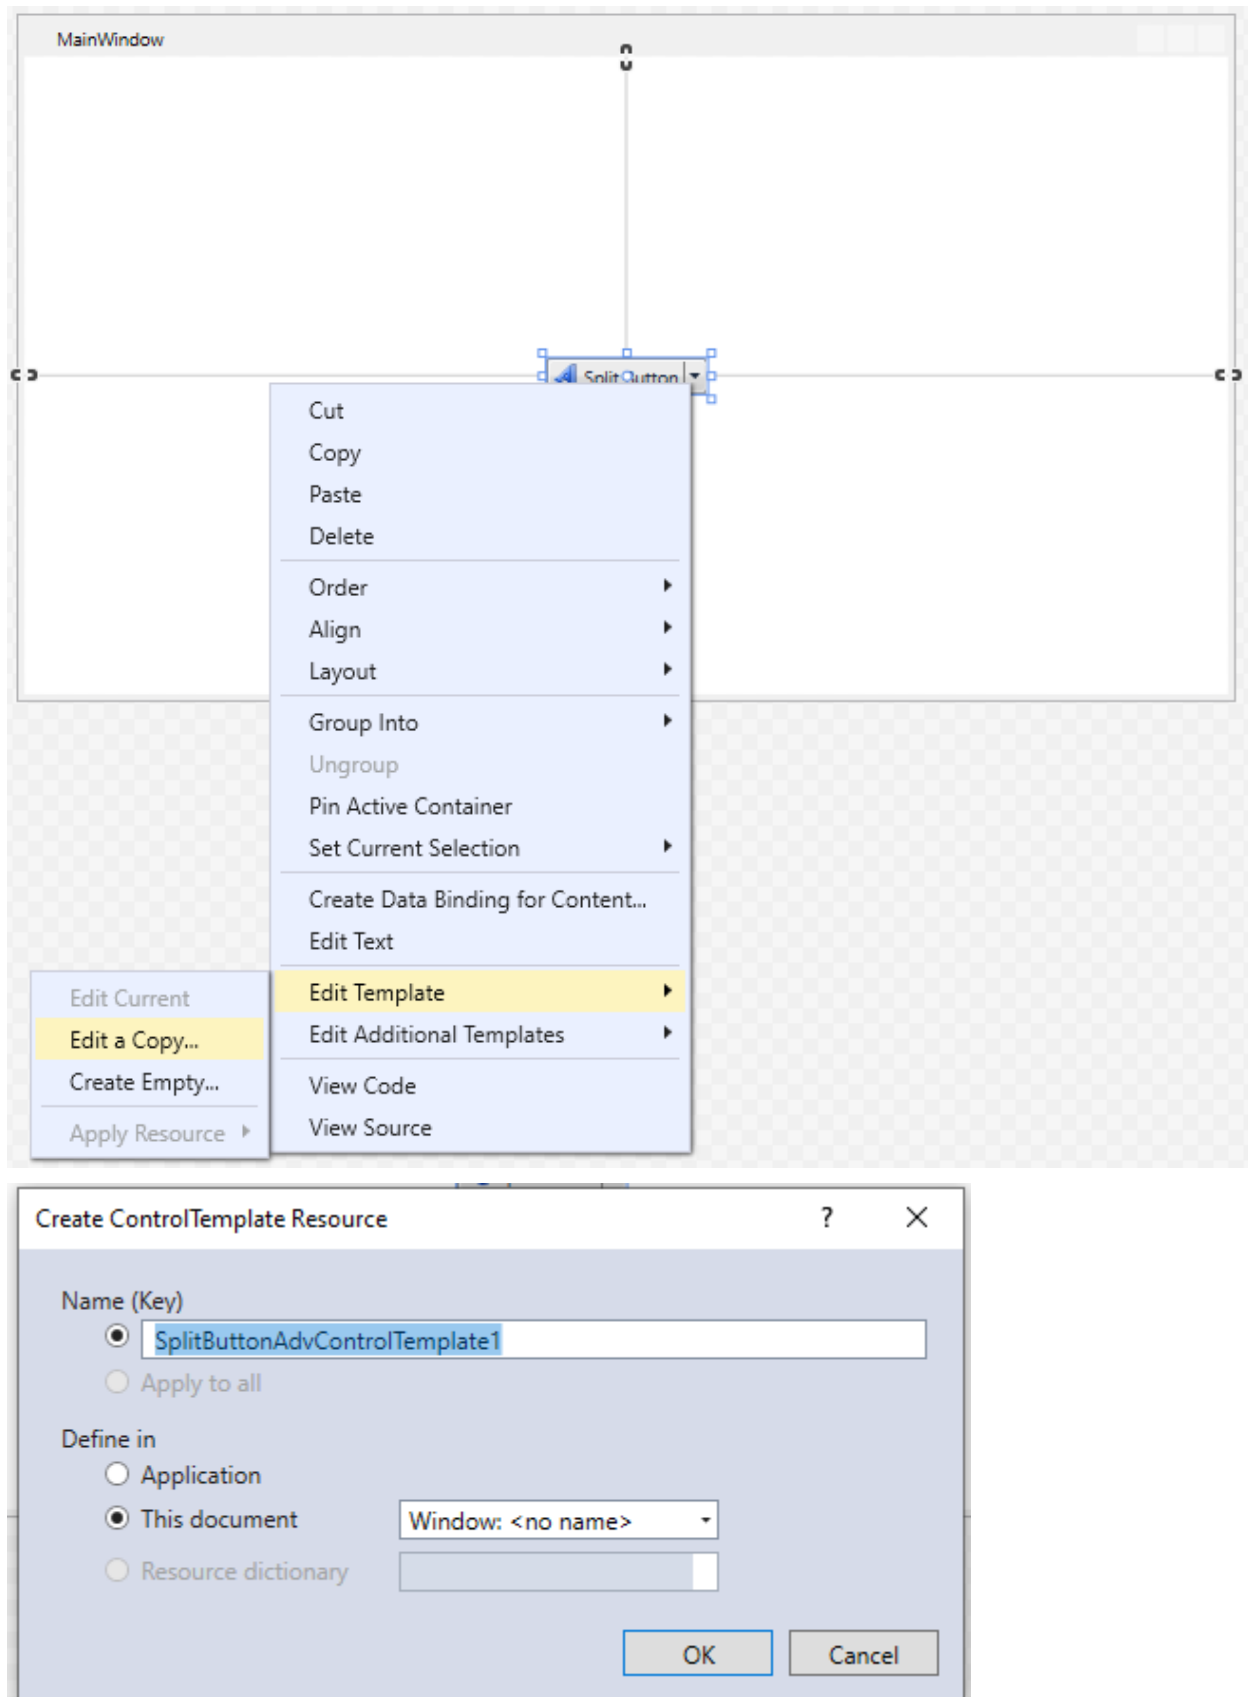

Split Button control edited in Expression Blend

[Edit appearance in Visual Studio](#)

- Open the application in Visual Studio.
- Open design view and select the Split Button control. Now right Click on the Split Button control and you can see some menu options showing up.

- On choosing menu option **Edit Template**, it further comprise of following two options.
- **Edit a Copy...** – Edit a copy of the default style. When selecting this option, a new dialog opens as follows.

The **Create ControlTemplate Resource** dialog allows to enter the name or change the control template name, as well as choose the location for the template. When **OK** is pressed, the Split Button control template is generated in the **Resource** section. The generated XAML can be edited in XAML view.

- **Create Empty...** - Creates an empty Split Button style. Selecting this option will open the **Create ControlTemplate Resource** dialog which allows the user to enter the name or change the control template name, as well as choose the location for the template.

All resources will be displayed on the XAML file of the application after performing above steps. These resources can be edited to create a new Style.

Split Button control edited in Visual Studio

Themes in WPF Split Button

Split Button supports various built-in themes. Refer to the below links to apply themes for the Split Button,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

SfSpreadsheet

WPF Spreadsheet (SfSpreadsheet) Overview

The SfSpreadsheet is excel inspired control that allows you to create, edit, view and format the Microsoft Excel files without excel installed. It provides absolute ease of use UI experience with integrated ribbon to cover any possible business scenario. SfSpreadsheet comes with built-in calculation engine with support for 400+ most widely used formulas.

Key Features

- **Ribbon** – Ribbon integrated with organically enhanced UI experience.
- **Editing and Selection**- Interactive support for editing and cell selection in workbook.
- **Formulas** - Provides support for 400+ most widely used formulas which any business user needs and allows you to add, remove and edit the formulas like in excel.
- **Name Manager** – Supports the name ranges in the formulas. By using the name ranges, you can specify the name of the cell range, and then you can use it in the formula more easily without hassling of remembering cell locations.
- **Data validation** – Provides support to ensure the data integrity by enforcing end users to enter valid data into the cells and if entered data does not meet the specified criteria, and error message is displayed.

- **Floating Cells**- Provides support for floating cell mode that is when the text exceeds the length of the cell, it will float the text to the adjacent cell.
- **Merge Cells** - Merge two or more adjacent cells into a single cell and display the contents of one cell in the merged cell.
- **Conditional Formatting**- Provides support for excel compatible conditional formatting and allows you to apply formats to a cell or range of cells depending on the value of cells or formula that meet specific criteria. Also provides support to define and import the conditional formatting. rules such as Data Bars, Icon Sets and Color Scales options which are used to visualize the data.
- **Cell Comments**- Supports comments that provide additional information about a cell such as what the value represents. And it would be useful if you want the end users to understand the data in the cells more deeply.
- **Hyperlinks and Bookmarks**- Provides support to import, create, and edit hyperlinks and bookmarks. The hyperlink is a convenient way to navigate or browse data within a worksheet or other worksheets in a workbook.
- **Undo/Redo** - Provides support to undo or redo the changes that you have made in the workbook.
- **Clipboard Operations** – Provides support for Cut/Copy/Paste Operations in Spreadsheet.
- **Fill Series** – Provides support to automatically fill cells with data that follows or completes a pattern.
- **Freeze panes** – Provides support to freeze rows/columns.
- **Resizing and Hiding** – Provides interactive support to resize or hide/unhide the rows and columns.
- **Charts, Pictures and Textboxes** - Provides support to import Charts, Pictures and Textboxes.
- **Sparklines** – Provides support to import Sparklines.
- **Outlines** - Provides support to group or ungroup rows and columns.
- **Workbook and Worksheet Protection**- Provides support to protect the worksheet and also supports to lock-down the structure and window of workbook, which enables you to prevent workbook from any structural change or from any change in size.
- **Conversion** – Provides support to export the workbook to PDF, HTML, Image and CSV.
- **Zooming** – Provides support to zoom in and zoom out of the worksheet view.
- **Localization** - Provides support to localize all the static text in a Ribbon and all dialogs to any desired language.
- **Supported file types** - Ability to import the different types of excel which are XLS, XLSX, XLSM, XLT, XLTX, CSV(Comma delimited) respectively.

Choose between SfSpreadsheet and Spreadsheet control

WPF suite contains **SfSpreadsheet** and **Spreadsheet** control for viewing and editing the excel files. SfSpreadsheet is an alternate for Spreadsheet control which is marked as classic control. Hence it is recommended to use SfSpreadsheet which provides better performance and rich set features over Spreadsheet control.

Below are the features that SfSpreadsheet have over Spreadsheet control,

Feature	SfSpreadsheet
Scrolling performance	Supports fast and fluid scrolling even if the excel has a huge set of data .Thus its performance is high compared to Spreadsheet control.

Copy Paste	Supports various paste options similar to excel options like Paste, Formulas, Values, Formula and Source Formatting, Values and Source Formatting and Formatting alone. It also provides a good performance compared to Spreadsheet control.
Undo/Redo	Supports undo/redo functionalities similar to those achieved with Microsoft Office-type applications. This operation records the changes in the whole workbook while Spreadsheet Control records the changes in sheet level only.
Formula calculation	Provides support for 400+ most widely used formulas and uses Multi-threading concept So, the calculation speed is also high compared to Spreadsheet control.
Floating Cells	Provides support to float cell both in display and edit mode.
Hyperlinks	Provides support for Hyperlink feature which you can create hyperlink for existing files or web page and email addresses too.
Conditional Formatting	Provides support to define and import the conditional formatting rules such as Data Bars, Icon Sets and Color Scales options which are used to visualize the data.
Data validation	Provides support for validation for cross sheet references and list validation with formula/cell references compared to Spreadsheet control.

Properties table

Below are the properties difference between SfSpreadsheet and Spreadsheet control,

SfSpreadsheet	Spreadsheet	Description
ActiveGrid	GridProperties->ActiveSpreadsheetGrid	Gets the active SpreadsheetGrid
IsCustomTabItemContextMenuEnabled	TabStyleManager -> IsCustomTabItemContextMenuEnabled	Gets or sets whether Custom ContextMenu is to be Enabled
ShowTabItemContextMenu	TabStyleManager -> ShowTabItemContextMenu	Gets or sets whether TabItemContextMenu is to be displayed
TabItemContextMenu	TabStyleManager ->TabItemContextMenu	Gets or sets the ContextMenu Items for TabItem
ActiveSheet	ExcelProperties->Workbook->ActiveSheet	Gets the Current ActiveSheet

Workbook	ExcelProperties->Workbook	
CurrentCellStyle	GridProperties->CurrentCellStyle	Gets the Style of the Current Cell
HistoryManager	GridProperties.ActiveSpreadsheetGrid.Model.CommandStack	Gets the command stack of the SfSpreadsheet. By default it has been enabled
SheetName	GridProperties->CurrentSheetName	Gets the tab sheet name

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Getting Started with WPF Spreadsheet (SfSpreadsheet)

This section helps you to get started with the SfSpreadsheet

Assemblies Deployment

Below table describes, list of assemblies required to be added in project when the SfSpreadsheet control is used in your application.

Assembly	Description
Syncfusion.SfCellGrid.WPF.dll	Contains the base and fundamental classes which holds the underlying architecture for displaying cells with virtualized behavior and selection/interaction of cells.
Syncfusion.SfGridCommon.WPF.dll	Contains the classes which holds the properties and functions of scroll viewer and disposable elements
Syncfusion.SfSpreadsheet.WPF.dll	Contains the classes that handles all the UI Operations of SfSpreadsheet such as importing of sheets, applying formulas/styles etc.
Syncfusion.Shared.WPF.dll	Contains the classes which holds the controls like Color pickers, Chromeless window, ComboBoxAdv, DateTimeEdit etc.
Syncfusion.Tools.WPF.dll	Contains the classes which holds the controls like TabControlExt, TabItemExt, Gallery, GroupBar, TabSplitter etc which are used in SfSpreadsheet
Syncfusion.XlsIO.Base.dll	Contains the base classes which is responsible for read and write in Excel files, Worksheet Manipulations, Formula calculations etc.

Below are the assemblies list that can be added when you want to enable certain features in SfSpreadsheet control.

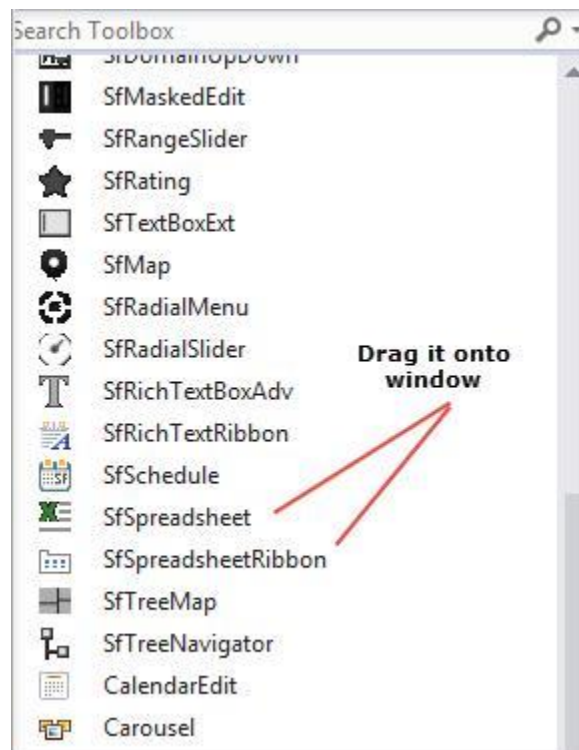

Optional Assemblies	Description
Syncfusion.SfSpreadsheetHelper.WPF.dll	Contains the classes which is responsible for importing charts and sparklines into SfSpreadsheet.
Syncfusion.ExcelChartToImageConverter.WPF.dll	Contains the classes which is responsible for converting charts as image.
Syncfusion.SfChart.WPF.dll	Contains the classes which is responsible for importing charts like Line charts, Pie charts, Sparklines etc.
Syncfusion.ExcelToPDFConverter.Base.dll	Contains the base and fundamental classes which is responsible for converting excel to PDF.
Syncfusion.Pdf.Base.dll	Contains the base and fundamental classes for creating PDF.

Create a Simple Application with Spreadsheet

SfSpreadsheet control can be added into the application either via designer or via coding.

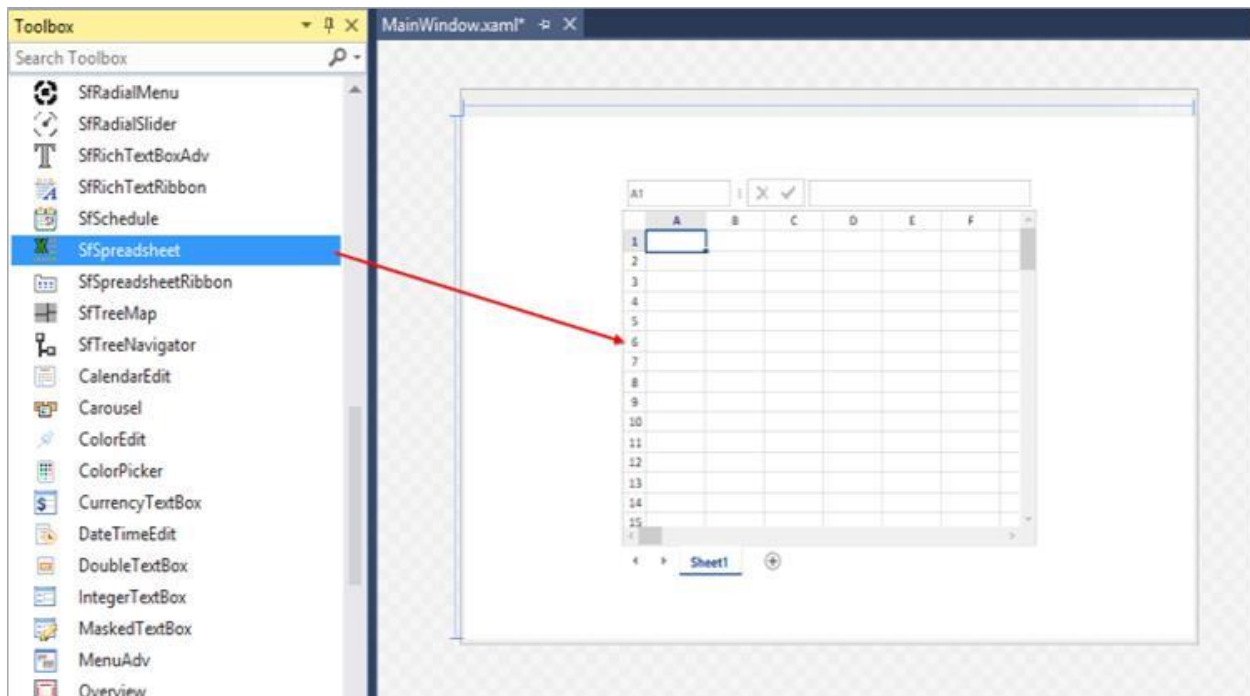

Adding a Control via Designer

1. Create new WPF application in Visual Studio. 2. Open the Visual Studio **Tool box**. Navigate to “Syncfusion Controls” tab, and find the SfSpreadsheet/SfSpreadsheetRibbon toolbox items

Syncfusion Control tab

3. Drag SfSpreadsheet and drop in the Designer area from the Toolbox

For Spreadsheet

XML

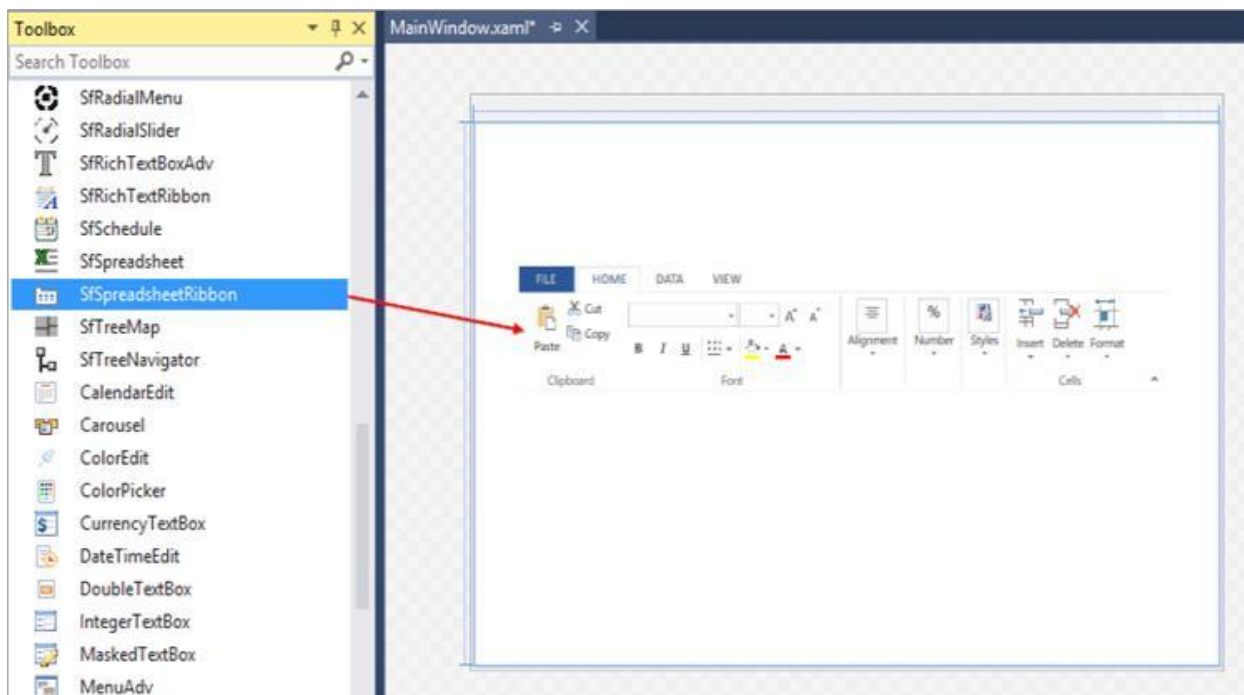

```
<syncfusion:SfSpreadsheet x:Name = spreadsheet />
```

4. Ribbon can be added to the application by dragging SfSpreadsheetRibbon to the Designer area. 5. To make an interaction between Ribbon items and SfSpreadsheet, bind the SfSpreadsheet as DataContext to the SfSpreadsheetRibbon.

For Ribbon

XML

```
<syncfusion:SfSpreadsheetRibbon DataContext= "{Binding  
ElementName=spreadsheet}" />
```

Adding Control via Coding

Spreadsheet is available in the following namespace *"Syncfusion.UI.Xaml.Spreadsheet"* and it can be created programmatically either by using XAML or C# code.

For Spreadsheet

XML

```
<Window x:Class="SpreadsheetDemo.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
syncfusion:SkinStorage.VisualStudio="Office2013"
mc:Ignorable="d">
<syncfusion:SfSpreadsheet x:Name="spreadsheet"
FormulaBarVisibility="Visible"/>
</Window>
```

C#

```
SfSpreadsheet spreadsheet = new SfSpreadsheet();
this.grid.Children.Add(spreadsheet);
```

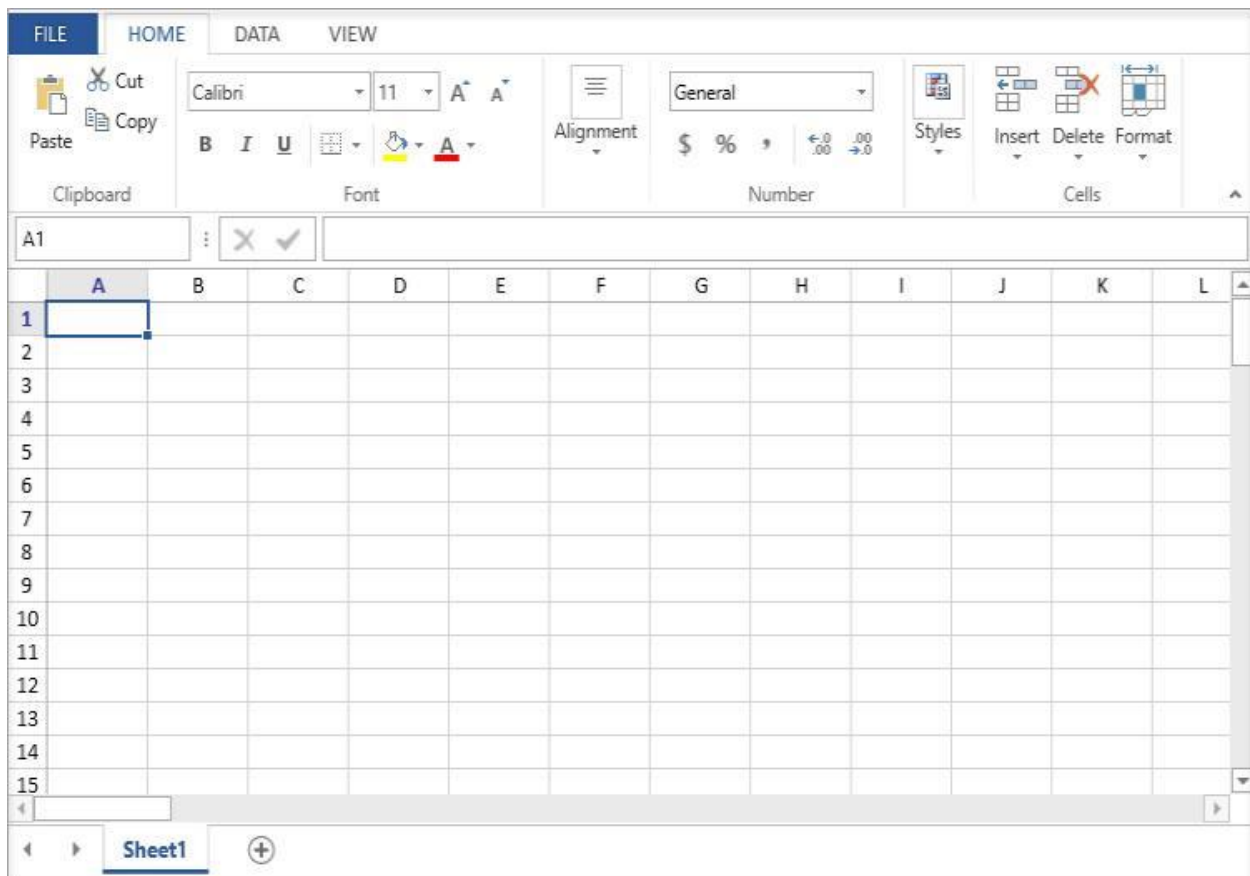

Note: To add the **SfSpreadsheetRibbon** in your application, use the **RibbonWindow** since the backstage of Ribbon will be opened only when the ribbon is loaded under the **RibbonWindow**

XML

```
<syncfusion:RibbonWindow x:Class="SpreadsheetDemo.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
```

```
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"  
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"  
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"  
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"  
syncfusion:SkinStorage.VisualStudio="Office2013"  
mc:Ignorable="d">  
</syncfusion:RibbonWindow>
```

You can get the following output when execute the application.

Creating a new Excel Workbook

A new workbook can be created by using a [Create](#) method with specified number of worksheets. By default, a workbook will be created with single worksheet.

C#

```
spreadsheet.Create(2);
```

Opening an existing Excel Workbook

The Excel Workbook can be opened in SfSpreadsheet using the [Open](#) method in various ways,

C#

```
//Using Stream,  
spreadsheet.Open (Stream file);  
//Using String,
```

```
spreadsheet.Open (string file);
//Using Workbook,
spreadsheet.Open(IWorkbook workbook);
```

C#

```
spreadsheet.Open (@"..\\..\\Data\\Outline.xlsx");
```

Opening Excel File in SfSpreadsheet**Saving the Excel Workbook**

The Excel workbook can be saved in SfSpreadsheet using [Save](#) method. If the workbook already exists in the system drive, it will be saved in the same location, otherwise Save Dialog box opens to save the workbook in user specified location.

C#

```
spreadsheet.Save();
```

You can also use [SaveAs](#) method directly to save the existing excel file with modifications.

The [SaveAs](#) method in SfSpreadsheet can be used in various ways,

C#

```
//Using Stream,
spreadsheet.SaveAs (Stream file);
//Using String,
```

```
spreadsheet.SaveAs (string file);  
//For Dialog box,  
spreadsheet.SaveAs();
```

Displaying Charts and Sparklines

For importing charts and sparklines in SfSpreadsheet, add the following assembly as reference into the application.

Assembly: **Syncfusion.SfSpreadsheetHelper.WPF.dll**

Charts

Create an instance of Syncfusion.UI.Xaml.SpreadsheetHelper.[GraphicChartCellRenderer](#) and add that renderer into [GraphicCellRenderers](#) collection by using the helper method [AddGraphicChartCellRenderer](#) which is available under the namespace Syncfusion.UI.Xaml.Spreadsheet.GraphicCells.

C#

```
public MainWindow()  
{  
    InitializeComponent();  
    //For importing charts,  
    this.spreadsheet.AddGraphicChartCellRenderer(new  
        GraphicChartCellRenderer());  
}
```

Sparklines

Create an instance of Syncfusion.UI.Xaml.SpreadsheetHelper.[SparklineCellRenderer](#) and add that renderer into the Spreadsheet by using the helper method [AddSparklineCellRenderer](#) which is available under the namespace Syncfusion.UI.Xaml.Spreadsheet.GraphicCells.

C#

```
public MainWindow()  
{  
    InitializeComponent();  
    //For importing sparklines,  
    this.spreadsheet.AddSparklineCellRenderer(new SparklineCellRenderer());  
}
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Working With Spreadsheet in WPF Spreadsheet (SfSpreadsheet)

This section explains about accessing the Worksheet, Grid and the events associated with it.

Accessing the Worksheet

A **workbook** is an excel document in the SfSpreadsheet. It is an object that exposes the [IWorkbook](#) interface. Currently loaded workbook in the Spreadsheet can be accessed by using the [Workbook](#) property of SfSpreadsheet.

A workbook consists of one or more worksheets stored within the worksheet collection. Accessing the worksheets in the collection, can be done by the following ways,

C#

```
//By Specifying the index as,
spreadsheet.Workbook.Worksheets[0]
//By Specifying the sheet name as,
spreadsheet.Workbook.Worksheets["sheet1"]
//Access the Active worksheet as,
spreadsheet.ActiveSheet
```

For more information regarding working with worksheets, you can refer the [XlsIO UG](#) link

Note: `ActiveGrid` and `ActiveSheet` property can be accessed only after the `WorkbookLoaded` Event of `SfSpreadsheet` is triggered

Accessing the Grid

Each worksheet in the workbook is loaded into the view as `SpreadsheetGrid` in `SfSpreadsheet`.

When the workbook is loaded in the `SfSpreadsheet`, the `WorkbookLoaded` Event is invoked and when the workbook is removed from `SfSpreadsheet`, the `WorkbookUnloaded` Event is invoked.

When the worksheet is added into the `SfSpreadsheet`, the `WorksheetAdded` Event is invoked and when the worksheet is removed in the `SfSpreadsheet`, `WorksheetRemoved` Event is invoked.

Hence you can access the `ActiveGrid` either in the `WorkbookLoaded` or `WorksheetAdded` Event.

C#

```
spreadsheet.WorksheetAdded += spreadsheet_WorksheetAdded;
spreadsheet.WorksheetRemoved += spreadsheet_WorksheetRemoved;
void spreadsheet_WorksheetAdded(object sender, WorksheetAddedEventArgs args)
{
    //Access the Active SpreadsheetGrid and hook the events associated with it.
    var grid = spreadsheet.ActiveGrid;
    grid.CurrentCellActivated += grid_CurrentCellActivated;
}
void spreadsheet_WorksheetRemoved(object sender, WorksheetRemovedEventArgs
args)
{
    //Access the Active SpreadsheetGrid and unhook the events associated with it
    var grid = spreadsheet.ActiveGrid;
    grid.CurrentCellActivated -= grid_CurrentCellActivated;
}
```

You can also access the each `SpreadsheetGrid` in the `SfSpreadsheet` either by passing the particular sheet name in the `GridCollection` or by invoking `WorkbookLoaded` Event of `SfSpreadsheet`.

By using Sheet Name

For your reference, setting the row and column count dynamically for the second sheet in the Workbook

C#

```
var sheet = spreadsheet.Workbook.Worksheets[1];
spreadsheet.GridCollection[sheet.Name].RowCount = 50;
```

```
spreadsheet.GridCollection[sheet.Name].ColumnCount = 12;
```

By using Event

C#

```
spreadsheet.WorkbookLoaded += spreadsheet_WorkbookLoaded;
spreadsheet.WorkbookUnloaded += spreadsheet_WorkbookUnloaded;
void spreadsheet_WorkbookLoaded(object sender, WorkbookLoadedEventArgs args)
{
    //Hook the events here
    foreach (var grid in args.GridCollection)
    {
        grid.QueryRange += grid_QueryRange;
    }
}
void spreadsheet_WorkbookUnloaded(object sender, WorkbookUnloadedEventArgs args)
{
    //Unhook the events here
    foreach (var grid in args.GridCollection)
    {
        grid.QueryRange -= grid_QueryRange;
    }
}
```

Note: SfSpreadsheet supports virtual mode, which lets you dynamically provide data to the grid by handling an event, [QueryRange](#), for example. In virtual mode, data will be dynamically loaded into the SpreadsheetGrid on demand or when users need to view the data.

Setting the ActiveSheet programmatically

SfSpreadsheet allows you to set the [ActiveSheet](#) programmatically by specifying the sheet name in the [SetActiveSheet](#) method of [SfSpreadsheet](#).

C#

```
spreadsheet.SetActiveSheet("Sheet5");
```

Accessing the cell or range of cells

SfSpreadsheet allows to access a single cell or range of cells in the workbook using [IRange](#) interface.

The following code shows the several ways of accessing a single cell or range of cells in the [Worksheet](#),

C#

```
// Access a cell by specifying cell address.
var cell = spreadsheet.Workbook.Worksheets[0].Range["A3"];
// Access a cell by specifying cell row and column index.
var cell1 = spreadsheet.Workbook.Worksheets[0].Range[3, 1];
// Access a cells by specifying user defined name.
var cell2 = spreadsheet.Workbook.Worksheets[0].Range["Namerange"];
// Accessing a range of cells by specifying cell's address.
var cell3 = spreadsheet.Workbook.Worksheets[0].Range["A5:C8"];
// Accessing a range of cells specifying cell row and column index.
var cell4 = spreadsheet.Workbook.Worksheets[0].Range[15, 1, 15, 3];
```

For more reference regarding accessing the range, refer [XlsIO](#) UG.

Note: If the user has made any modifications with XlsIO range in SfSpreadsheet, then they should [refresh the view](#) to update the modifications in `SpreadsheetGrid`.

Accessing the value of a cell

SfSpreadsheet allows you to access the value of a cell by using `Value` property of `IRange` and to get the value of the cell along with its format, `DisplayText` property can be used.

C#

```
// Access a cell value by using "Value" Property,
var cellValue = spreadsheet.Workbook.Worksheets[1].Range["A3"].Value
// Access a cell value by using "DisplayText" Property.
var displayValue = spreadsheet.Workbook.Worksheets[1].Range[4,
1].DisplayText;
```

Setting the value or formula to a cell

In SfSpreadsheet, to update the cell value and formula programmatically, `SetCellValue` method of `SpreadsheetGrid` should be invoked and then invalidate that cell to update the view.

C#

```
var range = spreadsheet.ActiveSheet.Range[2, 2];
spreadsheet.ActiveGrid.SetCellValue(range, "cellValue");
spreadsheet.ActiveGrid.InvalidateCell(2, 2);
```

Clearing the value or formatting from a cell

SfSpreadsheet allows you to delete the contents of a cell or delete the contents along with its formatting (comments, Conditional formats,..) also.

The following code illustrates the different way of deleting the value from a cell,

C#

```
//To clear the contents in the range alone,
spreadsheet.Workbook.Worksheets[0].Range[3, 3].Clear();
//To clear the contents along with its formatting in the range,
spreadsheet.Workbook.Worksheets[0].Range[3, 3].Clear(true);
//To clear the range with specified ExcelClearOptions,
spreadsheet.Workbook.Worksheets[0].Range[3,
3].Clear(ExcelClearOptions.ClearDataValidations);
```

Note: `ExcelClearOptions` is an enum which specifies the possible directions to clear the cell formats, content, comments, conditional format, data validation or clear all of them.

Refreshing the view

SfSpreadsheet allows you to invalidate or refresh the view either by specifying the specific range or full range.

The following code demonstrates the different ways of refreshing the view,

C#

```
//Invalidates the mentioned cell in the grid,
spreadsheet.ActiveGrid.InvalidateCell(3, 3);
//Invalidates the range ,
var range = GridRangeInfo.Cells(5, 4, 6, 7);
spreadsheet.ActiveGrid.InvalidateCell(range);
//Invalidates all the cells in the grid,
spreadsheet.ActiveGrid.InvalidateCells();
//Invalidates the measurement state(layout) of grid,
spreadsheet.ActiveGrid.InvalidateVisual();
//Invalidates the cell borders in the range,
var range = GridRangeInfo.Cells(2, 4, 6, 4);
spreadsheet.ActiveGrid.InvalidateCellBorders(range);
```

Scrolling the Grid programmatically

SfSpreadsheet allows the user to scroll the grid into mentioned cell, by using [ScrollInView](#) method of `SpreadsheetGrid`.

C#

```
spreadsheet.ActiveGrid.ScrollInView(new RowColumnIndex(5, 5));
```

Formula Bar

The Formula Bar is located above the worksheet area of the SfSpreadsheet. The formula bar displays the data or formula stored in the active cell.

Users can set the visibility state of Formula Bar using [FormulaBarVisibility](#) property of `SfSpreadsheet`.

XML

```
<syncfusion:SfSpreadsheet x:Name="spreadsheet"
FormulaBarVisibility="Collapsed"/>
```

C#

```
spreadsheet.FormulaBarVisibility = System.Windows.Visibility.Collapsed;
```

Identify whether the workbook is modified or not

`IsCellModified` property of `WorkbookImpl` is used to identify whether any cell modified in a workbook or not after importing. Since it is an internal property, access it using Reflection.

C#

```
var workbook = spreadsheet.Workbook as WorkbookImpl;
BindingFlags bindFlags = BindingFlags.Instance | BindingFlags.Public |
BindingFlags.NonPublic | BindingFlags.Static;
var value = typeof(WorkbookImpl).GetProperty("IsCellModified",
bindFlags).GetValue(workbook);
```

Suppress message boxes in Spreadsheet

In Spreadsheet, warning messages, error alerts are displayed while performing some actions like Excel. If you want to avoid those alerts, then set the [DisplayAlerts](#) property to `false`.

C#

```
//To Suppress message boxes in Spreadsheet
spreadsheet.DisplayAlerts = false;
```

Suspend and resume formula calculation

Spreadsheet provides support to suspend the formula calculation and resume it whenever needed using the [SuspendFormulaCalculation](#) and [ResumeFormulaCalculation](#) method.

Resuming formula calculation will recalculate all the formula cells in a workbook. This would be helpful to improve the performance when you are updating the value of more number of cells by skipping the dependent cells recalculation on each cell value changed.

C#

```
//Resumes the automatic formula calculation
spreadsheet.ResumeFormulaCalculation();
//Suspends the automatic formula calculation
spreadsheet.SuspendFormulaCalculation();
```

Close the popup programmatically

In SfSpreadsheet, popup windows are used to display the options like copy paste option, fill series option, etc. which will be closed automatically on certain actions. However you can also able to close the popup programmatically by using the [ShowHidePopup](#) method of [SpreadsheetGrid](#).

C#

```
//To close the popup
spreadsheet.ActiveGrid.ShowHidePopup(false);
//To show the closed popup, if needed.
spreadsheet.ActiveGrid.ShowHidePopup(true);
```

Identify when the active sheet is changed

SfSpreadsheet provides support to identify when the active sheet is changed by using [PropertyChanged](#) event of SfSpreadsheet like below.

C#

```
Spreadsheet.PropertyChanged += Spreadsheet_PropertyChanged;
void Spreadsheet_PropertyChanged(object sender,
System.ComponentModel.PropertyChangedEventArgs e)
{
    // when the worksheets in the workbook changed
    if(e.PropertyName == "ActiveSheet")
    {
        //Implement code
    }
}
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Selection in WPF Spreadsheet (SfSpreadsheet)

This section explains about the Selection behavior in SfSpreadsheet.

The SfSpreadsheet control provides support for selection in grid by using mouse, keyboard and touch interactions.

By default, Selection behavior will be enabled in SfSpreadsheet, but if you want to disable the selection in SfSpreadsheet, then set the [AllowSelection](#) Property to be false.

C#

```
void spreadsheet_WorkbookLoaded(object sender, WorkbookLoadedEventArgs args)
{
    spreadsheet.ActiveGrid.AllowSelection = false;
}
```

Accessing the Current cell

SfSpreadsheet allows the user to access the active cell by using the [CurrentCell](#) property of [SelectionController](#) Class.

C#

```
var cell= spreadsheet.ActiveGrid.SelectionController.CurrentCell;
```

Accessing the Selected ranges

SfSpreadsheet allows the user to access the selected ranges of the [SpreadsheetGrid](#) using [SelectedRanges](#) property of [SpreadsheetGrid](#).

C#

```
var rangeList = spreadsheet.ActiveGrid.SelectedRanges;
```

Note: To get the active range in the selected ranges list, use [ActiveRange](#) property of [GridRangeInfoList](#) class.

Adding or Clearing the Selection

SfSpreadsheet allows the user to add and clear the selection in the Active [SpreadsheetGrid](#) for the given range.

C#

```
//To Add the Selection for range,
spreadsheet.ActiveGrid.SelectionController.AddSelection(GridRangeInfo.Cells(
4, 6, 5, 8));
//To Add the Selection for particular row,
spreadsheet.ActiveGrid.SelectionController.AddSelection(GridRangeInfo.Row(4)
);
//To Add the Selection for multiple rows,
spreadsheet.ActiveGrid.SelectionController.AddSelection(GridRangeInfo.Rows(4
, 9));
//To Add the Selection for particular column,
spreadsheet.ActiveGrid.SelectionController.AddSelection(GridRangeInfo.Col(5)
);
//To Add the Selection for multiple columns,
spreadsheet.ActiveGrid.SelectionController.AddSelection(GridRangeInfo.Cols(5
, 10));
//To Clear the Selection,
```

```
spreadsheet.ActiveGrid.SelectionController.ClearSelection();
```

Move Current Cell

SfSpreadsheet allows the user to move the current cell to the mentioned cell in [SpreadsheetGrid](#).

C#

```
//Moves current cell to the mentioned row and column index of cell,
spreadsheet.ActiveGrid.CurrentCell.MoveCurrentCell(5, 5);
//For moving the current cell to a different sheet,
spreadsheet.SetActiveSheet("Sheet2");
spreadsheet.ActiveGrid.CurrentCell.MoveCurrentCell(6, 5);
```

Converting GridRangeInfo into IRange

SfSpreadsheet allows the user to convert the [GridRangeInfo](#) into the equivalent [IRange](#) by using [ConvertGridRangeToExcelRange](#) method of [GridExcelHelper](#) class.

C#

```
var excelRange =
GridExcelHelper.ConvertGridRangeToExcelRange(GridRangeInfo.Cell(4, 5),
spreadsheet.ActiveGrid);
```

Tips: Users can also convert the [IRange](#) into equivalent [GridRangeInfo](#) by using [ConvertExcelRangeToGridRange](#) method of [GridExcelHelper](#) class.

Properties, Methods and Events

Below table lists the events associated with selection behavior,

Events	Description
CellClick	Occurs when you click on the cell.
CurrentCellActivating	Occurs when the current cell is going to be activated. This event allow to cancel the current cell activation.
CurrentCellActivated	Occurs after the current cell is activated.
SelectionChanging	Occurs when the selection is going to be changed. This event allows to cancel the selection change.
SelectionChanged	Occurs after the selection is changed.

Below table lists the properties associated with selection,

Properties	Description
SelectedRanges	Gets or sets the collection of selected ranges from grid.
SelectionBrush	Gets or sets the selected area brush.

SelectionBorderBrush	Gets or sets the selection border brush.
SelectionBorderThickness	Gets or sets the thickness of selection border.
SelectionController	Gets the Selection Controller which provides the selection of content when the user drags the pressed mouse to an edge of the control.
AllowSelection	Gets or Sets the value whether to allow the selection in the ActiveGrid or not.
ShowTouchIndicator	Determines whether the touch indicator will be shown or not.
TouchHitTestPrecision	Gets or sets the distance of touch precision point from touch indicator.

Below table lists the properties associated with [CurrentCell](#) of SpreadsheetGrid,

Properties	Description
CellRowColumnIndex	Gets the row and column index of the CurrentCell.
RowIndex	Gets the row index of the CurrentCell.
ColumnIndex	Gets the column index of the CurrentCell.
Range	Gets the range of the CurrentCell.
HasCurrentCell	Gets the value indicating whether the Grid has CurrentCell or not.
PreviousRowColumnIndex	Gets or sets the row and column index of old CurrentCell.

Below table lists the methods associated with selection,

Methods	Description
AddSelection	Adds/Extends the Selection to the mentioned range .
ClearSelection	Clears the Selection.
MoveCurrentCell	Move the Current cell to mentioned row and column index.

Key Navigation

Below table lists the key combinations associated with selection,

Key Combination	Description
HOME	Moves to the first cell of the current row .
END	Moves to the last cell of the current row .
UPARROW	Moves to one cell up of the current cell in the worksheet.
DOWNARROW	Moves to one cell down of the current cell in the worksheet.
LEFTARROW	Moves to one cell left of the current cell in the worksheet.

RIGHTARROW	Moves to one cell right of the current cell in the worksheet.
PAGEUP	Moves to the first visible cell of the current column.
PAGEDOWN	Moves to the last visible cell of the current column.
CTRL+HOME	Moves to the beginning cell of a worksheet.
CTRL+END	Moves to the last cell of a worksheet.
ALT+PAGE UP	Moves one screen to the left in a worksheet.
ALT+PAGE DOWN	Moves one screen to the right in a worksheet.
CTRL + ARROW KEYS	Moves to the first/last cell of the current cell based on Arrow directions .
ENTER	Moves the active current cell to one cell down in the selection.
SHIFT+ENTER	Moves the active current cell to one cell up in the selection.
TAB	Moves the active current cell in one cell to the right of the selection.
SHIFT+TAB	Moves the active current cell in one cell to the left of the selection.
BACKSPACE	Begins the edit operation for the active cell in the selection.
CTRL+A	Selects the entire worksheet.
SHIFT+ARROW KEYS	Extends the selection by one cell based on the arrow direction.
CTRL+SHIFT+ARROW KEYS	Extend the selection to the last cell in a row or column.
SHIFT+HOME	Extends the selection to the first column from the active cell.
CTRL+SHIFT+HOME	Extends the selection from the active cell to the first cell.
SHIFT+PAGE DOWN	Extends the selection down in a worksheet.
SHIFT+PAGE UP	Extends the selection up in a worksheet.

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Editing in WPF Spreadsheet (SfSpreadsheet)

This section explains about the Editing behavior, Data Validation and Hyperlinks in SfSpreadsheet.

Editing

The SfSpreadsheet control provides support for editing, you can modify and commit the cell values in the workbook.

By default, Editing will be enabled in SfSpreadsheet, but if you want to disable the editing in SfSpreadsheet, then set the [AllowEditing](#) Property to be false.

C#

```
void spreadsheet_WorkbookLoaded(object sender, WorkbookLoadedEventArgs args)
{
    spreadsheet.ActiveGrid.AllowEditing = false;
}
```

Editing a cell programmatically

Start Editing

User can edit a cell programmatically by using [BeginEdit](#) method.

C#

```
spreadsheet.ActiveGrid.CurrentCell.BeginEdit(true);
```

End Editing

User can end the editing of a cell programmatically in any of the following way,

- [ValidateAndEndEdit](#) - Validates and ends the edit operation for the current cell. if the cancel is "true", then the current cell remains in edit mode else if the validation is true, commits the new value and moved to next cell or else if the validation is false, it reverts the old value and moved to next cell.
- [EndEdit](#) - Commits and ends the edit operation for the current cell, if it is passed with parameter "true", commits the new changes for the cell, else reverts the old value.

C#

```
//Validates and end the edit operation,
spreadsheet.ActiveGrid.CurrentCell.ValidateAndEndEdit();
//Commits the value and end the edit operation,
spreadsheet.ActiveGrid.CurrentCell.EndEdit(true);
```

Locking or Unlocking a cell

Locking cells allows you to disable editing and formatting the cells when the sheet is protected. By default, every cells are locked in the worksheet.

But while in protect mode, if you want to edit or format a cell, you can unlock the cells.

C#

```
var worksheet = spreadsheet.ActiveSheet;
var excelStyle = worksheet.Range["A2"].CellStyle;
//To unlock a cell,
excelStyle.Locked = false;
//To lock a cell,
excelStyle.Locked = true;
```

Properties, Methods and Events

The order of events when editing and committing a cell value in SfSpreadsheet,

Events	Description
--------	-------------

CurrentCellBeginEdit	Occurs when the current cell enters into edit mode. This event allows to cancel entering the edit mode.
CurrentCellValueChanged	Occurs when the current cell value is changed in edit mode.
CurrentCellValidating	Occurs when the current cell value is going to be validated. It allows you to validate and cancel the end editing.
CurrentCellValidated	Occurs after the current cell is validated.
CurrentCellEndEdit	Occurs when the current cell leaves from edit mode.

Below table list the properties associated with Editing.

Properties	Description
AllowEditing	Gets or sets the value indicating whether to allow the editing operation or not.
EditorSelectionBehavior	Gets or sets a value indicating whether editor select all the value or move last position.
EditTrigger	Gets or sets a value indicating any of the trigger options will cause cells to enter Edit Mode.
IsEditing	Gets whether the current cell is in edit mode or not.

Below table list the methods associated with Editing.

Methods	Description
BeginEdit	Begins the editing operation of the current cell and returns true if the current cell enters into edit mode.
EndEdit	Commits and ends the edit operation of the current cell.
ValidateAndEndEdit	Validates and ends the edit operation of the current cell.
Validate	Validates the current cell in the SpreadsheetGrid.

Data Validation

Data Validation is a list of rules to limit the type of data or the values that can be entered in the cell.

Applying Data Validation at runtime

SfSpreadsheet allows the user to apply the data validation rules at runtime for particular cell or range using `IDataValidation` interface.

C#

```
//Number Validation
IDataValidation validation =
spreadsheet.ActiveSheet.Range["A5"].DataValidation;
validation.AllowType = ExcelDataType.Integer;
```

```
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstFormula = "4";
validation.SecondFormula = "15";
validation.ShowErrorBox = true;
validation.ErrorBoxText = "Accepts values only between 4 to 15";
//Date Validation
IDataValidation validation =
spreadsheet.ActiveSheet.Range["B4"].DataValidation;
validation.AllowType = ExcelDataType.Date;
validation.CompareOperator = ExcelDataValidationComparisonOperator.Greater;
validation.FirstDateTime = new DateTime(2016, 5, 5);
validation.ShowErrorBox = true;
validation.ErrorBoxText = "Enter the date value which is greater than
05/05/2016";
//TextLength Validation
IDataValidation validation =
spreadsheet.ActiveSheet.Range["A3:B3"].DataValidation;
validation.AllowType = ExcelDataType.TextLength;
validation.CompareOperator =
ExcelDataValidationComparisonOperator.LessOrEqual;
validation.FirstFormula = "4";
validation.ShowErrorBox = true;
validation.ErrorBoxText = "Text length should be lesser than or equal 4
characters";
//List Validation
IDataValidation validation =
spreadsheet.ActiveSheet.Range["D4"].DataValidation;
validation.ListOfValues = new string[] { "10", "20", "30" };
//Custom Validation
IDataValidation validation =
spreadsheet.ActiveSheet.Range["D4"].DataValidation;
validation.AllowType = ExcelDataType.Formula;
validation.FirstFormula = "=A1+A2>0";
validation.ErrorBoxText = "Sum of the values in A1 and A2 should be greater
than zero";
```

For more reference, please go through the [XlsIO](#) UG.

Tips: If you want to load ComboBox to a cell in SfSpreadsheet, you can apply List Validation to that cell.

Hyperlink

The Hyperlink is a convenient way to access the web pages, files and browse the data within a worksheet or other worksheets in a workbook. SfSpreadsheet provides support to add, edit and remove the Hyperlinks in the workbook.

Add a Hyperlink to a cell

SfSpreadsheet provides support to add hyperlink to a cell and it can be added in the hyperlinks collection using [IHyperlinks](#) interface.

SfSpreadsheet allows you to add below types of the hyperlink.

- Web URL
- Cell or range in workbook
- E-mail
- External files

C#

```
// Creating a Hyperlink for e-mail,
var range = spreadsheet.ActiveSheet.Range["A5"];
IHyperLink hyperlink1 = spreadsheet.ActiveSheet.HyperLinks.Add(range);
hyperlink1.Type = ExcelHyperLinkType.Url;
hyperlink1.Address = "mailto:Username@syncfusion.com";
hyperlink1.TextToDisplay="Send Mail";
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Cell(5, 1));
// Creating a Hyperlink for Opening Files,
var range1 = spreadsheet.ActiveSheet.Range["D5"];
IHyperLink hyperlink2 = spreadsheet.ActiveSheet.HyperLinks.Add(range1);
hyperlink2.Type = ExcelHyperLinkType.File;
hyperlink2.Address = @"C:\Samples\Local";
hyperlink2.TextToDisplay = "File Location";
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Cell(5, 4));
//Creating a Hyperlink to refer another cell in the workbook,
var range2 = spreadsheet.ActiveSheet.Range["C13"];
IHyperLink hyperlink3 = spreadsheet.ActiveSheet.HyperLinks.Add(range);
hyperlink3.Type = ExcelHyperLinkType.Workbook;
hyperlink3.Address = "Sheet2!C23";
hyperlink3.TextToDisplay = "Sample";
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Cell(13, 3));
```

Edit or Remove a Hyperlink

SfSpreadsheet provides support to edit or remove the hyperlinks from the range by accessing Hyperlinks collection.

C#

```
//To Edit a hyperlink in a cell,
var hyperlink = spreadsheet.ActiveSheet.Range["A5"].Hyperlinks[0];
hyperlink.TextToDisplay = "Sample";
hyperlink.Address = "http://help.syncfusion.com";
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Cell(5, 1));
//To remove a hyperlink in a cell,
var hyperlink = spreadsheet.ActiveSheet.Range["A5"].Hyperlinks.RemoveAt(0);
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Cell(5, 1));
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Formatting in WPF Spreadsheet (SfSpreadsheet)

This section explains about the formatting options similar to excel in SfSpreadsheet.

Styles and formats defined in an Excel file are automatically imported. Users can also apply these settings to cells during run time. The following are the formatting attributes for the cell.

- Cell font settings (font name, size, color, style, etc.)
- Cell background
- Cell content alignment (vertical and horizontal alignment, indent and text wrapping)
- Cell borders
- Number Formatting

- Merge Cells
- Built-in Styles
- Table Formats

Cell Background

For applying background color for the cells at runtime in SfSpreadsheet, set the color index for the particular XlsIO range and invalidate the range in order to update the view in [SpreadsheetGrid](#).

For single cell

C#

```
IRange range = spreadsheet.ActiveSheet.Range["A5"];
range.CellStyle.ColorIndex = Syncfusion.XlsIO.ExcelKnownColors.Blue;
spreadsheet.ActiveGrid.InvalidateCell(range.Row, range.Column);
```

For selected range of cells,

C#

```
var selectedRanges = spreadsheet.ActiveGrid.SelectedRanges;
foreach (var range in selectedRanges)
{
    string cell = GridExcelHelper.ConvertGridRangeToExcelRange(range,
        spreadsheet.ActiveGrid);
    spreadsheet.ActiveSheet.Range[cell].CellStyle.ColorIndex =
        ExcelKnownColors.Blue;
    spreadsheet.ActiveGrid.InvalidateCell(range, true);
}
```

Font

SfSpreadsheet allows the user to apply the font settings such as font color, font name, font size etc., for a particular cell or a range of cells.

C#

```
IRange range = spreadsheet.Workbook.Worksheets[0].Range["A1:B5"];
var gridRange = GridExcelHelper.ConvertExcelRangeToGridRange(range);
//Setting the Font Family Name,
range.CellStyle.Font.FontName = "Arial Black";
//Setting the Font Styles,
range.CellStyle.Font.Bold = true;
range.CellStyle.Font.Italic = true;
//Setting the Font Size,
range.CellStyle.Font.Size = 18;
//Setting the Font Effects,
range.CellStyle.Font.Strikethrough = true;
//Setting the Underline Types,
range.CellStyle.Font.Underline = ExcelUnderline.Single;
//Setting the Font Color,
range.CellStyle.Font.Color = ExcelKnownColors.Blue;
//Invalidating the range, to update in view,
spreadsheet.ActiveGrid.InvalidateCell(gridRange, true);
```

Cell Borders

SfSpreadsheet allows the user to apply the borders at runtime for particular cell or range of cells,

C#

```
//For a single cell,
IRange range = spreadsheet.Workbook.Worksheets[0].Range["A5"];
range.Borders.LineStyle = ExcelLineStyle.Dash_dot;
range.Borders.Color = ExcelKnownColors.Gold;
spreadsheet.ActiveGrid.InvalidateCell(range.Row, range.Column);
//For a range of cells,
IRange excelRange = spreadsheet.Workbook.Worksheets[0].Range["C3:D8"];
excelRange.BorderAround(ExcelLineStyle.Double, ExcelKnownColors.Green);
excelRange.BorderInside(ExcelLineStyle.Dotted, ExcelKnownColors.Tan);
var gridRange = GridExcelHelper.ConvertExcelRangeToGridRange(excelRange);
spreadsheet.ActiveGrid.InvalidateCell(gridRange, true);
```

Cell Alignment

SfSpreadsheet allows the user to align the content of the cell. The alignment options includes Horizontal Alignment, Vertical Alignment, Indentation, Orientation etc.,

C#

```
//Applying Horizontal Alignment for the cell "A2",
spreadsheet.Workbook.Worksheets[0].Range["A2"].CellStyle.HorizontalAlignment = ExcelHAlign.HAlignCenter;
spreadsheet.ActiveGrid.InvalidateCell(2,1);
//Applying Vertical Alignment for the cell "B2",
spreadsheet.Workbook.Worksheets[0].Range["B2"].CellStyle.VerticalAlignment = ExcelVAlign.VAlignBottom;
spreadsheet.ActiveGrid.InvalidateCell(2,2);
//Applying Orientation for the selected cell or ranges,
spreadsheet.FormatOrientation(90);
//For Indentation,
//Increase the indent for the selected ranges or cell,
spreadsheet.FormatIndent(true);
//Decrease the indent for the selected ranges or cell,
spreadsheet.FormatIndent(false);
//Level of indent for selected ranges or cell,
spreadsheet.FormatIndentLevel(3);
```

Wrap Text

SfSpreadsheet allows the user to wrap the text in the cell, if the text is too large.

C#

```
spreadsheet.ActiveSheet.Range["C4"].Text = "Wrapping the content in the cell";
spreadsheet.ActiveSheet.Range["C4"].WrapText = true;
spreadsheet.ActiveSheet.AutofitRow(4);
spreadsheet.ActiveGrid.SetRowHeight(4, 4,
spreadsheet.ActiveSheet.GetRowHeightInPixels(4));
spreadsheet.ActiveGrid.InvalidateCell(4, 3);
```

Merge Cells

Merge

SfSpreadsheet provides support to merge two or more cells. When a group of cells is merged, the contents of the upper-left cell will be taken as the content of the merged cell, rest will be deleted.

For merging the cells in SfSpreadsheet, you need to add the [CoveredCellInfo](#) into [CoveredCells](#) collection of SpreadsheetGrid and merge the range using [Merge](#) method in XlsIO. Also to update the view, you need to invalidate the cells in the SpreadsheetGrid

C#

```
var gridRange = spreadsheet.ActiveGrid.SelectedRanges.ActiveRange;
var excelRange =
gridRange.ConvertGridRangeToExcelRange(spreadsheet.ActiveGrid);
var coverCell = new CoveredCellInfo(gridRange.Top, gridRange.Left,
gridRange.Bottom, gridRange.Right);
spreadsheet.ActiveGrid.CoveredCells.Add(coverCell);
spreadsheet.ActiveSheet.Range[excelRange].Merge();
spreadsheet.ActiveGrid.InvalidateCell(gridRange, true);
```

Unmerge

You can also unmerge the merged cells in SfSpreadsheet.

For unmerging the cells in SfSpreadsheet, you need to clear the [CoveredCells](#) from the SpreadsheetGrid and unmerge the range using [UnMerge](#) method in XlsIO. Also to update the view, you need to invalidate the cells in the SpreadsheetGrid

C#

```
var gridRange = spreadsheet.ActiveGrid.SelectedRanges.ActiveRange;
var excelRange =
gridRange.ConvertGridRangeToExcelRange(spreadsheet.ActiveGrid);
spreadsheet.ActiveGrid.CoveredCells.Clear(gridRange);
spreadsheet.ActiveSheet.Range[excelRange].UnMerge();
spreadsheet.ActiveGrid.InvalidateCell(gridRange, true);
```

Number Format

SfSpreadsheet allows the user to view the numbers in the cells with different formats which includes currency, percentage, datetime, scientific etc.,

C#

```
//Applying Percentage format for the selected ranges at runtime,
spreadsheet.Workbook.ActiveSheet.Range["C3"].NumberFormat = "0.00%";
spreadsheet.ActiveGrid.InvalidateCell(3, 3);
//Applying Date format for the selected ranges at runtime,
spreadsheet.Workbook.ActiveSheet.Range["D1"].NumberFormat = "m/d/yyyy";
spreadsheet.ActiveGrid.InvalidateCell(1, 4);
//Applying Time format for the selected ranges at runtime,
spreadsheet.Workbook.ActiveSheet.Range["D4"].NumberFormat = "[$-F400]h:mm:ss
AM/PM";
spreadsheet.ActiveGrid.InvalidateCell(3, 4);
//Applying Text format for the selected ranges at runtime,
spreadsheet.Workbook.ActiveSheet.Range["D5"].NumberFormat = "@";
spreadsheet.ActiveGrid.InvalidateCell(4, 4);
```

The different types of number formats with its notation are

Formats	Notation
General	General
Number	0.00
Currency	\$* #,##0.00
Accounting	\$ (#,##0.00);\$ -?;@
Short Date	m/d/yyyy
Long Date	[\$-F800]dddd, mmmm dd, yyyy
Time	[\$-F400]h:mm:ss AM/PM
Percentage	0.00%
Fraction	#?/?
Scientific	0.00E+00
Text	@

Built-in Styles

SfSpreadsheet supports some predefined built in styles of XlsIO. [BuiltInStyles](#) is an enum which contains different styles for formatting a cell or range of cells.

C#

```
spreadsheet.Workbook.ActiveSheet.Range["A3"].BuiltInStyle =
BuiltInStyles.Heading2;
spreadsheet.ActiveGrid.InvalidateCell(3, 1);
```

Format as Table

SfSpreadsheet allows the users to format a table with built in styles of table (i.e.) [TableBuiltInStyles](#) of XlsIO

C#

```
// Creating a table
IListObject table =
spreadsheet.Workbook.ActiveSheet.ListObjects.Create("Table1",
spreadsheet.Workbook.ActiveSheet.Range["C1:G5"]);
// Formatting table with a built-in style
table.BuiltInTableStyle = TableBuiltInStyles.TableStyleLight6;
spreadsheet.ActiveGrid.InvalidateCells();
```

For more information regarding formatting options, please go through [XlsIO](#)

Note: Users need to [refresh the view](#) after the formatting is applied on the XlsIO range to update the styles in `SpreadsheetGrid`.

Clear formatting

SfSpreadsheet provides support to clear the contents of a cell along with its formatting or by specifying the required clear options using [ExcelClearOptions](#) enum which specifies the possible directions to clear the cell formats, content, comments, conditional format, data validation or clear all of them.

C#

```
//To clear the contents along with its formatting in the range,
spreadsheet.Workbook.Worksheets[0].Range[4, 5].Clear(true);
//To clear the range with specified ExcelClearOptions,
spreadsheet.Workbook.Worksheets[0].Range[4,
5].Clear(ExcelClearOptions.ClearConditionalFormats);
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Conditional Formatting in WPF Spreadsheet (SfSpreadsheet)

This section explains about how to apply conditional formatting rules programmatically at run time in SfSpreadsheet.

In SfSpreadsheet, to apply conditional format for a cell or range of cells, add [IConditionalFormat](#) to that range by using [AddCondition](#) method.

C#

```
var worksheet = spreadsheet.Workbook.Worksheets[0];
IConditionalFormats condition = worksheet.Range["A1"].ConditionalFormats;
IConditionalFormat condition1 = condition.AddCondition();
```

Highlight Cell Rules

Based on CellValue

To format the cells based on cell value, define the conditional format type as **CellValue** and other formatting options such as formula, operator, background color etc., to the specified cell or range. Finally, invalidate the cells to refresh the view.

C#

```
var worksheet = spreadsheet.Workbook.Worksheets[0];
IConditionalFormats condition =
worksheet.Range["A1:A100"].ConditionalFormats;
IConditionalFormat condition1 = condition.AddCondition();
condition1.FormatType = ExcelCfType.CellValue;
condition1.Operator = ExcelComparisonOperator.Greater;
condition1.FirstFormula = "10";
condition1.BackColor = ExcelKnownColors.Light_orange;
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Col(1));
```

Based on Formula or Cell References

To format the cells based on Formula or Cell References, define the conditional format type as **Formula** and other formatting options such as formula, background color etc., to the specified cell or range. Finally, invalidate the cells to refresh the view.

C#

```
var worksheet = spreadsheet.Workbook.Worksheets[0];
IConditionalFormats condition =
worksheet.Range["A1:A100"].ConditionalFormats;
IConditionalFormat condition1 = condition.AddCondition();
condition1.FormatType = ExcelCFTType.Formula;
condition1.FirstFormula = "= (B1+B2) > 50";
condition1.BackColor = ExcelKnownColors.Brown;
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Col(1));
```

Based on SpecificText

To format the cells based on specified text, define the conditional format type as **SpecificText** and other formatting options such as the particular text, operator, background color etc., to the specified cell or range. Finally, invalidate the cells to refresh the view.

C#

```
var worksheet = spreadsheet.Workbook.Worksheets[0];
IConditionalFormats condition =
worksheet.Range["A1:A100"].ConditionalFormats;
IConditionalFormat condition1 = condition.AddCondition();
condition1.FormatType = ExcelCFTType.SpecificText;
condition1.Text = "SYNC";
condition1.Operator = ExcelComparisonOperator.ContainsText;
condition1.BackColor = ExcelKnownColors.Light_orange;
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Col(1));
```

Based on TimePeriod

To format the cells based on time period, define the conditional format type as **TimePeriod** and other formatting options such as the time periods for the date, operator, background color etc., to the specified cell or range. Finally, invalidate the cells to refresh the view.

C#

```
var worksheet = spreadsheet.Workbook.Worksheets[0];
IConditionalFormats condition =
worksheet.Range["A1:A100"].ConditionalFormats;
IConditionalFormat condition1 = condition.AddCondition();
condition1.FormatType = ExcelCFTType.TimePeriod;
condition1.TimePeriodType = CFTTimePeriods.Today;
condition1.BackColor = ExcelKnownColors.Light_orange;
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Col(1));
```

Sample Output

	A	B	D	E
1		HighlightCellRules		
2				
3		GreaterThan >10	12	
4				
5		LessThan <10	2	
6				
7		Between 10 to 20	12	
8				
9		Equal to 10	10	
10				
11		Text Contains	Syncfusion	
12				
13		Dates Occuring "Today"	1/20/2016	

Data Bars

To apply the conditional format based on data bars, define the conditional format type as a **DataBar** and specify the properties associated with DataBars such as bar color, MinPoint, MaxPoint etc., to the specified cell or range. Finally, invalidate that cells to update the view.

C#

```
var worksheet = spreadsheet.Workbook.Worksheets[0];
var conditionalFormats = worksheet.Range["B1:B100"].ConditionalFormats;
var conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCFTType.DataBar;
conditionalFormat.DataBar.BarColor = Color.FromArgb(255, 214, 0, 123);
conditionalFormat.DataBar.MinPoint.Type = ConditionValueType.LowestValue;
conditionalFormat.DataBar.MaxPoint.Type = ConditionValueType.HighestValue;
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Col(2));
```

Sample Output

	A	B	D	E	F	G	H	I
1	Mountain	Location	Default Value	Percent	Percentile	Bar only	Two column bar chart	
2	Aconcagua	Argentina	6,960	6,960	6,960		6,960	
3	Annapurna I	Nepal	8,078	8,078	8,078		8,078	
4	Ararat	Turkey	5,122	5,122	5,122		5,122	
5	Citlaltepetl	Mexico	5,700	5,700	5,700		5,700	
6	Cook	New Zealand	3,764	3,764	3,764		3,764	
7	Everest	India-Nepal	8,848	8,848	8,848		8,848	
8	Grand Teton	Wyoming, U.S.	4,196	4,196	4,196		4,196	
9	Huascaran	Peru	6,768	6,768	6,768		6,768	
10	Jaja	New Guinea	5,029	5,029	5,029		5,029	
11	Jebel Toubkal	Morocco	4,164	4,164	4,164		4,164	

Color Scales

To apply the conditional format based on color scales, define the conditional format type as a **ColorScale** and specify the other properties associated with ColorScale such as condition count,color criteria etc.,to the specified cell or range. Finally,invalidate that cells to update the view.

C#

```
var worksheet = spreadsheet.Workbook.Worksheets[0];
var conditionalFormats = worksheet.Range["C2:C100"].ConditionalFormats;
var conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCFTType.ColorScale;
conditionalFormat.ColorScale.SetConditionCount(2);
conditionalFormat.ColorScale.Criteria[0].FormatColorRGB =
Color.FromArgb(255, 99, 190, 123);
conditionalFormat.ColorScale.Criteria[1].FormatColorRGB =
Color.FromArgb(255, 90, 138, 198);
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Col(3));
```

Sample Output

	A	B	C	D	E	F
1	Country	Region	Dairy	Produce	Grain	Total Sales
2	Finland	North	\$1	\$1,000	\$10,000	\$11,001
3	Finland	South	\$2	\$2,000	\$20,000	\$22,002
4	Spain	North	\$3	\$3,000	\$30,000	\$33,003
5	Spain	South	\$4	\$4,000	\$40,000	\$44,004
6	France	East	\$5	\$5,000	\$50,000	\$55,005
7	France	West	\$6	\$6,000	\$60,000	\$66,006
8	Norway	North	\$7	\$7,000	\$70,000	\$77,007
9	Norway	South	\$8	\$8,000	\$80,000	\$88,008
10	Denmark	East	\$9	\$9,000	\$90,000	\$99,009
11	Denmark	West	\$10	\$10,000	\$100,000	\$110,010

Icon Sets

To apply the conditional format for Icon sets, define the conditional format type as **IconSet** and the properties associated with IconSet such as the type of the icon,criteria etc., to the specified cell or range. Finally, invalidate that cells to update the view.

C#

```
vvar worksheet = spreadsheet.Workbook.Worksheets[0];
var conditionalFormats = worksheet.Range["D2:D100"].ConditionalFormats;
var conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCfType.IconSet;
conditionalFormat.IconSet.IconSet = ExcelIconSetType.ThreeSymbols;
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Col(4));
```

Sample Output

	A	B	C	D	E	F
2		BID #	DESCRIPTION	VAL1	VAL2	VAL3
3		1	Bid number 1	 10	 1	 100
4		2	Bid number 2	 20	 2	 200
5		3	Bid number 3	 30	 3	 300
6		4	Bid number 4	 40	 4	 400
7		5	Bid number 5	 50	 5	 500
8		6	Bid number 6	 60	 6	 600
9		7	Bid number 7	 70	 7	 700
10		8	Bid number 8	 80	 8	 800

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Themes in WPF Spreadsheet (SfSpreadsheet)

SfSpreadsheet supports the following built-in themes.

MaterialLight *MaterialDark* *Office2019Colorful* *Office2019Black* *Office2019White*
Office2019DarkGray *FluentLight* *FluentDark* * *SystemTheme*

Refer to the below links to apply themes for the SfSpreadsheet,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

	A	B	C	D	E	F
	Employee ID	Employee Name	Gender	Title	Birth Date	Sick Leave
1						
2	1001	Teresa Atkinson	Male	Engineering Manager	5/19/2015	
3	1002	Mae Anderson	Male	Production Technician - WC45	3/17/2013	
4	1003	Ronald Adina	Female	Information Services Manager	3/21/2005	
5	1004	Chris Ashton	Female	Production Technician - WC50	7/27/2014	
6	1005	Kim Akers	Male	Production Supervisor - WC50	8/22/2011	
7	1006	Marvin Allen	Male	Production Technician - WC50	8/8/2013	
8	1007	Francois Ferrier	Male	Shipping and Receiving Clerk	1/14/2012	
9	1008	James Aguilar	Female	Human Resources Manager	10/15/2010	
10	1009	Francois Ferrier	Male	Recruiter	10/6/2010	
11	1010	Sabria Appelbaum	Male	Marketing Assistant	1/17/2015	
12	1011	Stephen Ayers	Male	Tool Designer	4/15/2005	
13	1012	Cecil Allison	Male	Production Technician - WC50	3/12/2012	
14	1013	Phyllis Allen	Male	Senior Tool Designer	4/25/2011	

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Sorting and Filtering in WPF Spreadsheet (SfSpreadsheet)

This section explains about sorting and filtering functionalities in the SfSpreadsheet.

Filtering

By default, Filtering support will be enabled in the SfSpreadsheet, but if you want to disable the Filtering in SfSpreadsheet, set the `AllowFiltering` property of the `SfSpreadsheet` to be false.

XML

```
<syncfusion:SfSpreadsheet x:Name="spreadsheet" AllowFiltering="False"/>
```

C#

```
spreadsheet.AllowFiltering = false;
```

Programmatic Sorting and Filtering

Sorting

Programmatically sort the data while importing the workbook by using `XlsIO` in the `WorkbookLoaded` event of `SfSpreadsheet`.

C#

```
spreadsheet.WorkbookLoaded += spreadsheet_WorkbookLoaded;
void spreadsheet_WorkbookLoaded(object sender, WorkbookLoadedEventArgs args)
{
    IRange filterRange = spreadsheet.Workbook.ActiveSheet.Range["A1:D9"];
}
```

```
spreadsheet.Workbook.ActiveSheet.AutoFilters.FilterRange = filterRange;  
IDataSort sorter = spreadsheet.Workbook.CreateDataSorter();  
sorter.SortRange = spreadsheet.ActiveSheet.Range["A1:D9"];  
ISortField sortField = sorter.SortFields.Add(1, SortOn.Values,  
OrderBy.Ascending);  
sorter.Sort();  
}
```

Filtering

Programmatically filter the data while importing the workbook by using XlsIO in the **WorkbookLoaded** event of SfSpreadsheet.

C#

```
spreadsheet.WorkbookLoaded += spreadsheet_WorkbookLoaded;  
void spreadsheet_WorkbookLoaded(object sender, WorkbookLoadedEventArgs args)  
{  
    IRange filterRange = spreadsheet.Workbook.ActiveSheet.Range["A1:D9"];  
    spreadsheet.Workbook.ActiveSheet.AutoFilters.FilterRange = filterRange;  
    IAutoFilter filter = spreadsheet.Workbook.ActiveSheet.AutoFilters[0];  
    filter.AddTextFilter("1");  
}
```

For more reference, please go through the [XlsIO](#) UG documentation.

Note: If sorting or filtering has been applied programmatically at runtime, then [refresh the view](#) to update it in **SpreadsheetGrid**. But this changes will not be updated in Filter popup even after refreshing the view.

Unsupported Features

Currently SfSpreadsheet does not have support for following features.

- Advanced filtering
- Table filtering
- Multi-column sorting

Limitations

Sorting

- In Microsoft Excel, sorting label should be varied in filter popup based on the type of values in a column (For e.g, "Sort Smallest to Largest" for numeric values, "Sort A to Z" for string values, etc.). But in Spreadsheet, sort label should not be varied based on values due to improve the loading performance of filter popup.
- Sort Ascending or Sort Descending label is not checked in the filter popup, if the column is sorted in Microsoft Excel. Because currently XlsIO do not have support to fetch the sorted order while importing the workbook.

Filtering

- If the filter applied in Microsoft Excel, then the filter will be cleared from all columns while clearing the filter from any one column. Because unable to fetch the filtering order.
- While importing the workbook, checked and unchecked items are only displayed in the right most filtered column. Because unable to fetch the filtering order.

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Formulas in WPF Spreadsheet (SfSpreadsheet)

SfSpreadsheet calculation engine offers automated calculation over a formula, expression, or cross sheet references. SfSpreadsheet calculation engine is preloaded with 409 formulas covering a broad range of business functions.

Adding Formula into cell

To add formulas into a cell programmatically, use [SetCellValue](#) method of [SpreadsheetGrid](#) should be invoked and then invalidate that cell to update the view.

C#

```
var range = spreadsheet.ActiveSheet.Range["A2"];
spreadsheet.ActiveGrid.SetCellValue(range, "=SUM(B1:B2)");
spreadsheet.ActiveGrid.InvalidateCell(2, 1);
```

Named Ranges

Named Ranges are the defined names that represents a cell, range of cells, formula, or constant value or table. Each name have a scope of either to a specific worksheet or to the entire workbook.

Define named ranges at runtime

SfSpreadsheet allows the user to define/add the named ranges at runtime by using [AddNamedRange](#) method.

C#

```
spreadsheet.AddNamedRange("SampleName", "A3:B3", "Sheet1");
```

Edit or remove named ranges at runtime

SfSpreadsheet allows the user to edit the named ranges at runtime by [EditNamedRange](#) method and remove the named ranges at runtime by [DeleteNamedRange](#) method

C#

```
//To Edit the named ranges,
IName name = spreadsheet.Workbook.Names["Sample"];
spreadsheet.EditNamedRange("Test", "A3:B3", name);
//To remove the named ranges,
IName name = spreadsheet.Workbook.Names["Sample"];
spreadsheet.DeleteNamedRange(name);
```

Supported functions

Following is a list of functions that are supported by SfSpreadsheet

Database Functions

Name	Description
DCOUNT	Returns the number of cells containing numbers in a field of a list or database that satisfy specified conditions
DCOUNTA	Returns the number of non-blank cells in a field of a list or database, that satisfy specified conditions
DAVERAGE	Calculates the average of values in a field of a list or database, that satisfy specified conditions
DGET	Returns a single value from a field of a list or database, that satisfy specified conditions
DMAX	Returns the maximum value from a field of a list or database, that satisfy specified conditions
DMIN	Returns the minimum value from a field of a list or database, that satisfy specified conditions
DSTDEVP	Calculates the standard deviation (based on an entire population) of values in a field of a list or database, that satisfy specified conditions
DSTEVP	Calculates the standard deviation (based on a sample of a population) of values in a field of a list or database, that satisfy specified conditions
DVARP	Calculates the variance (based on an entire population) of values in a field of a list or database, that satisfy specified conditions
DVAR	Calculates the variance (based on a sample of a population) of values in a field of a list or database, that satisfy specified conditions

Date and Time Functions

Name	Description
DATE	Returns a date, from a user-supplied year, month and day
DATEVALUE	Converts a text string showing a date, to an integer that represents the date in Excel's date-time code
DAY	Returns the day (of the month) from a user-supplied date

DAYS360	Calculates the number of days between 2 dates, based on a 360-day year (12 x 30 months)
HOUR	Returns the hour part of a user-supplied time
MINUTE	Returns the minute part of a user-supplied time
SECOND	Returns the seconds part of a user-supplied time
MONTH	Returns the month from a user-supplied date
NOW	Returns the current date & time
TIME	Returns a time, from a user-supplied hour, minute and second
TIMEVALUE	Converts a text string showing a time, to a decimal that represents the time in Excel
TODAY	Returns today's date
WEEKDAY	Returns an integer representing the day of the week for a supplied date
YEAR	Returns the year from a user-supplied date
DAYS	Calculates the number of days between 2 dates
EDATE	Returns a date that is the specified number of months before or after an initial supplied start date
EOMONTH	Returns a date that is the last day of the month which is a specified number of months before or after an initial supplied start date
ISOWEEKNUM	Returns the ISO week number of the year for a given date
NETWORKDAYS.INTL	Returns the number of whole network days (excluding weekends & holidays), between two supplied dates, using parameters to specify weekend days
WEEKNUM	Returns an integer representing the week number (from 1 to 53) of the year from a user-supplied date
WORKDAY	Returns a date that is a supplied number of working days (excluding weekends & holidays) ahead of a given start date
WORKDAY.INTL	Returns a date that is a supplied number of working days (excluding weekends & holidays) ahead of a given start date, using supplied parameters to specify weekend days

YEARFRAC	Calculates the fraction of the year represented by the number of whole days between two dates
----------	---

Engineering Functions

Name	Description
DEC2BIN	Converts a decimal number to binary
DCE2OCT	Converts a binary number to octal
DEC2HEX	Converts a decimal number to hexadecimal
BIN2DEC	Converts a binary number to hexadecimal
BIN2OCT	Converts a binary number to octal
BIN2HEX	Converts a binary number to hexadecimal
HEX2BIN	Converts a hexadecimal number to binary
HEX2DEC	Converts a hexadecimal number to a decimal
HEX2OCT	Converts a hexadecimal number to octal
OCT2BIN	Converts octal number to binary
OCT2DEC	Converts octal number to a decimal
OCT2HEX	Converts octal number to hexadecimal
IMABS	Returns the absolute value (the modulus) of a complex number
IMAGINARY	Returns the imaginary coefficient of a complex number
IMREAL	Returns the real coefficient of a complex number
COMPLEX	Converts user-supplied real and imaginary coefficients into a complex number
IMSUM	Calculates the sum of two complex numbers
IMSUB	Subtracts two complex numbers
IMPRODUCT	Returns the product of up to 255 supplied complex numbers

IMDIV	Returns the quotient of two supplied complex numbers
IMCONJUGATE	Returns the complex conjugate of a complex number
IMSQRT	Returns the square root of a complex number
IMARGUMENT	Returns the argument $\hat{\sim}$ (an angle expressed in radians) of a complex number
IMSIN	Returns the sine of a complex number
IMCSC	Returns the cosecant of a complex number
IMCOS	Returns the cosine of a complex number
IMSEC	Returns the secant of a complex number
IMTAN	Returns the tangent of a complex number
IMCOT	Returns the cotangent of a complex number
IMSINH	Returns the hyperbolic sine of a complex number
IMCSCH	Returns the hyperbolic cosecant of a complex number
IMCOSH	Returns the hyperbolic cosine of a complex number
IMSECH	Returns the hyperbolic secant of a complex number
IMLOG10	Returns the base-10 logarithm of a complex number
IMLOG2	Returns the base-2 logarithm of a complex number
IMLN	Returns the natural logarithm of a complex number
IMEXP	Returns the exponential of a complex number
IMPOWER	Calculates a complex number raised to a supplied power
GESTEP	Tests whether a number is greater than a supplied threshold value
DELTA	Tests whether two supplied numbers are equal
BITAND	Returns a Bitwise 'And' of two numbers
BITOR	Returns a Bitwise 'Or' of two numbers

BITXOR	Returns a Bitwise 'Exclusive Or' of two numbers
BITLSHIFT	Returns a number shifted left by a specified number of bits
BITRSHIFT	Returns a number shifted right by a specified number of bits
ERF	Returns the error function integrated between two supplied limits
ERF.PRECISE	Returns the error function integrated between 0 and a supplied limit
ERFC.PRECISE	Returns the complementary error function integrated between a supplied lower limit and infinity
BESSELI	Calculates the modified Bessel function $I_n(x)$
BESSELJ	Calculates the Bessel function $J_n(x)$
BESSELY	Calculates the modified Bessel function $Y_n(x)$
BESSELK	Calculates the modified Bessel function $K_n(x)$
CONVERT	Converts a number from one measurement system to another

Financial Functions

Name	Description
DB	Calculates the depreciation of an asset for a specified period, using the fixed-declining balance method
DDB	Calculates the depreciation of an asset for a specified period, using the double-declining balance method, or some other user-specified method
FV	Calculates the future value of an investment with periodic constant payments and a constant interest rate
IPMT	Calculates the interest payment for a given period of an investment, with periodic constant payments and a constant interest rate
IRR	Calculates the internal rate of return for a series of cash flows
XIRR	Calculates the internal rate of return for a schedule of cash flows
ISPMT	Returns the interest paid during a specified period of an investment

MIRR	Calculates the internal rate of return for a series of periodic cash flows, considering the cost of the investment and the interest on the reinvestment of cash
NPER	Returns the number of periods for an investment with periodic constant payments and a constant interest rate
NPV	Calculates the net present value of an investment, based on a supplied discount rate, and a series of future payments and income
PMT	Calculates the payments required to reduce a loan, from a supplied present value to a specified future value
PPMT	Calculates the payment on the principal for a given investment, with periodic constant payments and a constant interest rate
PV	Calculates the present value of an investment (i.e. the total amount that a series of future payments is worth now)
RATE	Calculates the interest rate required to pay off a specified amount of a loan, or reach a target amount on an investment over a given period
SLN	Returns the straight-line depreciation of an asset for one period
SYD	Returns the sum-of-years' digits depreciation of an asset for a specified period
VDB	Returns the depreciation of an asset for a specified period, (including partial periods), using the double-declining balance method or another user-specified method
DOLLARDE	Converts a dollar price expressed as a fraction, into a dollar price expressed as a decimal
DOLLARFR	Converts a dollar price expressed as a decimal, into a dollar price expressed as a fraction
DURATION	Calculates the Macaulay duration of a security with an assumed par value of \$100
RRI	Calculates an equivalent interest rate for the growth of an investment
FVSCHEDULE	Calculates the future value of an initial principal, after applying a series of compound interest rates
DISC	Calculates the discount rate for a security
INTRATE	Calculates the interest rate for a fully invested security
CUMIPMT	Calculates the cumulative interest paid between two specified periods
CUMPRINC	Calculates the cumulative principal paid on a loan, between two specified periods

RECEIVED	Calculates the amount received at maturity for a fully invested Security
----------	--

Information Functions

Name	Description
ISERROR	Checks whether the value is an error and returns true or false
ISNUMBER	Checks whether the value is number and returns true or false
ISLOGICAL	Checks whether a value is logical value(TRUE/FALSE) and returns true or false
ISNA	Checks whether a value is #N/A and returns true or false
ISERR	Checks whether the value is an error except #N/A and returns true or false
ISBLANK	Checks whether the reference is to an empty cell and returns true or false
ISTEXT	Checks whether the value is text and returns true or false
ISNONTEXT	Checks whether the value is not text(blank cells are not text) and returns true or false
ISEVEN	Returns true if number is even
CONCATENATE	Joins together two or more text strings
DOLLAR	Converts a number to text using currency format
LEN	Returns the length of a supplied text string
FIXED	Rounds a supplied number to a specified number of decimal places, and then converts this into text
ISODD	Returns true if number is odd
ERROR.TYPE	Tests a supplied value and returns an integer relating to the supplied value's error type
N	Converts a non-number value to a number, a date to a serial number, the logical valueÂ TRUEÂ to 1 and all other values to 0
NA	Returns the Excel #N/A error
CELL	Returns information about the contents, formatting or location of a given cell
INFO	Returns information about the the current operating environment

TYPE	Returns information about the data type of a supplied value
ISFORMULA	Tests if a supplied cell contains a formula and if so, returns TRUE; Otherwise, returns FALSE

Logical Functions

Name	Description
AND	Tests a number of user-defined conditions and returnsÂ TRUEÂ ifÂ ALLÂ of the conditions evaluate to TRUE, orFALSEÂ otherwise
OR	Tests a number of user-defined conditions and returnsÂ TRUEÂ ifÂ ANYÂ of the conditions evaluate to TRUE, orFALSEÂ otherwise
IF	Tests a user-defined condition and returns one result if the condition is TRUE, and another result if the condition is FALSE
IFERROR	Tests if an initial supplied value (or expression) returns an error, and if so, returns a supplied value; Otherwise the function returns the initial value.
FALSE	Simply returns the logical valueÂ FALSE
TRUE	Simply returns the logical valueÂ TRUE
NOT	Returns a logical value that is the opposite of a user supplied logical value or expression

Lookup & Reference Functions

Name	Description
OFFSET	Returns a reference to a range of cells that is a specified number of rows and columns from an initial supplied range
HLOOKUP	Looks up a supplied value in the first row of a table, and returns the corresponding value from another row
VLOOKUP	Looks up a supplied value in the first column of a table, and returns the corresponding value from another column
MATCH	Finds the relative position of a value in a supplied array
COLUMN	Returns the column number of a supplied range, or of the current cell
ROW	Returns the row number of a supplied range, or of the current cell

INDIRECT	Returns a cell or range reference that is represented by a supplied text string
AREAS	Returns the number of areas in a supplied range
COLUMNS	Returns the number of columns in a supplied range
FORMULATEXT	Returns a formula as a string
HYPERLINK	Creates a hyperlink to a document in a supplied location
ROW	Returns the row number of a supplied range, or of the current cell
ROWS	Returns the number of rows in a supplied range
SHEET	Returns the sheet number of the referenced sheet
TRANSPOSE	Performs a transpose transformation on a range of cells (i.e. transforms a horizontal range of cells into a vertical range and vice versa)
SHEETS	Returns the number of sheets in reference

Math & Trigonometry functions

Name	Description
ABS	Returns the absolute value of a number
ACOS	Returns the arccosine of a number
ACOSH	Returns the inverse hyperbolic cosine of a number
ASIN	Returns the arcsine of a number
ASINH	Returns the inverse hyperbolic sine of a number
ATAN	Returns the arctangent of a number
ATAN2	Returns the arctangent from x- and y-coordinates
ATANH	Returns the inverse hyperbolic tangent of a number
SUM	Adds its arguments
PI	Returns the value of pi

POWER	Returns the result of a number raised to a power
POW	Returns the result of a number raised to a power
SUBTOTAL	Returns a subtotal in a list or database
COS	Returns the cosine of a number
SIN	Returns the sine of the given angle
COSH	Returns the hyperbolic cosine of a number
SINH	Returns the hyperbolic sine of a number
TANH	Returns the hyperbolic tangent of a number
TAN	Returns the tangent of a number
ACOT	Returns the arc cotangent of a number, in radians in the range 0 to Pi
ACOTH	Returns the inverse hyperbolic cotangent of a number
SIGN	Returns the sign of a number
SQRT	Returns a positive square root
ROUND	Rounds a number to a specified number of digits
LOG	Returns the logarithm of a number to a specified base
LOG10	Returns the base-10 logarithm of a number
EXP	Returns e raised to the power of a given number
CEILING	Rounds a number to the nearest integer or to the nearest multiple of significance
CEILING.MATH	Returns the RoundUp of the given number to the given significance
COLUMNS	Returns the number of columns of the passed in cell reference
FLOOR	Rounds a number down, toward zero
PRODUCT	Multiplies its arguments
MOD	Returns the remainder from division

TRUNC	Truncates a number to an integer
INT	Rounds a number down to nearest integer
ISEVEN	Returns true if the number is even
SUMPRODUCT	Returns the sum of the products of corresponding array components
EXP	Returns e raised to the power of a given number
INT	Rounds a number down to the nearest integer
RAND	Returns an evenly distributed random number ≥ 0 and < 1
COMBIN	Returns the number of combinations for a given number of objects
DEGREES	Converts radians to degrees
EVEN	Rounds a number up to the nearest even integer
FACT	Returns the factorial of a number
LN	Returns the natural logarithm of a number
ODD	Rounds a number up to the nearest odd integer
RADIANS	Converts degrees to radians
ROUND DOWN	Rounds a number down, toward zero
ROUND UP	Rounds a number up, away from zero
MROUND	Returns a number rounded to the desired multiple
MULTINOMIAL	Returns the multinomial of a set of numbers
QUOTIENT	Returns the integer portion of a division
FACTDOUBLE	Returns the double factorial of a number
GCD	Returns the greatest common divisor
LCM	Returns the least common multiple
SQRTPI	Returns the square root of (number * pi)

ROMAN	Converts an Arabic numeral to Roman, as text
SUMSQ	Returns the sum of the squares of the arguments
SUMX2MY2	Returns the sum of the difference of squares of corresponding values in two arrays
SUMX2PY2	Returns the sum of the sum of squares of corresponding values in two arrays
SUMXMY2	Returns the sum of squares of differences of corresponding values in two arrays
SUMIFS	Adds the cells specified by a given set of conditions or criteria
SEC	Returns the secant of an angle
SECH	Returns the hyperbolic secant of an angle
COT	Returns the cotangent of an angle
COTH	Returns the hyperbolic cotangent of a number
CSC	Returns the cosecant of an angle
CSCH	Returns the hyperbolic cosecant of an angle
TRUNCATE	Truncates a number to an integer
COMBINA	Returns the number of combinations for a given number of objects
BASE	Converts number into text representation
DECIMAL	Converts text representation of a number in a given base into decimal number
ARABIC	Converts a roman numeral to Arabic
CEILING.MATH	Rounds a number to the nearest integer or to the nearest multiple of significance
MDETERM	Returns the matrix determinant of an array
MMULT	Returns the matrix product of two arrays
MINVERSE	Returns the matrix inverse of an array
MUNIT	Returns the unit matrix for the specified dimension

Statistical functions

Name	Description
AVG	Returns the average of its arguments
AVERAGE	Returns the average of its arguments
MAX	Returns the maximum value in a list of arguments
MIN	Returns the minimum value in a list of arguments
MAXA	Returns the maximum value in a list of arguments, including numbers, text, and logical values
MINA	Returns the smallest value in a list of arguments, including numbers, text, and logical values
MEDIAN	Returns the median of the given numbers
CONFIDENCE.T	Returns the confidence interval for a population mean
SKEW.P	Returns the skewness of a distribution
COVARIANCE.P	Returns population covariance, the average of the products deviation for each data point pair in two data sets.
COVARIANCE.S	Returns the sample covariance, the average of the products deviation for each data point pair in two data sets.
PERCENTILE.EXC	Returns the Kth percentile of the values in a range, where K is in the range 0É.1 exclusive
PERCENTILE.INC	Returns the Kth percentile of the values in a range, where K is in the range 0É.1 inclusive
PERCENTRANK.EXC	Returns the rank of value in dataset as a percentage of the data set as percentage (0É.1, exclusive) of the dataset
PERCENTRANK.INC	Returns the rank of value in dataset as a percentage of the data set as percentage (0É.1, inclusive) of the dataset
STDEV.P	Calculates standard deviation based on the entire population
STDEV.S	Estimates standard deviation based on a sample
PERMUTATIONA	Returns the number of permutations for a given number of objects

NORM.DIST	Returns the normal cumulative distribution
NORM.INV	Returns the inverse of the normal cumulative distribution
NORM.S.DIST	Returns the standard normal cumulative distribution
NORM.S.INV	Returns the inverse of the standard normal cumulative distribution
WEIBULL.DIST	Returns the Weibull distribution
EXPON.DIST	Returns the exponential distribution
GAMMA.DIST	Returns the gamma distribution
GAMMA.INV	Returns the inverse of the gamma cumulative distribution
GAMMALN.PRECISE	Returns the natural logarithm of the gamma function, $\Gamma(x)$
T.INV	Returns the left-tailed inverse of the Student's t-distribution
F.INV.RT	Returns the inverse of the right-tailed F probability distribution for two data sets
BINOM.INV	Returns the smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value
HYPGEOM.DIST	Returns the hypergeometric distribution
LOGNORM.DIST	Returns the cumulative log-normal distribution
LOGNORM.INV	Returns the inverse of the lognormal distribution
CONFIDENCE.NORM	Returns the confidence interval for a population mean, using a normal distribution
CHISQ.DIST.RT	Returns the right-tailed probability of the chi-squared distribution
F.DIST	Returns the F probability distribution
F.DIST.RT	Returns the right-tailed F probability distribution for two data sets
CHISQ.TEST	Returns the chi-squared statistical test for independence
CHISQ.INV	Returns the inverse of the left-tailed probability of the chi-squared distribution
CHISQ.INV.RT	Returns the inverse of the right-tailed probability of the chi-squared distribution

BINOM.DIST	Returns the individual term binomial distribution probability
Z.TEST	Returns the one-tailed probability value of a z-test
RANK.AVG	Returns the statistical rank of a given value, within a supplied array of values (if more than one value has same rank, the average rank is returned)
RANK.EQ	Returns the Mode (the most frequently occurring value) of a list of supplied numbers (if more than one value has same rank, the top rank of that set is returned)
NEGBINOM.DIST	Returns the negative binomial distribution
POISSON.DIST	Returns the Poisson distribution
QUARTILE.EXC	Returns the specified quartile of a set of supplied numbers, based on percentile value 0 - 1 (exclusive)
QUARTILE.INC	Returns the specified quartile of a set of supplied numbers, based on percentile value 0 - 1 (inclusive)
AVEDEV	Returns the average of the absolute deviations of data points from their mean
AVERAGEA	Returns the Average of a list of supplied numbers, counting text and the logical value FALSE as the value 0 and counting the logical value TRUE as the value 1
GAMMALN	Calculates the natural logarithm of the gamma function for a supplied value
GAMMADIST	Returns the gamma distribution
GAMMAINV	Returns the inverse gamma cumulative distribution
GEOMEAN	Returns the geometric mean of a set of supplied numbers
HARMEAN	Returns the harmonic mean of a set of supplied numbers
HYPGEOMDIST	Returns the hypergeometric distribution
INTERCEPT	Calculates the best fit regression line, through a supplied series of x- and y- values and returns the value at which this line intercepts the y-axis
BINOMDIST	Returns the individual term binomial distribution probability
CHIDIST	Returns the right-tailed probability of the chi-squared distribution

CHIINV	Returns the inverse of the right-tailed probability of the chi-squared distribution
CHITEST	Returns the chi-squared statistical test for independence
NORMDIST	Returns the normal cumulative distribution
NORMINV	Returns the inverse of the normal cumulative distribution
NORMSINV	Returns the inverse of the standard normal cumulative distribution
NORMSDIST	Returns the standard normal cumulative distribution
CONFIDENCE	Returns the confidence interval for a population mean, using a normal distribution
CORREL	Returns the correlation coefficient between two sets of values
COUNT	Returns the number of numerical values in a supplied set of cells or values
COUNTA	Returns the number of non-blanks in a supplied set of cells or values
COUNTBLANK	Returns the number of blank cells in a supplied range
COUNTIF	Returns the number of cells (of a supplied range), that satisfy a given criteria
COVAR	Returns population covariance (i.e. the average of the products of deviations for each pair within two supplied data sets)
CRITBINOM	Returns the smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value
DEVSQ	Returns the sum of the squares of the deviations of a set of data points from their sample mean
EXPONDIST	Returns the exponential distribution
FDIST	Returns the F probability distribution (probability density or cumulative distribution function)
FINV	Returns the inverse of the right-tailed F probability distribution for two data sets
FISHER	Returns the Fisher transformation
FISHERINV	Returns the inverse of the Fisher transformation

FORECAST	Predicts a future point on a linear trend line fitted to a supplied set of x- and y-values
KURT	Returns the kurtosis of a data set
LARGE	Returns the Kth LARGEST value from a list of supplied numbers, for a given value K
LOGNORMDIST	Returns the cumulative log-normal distribution
LOGINV	Returns the inverse of the lognormal distribution
MODE	Returns the Mode (the most frequently occurring value) of a list of supplied numbers
NEGBINOMDIST	Returns the negative binomial distribution
PEARSON	Returns the Pearson product moment correlation coefficient
PERCENTILE	Returns the K'th percentile of values in a supplied range, where K is in the range 0 - 1 (inclusive)
PERCENTILERANK	Returns the rank of a value in a data set, as a percentage (0 - 1 inclusive)
PERMUT	Returns the number of permutations for a given number of objects
POISSON	Returns the Poisson distribution
PROB	Returns the probability that values in a supplied range are within given limits
QUARTILE	Returns the specified quartile of a set of supplied numbers, based on percentile value 0 - 1 (inclusive)
RANQ	Returns the Mode (the most frequently occurring value) of a list of supplied numbers (if more than one value has same rank, the top rank of that set is returned)
RSQ	Returns the square of the Pearson product moment correlation coefficient
SKEW	Returns the skewness of a distribution
SLOPE	Returns the slope of the linear regression line through a supplied series of x- and y- values
SMALL	Returns the Kth SMALLEST value from a list of supplied numbers, for a given value K

STANDARDIZE	Returns a normalized value
STDEV	Returns the standard deviation of a supplied set of values (which represent a sample of a population)
STDEVA	Returns the standard deviation of a supplied set of values (which represent a sample of a population), counting text and the logical value FALSE as the value 0 and counting the logical value TRUE as the value 1
STDEVP	Returns the standard deviation of a supplied set of values (which represent an entire population)
STDEVPA	Returns the standard deviation of a supplied set of values (which represent an entire population), counting text and the logical value FALSE as the value 0 and counting the logical value TRUE as the value 1
STEYX	Returns the standard error of the predicted y-value for each x in the regression line for a set of supplied x- and y- values
TRIMMEAN	Returns the mean of the interior of a supplied set of values
VAR	Returns the variance of a supplied set of values (which represent a sample of a population)
VARA	Returns the variance of a supplied set of values (which represent a sample of a population), counting text and the logical value FALSE as the value 0 and counting the logical value TRUE as the value 1
VARP	Returns the variance of a supplied set of values (which represent an entire population)
VARPA	Returns the variance of a supplied set of values (which represent an entire population), counting text and the logical value FALSE as the value 0 and counting the logical value TRUE as the value 1
WEIBULL	Returns the Weibull distribution
ZTEST	Returns the one-tailed probability value of a z-test

Text Functions

Name	Description
LEFT	Returns a specified number of characters from the start of a supplied text string

LEN	Returns the length of a supplied text string
TRUNC	Truncates a number to an integer removing decimal part or fractional part
MID	Returns a specified number of characters from the middle of a supplied text string
RIGHT	Returns a specified number of characters from the end of a supplied text string
VALUE	Converts a text string into a numeric value
DOLLAR	Converts a supplied number into text, using a currency format
FIXED	Rounds a supplied number to a specified number of decimal places, and then converts this into text
LOWER	Converts all characters in a supplied text string to lower case
UPPER	Converts all characters in a supplied text string to upper case
TEXT	Converts a supplied value into text, using a user-specified format
TRIM	Removes duplicate spaces, and spaces at the start and end of a text string
CONCATENATE	Joins together two or more text strings
SUBSTITUTE	Substitutes all occurrences of a search text string, within an original text string, with the supplied replacement text
T	Tests whether a supplied value is text and if so, returns the supplied text; If not, returns an empty text string.
CODE	Returns the numeric code for the first character of a supplied string
FINDB	Returns the position of a supplied character or text string from within a supplied text string (case-sensitive)
LEFTB	Returns a specified number of characters from the start of a supplied text string
LENB	Returns the length of a supplied text string
MINB	Returns the smallest value in a set of values. does not ignore logical text and values
RIGHTB	Returns a specified number of characters from the end of a supplied text string
NUMBERVALUE	Converts text to a number, in a locale-independent way

PROPER	Converts all characters in a supplied text string to proper case (i.e. letters that do not follow another letter are upper case and all other characters are lower case)
REPLACE	Replaces all or part of a text string with another string (from a user supplied position)
REPT	Returns a string consisting of a supplied text string, repeated a specified number of times
SEARCHB	Returns the position of a supplied character or text string from within a supplied text string (non-case-sensitive)
UNICHAR	Returns the Unicode character that is referenced by the given numeric value
UNICODE	Returns the number (code point) corresponding to the first character of a supplied text string

Web Functions

Name	Description
ENCODEURL	Returns a URL-encoded string
FILTERXML	Returns data from XML content, using a specified XPath
WEBSERVICE	Returns data from a web service on the Internet or Intranet

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Rows and Columns in WPF Spreadsheet (SfSpreadsheet)

This section explains about the operations related with rows and columns in SfSpreadsheet

Insert Rows and Columns

SfSpreadsheet provides support for dynamically inserting rows and columns into a worksheet.

C#

```
//For Inserting Rows
spreadsheet.ActiveSheet.InsertRow(2, 3);
spreadsheet.ActiveGrid.Model.InsertRows(2, 3);
//For Inserting Cols
spreadsheet.ActiveSheet.InsertColumn(3, 2);
spreadsheet.ActiveGrid.Model.InsertColumns(3, 2);
```

Events

Below events of [SpreadsheetGridModel](#) are triggered while inserting the rows and columns.

- [RowsInserted](#)
- [ColumnsInserted](#)

C#

```
//To notify when rows are inserted
spreadsheet.ActiveGrid.Model.RowsInserted += Model_RowsInserted;
void Model_RowsInserted(object sender, GridRangeInsertedEventArgs e)
{
}
//To notify when Columns are inserted
spreadsheet.ActiveGrid.Model.ColumnsInserted += Model_ColumnsInserted;
void Model_ColumnsInserted(object sender, GridRangeInsertedEventArgs e)
{
}
```

Delete Rows and Columns

SfSpreadsheet provides support for deleting rows and columns from a worksheet.

C#

```
//For Deleting Rows
spreadsheet.ActiveSheet.DeleteRow(5, 2);
spreadsheet.ActiveGrid.Model.RemoveRows(5, 2);
//For Deleting Cols
spreadsheet.ActiveSheet.DeleteColumn(3, 2);
spreadsheet.ActiveGrid.Model.RemoveColumns(3, 2);
```

Events

Below events of [SpreadsheetGridModel](#) are triggered while deleting the rows and columns.

- [RowsRemoved](#)
- [ColumnsRemoved](#)

C#

```
//To notify when rows are deleted
spreadsheet.ActiveGrid.Model.RowsRemoved += Model_RowsRemoved;
void Model_RowsRemoved(object sender, GridRangeRemovedEventArgs e)
{
}
//To notify when columns are deleted
spreadsheet.ActiveGrid.Model.ColumnsRemoved += Model_ColumnsRemoved;
void Model_ColumnsInserted(object sender, GridRangeInsertedEventArgs e)
{
}
```

Hide Rows and Columns

SfSpreadsheet provides support to hide rows/columns and this can be done by [HideRow](#) and [HideColumn](#) method

C#

```
//For Hiding Rows,  
spreadsheet.ActiveSheet.HideRow(5);  
spreadsheet.ActiveGrid.RowHeights.SetHidden(5, 5, true);  
//For Hiding Cols,  
spreadsheet.ActiveSheet.HideColumn(4);  
spreadsheet.ActiveGrid.ColumnWidths.SetHidden(4, 4, true);
```

Unhide Rows and Columns

Unhide the rows/columns in SfSpreadsheet can be done by [ShowRow](#) and [ShowColumn](#) methods.

C#

```
//For Unhiding Rows,  
spreadsheet.ActiveSheet.ShowRow(5, true);  
spreadsheet.ActiveGrid.RowHeights.SetHidden(5, 5, false);  
//For Unhiding Cols,  
spreadsheet.ActiveSheet.ShowColumn(4, true);  
spreadsheet.ActiveGrid.ColumnWidths.SetHidden(4, 4, false);
```

Row Height and Column Width

SfSpreadsheet provides support to adjust the row height and column width. And also can import the adjusted row height and column width from Excel. SfSpreadsheet provides support to fit the row and column based on its contents.

C#

```
//For setting RowHeight for 4th Row  
spreadsheet.ActiveGrid.SetRowHeight(4, 4, 30);  
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Row(4), true);  
//For setting ColumnWidth for 5th Column  
spreadsheet.ActiveGrid.SetColumnWidth(5, 5, 22);  
spreadsheet.ActiveGrid.InvalidateCell(GridRangeInfo.Col(5), true);
```

Note: In case if you insert/delete and hide/unhide the rows/columns inside the Grouping, [RefreshOutlines](#) method must be invoked to refresh/update the Outlines of the Group.

Freeze Rows and Columns

SfSpreadsheet provides support for Freeze panes to keep an area of a worksheet visible while you scroll to another area of the worksheet.

C#

```
//Freeze panes  
//To Freeze 4 rows and 4 columns  
spreadsheet.Workbook.ActiveSheet.Range[4, 4].FreezePanes();  
spreadsheet.ActiveGrid.FrozenRows = 5;  
spreadsheet.ActiveGrid.FrozenColumns = 5;
```

Unfreeze Rows and Columns

SfSpreadsheet provides support to unfreeze the freeze panes in the worksheet of SfSpreadsheet.

C#

```
//Unfreeze panes
```

```
//To Unfreeze 4 rows and 4 columns
spreadsheet.Workbook.ActiveSheet.RemovePanes();
spreadsheet.ActiveGrid.FrozenRows = 1;
spreadsheet.ActiveGrid.FrozenColumns = 1;
```

Auto Fit Rows and Columns

SfSpreadsheet provides support to fit the rows or columns based on its content at run time.

You can fit the rows/columns by calling [AutoFitRows](#) and [AutoFitColumns](#) methods of XlsIO's `IRange`. Also set the adjusted row height and column width into the grid by using [SetRowHeight](#) and [SetColumnWidth](#) methods of `SpreadsheetGrid`.

C#

```
//To AutoFit a single column,
spreadsheet.ActiveSheet.AutofitColumn(2);
spreadsheet.ActiveGrid.SetColumnWidth(2, 2, spreadsheet.ActiveSheet.GetColumnWidthInPixels(2));
//To AutoFit multiple columns,
spreadsheet.ActiveSheet["A1:D100"].AutofitColumns();
for(int i = 1; i <= 4 ; i++)
{
    spreadsheet.ActiveGrid.SetColumnWidth(i, i, spreadsheet.ActiveSheet.GetColumnWidthInPixels(i));
}
//To AutoFit a single row,
spreadsheet.ActiveSheet.AutofitRow(3);
spreadsheet.ActiveGrid.SetRowHeight(3, 3, spreadsheet.ActiveSheet.GetRowHeightInPixels(3));
//To AutoFit multiple rows,
spreadsheet.ActiveSheet["B1:B5"].AutofitRows();
for(int i = 1; i <= 5 ; i++)
{
    spreadsheet.ActiveGrid.SetRowHeight(i, i, spreadsheet.ActiveSheet.GetRowHeightInPixels(i));
}
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Worksheet Management in WPF Spreadsheet (SfSpreadsheet)

This section explains about the operations that are performed with the worksheet.

Insert and Delete worksheet

SfSpreadsheet provides support to insert and delete the worksheets in a workbook.

C#

```
//Insert Sheet
spreadsheet.AddSheet();
//Insert sheet with name
spreadsheet.AddSheet("Sheet4", 3);
//Delete Sheet
spreadsheet.RemoveSheet("Sheet2");
```

Hide and Unhide worksheets

SfSpreadsheet provides support to hide and unhide the worksheets in a workbook.

C#

```
//Hide Sheet
spreadsheet.HideSheet("Sheet 2");
//Unhide Sheet
spreadsheet.UnhideSheet("Sheet 2");
```

Hide or unhide sheet tabs

Spreadsheet provides support to hide and unhide the all worksheet tabs in the workbook using the [ShowSheetTabs](#) property. The Default value is `true`.

C#

```
private void SpreadsheetControl_Loaded(object sender, RoutedEventArgs e)
{
    spreadsheetControl.ShowSheetTabs = false;
}
```

XML

```
<syncfusion:SfSpreadsheet x:Name="spreadsheetControl" ShowSheetTabs="False" />
```

Rename a worksheet

SfSpreadsheet provides support to rename a worksheet in the workbook by using [RenameSheet](#) method. After invoking this method, the sheet tab enters into editing mode and now the users can change the name of the sheet in the tab.

C#

```
//Rename sheet
spreadsheet.RenameSheet("Sheet1");
```

Rename a worksheet programmatically

SfSpreadsheet provides support to rename a worksheet in the workbook programmatically by using [RenameSheet](#) method.

C#

```
//To Rename a sheet programmatically
spreadsheet.RenameSheet("ExistingSheetName", "NewSheetName");
```

Worksheet Protection

Protecting a worksheet

SfSpreadsheet provides support to protect the worksheet with or without password. This helps to prevent a user from modifying the contents of the worksheet. The protection of worksheet can be done with [ExcelSheetProtection](#) options also.

The Protect sheet options are

- LockedCells - Allows the users to select the locked cells of the protected worksheet.
- UnLockedCells - Allows the users to select the unlocked cells of the protected worksheet.
- FormattingCells - Allows the users to format any cell on a protected worksheet.
- FormattingRows - Allows the users to format any row on a protected worksheet.
- FormattingColumns - Allows the users to format any column on a protected worksheet.
- InsertingRows - Allows the users to insert rows on the protected worksheet.
- InsertingColumns - Allows the users to insert columns on the protected worksheet.
- InsertingHyperlinks - Allows the users to insert hyperlinks on the protected worksheet.
- DeletingRows - Allows the users to delete rows on the protected worksheet.
- DeletingColumns - Allows the users to delete columns on the protected worksheet.
- Objects - Allows the users to edit the objects such as Graphic cells like charts,rich textbox, etc.

C#

```
//Protect the sheet with password
spreadsheet.ProtectSheet(spreadsheet.ActiveSheet, "123");
//Protect the sheet with Protection options
spreadsheet.ProtectSheet(spreadsheet.ActiveSheet, "123",
ExcelSheetProtection.FormattingCells);
//Unprotect the sheet
spreadsheet.UnProtectSheet(spreadsheet.ActiveSheet, "123");
```

Protecting a workbook

SfSpreadsheet provides support to protect the structure and windows of a workbook. By protecting the structure, prevent a user from adding or deleting worksheets or from displaying hidden worksheets. By protecting the windows in the workbook, you can control the size of the workbook, etc.

C#

```
// To Protect the Workbook
spreadsheet.Protect(true, true, "123");
//To Unprotect the Workbook
spreadsheet.Unprotect("123");
```

Gridlines

SfSpreadsheet provides support to control the visibility and color of the Gridlines in a worksheet.

C#

```
//To show GridLines
spreadsheet.SetGridLinesVisibility(true);
//To hide GridLines
spreadsheet.SetGridLinesVisibility(false);
```

Headings

SfSpreadsheet provides support to control the visibility of row and column headers in a worksheet

C#

```
//To hide the Header cells visibility
```

```
spreadsheet.SetRowColumnHeadersVisibility(false);
```

Zooming

SfSpreadsheet provides support to zoom in and zoom out of a worksheet view. The property [AllowZooming](#) determines whether to allow zooming or not.

C#

```
//zoom factor
spreadsheet.SetZoomFactor("Sheet1", 200);
```

The Events associated with the Zooming are

- . [ZoomFactorChanged](#)
- . [ZoomFactorChanging](#)

Events

Events	Description
WorkbookCreating	Occurs when the workbook is to be created in SfSpreadsheet.
WorkbookLoaded	Occur when the workbook is loaded in SfSpreadsheet.
WorksheetAdding	Occurs when the worksheet is to be added in SfSpreadsheet.
WorksheetAdded	Occurs when the worksheet is added in SfSpreadsheet.
WorksheetRemoving	Occurs when the worksheet is to be removed from SfSpreadsheet.
WorksheetRemoved	Occurs when the worksheet is removed from SfSpreadsheet.
WorkbookUnloaded	Occurs when the workbook is unloaded or removed from the SfSpreadsheet.
ZoomFactorChanged	Occurs when the zoom factor in SfSpreadsheet is changed.
ZoomFactorChanging	Occurs when the zoom factor in SfSpreadsheet is to be changed.
ResizingColumns	Occurs when performing the resizing columns in SfSpreadsheet.
ResizingRows	Occurs when performing the resizing rows in SfSpreadsheet.

CellCommentOpening	Occurs when opening the comments in the cells of SfSpreadsheet.
CellTooltipOpening	Occurs when opening the tool tips of cells in SfSpreadsheet.
CellContextMenuOpening	Occurs when opening the context menu of the cell in SfSpreadsheet.
QueryRange	Occurs when grid queries for <code>IRange</code> information about a specific cell while rendering.

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Data Management in WPF Spreadsheet (SfSpreadsheet)

This section explains about how to import and export the DataTable in SfSpreadsheet.

Import from DataTable

SfSpreadsheet provides support to import the data. The following list of data can be imported into the worksheet

- Data Table
- Data Column
- Data View
- Business Objects
- Array

To import the data from a data table, you can use [ImportDataTable](#)

method

C#

```
spreadsheet.ActiveSheet.ImportDataTable(data_table, true, 1, 1);
spreadsheet.ActiveGrid.InvalidateCells();
```

For more details regarding importing of data, please refer the [XlsIO UG](#)

Export to DataTable

SfSpreadsheet provides support to export the data. To Export the data from a data table, you can use [ExportDataTable](#)

method

C#

```
IWorksheet sheet = spreadsheet.Workbook.Worksheets[0];
IRange range = sheet.Range["A1:K50"];
DataTable data_table = sheet.ExportDataTable(range,
ExcelExportDataTableOptions.ColumnNames);
```

For more details regarding exporting of data, please refer the [XlsIO UG](#)

Interactive Features in WPF Spreadsheet (SfSpreadsheet)

This section explains about the interactive operations with SfSpreadsheet

Clipboard Operations

SfSpreadsheet provides support for all the clipboard operations to with all the format settings when copied within a workbook.

You can use the following shortcut keys for Clipboard operations like Excel

Operations	Shortcut Keys
Cut	Ctrl + X
Copy	Ctrl + C
Paste	Ctrl + V

The following are a list of paste options used while performing paste operation,

Options	Description
Paste	To paste with all the format options in the source range
Formula	To paste the formulas alone
Keep Source Formatting	To maintain the source range's formatting
Value	To paste the values alone
Format	To paste only the formats alone without pasting the values.
Value & Source Formatting	To maintain the source range original format and paste only values

Note: When the content is copied from external source, SfSpreadsheet does not support the format settings (paste options).

For [Cut](#) Operation,

C#

```
//To perform cut operation for selected ranges
var range = spreadsheet.ActiveGrid.SelectedRanges.ActiveRange;
spreadsheet.ActiveGrid.CopyPaste.Copy(range, true);
//To perform cut operation
spreadsheet.ActiveGrid.CopyPaste.Cut();
```

For [Copy](#) Operation,

C#

```
//To perform copy operation for selected ranges
var range = spreadsheet.ActiveGrid.SelectedRanges.ActiveRange;
spreadsheet.ActiveGrid.CopyPaste.Copy(range, false);
```

```
//To perform Copy operation
spreadsheet.ActiveGrid.CopyPaste.Copy();
```

For [Paste](#) Operation,

C#

```
//To perform paste operation
spreadsheet.ActiveGrid.CopyPaste.Paste();
//To perform paste operation with range and Paste Options
var copyPaste = spreadsheet.ActiveGrid.CopyPaste as SpreadsheetCopyPaste;
copyPaste.Paste(range);
copyPaste.Paste(range, PasteOptions.Paste);
```

Tips: Users can also set their default [PasteOptions](#) while pasting in SfSpreadsheet, by using [DefaultPasteOption](#) property.

Undo/Redo

SfSpreadsheet provides support for Undo/Redo functionality like Microsoft Excel.

The shortcut keys used for Undo/Redo Operations

Operations	Shortcut Keys
Undo	Ctrl + Z
Redo	Ctrl + Y

SfSpreadsheet has [History Manager](#) class that supports the implementation of undo/ redo operations

By default, Undo/Redo operations in SfSpreadsheet is enabled. To disable the Undo/Redo operations, set the [Enabled](#) property of [History Manager](#) to be false.

C#

```
spreadsheet.HistoryManager.Enabled = false;
```

To programmatically, invoke the Undo/Redo operations,

C#

```
spreadsheet.HistoryManager.Enabled = true;
spreadsheet.HistoryManager.Undo();
spreadsheet.HistoryManager.Redo();
```

Context menu

Context menu in SfSpreadsheet is customizable menu which can be used for various functionalities

[TabItem Context menu](#)

TabItem Context menu opens when the user right-click on the sheet tab and contains the menus related to worksheet operations.

By default, TabItem Context menu is enabled in SfSpreadsheet. To disable the TabItem context menu, set the [AllowTabItemContextMenu](#) property to false.

C#

```
spreadsheet.AllowTabItemContextMenu = false;
```

Default TabItem context menu has options like Insert, Delete, Hide/Unhide and Protect sheet. You can also customize the TabItem Context menu by setting [IsCustomTabItemContextMenuEnabled](#) property to be true and you can add your customized menu items.

C#

```
spreadsheet.IsCustomTabItemContextMenuEnabled = true;
spreadsheet.TabItemContextMenu = CustomTabItemContextMenu();
//Custom TabItem ContextMenus
public ContextMenu CustomTabItemContextMenu()
{
    var contextMenu = new ContextMenu();
    var insertRowIcon = new Image() { Source = new BitmapImage(new
    Uri(@"..\..\Icon\insertRow.png", UriKind.Relative)) };
    var insertRow = new MenuItem() { Header = "InsertRow" };
    insertRow.Icon = insertRowIcon;
    insertRow.Click += insertRow_Click;
    var deleteRowIcon = new Image() { Source = new BitmapImage(new
    Uri(@"..\..\Icon\deleteRow.png", UriKind.Relative)) };
    var deleteRow = new MenuItem() { Header = "DeleteRow" };
    deleteRow.Icon = deleteRowIcon;
    deleteRow.Click += deleteRow_Click;
    contextMenu.Items.Add(insertRow);
    contextMenu.Items.Add(deleteRow);
    return contextMenu;
}
```

Cell Context menu

Cell Context menu opens when the user right-click on a worksheet cell or selection of cells in SfSpreadsheet.

By default, Cell Context menu is enabled in SfSpreadsheet. To disable the Cell Context menu, set the [AllowCellContextMenu](#) property as false.

C#

```
spreadsheet.AllowCellContextMenu = false;
```

Users can also customize the Cell Context menu of SfSpreadsheet by using [CellContextMenuOpening](#) Event of [SpreadsheetGrid](#).

Adding the customized menu items in the CellContextMenuOpening Event,

C#

```
spreadsheet.ActiveGrid.CellContextMenuOpening +=
ActiveGrid_CellContextMenuOpening;
void ActiveGrid_CellContextMenuOpening(object sender,
CellContextMenuOpeningEventArgs e)
{
    //Adding Customized Menu item
    MenuItem PasteSpecial = new MenuItem();
```

```
PasteSpecial.Header = "Pastespecial";  
Image paste = new Image() { Source = new BitmapImage(new  
Uri(@"..\..\Icon\paste.png", UriKind.Relative)) };  
PasteSpecial.Icon = paste;  
spreadsheet.ActiveGrid.CellContextMenu.Items.Add(PasteSpecial);  
//Remove the existing Context menu  
spreadsheet.ActiveGrid.CellContextMenu.Items.RemoveAt(2);  
}
```

Tips: Custom Cell Context menu can also be added by assigning the customized menu items to the [CellContextMenu](#) property of SpreadsheetGrid. For your reference, [CustomContextMenu](#)

Cell Comments

SfSpreadsheet provides support for cell comments like in excel to give the reader additional context for the data it contains. You can set the comment height and color for the particular comments at runtime by invoking [CellCommentOpening](#) Event of SpreadsheetGrid

To enable the comment in SfSpreadsheet, set the [ShowComment](#) property of SpreadsheetGrid to true.

C#

```
spreadsheet.ActiveGrid.ShowComment = true;
```

To set the comments for particular cell at run time,

C#

```
spreadsheet.ActiveSheet.Range["E5"].AddComment().Text = "Sample Comment";  
spreadsheet.ActiveGrid.InvalidateCell(5, 5);
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Find and Replace in WPF Spreadsheet (SfSpreadsheet)

This section explains about Find and Replace operations in SfSpreadsheet.

Find

Searches for specific data such as particular number or text according to specified options and returns an IRange representing the cell or null if no cell is found. The various options in Find operation are

- [FindAll](#)
- [FindNext](#)
- [FindConditionalFormatting](#)
- [FindConstants](#)
- [FindFormulas](#)
- [FindDataValidation](#)

The common parameters to be passed in Find functions are,

- The option to specify whether the search can be done within the Workbook([IWorkbook](#)) or Worksheet([IWorksheet](#)).

- The text to be searched.
- The option to specify the direction whether the search can be done either by row wise or column wise using [SearchBy](#) enum.
- The type to specify whether the search can be done either in formulas or values using [ExcelFindType](#) enum.
- For a case sensitive search, pass the parameter as true otherwise you can pass the parameter as false.
- For matching the entire cell content with the search text, pass the parameter as true otherwise you can pass the parameter as false.

Find All

Searches every occurrence of specific data based on the criteria that you are searching for and returns an [IRange](#) list representing the cells in [SfSpreadsheet](#)

C#

```
//Search the entire workbook
var list = spreadsheet.SearchManager.FindAll(spreadsheet.Workbook, "sample",
SearchBy.ByRows, ExcelFindType.Text, false, true);
// To select the matched cell content ranges,
foreach (var cell in list)
{
    spreadsheet.
    ActiveGrid.SelectionController.AddSelection(GridRangeInfo.Cell(cell.Row,
    cell.Column));
}
//Search the particular worksheet
var list =
spreadsheet.SearchManager.FindAll(spreadsheet.Workbook.Worksheets[0],
"sample", SearchBy.ByRows, ExcelFindType.Text, false, true);
// To select the matched cell content ranges,
foreach (var cell in list)
{
    spreadsheet.ActiveGrid.SelectionController.AddSelection(GridRangeInfo.Cell(c
    ell.Row, cell.Column));
}
```

Find Next

Searches the first occurrence of specific data which matches the conditions and returns the matched [IRange](#) from the current range that represents the cell.

C#

```
//Search the text in entire workbook in column wise,
var cell = spreadsheet.SearchManager.FindNext(spreadsheet.Workbook,
"sample", SearchBy.ByColumns, ExcelFindType.Text, false, true);
// To move the current cell to matched cell content range,
spreadsheet.ActiveGrid.CurrentCell.MoveCurrentCell(cell.Row, cell.Column);
//Search the formula in particular worksheet in row wise,
var cell =
spreadsheet.SearchManager.FindNext(spreadsheet.Workbook.Worksheets[0],
"sum", SearchBy.ByRows, ExcelFindType.Text, false, false);
// To move the current cell to matched cell content range,
spreadsheet.ActiveGrid.CurrentCell.MoveCurrentCell(cell.Row, cell.Column);
```

Find Conditional Formatting

Searches and returns the **IRange** list which have conditional formatting within the specified worksheet.

C#

```
//Searches the conditional formatting within the worksheet,
var list =
spreadsheet.SearchManager.FindConditionalFormatting(spreadsheet.Workbook.Worksheets[0]);
// To select the matched cell content ranges,
foreach (var cell in list)
{
spreadsheet.ActiveGrid.SelectionController.AddSelection(GridRangeInfo.Cell(cell.Row, cell.Column));
}
```

Find Constants

Searches and returns the **IRange** list which have constants within the specified worksheet.

C#

```
//Searches the constants within the worksheet,
var list =
spreadsheet.SearchManager.FindConstants(spreadsheet.Workbook.Worksheets[0]);
// To select the matched cell content ranges,
foreach (var cell in list)
{
spreadsheet.ActiveGrid.SelectionController.AddSelection(GridRangeInfo.Cell(cell.Row, cell.Column));
}
```

Find Formulas

Searches and returns the **IRange** list which have formulas within the specified worksheet.

C#

```
//Searches the formulas within the worksheet,
var list =
spreadsheet.SearchManager.FindFormulas(spreadsheet.Workbook.Worksheets[0]);
// To select the matched cell content ranges,
foreach (var cell in list)
{
spreadsheet.ActiveGrid.SelectionController.AddSelection(GridRangeInfo.Cell(cell.Row, cell.Column));
}
```

Find Data Validation

Searches and returns the **IRange** list which have data validation within the specified worksheet.

C#

```
//Searches the data validation within the worksheet,
```

```
var list =
spreadsheet.SearchManager.FindDataValidation(spreadsheet.Workbook.Worksheets
[0]);
// To select the matched cell content ranges,
foreach (var cell in list)
{
spreadsheet.ActiveGrid.SelectionController.AddSelection(GridRangeInfo.Cell(c
ell.Row, cell.Column));
}
```

Replace All

Searches and replaces all the texts either in the workbook or worksheet based on the given option.

The parameters to be passed in [ReplaceAll](#) function is,

- The option to specify whether the search can be done within the Workbook([IWorkbook](#)) or Worksheet([IWorksheet](#)) in SfSpreadsheet.
- The text to be searched.
- The text to be replaced.
- For a case sensitive search, pass the parameter as true otherwise you can pass the parameter as false.
- For matching the entire cell content with the search text, pass the parameter as true otherwise you can pass the parameter as false.

C#

```
//Replaces the text in the entire workbook
spreadsheet.SearchManager.ReplaceAll(spreadsheet.Workbook, "sample", "Sync",
false, false);
//Replaces the text in the particular worksheet
spreadsheet.SearchManager.ReplaceAll(spreadsheet.Workbook.Worksheets[0],
"sample", "sync", false, true);
```

Replace

Searches for the text or numbers that you want to change using [FindNext](#) method and once the immediate matched cell has been found, use [SetCellValue](#) method to replace it with specified text or numbers in SfSpreadsheet.

C#

```
//Searches the given text and replaces it with specified text
var cell = spreadsheet.SearchManager.FindNext(spreadsheet.Workbook,
"sample", SearchBy.ByColumns, ExcelFindType.Text, false, true);
spreadsheet.ActiveGrid.SetCellValue(cell, "sync");
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Outline in WPF Spreadsheet (SfSpreadsheet)

SfSpreadsheet provides support for outlines like in excel which makes your data easier to view. You can group or ungroup the data's either by rows or columns.

Group rows and columns

SfSpreadsheet provides support to group the specified range in a worksheet.

To [Group](#) the rows/columns

C#

```
//Group rows,
var gridRange = GridRangeInfo.Rows(4, 8);
spreadsheet.Group(spreadsheet.ActiveSheet, gridRange, ExcelGroupBy.ByRows);
//Group columns,
var gridRange = GridRangeInfo.Cols(4, 8);
spreadsheet.Group(spreadsheet.ActiveSheet, gridRange,
ExcelGroupBy.ByColumns);
```

Ungroup rows and columns

SfSpreadsheet provides support to ungroup the specified range in a worksheet.

To [Ungroup](#) the rows/columns

C#

```
//Ungroup rows,
var gridRange = GridRangeInfo.Rows(4, 8);
spreadsheet.Ungroup(spreadsheet.ActiveSheet, gridRange,
ExcelGroupBy.ByRows);
//Ungroup columns,
var gridRange = GridRangeInfo.Cols(4, 8);
spreadsheet.Ungroup(spreadsheet.ActiveSheet, gridRange,
ExcelGroupBy.ByColumns);
```

Collapse or Expand Group

Groups can be Expanded by [ExpandGroup](#) method and Collapsed by [CollapseGroup](#) method of **XlsIO**.

C#

```
//Expand Rows,
spreadsheet.ActiveSheet.Range["A4:A8"].ExpandGroup(ExcelGroupBy.ByRows);
spreadsheet.ActiveGrid.RowHeights.SetHidden(4, 8, false);
spreadsheet.RefreshOutlines(true, false);
//Expand Columns,
spreadsheet.ActiveSheet.Range["A3:F3"].ExpandGroup(ExcelGroupBy.ByColumns);
spreadsheet.ActiveGrid.ColumnWidths.SetHidden(1, 6, false);
spreadsheet.RefreshOutlines(false, true);
//Collapse Rows,
spreadsheet.ActiveSheet.Range["A4:A8"].CollapseGroup(ExcelGroupBy.ByRows);
spreadsheet.ActiveGrid.RowHeights.SetHidden(4, 8, true);
spreadsheet.RefreshOutlines(true, false);
//Collapse Columns,
spreadsheet.ActiveSheet.Range["A3:F3"].CollapseGroup(ExcelGroupBy.ByColumns);
;
spreadsheet.ActiveGrid.ColumnWidths.SetHidden(1, 6, true);
```

```
spreadsheet.RefreshOutlines(false, true);
```

Note: [RefreshOutlines](#) method is invoked to refresh/update the Outlines of the Group in SfSpreadsheet.

Change Outline Settings

In SfSpreadsheet, users can change the outline settings by changing the display of summary rows to either below or above the details and summary columns to either left or right of the details in Outlines Group.

C#

```
spreadsheet.ActiveSheet.PageSetup.IsSummaryRowBelow = false;  
spreadsheet.ActiveSheet.PageSetup.IsSummaryColumnRight = false;  
spreadsheet.RefreshOutlines(true, true);
```

Clear Outlines

SfSpreadsheet provides support to clear all the Outlines of the Grouped range.

C#

```
var sheet = spreadsheet.Workbook.Worksheets[0] as WorksheetImpl;  
foreach (OutlineWrapper outline in sheet.OutlineWrappers)  
{  
    outline.OutlineRange.Ungroup(outline.GroupBy);  
}  
spreadsheet.RefreshOutlines(true, true);
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Shapes in WPF Spreadsheet (SfSpreadsheet)

This section explains how to import charts, sparklines, pictures and textboxes in SfSpreadsheet.

Charts

SfSpreadsheet provides support to import charts from excel which are used to represent numeric data in graphical format to make it easier to understand large quantities of data.

For importing charts in SfSpreadsheet, add the following assembly as reference into the application.

Assembly: **Syncfusion.SfSpreadsheetHelper.WPF.dll**

Create an instance of Syncfusion.UI.Xaml.SpreadsheetHelper.[GraphicChartCellRenderer](#) and add that renderer into [GraphicCellRenderers](#) collection by using the helper method [AddGraphicChartCellRenderer](#) which is available under the namespace Syncfusion.UI.Xaml.Spreadsheet.GraphicCells.

C#

```
public MainWindow()  
{  
    InitializeComponent();  
    //For importing charts,  
    this.spreadsheet.AddGraphicChartCellRenderer(new  
        GraphicChartCellRenderer());  
}
```

```
}
```

Adding the Charts at Runtime

For adding the Charts in SfSpreadsheet at runtime, use [AddChart](#) method, also you can resize and reposition the chart.

C#

```
var chart = spreadsheet.AddChart(spreadsheet.ActiveSheet);
object[] Y_values = new object[] { 200, 100, 100 };
object[] X_values = new object[] { "Total Income", "Expenses", "Profit" };
IChartSeries series = chart.Series.Add(ExcelChartType.Pie);
// Enters the X and Y values directly
series.EnteredDirectlyValues = Y_values;
series.EnteredDirectlyCategoryLabels = X_values;
var shape = chart as ShapeImpl;
// Re-Positioning Chart
shape.Top = 200;
shape.Left = 200;
//Re-sizing a Chart
shape.Height = 300;
shape.Width = 300;
```

Sparklines

For importing sparklines in SfSpreadsheet, add the following assembly as reference into the application.

Assembly: **Syncfusion.SfSpreadsheetHelper.WPF.dll**

Create an instance of Syncfusion.UI.Xaml.SpreadsheetHelper.[SparklineCellRenderer](#) and add that renderer into the Spreadsheet by using the helper method [AddSparklineCellRenderer](#) which is available under the namespace `Syncfusion.UI.Xaml.Spreadsheet.GraphicCells`.

C#

```
public MainWindow()
{
    InitializeComponent();
    //For importing sparklines,
    this.spreadsheet.AddSparklineCellRenderer(new SparklineCellRenderer());
}
```

Pictures

SfSpreadsheet provides support to import images in SpreadsheetGrid and to add an image at run time, use [AddImage](#) method and also you can resize and reposition the image.

C#

```
var worksheet = spreadsheet.ActiveSheet;
var stream =
typeof(MainWindow).Assembly.GetManifestResourceStream("GraphicCellDemo.Data.
Sample.jpg");
var shape = spreadsheet.AddImage(worksheet, new RowColumnIndex(5, 5),
stream);
// Re-Positioning Picture
shape.Top = 200;
```

```
shape.Left = 200;
//Re-sizing a Picture
shape.Height = 200;
shape.Width = 200;
```

TextBoxes

SfSpreadsheet provides support to import RichText Box in `SpreadsheetGrid` and to add the rich text box at run time, use [AddTextBox](#) method

C#

```
var rtfText =
"{\rtf1\ansi\ansicpg1252\deff0\deflang1033{\fonttbl{\f0\fnil\fchars
et1 Calibri;}}{\f1\fnil\fcharset1
Calibri;}}{\colortbl;\red0\green0\blue0;\red255\green0\blue0;}{\f0\
fs22\b\cf1\u83*\u121*\u110*\u99*\u102*\u117*\u115*\u105*\u111*\u
110*\u32*\b0}
{\f1\fs22\cf2\u83*\u111*\u102*\u116*\u119*\u97*\u114*\u101*\u32*
}{\f1\fs22\cf1\u80*\u118*\u116*\u46*\u32*\u76*\u116*\u100*}}";
var textBox = spreadsheet.AddTextBox(spreadsheet.ActiveSheet, new
RowColumnIndex(5, 5), new Size(200, 200), rtfText) as TextBoxShapeImpl;
// Re-positioning RichTextBox
textBox.Left = 200;
textBox.Top = 200;
```

Accessing the selected Shapes

SfSpreadsheet allows the user to access the selected shapes and modify the properties associated with it in `SpreadsheetGrid`.

C#

```
var selectedShape = spreadsheet.ActiveGrid.GraphicModel.SelectedShapes;
for(int i = 0; i < selectedShape.Count ; i++)
{
    if(ExcelShapeType.Chart == selectedShape[i].ShapeType)
    {
        var chart = selectedShape[i] as IChart;
        chart.ChartArea.Fill.FillType = ExcelFillType.Gradient;
        chart.ChartArea.Fill.ForeColor = Color.Blue;
    }
    else if(ExcelShapeType.Picture == selectedShape[i].ShapeType)
    {
        var picture = selectedShape[i] as ShapeImpl;
        picture.Height = 100;
        picture.Width = 100;
    }
}
spreadsheet.ActiveGrid.GraphicModel.InvalidateGraphicObjects();
spreadsheet.ActiveGrid.GraphicModel.InvalidateGraphicVisual();
```

Select a Shape Programmatically

Users can select a shape programmatically by using [AddSelectedShapes](#) method of [GraphicModel](#) class.

C#

```
var shape = spreadsheet.ActiveSheet.Shapes[2] as ShapeImpl;  
spreadsheet.ActiveGrid.GraphicModel.AddSelectedShapes(shape);
```

Clear a Selection

Users can clear the selection from the shapes and move the selection to the grid using [ClearSelection](#) method of [GraphicModel](#) class.

C#

```
spreadsheet.ActiveGrid.GraphicModel.ClearSelection();
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Conversion in WPF Spreadsheet (SfSpreadsheet)

This section explains about the conversion of workbook in SfSpreadsheet into image, PDF and HTML

Convert to Image

SfSpreadsheet provides support to convert a worksheet in to an image of type Bitmap or Metafile based on the input range of rows and columns with all basic formats preserved, By using the [ConvertToImage](#) method, worksheet can be converted into an image.

C#

```
IWorksheet sheet = spreadsheet.Workbook.ActiveSheet;  
sheet.UsedRangeIncludesFormatting = false;  
int lastRow = sheet.UsedRange.LastRow + 1;  
int lastColumn = sheet.UsedRange.LastColumn + 1;  
System.Drawing.Image image = sheet.ConvertToImage(1, 1, lastRow, lastColumn,  
ImageType.Bitmap, null);  
image.Save("Sample.png", ImageFormat.Png);  
System.Diagnostics.Process.Start("Sample.png");
```

Convert to PDF

SfSpreadsheet provides support to export the Excel workbook to PDF using ExcelToPdfConverter.

For converting the Excel sheet to PDF, “Syncfusion.ExcelToPDFConverter.Base.dll” and “Syncfusion.Pdf.Base.dll” references should be added.

Export the Excel workbook as PDF document using [Convert](#) method of [ExcelToPdfConverter](#) class which is available under the name space “Syncfusion.ExcelToPdfConverter”

C#

```
ExcelToPdfConverter converter = new  
ExcelToPdfConverter(spreadsheet.Workbook);  
//Initialize the PdfDocument  
PdfDocument pdfDoc = new PdfDocument();  
//Initialize the ExcelToPdfConverter Settings  
ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();  
settings.LayoutOptions = LayoutOptions.NoScaling;  
//Assign the PdfDocument to the templateDocument property of  
ExcelToPdfConverterSettings
```

```
settings.TemplateDocument = pdfDoc;  
settings.DisplayGridLines = GridLinesDisplayStyle.Invisible;  
//Convert Excel Document into PDF document  
pdfDoc = converter.Convert(settings);  
//Save the PDF file  
pdfDoc.Save("Sample.pdf");  
System.Diagnostics.Process.Start("Sample.pdf");
```

Convert to HTML

SfSpreadsheet provides support to convert the excel workbook into HTML page.

C#

```
spreadsheet.Workbook.SaveAsHtml("Sample.html", HtmlSaveOptions.Default);  
System.Diagnostics.Process.Start("Sample.html");
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Localization in WPF Spreadsheet (SfSpreadsheet)

Localization is the process of configuring the application to a specific language. SfSpreadsheet provides support to localize all the static text in a Ribbon and all dialogs to any desired language. Localization can be done by adding resource file and setting the specific culture in the application.

SfSpreadsheet allows you to set custom resource using Resx file. You can define your string values in resource file for a specific culture and set the culture in your application.

Set Current UI Culture to the Application

To set the CultureInformation in the Application, set the `CurrentUICulture` before the `InitializeComponent()` method is called.

Setting of the culture information,

C#

```
public MainWindow()  
{  
    System.Threading.Thread.CurrentThread.CurrentUICulture = new  
    CultureInfo("ja-JP");  
    InitializeComponent();  
}
```

Now, the Application is set to the Japanese Culture info.

Localization using Resource file

The following steps show how to implement the localization in SfSpreadsheet,

- Create a folder and name it as 'Resources' in your application.
- Add the default resource[English("en-US")] file of `SfSpreadsheet` in the 'Resources' folder named as `Syncfusion.SfSpreadsheet.WPF.resx`.

You can download the Resx file [here](#)

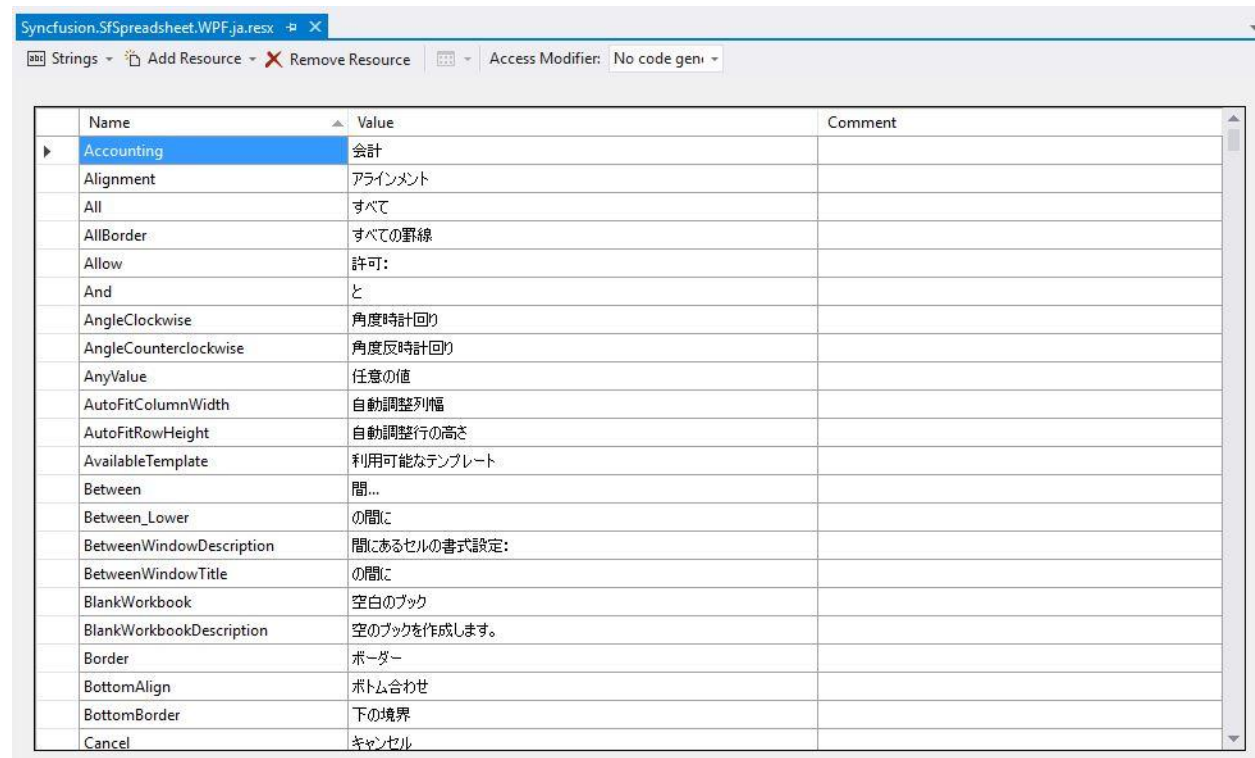

- Create Resx(resource) file under the 'Resources' folder and name it as Syncfusion.SfSpreadsheet.WPF.[Culture name].resx.

For example, Syncfusion.SfSpreadsheet.WPF.ja.resx for Japanese culture.

- Add the resource key such as name and its corresponding localized value in Resource Designer of Syncfusion.SfSpreadsheet.WPF.ja.resx file.

For your reference, you can download the Japanese("ja-JP") Resx file [here](#)

The following screenshot shows you the localization in SfSpreadsheet,

Modifying the localized strings in Resource file

Users can modify the default localized strings in Resource file by adding the default [Resx](#) (resource) file of SfSpreadsheet in the 'Resources' folder of your application and name it as Syncfusion.SfSpreadsheet.WPF.resx.

Now, the default localized strings can be modified by changing the Name/Value pair in the Syncfusion.SfSpreadsheet.WPF.resx file.

Name	Value	Comment
Accounting	Accounting	
Alignment	Alignment	
All	All	
AllBorder	All Borders	
Allow	Allow :	
And	and	
AngleClockwise	Angle Clockwise	
AngleCounterclockwise	Angle Counterclockwise	
AnyValue	Any value	
AutoFitColumnWidth	AutoFit Column Width	
AutoFitRowHeight	AutoFit Row Height	
AvailableTemplate	Available Template	
Between	Between...	
Between_Lower	between	
BetweenWindowDescription	Format cells that are BETWEEN:	
BetweenWindowTitle	Between	
BlankWorkbook	Blank workbook	
BlankWorkbookDescription	Creates an Empty Workbook	
Border	Border	
BottomAlign	BottomAlign	
BottomBorder	Bottom Border	
Cancel	Cancel	

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Printing in WPF Spreadsheet (SfSpreadsheet)

SfSpreadsheet control allows you to print the data in the workbook with the help of PDF Conversion. To provide the printing support in SfSpreadsheet, you need to convert the workbook into PDF document using ExcelToPdfConverter.

For Conversion of Excel Workbook in SfSpreadsheet to PDF document, use [Convert](#) method of [ExcelToPdfConverter](#).

For viewing the PDF document, you can use [PdfViewerControl](#) to load the saved PDF stream.

C#

```
//Create the pdf viewer for load the document.
PdfViewerControl pdfViewer = new PdfViewerControl();
//Create Memory Stream to save pdf document
MemoryStream pdfStream = new MemoryStream();
ExcelToPdfConverter converter = new ExcelToPdfConverter
(spreadsheet.Workbook);
//Initialize the ExcelToPdfConverter Settings
ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
settings.LayoutOptions = LayoutOptions.NoScaling;
```

For print preview you can load the PDF stream into viewer and for direct printing use **Print** method in PdfViewerControl which is available under the namespace "Syncfusion.PdfViewer.Wpf"

C#

```
//Initialize the PdfDocument
PdfDocument pdfDoc = new PdfDocument ();
//Assign the PdfDocument to the templateDocument property of
ExcelToPdfConverterSettings
settings.TemplateDocument = pdfDoc;
settings.DisplayGridLines = GridLinesDisplayStyle.Invisible;
//Convert Excel Document into PDF document
pdfDoc = converter.Convert(settings);
//Save the PDF file
pdfDoc.Save(pdfStream);
//Load the document to pdf viewer
pdfViewer.Load(pdfStream);
//Print the doc
pdfViewer.Print(true);
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Ribbon Customization in WPF Spreadsheet (SfSpreadsheet)

Ribbon Customization can be done in two ways,

Using Control Template

User can customize the ribbon items by overriding the template of [SfSpreadsheetRibbon](#).

Using Event

By invoking SfSpreadsheetRibbon Loaded Event, User can add/delete the ribbon menu items.

Adding a RibbonTab

To add a custom ribbon tab with user defined menu options in SfSpreadsheetRibbon,

XML

```
<syncfusion:SfSpreadsheetRibbon x:Name="ribbon" DataContext="{Binding  
ElementName=spreadsheet}" />
```

C#

```
ribbon.Loaded += ribbon_Loaded;  
void ribbon_Loaded(object sender, RoutedEventArgs e)  
{  
    var ribbon1 = GridUtil.GetVisualChild<Ribbon>(sender as FrameworkElement);  
    if (ribbon1 != null)  
    {  
        RibbonTab ribbonTab = new RibbonTab();  
        ribbonTab.Caption = "OTHER";  
        RibbonButton Button1 = new RibbonButton();  
        Button1.Label = "PRINT";  
        Button1.SmallIcon = new BitmapImage(new Uri("../Icon/Icons_Print.png",  
UriKind.Relative));  
        Button1.Click += Button1_Click;  
        RibbonButton Button2 = new RibbonButton();  
        Button2.Label = "PRINT PREVIEW";  
        Button2.SmallIcon = new BitmapImage(new Uri("../Icon/Icons_Print.png",  
UriKind.Relative));  
        Button2.Click += Button2_Click;  
        var customRibbonBar = new RibbonBar();  
        customRibbonBar.Header = "Printing Options";  
        customRibbonBar.Items.Add(Button1);  
        customRibbonBar.Items.Add(Button2);  
        customRibbonBar.IsLauncherButtonVisible = false;  
        ribbonTab.Items.Add(customRibbonBar);  
        ribbon1.Items.Add(ribbonTab);  
    }  
}
```

Adding a Ribbon Items in Existing Tab

To add a ribbon items in already existing tab,

XML

```
<syncfusion:SfSpreadsheetRibbon x:Name="ribbon" DataContext="{Binding  
ElementName=spreadsheet}" />
```

C#

```
ribbon.Loaded += ribbon_Loaded;  
void ribbon_Loaded(object sender, RoutedEventArgs e)  
{  
    var ribbon1 = GridUtil.GetVisualChild<Ribbon>(sender as FrameworkElement);
```

```
// To add the ribbon button in View tab,
if (ribbon1 != null)
{
    var ribbonTab = ribbon1.Items[2] as RibbonTab;
    RibbonButton Button1 = new RibbonButton();
    Button1.Label = "PRINT";
    Button1.SmallIcon = new BitmapImage(new Uri("../Icon/Icons_Print.png",
    UriKind.Relative));
    Button1.Click += Button1_Click;
    ribbonTab.Items.Add(Button1);
}
}
```

Removing a RibbonTab

To remove the ribbon tab in the SfSpreadsheetRibbon,

XML

```
<syncfusion:SfSpreadsheetRibbon x:Name="ribbon" DataContext="{Binding
ElementName=spreadsheet}" />
```

C#

```
ribbon.Loaded += ribbon_Loaded;
void ribbon_Loaded(object sender, RoutedEventArgs e)
{
    var ribbon1 = GridUtil.GetVisualChild<Ribbon>(sender as FrameworkElement);
    //To remove the Data tab from the ribbon,
    if (ribbon1 != null)
    {
        var item = ribbon1.Items[1];
        ribbon1.Items.Remove(item);
    }
}
```

Removing a Ribbon Items in a RibbonTab

To remove the ribbon menu items in the ribbon tab of SfSpreadsheetRibbon,

XML

```
<syncfusion:SfSpreadsheetRibbon x:Name="ribbon" DataContext="{Binding
ElementName=spreadsheet}" />
```

C#

```
ribbon.Loaded += ribbon_Loaded;
void ribbon_Loaded(object sender, RoutedEventArgs e)
{
    var ribbon1 = GridUtil.GetVisualChild<Ribbon>(sender as FrameworkElement);
    // To remove the Freeze panes menu group in View tab,
    if (ribbon1 != null)
    {
        var ribbonTab = ribbon1.Items[2] as RibbonTab;
        ribbonTab.Items.Remove(ribbonTab.Items[1]);
    }
}
```

```
}
```

Canceling a Ribbon commands

You can cancel particular action of SpreadsheetRibbon commands by handling [CommandExecuting](#) event.

XML

```
<syncfusion:SfSpreadsheetRibbon x:Name="ribbon" DataContext="{Binding
ElementName=spreadsheet}" />
```

C#

```
this.ribbon.Commands.CommandExecuting += Commands_CommandExecuting;
void Commands_CommandExecuting(object sender, CommandExecutingEventArgs
args)
{
    //stops copy button command execution.
    if(args.CommandName == "Copy")
    {
        //set the bool value is true.
        //the operation is not performed as you mentioned in CommandName
        args.cancel = true;
    }
}
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Custom Formula in WPF Spreadsheet (SfSpreadsheet)

SfSpreadsheet allows you to add custom formulas into its function library. You can add the custom formula into the SfSpreadsheet by using the [AddFunction](#) method of [FormulaEngine](#),

C#

```
spreadsheet.WorkbookLoaded += spreadsheet_WorkbookLoaded;
void spreadsheet_WorkbookLoaded(object sender, WorkbookLoadedEventArgs args)
{
    foreach (var grid in args.GridCollection)
        AddCustomFormula(grid);
    //Computing the formula at runtime
    var range = spreadsheet.ActiveSheet.Range["B2"];
    spreadsheet.ActiveGrid.SetCellValue(range, "=Find(sample)");
}
private void AddCustomFormula(SpreadsheetGrid grid)
{
    // Add a formula named Find to the Library.
    grid.FormulaEngine.AddFunction("Find", new
    FormulaEngine.LibraryFunction(ComputeLength));
}
//Implementation of formula
public string ComputeLength(string range)
{
```

```
//Used to calculate the length of the string
return range.Length.ToString();
}
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Cell Customization in WPF Spreadsheet (SfSpreadsheet)

SfSpreadsheet provides support to customize the cell with Data template. It allows to load any WPF control or custom control into the cell.

In order to customize the cell, please follow the below steps

- Create a DataTemplate
- Override the SpreadsheetColumn class
- Create the Custom Cell Renderer
- Associating the Custom Cell Renderer to SpreadsheetGrid

Create a DataTemplate

Create a custom DataTemplate (For ex: Button Template) in the Main window.xaml file,

XML

```
<DataTemplate x:Key="ButtonTemplate" >
<Expander x:Name="Button" ExpandDirection="Right" IsExpanded="True"
Expanded="Button_Expanded" Collapsed="Button_Collapsed"/>
</DataTemplate>
```

Override the SpreadsheetColumn class

Create an extension class SpreadsheetColumnExt by overriding the [SpreadsheetColumn](#) Class which holds all the operations related with cells.

Now override the function `OnUpdateColumn` which updates the column properties (cell types, renderer, cell element, etc.) and get the data template which is used for displaying in the particular cell.

C#

```
public class SpreadsheetColumnExt : SpreadsheetColumn
{
    public SpreadsheetColumnExt(SpreadsheetGrid grid) : base(grid)
    {
    }
    // Gets or sets the DataTemplate for the cell
    public DataTemplate CellItemTemplate
    {
        get;
        set;
    }
    // Gets or sets the DataTemplate for the cell
    public DataTemplate CellEditTemplate
    {
        get;
```

```

set;
}
//Update the cell with the defined template
protected override void OnUpdateColumn(out FrameworkElement oldElement)
{
    if (RowIndex == 3 && ColumnIndex == 6)
    {
        this.CellItemTemplate =
        Application.Current.MainWindow.Resources["ButtonTemplate"] as DataTemplate;
        this.CellEditTemplate =
        Application.Current.MainWindow.Resources["ButtonTemplate"] as DataTemplate;
    }
    base.OnUpdateColumn(out oldElement);
}
}

```

Create the Custom Cell Renderer

Create a SpreadsheetTemplateCellRenderer class by overriding the [SpreadsheetVirtualizingCellRendererBase](#) class to display the defined custom renderer element.

For initializing the display element, set the content template in `OnInitializeDisplayElement` method and for editing, set the content template in `OnInitializeEditElement` method otherwise it will load the default display and edit element in the cells

C#

```

public class SpreadsheetTemplateCellRenderer :
    SpreadsheetVirtualizingCellRendererBase<ContentControl, ContentControl>
{
    public SpreadsheetTemplateCellRenderer()
    {
        SupportDrawingOptimization = false;
    }
    //Update the cell style for display element
    protected override void OnUpdateCellStyle(RowColumnIndex cellRowColumnIndex,
        ContentControl uiElement, SpreadsheetColumn column)
    {
        if (uiElement.ContentTemplate == null)
        {
            uiElement.ContentTemplate = (column as
            SpreadsheetColumnExt).CellItemTemplate;
        }
        base.OnUpdateCellStyle(cellRowColumnIndex, uiElement, column);
    }
    //Update the cell style for edit element
    protected override void OnUpdateEditCellStyle (RowColumnIndex
        cellRowColumnIndex, ContentControl uiElement, SpreadsheetColumn column)
    {
        if (uiElement.ContentTemplate == null)
        {
            uiElement.ContentTemplate = (column as
            SpreadsheetColumnExt).CellEditTemplate;
        }
        base.OnUpdateEditCellStyle (cellRowColumnIndex, uiElement, column);
    }
}

```

```

//To initialize the display element on the cell
protected override void OnInitializeDisplayElement(RowColumnIndex
rowColumnIndex, ContentControl uiElement, SpreadsheetColumn column)
{
    uiElement.ContentTemplate = (column as
    SpreadsheetColumnExt).CellItemTemplate;
}
//To initialize the edit element on the cell
protected override void OnInitializeEditElement(RowColumnIndex
rowColumnIndex, ContentControl uiElement, SpreadsheetColumn column)
{
    uiElement.ContentTemplate = (column as
    SpreadsheetColumnExt).CellEditTemplate;
}
}

```

Note: If you want to load the default edit element, then no need to override the `OnInitializeEditElement` method.

Associating the Custom Cell Renderer to SpreadsheetGrid

To associate the custom cell renderer in [SpreadsheetGrid](#), invoke the [WorkbookLoaded](#) Event of SfSpreadsheet and initialize the `SpreadsheetTemplateCellRenderer` and add it to the renderer collection.

Invoke the [QueryRange](#) Event of `SpreadsheetGrid` and set the `CellType` of particular range to be "DataTemplate" to load the user defined template.

C#

```

void spreadsheet_WorkbookLoaded(object sender, WorkbookLoadedEventArgs args)
{
    var grid = spreadsheet.ActiveGrid;
    grid.CreateGridColumn = CreateSpreadsheetColumnExt;
    var renderer = new SpreadsheetTemplateCellRenderer();
    grid.CellRenderers.Add("DataTemplate", renderer);
    grid.QueryRange += grid_QueryRange;
}
//To access the SpreadsheetColumnExt
public GridColumn CreateSpreadsheetColumnExt(SfCellGrid grid)
{
    return new SpreadsheetColumnExt(grid as SpreadsheetGrid);
}
//To update the cell type
void grid_QueryRange(object sender, SpreadsheetQueryRangeEventArgs e)
{
    if (e.Cell.ColumnIndex == 6)
    {
        e.CellType = "DataTemplate";
        e.CellValue = "0";
        e.Handled = true;
    }
}

```

For more reference, please find the [customization](#) sample.

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

Limitations in WPF Spreadsheet (SfSpreadsheet)

Release memory held by AutomationPeer

SfSpreadsheet holds some instance in memory even after disposing the spreadsheet or removed the sheets from the spreadsheet. Because, the **AutomationPeer** for WPF Components holds some memory and it needs to be released manually. This can be done by using the following steps.

Create a class derived from **WindowAutomationPeer** and override its **GetChildrenCore** method and returns "null" value that clears the **AutomationPeer** item from memory as follows

C#

```
public class FakeWindowsPeer : WindowAutomationPeer
{
    public FakeWindowsPeer (Window window): base(window)
    { }
    protected override List<AutomationPeer> GetChildrenCore()
    {
        return null;
    }
}
```

Now override the **OnCreateAutomationPeer** of the window and it returns the class as follows.

C#

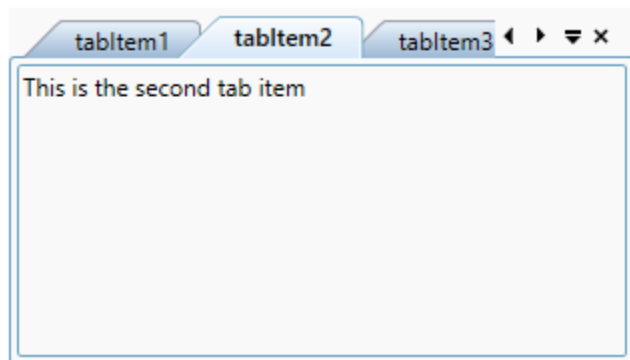

```
public partial class MainWindow : Window
{
    public MainWindow()
    {
        InitializeComponent();
    }
    protected override AutomationPeer OnCreateAutomationPeer()
    {
        return new FakeWindowsPeer(this);
    }
}
```

Note: You can refer to our [WPF Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [WPF Spreadsheet example](#) to know how to render and configure the spreadsheet.

TabControlExt

WPF TabControl (TabControlExt) Overview

The [TabControl](#) is similar to the dividers in a notebook or the labels in a file cabinet. By using **TabControl**, an application can define multiple pages for the same area of a window. **TabControl** contains the [TabItemExt](#), which is used to define Tab Items for **TabControl**. By clicking a tab item header, the data corresponding to that particular tab item will be displayed.

Key features

Tab Orientation - Provides support to position the tabs horizontally at the top or bottom and vertically at the left or right.

Editable header - Provides support to edit the headers interactively in UI by pressing the F2 key or by double-clicking a tab header.

Display mode - Provides support to customize the display mode of the Close button.

Layout - Provides different layout types for enhanced usage to the control. The types are SingleLine, MultiLine, and MultiLineWithFillWidth.

Pin and UnPin - Provides support to pinning tabs for quick access and allows users to interactively pin and unpin the tabs.

Selection - Provides support to select the tabs quickly through keyboard or mouse interaction.

Styles - Provides a rich set of built-in themes and customizes the style of each part of **TabControl**.

Drag and drop - Provides support to reorder the tabs by dragging and dropping headers and change the color of drag marker while dragging the tab page in **TabControl**.

Scrolling - Provides support to scroll the tab items to next, previous, first, and last in **TabControl**.

Images - Provides support to add images to the tab header and also aligns the header image to any position.

Context menu - Provides support to built-in context menu option for tab list and tab item.

Getting Started with WPF TabControl (TabControlExt)

This section explains how to create a WPF [TabControl](#) and explains about its structure.

Structure of TabControl

The various elements of **TabControl** are illustrated in the following images.

Assembly deployment

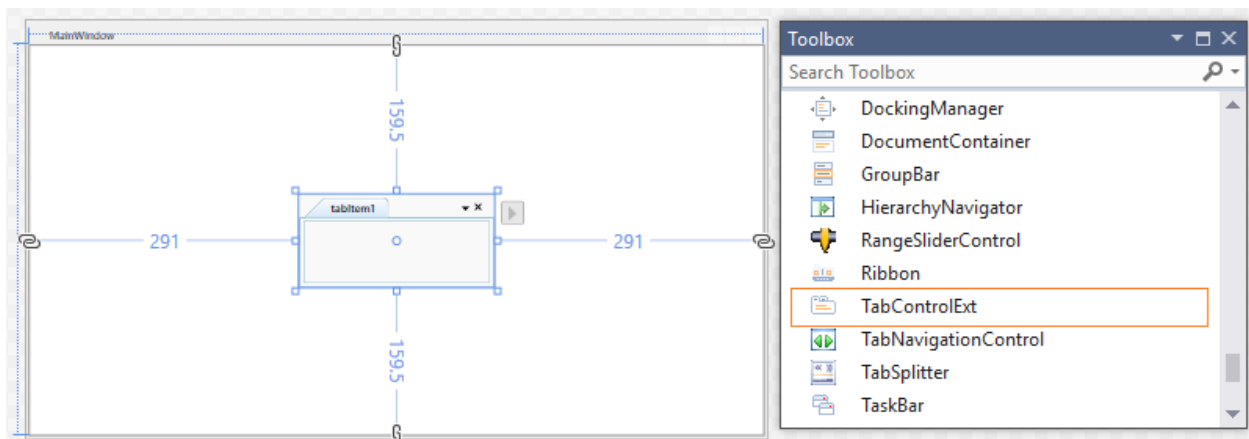

Refer to the [Control Dependencies](#) section to get the list of assemblies or NuGet package that needs to be added as a reference to use the control in any application.

Refer to this [documentation](#) to find more details about installing nuget packages in a WPF application.

Adding WPF TabControl via designer

You can add the **TabControl** control to an application by dragging it from the toolbox to a view of the designer. The following dependent assembly will be added automatically.

- Syncfusion.Tools.WPF
- Syncfusion.Shared.WPF

Adding WPF TabControl via XAML

To add the **TabControl** manually in XAML, follow these steps:

1) Create a new WPF project in Visual Studio. 2) Add the following required assembly references to the project: *Syncfusion.Tools.WPF* *Syncfusion.Shared.WPF* 3) Import Syncfusion WPF schema <http://schemas.syncfusion.com/wpf>, and declare the **TabControl** in XAML page.

XML

```
<Window x:Class="TabControlExt_sample.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
```

```
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:TabControlExt_sample"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
mc:Ignorable="d"
Title="MainWindow" Height="450" Width="800">
<Grid Name="grid">
<syncfusion:TabControlExt Name="tabControl" Height="100" Width="280" />
</Grid>
```

Adding WPF TabControl via C#

To add the [TabControl](#) control manually in C#, follow these steps:

1. Create a new WPF application via Visual Studio.
2. Add the following assembly references to the project,
 - o Syncfusion.Shared.WPF
3. Include the required namespace and create an instance of `TabControl` and add it to the window.
4. Declare the `TabControl` control using C#.

C#

```
using Syncfusion.Windows.Tools.Controls;
public partial class MainWindow : Window {
public MainWindow() {
InitializeComponent();
// Creating an instance of the TabControl
TabControlExt tabControlExt = new TabControlExt();
// Setting height and width to TabControl
tabControlExt.Height = 100;
tabControlExt.Width = 280;
//Adding TabControl as window content
this.Content = tabControlExt;
}
}
```

Adding TabItem

You can add the tab item using the `Items` property of `TabControl`. You can set the tab item name using `TabItemExt` property and add the content to each tab item by using `TabItemExt.Content` property.

XML

```
<syncfusion:TabControlExt Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1">
<TextBlock Name="textBlock" Text="This is the first tab item." />
</syncfusion:TabItemExt>
<syncfusion:TabItemExt Header="tabItem2">
```

```

<TextBlock Name="textBlock1" Text="This is the second tab item." />
</syncfusion:TabItemExt>
<syncfusion:TabItemExt Header="tabItem3">
<TextBlock Name="textBlock2" Text="This is the third tab item." />
</syncfusion:TabItemExt>
</syncfusion:TabControlExt>

```

C#

```

// Creating an instances of tabitems and adding header & content
TabItemExt tabItemExt1 = new TabItemExt()
{
    Header= "tabItem1",
    Content= new TextBlock() { Text= "This is the first tab item" }
};
TabItemExt tabItemExt2 = new TabItemExt()
{
    Header= "tabItem2",
    Content= new TextBlock() { Text= "This is the second tab item" }
};
TabItemExt tabItemExt3 = new TabItemExt()
{
    Header= "tabItem3",
    Content= new TextBlock() { Text= "This is the third tab item" }
};
// Creating an instances of TabControl and adding the tabitems into the
TabControl
TabControlExt tabControlExt = new TabControlExt();
tabControlExt.Items.Add(tabItemExt1);
tabControlExt.Items.Add(tabItemExt2);
tabControlExt.Items.Add(tabItemExt3);

```

Please refer [DataBinding](#) page to know about how to add a tab item using Data Binding.

Note: View [Sample](#) in GitHub

Placement of TabItem

You can place the tab item header at any of the four sides of **TabControl** using the [TabStripPlacement](#) property.

XML

```

<syncfusion:TabControlExt TabStripPlacement="Bottom"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
<syncfusion:TabItemExt Header="tabItem3" />
</syncfusion:TabControlExt>

```

C#

```
tabControlExt.TabStripPlacement = Dock.Bottom;
```

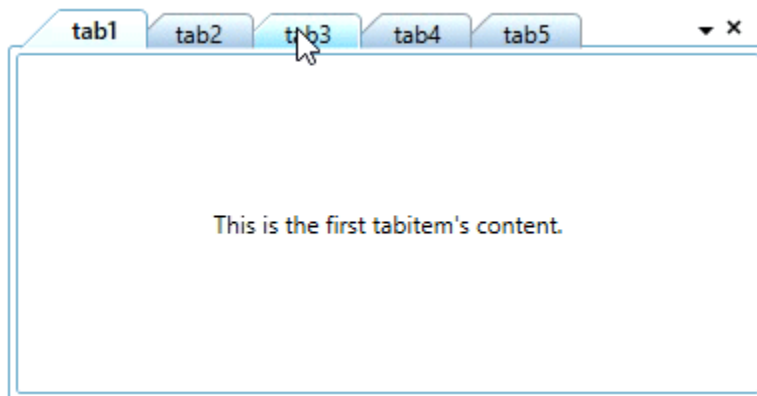

Note: View [Sample](#) in GitHub

Selecting TabItem

You can select a particular tab item by using the mouse click on the tab header. You can use the **Ctrl + Tab** key to select a tab item when control not in focused state. You also use the **Left-Arrow** and **Right-Arrow** key , to select the previous tab item or next tab item of current selected tab item when control in focused . You can get the selected item by using the **SelectedItem** property. By default, the first tab item is selected.

Note: You can select only one tab item at a time.

Note: View [Sample](#) in GitHub

Tab selection changed notification

The **TabControl** notifies that the selected tab item is changed by user through the **SelectedItemChangedEvent** event. You can use the **OldSelectedItem** and **NewSelectedItem** properties to get the old and new selected tabitem in the **SelectedItemChangedEvent** event.

XML

```
<syncfusion:TabControlExt  
    SelectedItemChangedEvent="TabControlExt_SelectedItemChangedEvent"  
    Name="tabControlExt" />
```

C#

```
TabControlExt tabControlExt = new TabControlExt();  
tabControlExt.SelectedItemChangedEvent +=  
    TabControlExt_SelectedItemChangedEvent;
```

You can handle the event as follows:

C#

```
private void TabControlExt_SelectedItemChangedEvent(object sender,  
    SelectedItemChangedEventArgs e) {  
    var newTabItem = e.NewSelectedItem.Header;  
    if (e.OldSelectedItem != null) {  
        var oldTabItem = e.OldSelectedItem.Header;  
    }  
    else {  
        var oldTabItem = string.Empty;  
    }  
}
```

Closing the tab item

TabControl allows end-users to close the tabs using close button. The close button can be displayed in Tabcontrol using [TabControlExt.CloseButtonType](#) property.

The following options are supported to show close the button in TabControl.

- **Common** - Only, TabControl shows the close button.
- **Individual** - The close button displayed only in the headers of tab items.
- **Both** - TabControl and tab items displays the close button.
- **Hide** - The close button is not visible.
- **IndividualOnMouseOver** - The close button displayed only when the mouse is over the tab item.
- **Extended** - The close button displayed only for the selected tabitem and the remaining tab item displays close button while mouse is over the tab header.

For example, when you set the TabControlExt.CloseButtonType as Both, then the close button is displayed in both TabItem and TabControl.

XML

```
<syncfusion:TabControlExt Name="tabControlExt" CloseButtonType="Both">  
    <syncfusion:TabItemExt Header="tabItem1" />  
    <syncfusion:TabItemExt Header="tabItem2" />  
</syncfusion:TabControlExt>
```

C#

```
//set `Both` option to `CloseButtonType` property.  
tabControlExt.CloseButtonType = CloseButtonType.Both;
```

Note: View [Sample](#) in GitHub

Disable particular tab close button

You can disable the users from closing on particular tab item by setting [TabItemExt.CanClose](#) property as `false`.

XML

```
<syncfusion:TabControlExt CloseButtonType="Both"
Name="tabControlExt" >
<syncfusion:TabItemExt Header="tabItem1" Name="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" Name="tabItem2"
CanClose="False" />
</syncfusion:TabControlExt>
```

C#

```
//set `Both` option to `CloseButtonType` property.
tabControlExt.CloseButtonType = CloseButtonType.Both;
//Disable the close button.
tabItem2.CanClose = false;
```

In the below screenshot, second tabitem `TabItemExt.CanClose` property is `false`. So, close button in tabitem header and `TabControl` is in disabled state for second tabitem.

Note: View [Sample](#) in GitHub

Hide particular tab close button

If you want to hide the visibility of close button in particular tab item, then you can collapse using [TabItemExt.CloseButtonState](#) property value as `Collapsed`.

XML

```
<syncfusion:TabControlExt CloseButtonType="Both"
Name="tabControlExt" >
<syncfusion:TabItemExt Header="tabItem1" Name="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" Name="tabItem2"
CloseButtonState="Collapsed"
CanClose="False" />
</syncfusion:TabControlExt>
```

C#

```
//set `Both` option to `CloseButtonType` property.
tabControlExt.CloseButtonType = CloseButtonType.Both;
//Disable the close button.
tabItem2.CanClose = false;
//Collapse the close button.
tabItem2.CloseButtonState = Collapsed;
```

Here, `tabItem2` close button is collapsed.

Note: View [Sample](#) in GitHub

Add new `TabItem` using new button

You can add the new tab item by clicking the New button. You can show the new tab button by setting the `TabControlExt.IsNewButtonEnabled` property to true in `TabControl`. The `NewButtonClick` event handles the click action of new tab button to add new tab item in `TabControl`.

XML

```
<syncfusion:TabControlExt IsNewButtonEnabled="True"
NewButtonClick="TabControlExt_NewButtonClick"
Name="tabControlExt" >
  <syncfusion:TabItemExt Header="tabItem1" />
  <syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

```
tabControlExt.IsNewButtonEnabled = true;
```

```
tabControlExt.NewButtonClick += TabControlExt_NewButtonClick;
```

C#

```
private void TabControlExt_NewButtonClick(object sender, EventArgs e) {
    TabItemExt itemExt = new TabItemExt();
    itemExt.Header = "tabItem" + (tabControlExt.Items.Count + 1);
    //Add a new item in a TabControl
    tabControlExt.Items.Add(itemExt);
}
```

Note: View [Sample](#) in GitHub

Tab list menu for switching tabs

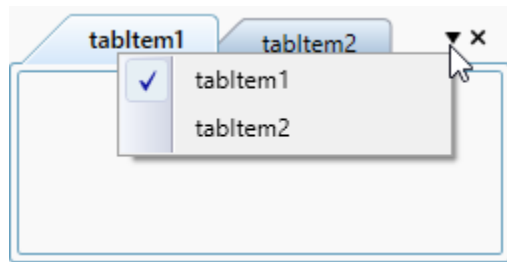

You can easily navigate to any tab item by using the tab list menu which is placed in the top-right corner of the tab header panel. The header of all tab item's are shown as a menu item in the tab list menu. You can hide this tab list menu by using the [ShowTabListContextMenu](#) property value as `false`. The default value of `ShowTabListContextMenu` property is `true`.

XML

```
<syncfusion:TabControlExt ShowTabListContextMenu="True"
Name="tabControlExt" >
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.ShowTabListContextMenu = true;
```

Note: View [Sample](#) in GitHub

Show hidden tab items

By default, all the tab items except hidden items are listed in the tab list context menu. If you want to show the hidden tab items into tab list context menu to navigate, use the [TabListContextMenuOptions](#) property value as `Default`, `ShowHiddenItems`. You can set single or multiple options for the `TabListContextMenuOptions` to show single or different types of tab items into the context menu. The default value of `TabListContextMenuOptions` property is `Default`.

XML

```
<syncfusion:TabControlExt TabListContextMenuOptions="Default,
ShowHiddenItems"
ShowTabListContextMenu="True">
```

```
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" Visibility="Collapsed"/>
<syncfusion:TabItemExt Header="tabItem2"/>
<syncfusion:TabItemExt Header="tabItem3" Visibility="Collapsed"/>
<syncfusion:TabItemExt Header="tabItem4" IsEnabled="False"/>
<syncfusion:TabItemExt Header="tabItem5"/>
<syncfusion:TabItemExt Header="tabItem6" Visibility="Collapsed"/>
</syncfusion:TabControlExt>
```

C#

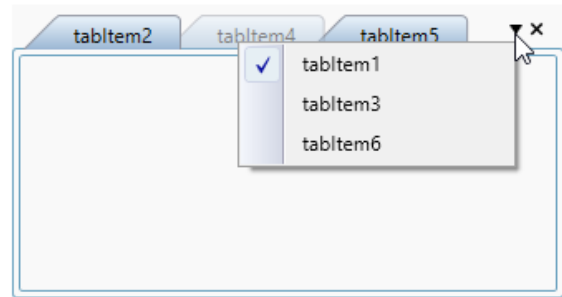

```
tabControlExt.ShowTabListContextMenu = true;
tabControlExt.TabListContextMenuOptions = TabListContextMenuOptions.Default
|
TabListContextMenuOptions.ShowHiddenItems;
```

Single options

TabListContextMenuOptions = "Default"

TabListContextMenuOptions = "ShowHiddenItems"

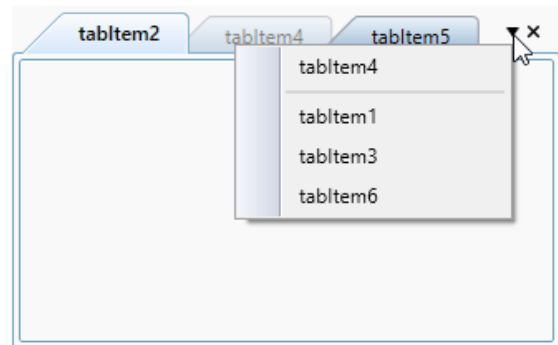

TabListContextMenuOptions = "ShowEnabledItems"

TabListContextMenuOptions = "ShowDisabledItems"

Multiple options

TabListContextMenuOptions= "Default,
ShowHiddenItems"TabListContextMenuOptions="ShowDisabledItems,
ShowHiddenItems"**Note:** View [Sample](#) in GitHub

Enable or disable tab navigation bar

You can enable or disable the the tab navigation bar in `TabControl` by using the `TabScrollButtonVisibility` property value as `Visible` or `Hidden`. You can show the different tab navigation style in `TabControl` using the `TabScrollStyle` property.

XML

```
<syncfusion:TabControlExt TabScrollButtonVisibility="Visible"
TabScrollStyle="Extended"
Name="tabControlExt" >
<syncfusion:TabItemExt Header="tabItem1" />
```

```
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.TabScrollButtonVisibility = TabScrollButtonVisibility.Visible;
tabControlExt.TabScrollStyle = TabScrollStyle.Extended;
```

Note: View [Sample](#) in GitHub

Show or hide built-in context menu

You can show the built-in context menu of the tab item by setting the [ShowTabItemContextMenu](#) property to **true** in **TabControl**.

The built-in context menu of the tab item has following menu items:

- **Close** - Closes the current or selected tab item.
- **Close All But This** - Closes all the tab items, except the current or selected tab item.
- **Close All** - Closes all the tab items.

XML

```
<syncfusion:TabControlExt ShowTabItemContextMenu="True"
Name="tabControlExt" >
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
//Changing the visibility of context menu
tabControlExt.ShowTabItemContextMenu = true;
```

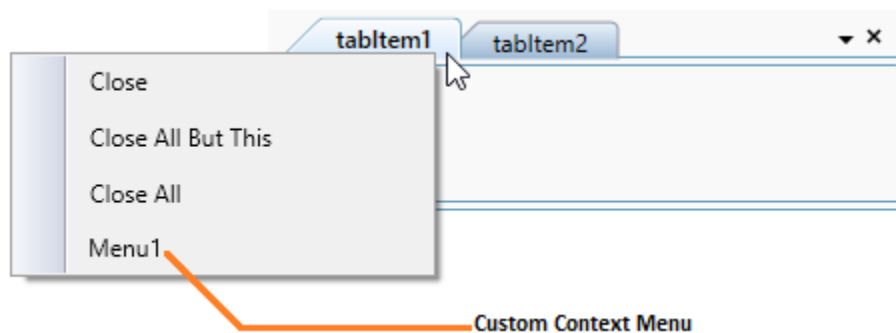

You can add custom context menu item using the [TabItemExt.ContextMenuItems](#) property in **TabControl**. This property is enabled by setting the [IsCustomTabItemContextMenuEnabled](#) property to **true**.

XML

```
<syncfusion:TabControlExt IsCustomTabItemContextMenuEnabled="True"
Name="tabControlExt">
  <syncfusion:TabItemExt Header="tabItem1" Name="tabItem1">
    <syncfusion:TabItemExt.ContextMenuItems>
      <syncfusion:CustomMenuItem Header="Menu1" />
    </syncfusion:TabItemExt.ContextMenuItems>
  </syncfusion:TabItemExt>
  <syncfusion:TabItemExt Header="tabItem2" Name="tabItem2">
    <syncfusion:TabItemExt.ContextMenuItems>
      <syncfusion:CustomMenuItem Header="Menu2" />
    </syncfusion:TabItemExt.ContextMenuItems>
  </syncfusion:TabItemExt>
</syncfusion:TabControlExt>
```

C#

```
// Enabling custom tabitem context menu
tabControlExt.IsCustomTabItemContextMenuEnabled = true;
// Adding custom context menu for the first tabitem
CustomMenuItem customMenuItem = new CustomMenuItem() { Header="Menu1" };
tabItem1.ContextMenuItems.Add(customMenuItem);
// Adding custom context menu for the second tabitem
CustomMenuItem customMenuItem1 = new CustomMenuItem() { Header = "Menu1" };
tabItem2.ContextMenuItems.Add(customMenuItem1);
```

Note: View [Sample](#) in GitHub

Localization support

Localization is the process of translating the application resources into different language for the specific cultures. You can localize the TabControl control by adding resource file for each language.

Refer the following links to know more about how provide a localization support for the TabControl,

- <https://help.syncfusion.com/wpf/localization>
- <https://github.com/syncfusion/wpf-controls-localization-resx-files>

Theme

The WPF TabControl supports various built-in themes. Refer to the below links to apply themes for the TabControl,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Note: View [Sample](#) in GitHub

DataBinding in WPF TabControl (TabControlExt)

You can add a tab item using data binding in the WPF [TabControl](#).

Adding tab items using data binding

The `TabControl` can bound to an external source to auto create tabs and display the data using `ItemsSource` property. When you are auto generating tabitem using `ItemsSource`, you need to set `HeaderTemplate` property in `ItemContainerStyle` or `ItemTemplate` to define header and use `ContentTemplate` for display the content of the tab item.

If the data source implements `INotifyCollectionChanged` interface, then `TabControl` will automatically refresh the UI when item is added, removed or cleared in the collection. When an item is added or removed in `ObservableCollection`, `TabControl` automatically refresh the UI as `ObservableCollection` implements `INotifyCollectionChanged`. But when an item is added or removed in `List`, `TabControl` will not refresh the UI automatically.

Note: To bind `ItemsSource` to `TabControl`, you need to have collection with data object which holds header and content details.

Here, `Model` class defined with `Header` and `Content` properties and `ViewModel` class has `ItemsSource` property of type `ObservableCollection<Model>`.

Note: Download demo application from [GitHub](#)

C#

```
// Model.cs
public class Model {
    public string Header { get; set; }
```

```

public string Content { get; set; }
public Model() {
}
}
//ViewModel.cs
public class ViewModel : NotificationObject {
private ObservableCollection<Model> tabItems;
public ObservableCollection<Model> TabItems {
get { return tabItems; }
set {
tabItems = value;
this.RaisePropertyChanged("TabItems");
}
}
public ViewModel() {
tabItems = new ObservableCollection<Model>();
PopulateCollection();
}
public void PopulateCollection() {
Model model1 = new Model() {
Header = "tab1",
Content = "This is the content of first tabitem."
};
Model model2 = new Model() {
Header = "tab1",
Content = "This is the content of second tabitem."
};
//Adding the tab items into the collection
tabItems.Add(model1);
tabItems.Add(model2);
}
}

```

XML

```

<Window.DataContext>
<local:ViewModel />
</Window.DataContext>
<Grid>
<syncfusion:TabControlExt ItemsSource="{Binding TabItems}"
Name="tabControlExt">
<!--Binding the header text for the Tab item-->
<syncfusion:TabControlExt.ItemContainerStyle>
<Style TargetType="syncfusion:TabItemExt">
<Setter Property="HeaderTemplate">
<Setter.Value>
<DataTemplate>
<TextBlock Text="{Binding Header, Mode=TwoWay}" />
</DataTemplate>
</Setter.Value>
</Setter>
</Style>
</syncfusion:TabControlExt.ItemContainerStyle>
<!--Binding the content for the Tab item-->
<syncfusion:TabControlExt.ContentTemplate>
<DataTemplate>

```

```
<TextBlock Text="{Binding Content}" />
</DataTemplate>
</syncfusion:TabControlExt.ContentTemplate>
</syncfusion:TabControlExt>
</Grid>
```

Note: View [Sample](#) in GitHub

TabItem Header

You can define tab item header using [ItemTemplate](#) or [HeaderTemplate](#) in [ItemContainerStyle](#) properties. Otherwise, Tab Item header will display the data object class name associated with tab item.

Note: The data object associated with tab item is the [BindingContext](#) for both [ItemContainerStyle.HeaderTemplate](#) and [ItemTemplate](#).

XML

```
<Window.DataContext>
<local:ViewModel />
</Window.DataContext>
<Grid>
<syncfusion:TabControlExt x:Name="tabControlExt"
ItemsSource="{Binding TabItems}">
<syncfusion:TabControlExt.ItemContainerStyle>
<Style TargetType="syncfusion:TabItemExt">
<Setter Property="HeaderTemplate">
<Setter.Value>
<DataTemplate>
<TextBlock Text="{Binding Header, Mode=TwoWay}" />
</DataTemplate>
</Setter.Value>
</Setter>
</Style>
</syncfusion:TabControlExt.ItemContainerStyle>
</syncfusion:TabControlExt>
</Grid>
```

Below code is used to define the tabitem header using [ItemTemplate](#) property.

XML

```
<Window.DataContext>
<local:ViewModel />
</Window.DataContext>
<Grid>
<syncfusion:TabControlExt x:Name="tabControl"
ItemsSource="{Binding TabItems}">
<syncfusion:TabControlExt.ItemTemplate>
```

```
<DataTemplate>
<TextBlock Text="{Binding Header}"/>
</DataTemplate>
</syncfusion:TabControlExt.ItemTemplate>
</syncfusion:TabControlExt>
</Grid>
```

Note: View [Sample](#) in GitHub

TabItem content

You can define the tab item content using `ContentTemplate` property. Otherwise, Tab item content will display the data object class name which is associated with tab item.

XML

```
<Window.DataContext>
<local:ViewModel />
</Window.DataContext>
<Grid>
<syncfusion:TabControlExt x:Name="tabControl"
ItemsSource="{Binding TabItems}">
<syncfusion:TabControlExt.ContentTemplate>
<DataTemplate>
<TextBlock Text="{Binding Content}" />
</DataTemplate>
</syncfusion:TabControlExt.ContentTemplate>
</syncfusion:TabControlExt>
</Grid>
```

Editing tab header

By default, built-in `TextBox` is used as editor for the tab item header editing. You can customize the editing tab item header appearance for the each tab items by using the [EditHeaderTemplate](#) property.

XML

```
<Window.DataContext>
<local:ViewModel />
</Window.DataContext>
<Grid>
```

```

<syncfusion:TabControlExt ItemsSource="{Binding TabItems}"
Name="tabControlExt"
Margin="20">
<syncfusion:TabControlExt.ItemContainerStyle>
<Style TargetType="syncfusion:TabItemExt">
<Setter Property="HeaderTemplate">
<Setter.Value>
<DataTemplate>
<TextBlock Text="{Binding Header}" />
</DataTemplate>
</Setter.Value>
</Setter>
<Setter Property="Content"
Value="{Binding Content}" />
</Style>
</syncfusion:TabControlExt.ItemContainerStyle>
<!--Custom UI for edit header template-->
<syncfusion:TabControlExt.EditHeaderTemplate>
<DataTemplate>
<TextBox Text="{Binding Header, Mode=TwoWay}"
Background="Red"
Foreground="White" />
</DataTemplate>
</syncfusion:TabControlExt.EditHeaderTemplate>
</syncfusion:TabControlExt>
</Grid>

```

Note: View [Sample](#) in GitHub

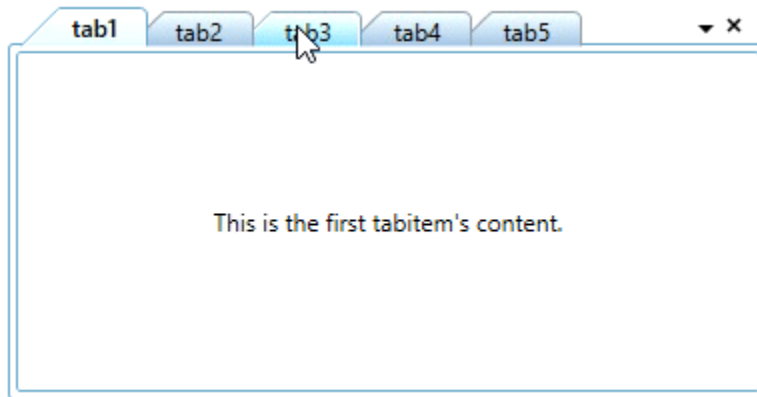

Select tab in WPF TabControl (TabControlExt)

This section explains how to select tab item and selection functionalities in the [TabControl](#).

Select tab item using mouse or keyboard

You can select a particular tab item by using the mouse click on the tab header. You can use the **Ctrl + Tab** key to select a next tab item when control not in focused state. You also use the **Left-Arrow** and **Right-Arrow** key , to select the previous tab item or next tab item of current selected tab item when control in focused state. You can get the selected item by using the **SelectedItem** property. By default, the first tab item is selected.

Note: You can select only one tab item at a time.

Tab selection changed notification

The `TabControl` notifies that the selected tabitem is changed by user through the [SelectedItemChangedEvent](#) event. You can use the [OldSelectedItem](#) and [NewSelectedItem](#) properties to get the old and new selected tabitem in the `SelectedItemChangedEvent` event.

XML

```
<syncfusion:TabControlExt
    SelectedItemChangedEvent="TabControlExt_SelectedItemChangedEvent"
    Name="tabControlExt" />
```

C#

```
TabControlExt tabControlExt = new TabControlExt();
tabControlExt.SelectedItemChangedEvent +=
    TabControlExt_SelectedItemChangedEvent;
```

You can handle the event as follows:

C#

```
private void TabControlExt_SelectedItemChangedEvent(object sender,
    SelectedItemChangedEventArgs e) {
    var newTabItem = e.NewSelectedItem.Header;
    if (e.OldSelectedItem != null) {
        var oldTabItem = e.OldSelectedItem.Header;
    }
    else {
        var oldTabItem = string.Empty;
    }
}
```

Load the previously selected tab item content

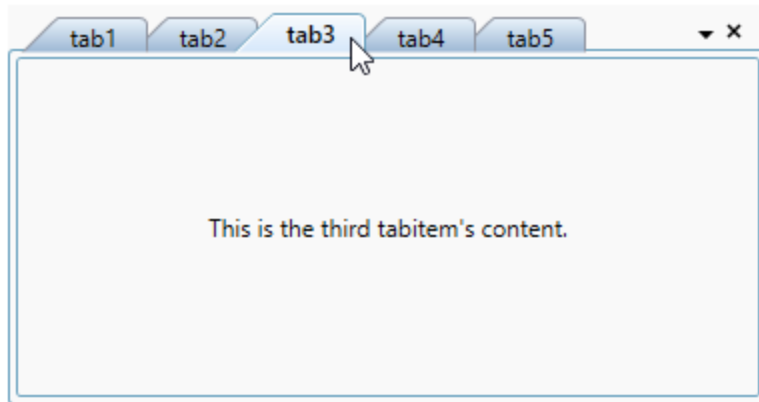

If you want to load the previously selected tab item in background after new tab item is selected, use the [IsDisableUnloadTabItemExtContent](#) property value as `true`. The default value of `IsDisableUnloadTabItemExtContent` property is `false`.

XML

```
<syncfusion:TabControlExt IsDisableUnloadTabItemExtContent="True"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tab1" Name="tabItemExt1"/>
<syncfusion:TabItemExt Header="tab2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.IsDisableUnloadTabItemExtContent = true;
```

Note: View [Sample](#) in GitHub

Display mode of the selected tab item

If you want to show tab items without its headers in the **TabControl**, use the [FullScreenMode](#) property. If you set **FullScreenMode** property value as **ControlMode**, then it will auto hide headers and show it only on when hover the mouse on respective tab header placed area. You can also display the **TabControl** in the full window by setting the **FullScreenMode** property value as **WindowMode**. The default value of **FullScreenMode** property is **None**.

XML

```
<syncfusion:TabControlExt FullScreenMode="ControlMode"
TabStripPlacement="Bottom"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
<syncfusion:TabItemExt Header="tabItem3" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.FullScreenMode = FullScreenMode.ControlMode;
tabControlExt.TabStripPlacement = Dock.Bottom;
```

Customize selected tab item header

You can change the selected tab item header font weight, background and foreground.

Change selected tab header font weight

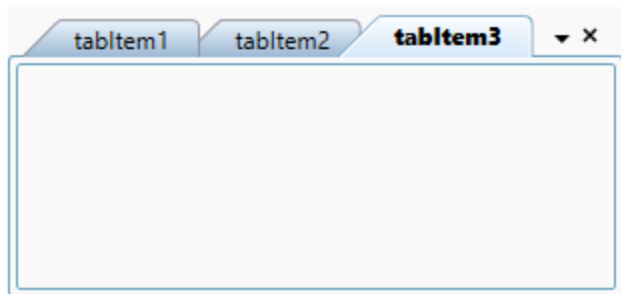

If you want to highlight the selected tab header, change the font of tab header from semi bold to extra bold by using the [SelectedItemFontWeight](#) property. The default value of `SelectedItemFontWeight` property is `SemiBold`.

XML

```
<syncfusion:TabControlExt SelectedItemFontWeight="ExtraBold"
Name="tabControlExt">
  <syncfusion:TabItemExt Header="tabItem1" Name="tabItemExt1"/>
  <syncfusion:TabItemExt Header="tabItem2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.SelectedItemFontWeight = FontWeights.ExtraBold;
```

Note: View [Sample](#) in GitHub

Change selected tab header background and foreground

You can change the highlighting background and foreground of the selected tab item by using the [TabItemSelectedForeground](#) and [TabItemSelectedBackground](#) properties. The default value of `TabItemSelectedForeground` property is `Black` and `TabItemSelectedBackground` property is `Lavender`.

XML

```
<syncfusion:TabControlExt TabItemSelectedForeground="Red"
TabItemSelectedBackground="Green"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" Name="tabItemExt1"/>
<syncfusion:TabItemExt Header="tabItem2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.TabItemSelectedForeground = Brushes.Red;
tabControlExt.TabItemSelectedBackground = Brushes.Green;
```

Note: View [Sample](#) in GitHub

Close tabs in WPF TabControl (TabControlExt)

This section explains how to closing the tab item and its functionalities in the [TabControl](#).

Closing tab item

You can close the selected tab by clicking the close button which is placed top-right corner of the tab panel.

Closing tab item using mouse middle click

You can close any tab item by clicking mouse middle button on the tab item header. You can enable it by setting the [CloseTabOnMiddleClick](#) property value as `true`. The default value of `CloseTabOnMiddleClick` property is `false`.

XML

```
<syncfusion:TabControlExt CloseTabOnMiddleClick="True"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" Name="tabItemExt1"/>
<syncfusion:TabItemExt Header="tabItem2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

```
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.CloseTabOnMiddleClick = true;
```

You can also close the tab items using the default tab item context menu. Refer this [page](#) to know more about the closing the tab item using context menu.

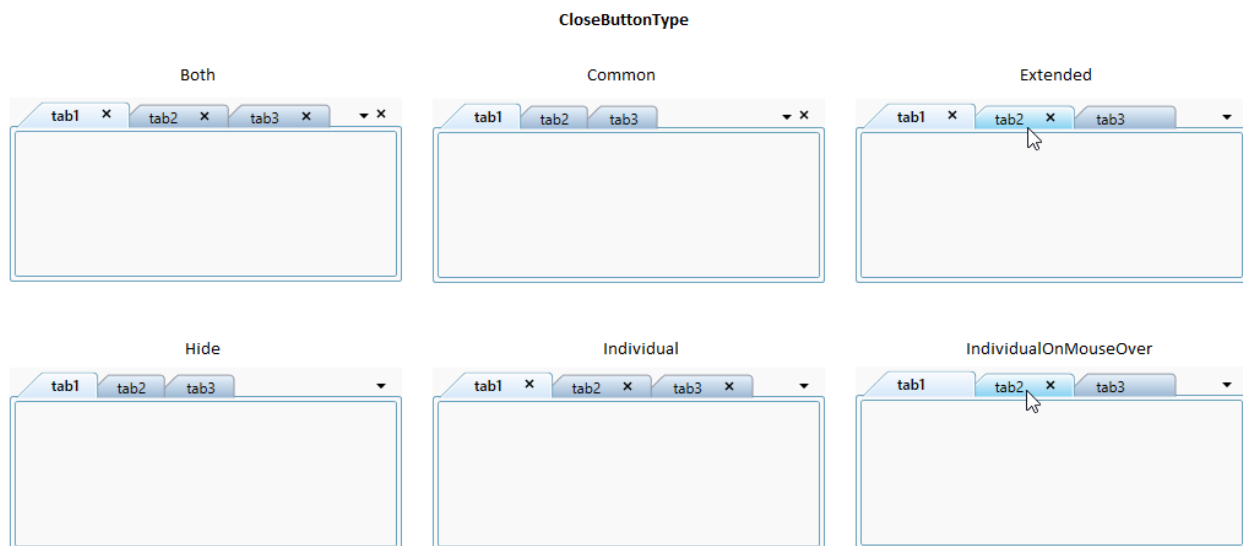

Note: View [Sample](#) in GitHub

Show or hide close button

You can show or hide the close button in each tabs and tab panel by using the [CloseButtonType](#) property.

The following Close button modes are supported by the **TabControl**.

- Common – The single close button is displayed commonly for all tab items in the tab panel.
- Individual – The close button is displayed individually for each tab items in the tab panel.
- Both – The close button is displayed individually for each tab item and also displayed in the tab panel.
- Hide – All close buttons is hidden in the tab panel.
- IndividualOnMouseOver - The close button is displayed when the mouse hovers over the tab item in the tab panel.
- Extended - The Close button is displayed in the selected tab and mousing hovering tab in the tab panel.

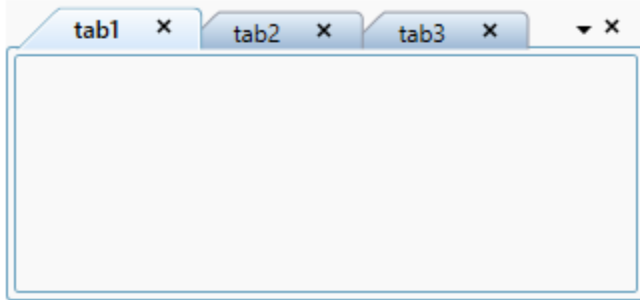

XML

```
<syncfusion:TabControlExt CloseButtonType="Both"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tab1" Name="tabItemExt1"/>
<syncfusion:TabItemExt Header="tab2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.CloseButtonType = CloseButtonType.Both;
```

Note: View [Sample](#) in GitHub

Show or hide close button for specific tab item

You can show or hide close button for particular tab item by using the [TabItemExt.CloseButtonState](#) property. The `TabItemExt.CloseButtonState` is effective only when the `CloseButtonType` property is set to one among `Individual`, `Extended`, or `Both`.

CloseButtonState	Description
Visible	The close button of TabItemExt is visible
Collapsed	The close button of TabItemExt is collapsed

XML

```
<syncfusion:TabControlExt CloseButtonType="Both"
Name="tabControlExt">
  <syncfusion:TabItemExt CloseButtonState="Visible"
Header="tabItem1" Name="tabItemExt1"/>
  <syncfusion:TabItemExt CloseButtonState="Collapsed"
Header="tabItem2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.CloseButtonType = CloseButtonType.Both;
//Changing the particular item close button visibility
tabItemExt1.CloseButtonState = Visibility.Visible;
tabItemExt2.CloseButtonState = Visibility.Collapsed;
```

Note: View [Sample](#) in GitHub

Restrict or allow closing the tab item

You can restrict or allow the tab item closing by using either property or event.

Restrict closing the tab item using property

You can restrict the closing functionality of specific tab item using the [TabItemExt.CanClose](#) property. When the `TabItemExt.CanClose` property is set to `false`, the corresponding tab item will be non-closable. The default value of `TabItemExt.CanClose` property is `true`.

XML

```
<syncfusion:TabControlExt CloseButtonType="Individual"
    Name="tabControlExt">
  <syncfusion:TabItemExt CanClose="False"
    Header="tabItem1" Name="tabItemExt1"/>
  <syncfusion:TabItemExt CanClose="True"
    Header="tabItem2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.CloseButtonType = CloseButtonType.Individual;
//Restrict and allow the particular item close button
tabItemExt1.CanClose = false;
tabItemExt2.CanClose = true;
```

Here, `tabItem1` cancel button is disabled.

Note: View [Sample](#) in GitHub

Restrict closing the tab item using event

The closing of tab item can be restricted by setting `e.Cancel` to `true` in [OnCloseButtonClick](#) event. `e` represents the event argument [CloseTabEventArgs](#) for `OnCloseButtonClick` event. The default value of `e.Cancel` is `false`.

XML

```
<syncfusion:TabControlExt
  OnCloseButtonClick="TabControlExt_OnCloseButtonClick" >
  <syncfusion:TabItemExt Header="tabItem1" />
  <syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.OnCloseButtonClick += TabControlExt_OnCloseButtonClick;
```

You can handle the event as follows:

C#

```
private void TabControlExt_OnCloseButtonClick(object sender,
  CloseTabEventArgs e) {
  if(e.TargetTabItem.Header.ToString() == "tabItem1") {
    e.Cancel = true;
  }
}
```

Here, `tabItem1` cannot be closed.

Note: View [Sample](#) in GitHub

Hide or delete item when closing a tab

You can decide whether the tab item can be only hidden from the view or removed from the items collection of `TabControl` by using the [CloseMode](#) property while closing it. If you set `CloseMode` property as `Hide`, the tab item will be hidden and the selection will be moved to previous index while hiding it. Also, if the property `CloseMode` is `Delete`, the tab item will be removed from the items collection and the selection will be retained in the same index while removing it. The default value of the `CloseMode` property is `Hide`.

XML

```
<syncfusion:TabControlExt CloseMode="Delete"
  Name="tabControlExt">
  <syncfusion:TabItemExt Header="tabItem1" />
  <syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.CloseMode = CloseMode.Delete;
```

Note: View [Sample](#) in GitHub

Tab item closed notification

When the tab item is closed, it will be notified by using the [TabClosed](#) event. You can get the details about the closed tab item from [CloseTabEventArgs](#).

XML

```
<syncfusion:TabControlExt TabClosed="TabControlExt_TabClosed" >
  <syncfusion:TabItemExt Header="tabItem1" />
  <syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.TabClosed += TabControlExt_TabClosed;
```

You can handle the event as follows:

C#

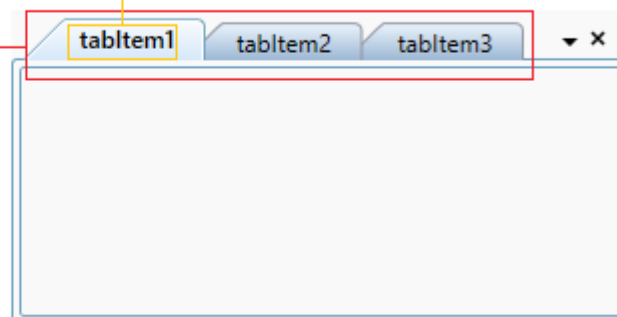

```
private void TabControlExt_TabClosed(object sender, CloseTabEventArgs e) {
    var deletedItem = e.TargetTabItem;
}
```

TabItem Header in WPF TabControl (TabControlExt)

This section explains how to set header text and UI customization of the tab header in the [TabControl](#).

Tab header text

Tabs

Setting tab item header

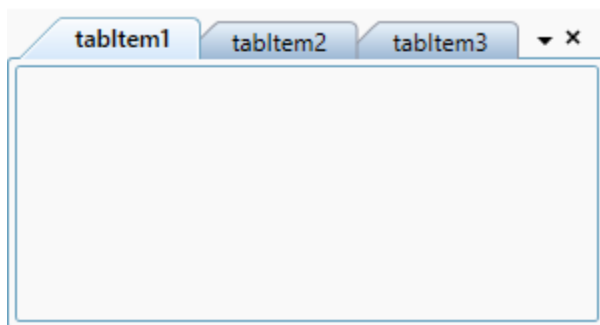

You can add a text for the each tab headers by using the `TabItemExt.Header` property.

XML

```
<syncfusion:TabControlExt Name="tabControlExt">
  <syncfusion:TabItemExt Header="tabItem1" Name="tabItemExt1"/>
  <syncfusion:TabItemExt Header="tabItem2" Name="tabItemExt2"/>
  <syncfusion:TabItemExt Header="tabItem3" Name="tabItemExt3"/>
</syncfusion:TabControlExt>
```

C#

```
// Creating an instances of tabitems and adding header
TabItemExt tabItemExt1 = new TabItemExt() { Header = "tabItem1" };
TabItemExt tabItemExt2 = new TabItemExt() { Header = "tabItem2" };
TabItemExt tabItemExt3 = new TabItemExt() { Header = "tabItem3" };
// Creating an instances of TabControl and adding the tabitems into the
TabControl
TabControlExt tabControlExt = new TabControlExt();
tabControlExt.Items.Add(tabItemExt1);
tabControlExt.Items.Add(tabItemExt2);
tabControlExt.Items.Add(tabItemExt3);
```

**Edit tab item header at runtime**

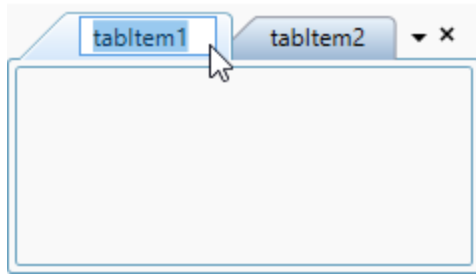

You can edit the text of the tab header at runtime by double clicking the tab header or selected a tab and pressing **Ctrl + F2** key. You can restrict all the tab header editing by using the [EnableLabelEdit](#) property value as **false**. The default value of **EnableLabelEdit** property is **true**.

XML

```
<syncfusion:TabControlExt EnableLabelEdit="True"
  Name="tabControlExt">
  <syncfusion:TabItemExt Header="tabItem1"/>
  <syncfusion:TabItemExt Header="tabItem2"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.EnableLabelEdit = true;
```

Note: View [Sample](#) in GitHub

Restrict header editing for specific tab item

If you want to restrict header editing for specific tab item, handle the [BeforeLabelEdit](#) and setting the [EnableLabelEdit](#) property as `true` for that specific tab item.

XML

```
<syncfusion:TabControlExt BeforeLabelEdit="tabControlExt_BeforeLabelEdit"
EnableLabelEdit="True"
Name="tabControlExt">
  <syncfusion:TabItemExt Header="tabItem1"/>
  <syncfusion:TabItemExt Header="tabItem2"/>
</syncfusion:TabControlExt>
```

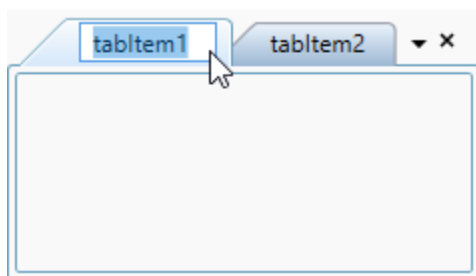

C#

```
tabControlExt.BeforeLabelEdit += tabControlExt_BeforeLabelEdit;
tabControlExt.EnableLabelEdit = true;
```

You can restrict the specific tab item as follows,

C#

```
private void tabControlExt_BeforeLabelEdit(object sender,
BeforeLabelEditEventArgs e) {
  //Restrict header editing for tabItem1
  if( e.HeaderBeforeEdit.ToString() == "tabItem1" ) {
    e.Cancel = true;
  }
}
```

Custom UI for the edit tab item header

You can customize the editing tab item header appearance for the each tab items by using the [EditHeaderTemplate](#) property.

Please refer [Editing tab header](#) topic to know more details about `EditHeaderTemplate`.

Note: View [Sample](#) in GitHub

Setting size and alignment of tab header

You can set a size of the each tabs by using the `TabItemExt.Width` and `TabItemExt.Height` properties. You can also align the header content horizontally and vertically by using the `TabItemExt.HorizontalContentAlignment` and `TabItemExt.VerticalContentAlignment` properties. The default value of `TabItemExt.HorizontalContentAlignment` and `TabItemExt.VerticalContentAlignment` properties is `Stretch`.

XML

```
<syncfusion:TabControlExt Name="tabControlExt">
  <syncfusion:TabItemExt Width="200" Height="30"
    HorizontalContentAlignment="Left"
    VerticalContentAlignment="Center"
    Header="tabItem1"
    Name="tabItemExt1"/>
  <syncfusion:TabItemExt Width="100" Height="30"
    VerticalContentAlignment="Bottom"
    HorizontalContentAlignment="Right"
    Header="tabItem2"
    Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
//Adding size and alignment of tabItemExt1 header
tabItemExt1.Width = 200;
tabItemExt1.Height = 300;
tabItemExt1.HorizontalContentAlignment = HorizontalAlignment.Left;
tabItemExt1.VerticalContentAlignment = VerticalAlignment.Center;
//Adding size and alignment of tabItemExt2 header
tabItemExt1.Width = 100;
tabItemExt1.Height = 30;
tabItemExt1.HorizontalContentAlignment = HorizontalAlignment.Right;
tabItemExt1.VerticalContentAlignment = VerticalAlignment.Bottom;
```

Setting image for tab item header

You can add images to the tab item headers by using the [TabItemExt.Image](#) property. You can change the height and width of the header image by using the [TabItemExt.ImageHeight](#) and [TabItemExt.ImageWidth](#) properties.

XML

```
<!-- Adding TabControlExt -->
<syncfusion:TabControlExt Name="tabControlExt">
  <!-- Adding TabItemExt with image -->
  <syncfusion:TabItemExt Image="sync_icon.ico"
    ImageWidth="20"
    ImageHeight="20"
    Header="TabItemExt1"
    Name="tabItemExt1">
  </syncfusion:TabItemExt>
</syncfusion:TabControlExt>
```

C#

```
//Adding header image for tabItemExt1
tabItemExt1.Image = new BitmapImage(
new Uri(@"sync_icon.ico", UriKind.RelativeOrAbsolute));
//Setting height and width for the tab header image
tabItemExt1.ImageWidth = 20;
tabItemExt1.ImageHeight = 20;
```

Note: View [Sample](#) in GitHub

Tab header image alignment

You can align the tab item header image by using the [TabItemExt.ImageAlignment](#) property. You can set a margin for the image by using the [TabItemExt.IconMargin](#) property. The default value of [TabItemExt.ImageAlignment](#) property is `LeftOfText` and [TabItemExt.IconMargin](#) property is `0,0,0,4`. You can align the image to any one of the following positions.

- `AboveText` - Images are placed above the tab item header text.
- `BelowText` - Images are placed below the tab item header text.
- `LeftOfText` - Images are placed to the left of the tab item header text.
- `RightOfText` - Images are placed to the right of the tab item header text.

XML

```
<!-- Adding TabControlExt -->
<syncfusion:TabControlExt Name="tabControlExt">
  <!-- Adding TabItemExt with image with alignment -->
  <syncfusion:TabItemExt Image="sync.png"
    ImageAlignment="AboveText"
    IconMargin= "2"
    Header="TabItemExt1"
    Name="tabItemExt1">
  </syncfusion:TabItemExt>
</syncfusion:TabControlExt>
```

C#

```
//Setting alignment for the tab header image
tabItemExt1.ImageAlignment = ImageAlignment.AboveText;
tabItemExt1.IconMargin = new Thickness(2);
```

Note: View [Sample](#) in GitHub

Setting tooltip

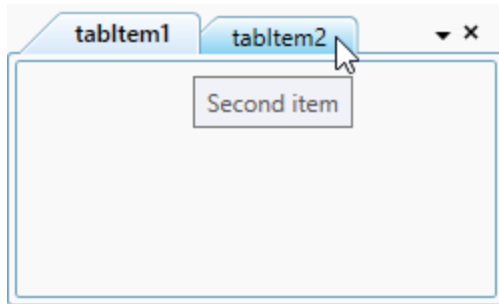

ToolTip is used to show the information about the segment, when you mouse over on the segment. You can add a tooltip information for the each tab items by using the [TabItemExt.ItemToolTip](#) property and show it by hovering the mouse on the respective header of the tab item.

XML

```
<syncfusion:TabControlExt Name="tabControlExt">
  <syncfusion:TabItemExt ItemToolTip="First item"
    Header="tabItem1" Name="tabItemExt1"/>
  <syncfusion:TabItemExt ItemToolTip="Second item"
    Header="tabItem2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
tabItemExt1.ItemToolTip = "First item";
tabItemExt2.ItemToolTip = "Second item";
```

Hide tab header when there is single tab item

You can hide the header of tab item only on when single tab item present in the `TabControl`. You can enable it by using the [HideHeaderOnSingleChild](#) property value as `true`. The Default value of `HideHeaderOnSingleChild` property is `false`.

XML

```
<syncfusion:TabControlExt HideHeaderOnSingleChild="True"
Name="tabControlExt">
  <syncfusion:TabItemExt Content="This is the first tab item"
Header="tabItem1"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.HideHeaderOnSingleChild = true;
```

Note: View [Sample](#) in GitHub

Customize tab item header

You can change the tab item header background and foreground.

Change tab item background

If you want to change the tab item and its header panel background, use the `Background` and [TabPanelBackground](#) properties. You can change the hover background of all tab headers by using the [TabItemHoverBackground](#) property. You can also change the individual tab item header background and its hover background by using the `TabItemExt.Background` and [TabItemExt.HoverBackground](#) properties.

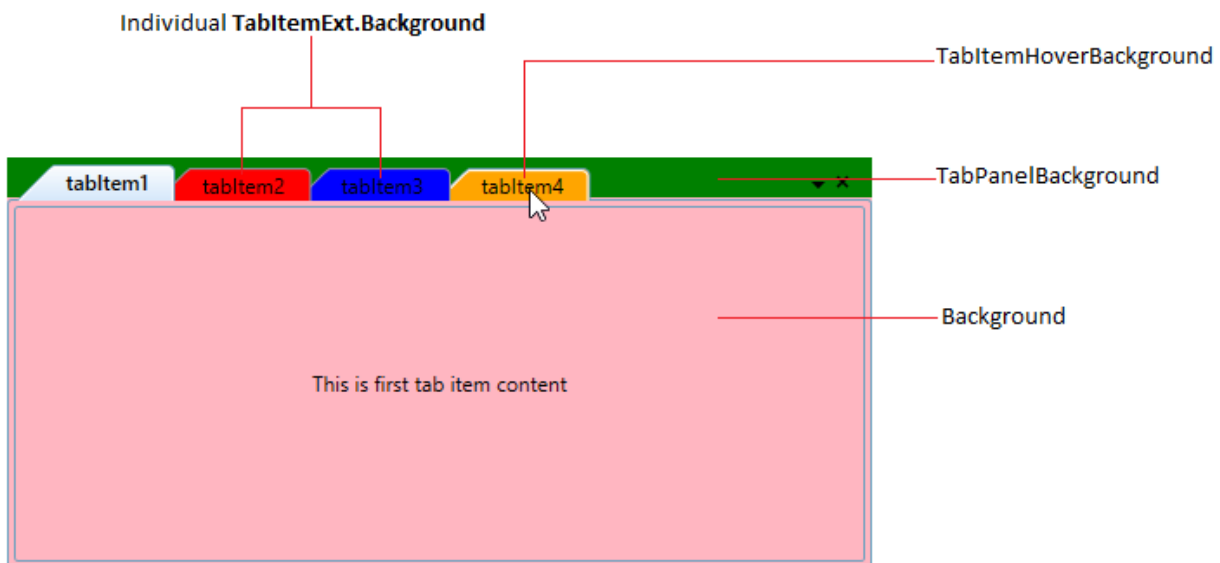

Note: If you use both `TabItemHoverBackground` and `TabItemExt.HoverBackground` for the tab item, the `TabItemExt.HoverBackground` have higher priority for that tab item.

XML

```
<syncfusion:TabControlExt Background="LightPink"
  TabPanelBackground="Green"
  TabItemHoverBackground="Orange"
  Name="tabControlExt">
  <syncfusion:TabItemExt HoverBackground="LightPink"
    Background="Red"
    Header="tabItem1"
    Name="tabItemExt1"/>
  <syncfusion:TabItemExt HoverBackground="Green"
    Background="Blue"
    Header="tabItem2"
    Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
//Setting the tab items panel, headers and its hover background
tabControlExt.Background = Brushes.LightPink;
tabControlExt.TabPanelBackground = Brushes.Green;
tabControlExt.TabItemHoverBackground = Brushes.Orange;
//Setting the header and hover background for the particular tab item
tabItemExt1.Background = Brushes.Red;
tabItemExt2.Background = Brushes.Blue;
tabItemExt1.HoverBackground = Brushes.LightPink;
tabItemExt2.HoverBackground = Brushes.Green;
```

Change tab item foreground

You can change the hover foreground of all tab headers by using the [TabItemHoverForeground](#) property. You can also change the individual tab item header foreground by using the `TabItemExt.Foreground` property. The default value of `TabItemHoverForeground` and `TabItemExt.Foreground` properties is `Black`.

XML

```
<syncfusion:TabControlExt TabItemHoverForeground="Green">
```

```

Name="tabControlExt">
<syncfusion:TabItemExt Foreground="Red"
Header="tabItem1"
Name="tabItemExt1"/>
<syncfusion:TabItemExt Foreground="Blue"
Header="tabItem2"
Name="tabItemExt2"/>
</syncfusion:TabControlExt>

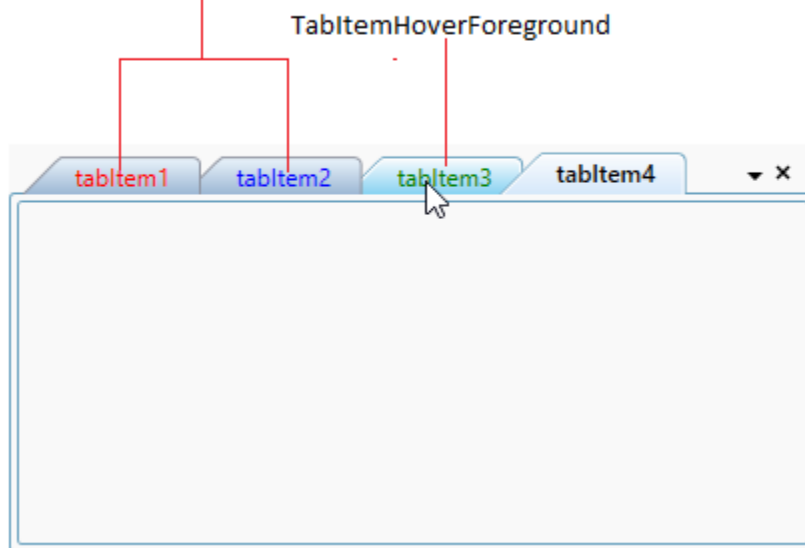

```

C#

```

//Setting the tab items hover foreground
tabControlExt.TabItemHoverForeground = Brushes.Green;
//Setting the header and item foreground for the particular tab item
tabItemExt1.Foreground = Brushes.Red;
tabItemExt2.Foreground = Brushes.Blue;

```

Individual TabItemExt.Foreground**Arrange tabs in WPF TabControl (TabControlExt)**

This section explains how to arrange the tab item and its alignment functionalities in the [TabControl](#).

Rearrange position of tab items

If you want to rearrange the tab items position, drag that item and drop to anywhere you want to place it in the tab panel. You can restrict it by setting the [AllowDragDrop](#) property value as `false`. The default value of `AllowDragDrop` property is `true`. The drag marker will preview the location, where you drop the dragged tab item.

XML

```

<syncfusion:TabControlExt AllowDragDrop="True" >
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
<syncfusion:TabItemExt Header="tabItem3" />

```

```
<syncfusion:TabItemExt Header="tabItem4" />
<syncfusion:TabItemExt Header="tabItem5" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.AllowDragDrop = true;
```

Note: View [Sample](#) in GitHub

*Rearrange position of tab items with auto scrolling*

You can easily move or rearrange tab items when there are several tab items by setting the `EnableAutoScroll` property as `true` and dragging the respective item over the overflow button (with three dots) or tab scroll buttons to autoscroll.

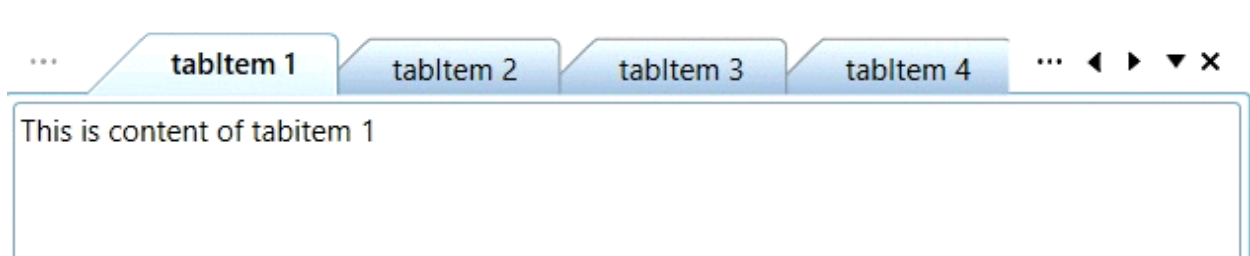

The default value of `EnableAutoScroll` property is `false`.

XML

```
<syncfusion:TabControlExt EnableAutoScroll="True">
<syncfusion:TabItemExt Header="tabItem 1" />
<syncfusion:TabItemExt Header="tabItem 2" />
<syncfusion:TabItemExt Header="tabItem 3" />
<syncfusion:TabItemExt Header="tabItem 4" />
<syncfusion:TabItemExt Header="tabItem 5" />
<syncfusion:TabItemExt Header="tabItem 6" />
<syncfusion:TabItemExt Header="tabItem 7" />
</syncfusion:TabControlExt>
```

C#

```
TabControlExt tabControlExt = new TabControlExt();
tabControlExt.EnableAutoScroll = true;
```

change drag marker color

You can change the drag marker color by setting the color value for the [DragMarkerColor](#) property. The default value of [DragMarkerColor](#) property is [Black](#).

XML

```
<syncfusion:TabControlExt DragMarkerColor="Red"
AllowDragDrop="True">
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.DragMarkerColor = Brushes.Red;
tabControlExt.AllowDragDrop = true;
```

Note: View [Sample](#) in GitHub

Tab item order changed notification

You will be notified when the tab item's order is changed by using the [TabOrderChanged](#) event. You can get the order changed item with its old and new index values by using the [TargetItem](#), [OldIndex](#) and [NewIndex](#) properties.

Note: The [TabOrderChanged](#) event occurs only during drag and drop operation. Not occurs when add or remove items interactively or using code behind.

XML

```
<syncfusion:TabControlExt TabOrderChanged="TabControlExt_TabOrderChanged"
AllowDragDrop="True" >
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
<syncfusion:TabItemExt Header="tabItem3" />
</syncfusion:TabControlExt>
```

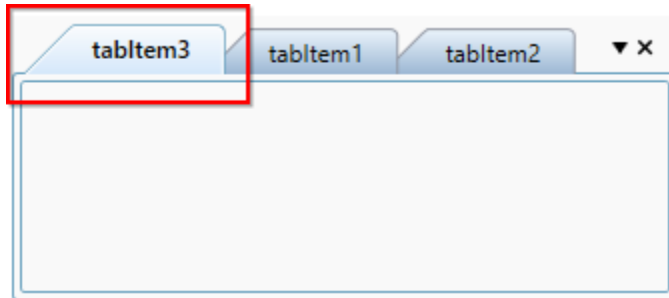

C#

```
tabControlExt.AllowDragDrop = true;
tabControlExt.TabOrderChanged += TabControlExt_TabOrderChanged;
```

You can handle the event as follows,

C#

```
private void TabControlExt_TabOrderChanged(object sender,
Syncfusion.Windows.Tools.Controls.TabOrderChangedEventArgs e)
{
    var drag_Drop_Item = e.TargetItem;
    var oldIndex = e.OldIndex;
    var newIndex = e.NewIndex;
}
```

Note: [View Sample in GitHub](#)

Restrict tab item reordering

If you want to restrict the user to reordering the tab item by drag and drop operation, use the [TabOrderChanging](#) event and set **Cancel** property value as **true**.

Note: The **TabOrderChanging** event occurs only during drag and drop operation. Not occurs when add or remove items using code behind.

XML

```
<syncfusion:TabControlExt TabOrderChanging="TabControlExt_TabOrderChanging"
AllowDragDrop="True" >
    <syncfusion:TabItemExt Header="tabItem1" />
    <syncfusion:TabItemExt Header="tabItem2" />
    <syncfusion:TabItemExt Header="tabItem3" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.AllowDragDrop = true;
tabControlExt.TabOrderChanging += TabControlExt_TabOrderChanging;
```

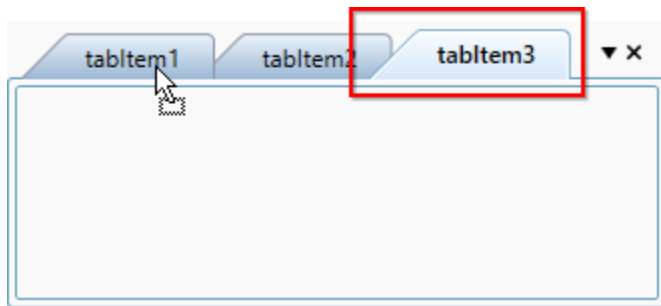

You can handle the event as follows,

C#

```
private void TabControlExt_TabOrderChanging(object sender,
Syncfusion.Windows.Tools.Controls.TabOrderChangedEventArgs e)
{
    // Restrict the Tab item order changing
    e.Cancel = true;
    var dragged_Item = e.TargetItem;
```

```
var oldIndex = e.OldIndex;  
var newIndex = e.NewIndex;  
}
```

Note: [View Sample in GitHub](#)

Tab items alignment

Tab items can be aligned to any side of the `TabControl` by using the `TabStripPlacement` property. The default value of `TabStripPlacement` property is `Top`.

The following `TabStrip` placement options are supported by the `TabControl`.

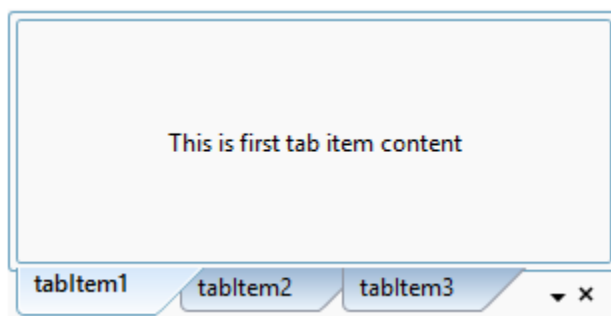

- `Top` - Tab items are placed at top of the `TabControl`.
- `Bottom` - Tab items are placed at bottom of the `TabControl`.
- `Left` - Tab items are placed at left side of the `TabControl`.
- `Right` - Tab items are placed at right side of the `TabControl`.

XML

```
<syncfusion:TabControlExt TabStripPlacement="Bottom">  
  <syncfusion:TabItemExt Header="tabItem1" />  
  <syncfusion:TabItemExt Header="tabItem2" />  
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.TabStripPlacement = Dock.Bottom;
```

Note: View [Sample](#) in GitHub

Rotating the tab items

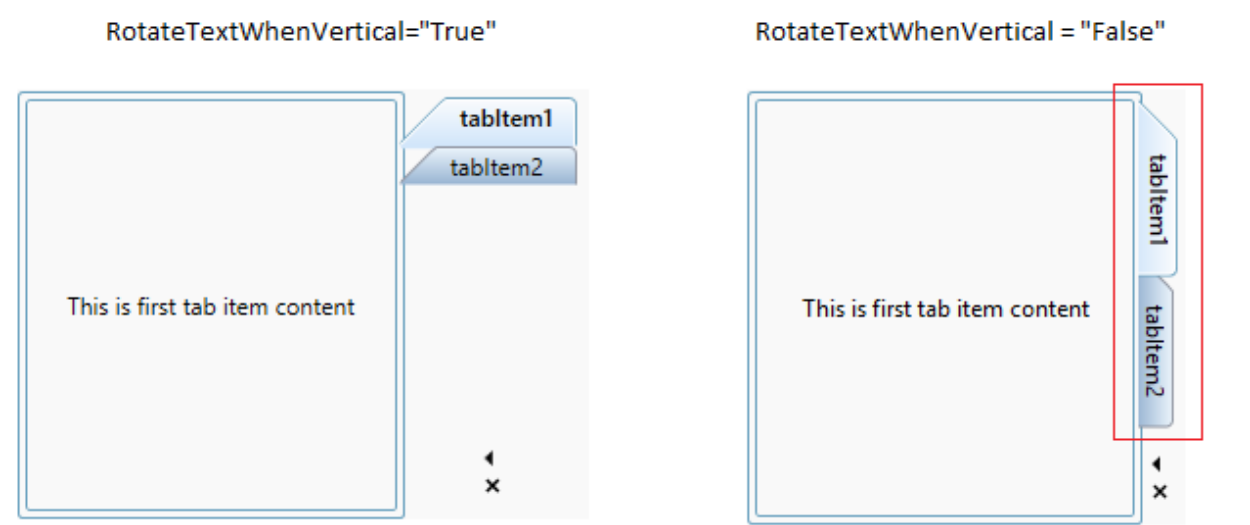

Whenever the `TabStripPlacement` is set to `Left` or `Right`, the tab headers are vertically arranged. To improve the user readability, the tab items can be rotated by using the `RotateTextWhenVertical` property as `true`. The default value of `RotateTextWhenVertical` property is `false`.

XML

```
<syncfusion:TabControlExt RotateTextWhenVertical="True"
TabStripPlacement="Right">
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.RotateTextWhenVertical = true;
tabControlExt.TabStripPlacement = Dock.Right;
```

Note: View [Sample](#) in GitHub

Arrange tab item on single or multiple lines

You can arrange the tab item in single-line or multi-line by using the `TabItemLayout` property. By default, the tab items are arranged in a single line. The default value of `TabItemLayout` property is `SingleLine`.

`TabControl` provides the following layout types.

TabItemLayout	Description	Image
SingleLine	Tabs are displayed in single line with default width. If you add more tabs and they exceed the TabControl size, then they are in hidden state and you can navigate to that hidden tabs only by using the scroll button or mouse scrolling. In this mode, each tab size not changed based on the TabControl size.	

SingleLineStar	All the tabs are visible and arranged in single line. TabControl width is equally divided by the tabs. In this mode, each tab size changed based on the TabControl size.	
MultiLine	If you want to arrange tabs with equal width in multiple tab rows , use "MultiLine" mode.	
MultiLineWithFullWidth	To eliminate the empty space at the end of the row,"MultiLineWithFullWidth" is used. Here, the tabs arranged like in multiline except they expand to fill up the empty space at last row.	
MultiLineStar	If you want to arrange the multiple tabs with equal with and without any unwanted space at last tab, use the "MultiLineStar" mode. In this mode, multiple tabs are arranged in last row to fill the empty space	

Note: MultiLineStar mode is preferable for the TabControl which contains larger width.

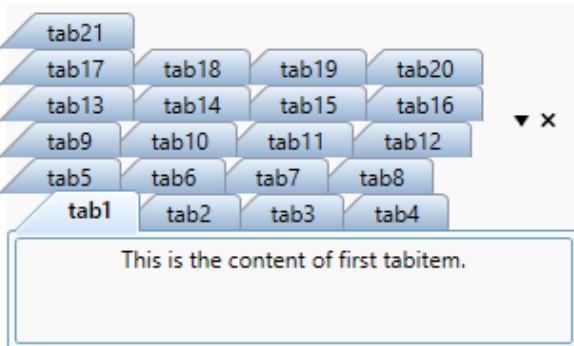

SingleLine

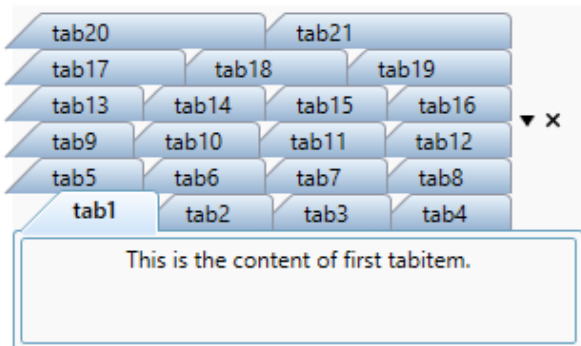

SingleLineStar

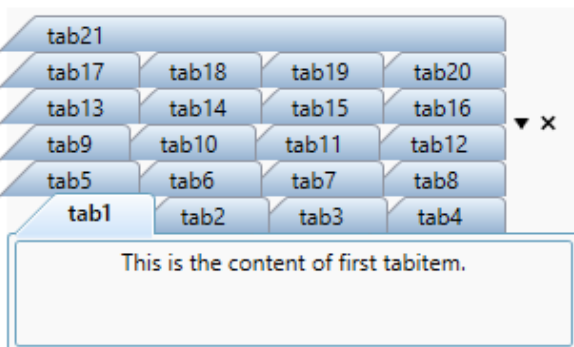

MultiLine

MultiLineStar

MultiLineWithFullWidth

Note: View [Sample](#) in GitHub

XML

```
<syncfusion:TabControlExt TabItemLayout="MultiLineStar"
Width="300"
Name="tabControlExt">
  <syncfusion:TabItemExt Header="tabItem1" />
  <syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.TabItemLayout = TabItemLayoutType.MultiLineStar;
```

Note: View [Sample](#) in GitHub

Restrict size of a TabItem

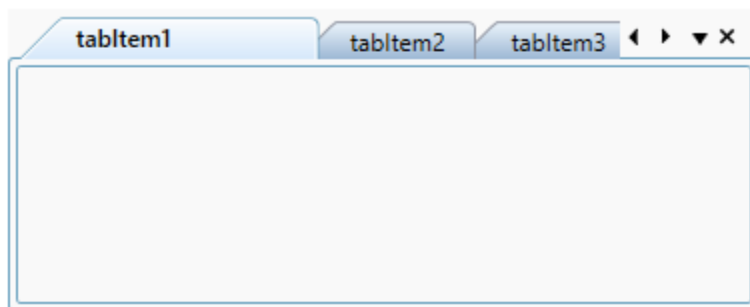

By default, size of the tab item is based on its content. When content size changes, tab item size also changes. You can restrict it for any `TabItemLayout` modes by using the `TabItemExt.Width`, `TabItemExt.MinWidth` and `TabItemExt.MaxWidth` properties. You can resize the tab item only within the `TabItemExt.MinWidth` and `TabItemExt.MaxWidth` values.

XML

```
<syncfusion:TabControlExt TabItemLayout="SingleLine"
Margin="30"
Name="tabControlExt">
<syncfusion:TabItemExt MinWidth="100"
Header="tabItem1"/>
<syncfusion:TabItemExt Header="tabItem2" />
<syncfusion:TabItemExt Header="tabItem3" />
</syncfusion:TabControlExt>
```

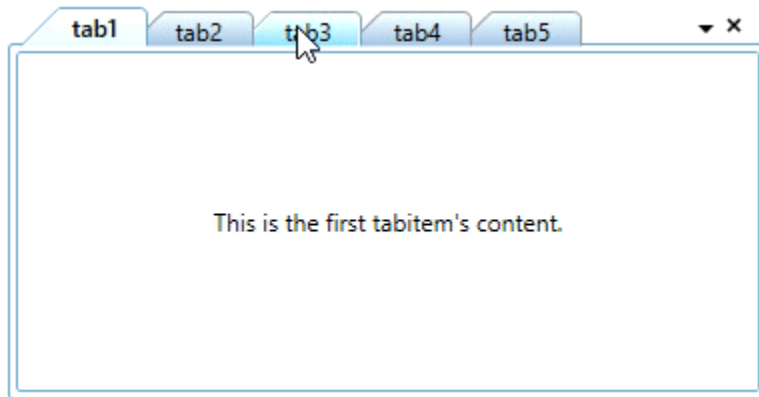

C#

```
tabControlExt.TabItemLayout = TabItemLayoutType.SingleLine;
```

Navigate using mouse or keyboard

You can navigate from one tab to any other tab by using the mouse click on the tab header. You can use the `Ctrl + Tab` key to navigate to the next tab item when control not in focused state. You also use the `Left-Arrow` and `Right-Arrow` key, to navigate the previous tab item or next tab item from the current tab item.

Navigate using scroll button

If you add more tab items, then some tab headers are collapsed. If you navigate to the collapsed tab items, click the scroll button which is placed in the top-right corner of the tab header panel. You can auto visible or hide the scroll button by using the [TabScrollButtonVisibility](#) property value as **Auto** or **Hidden**.

The following **TabScrollStyle** supported by the **TabControl** control.

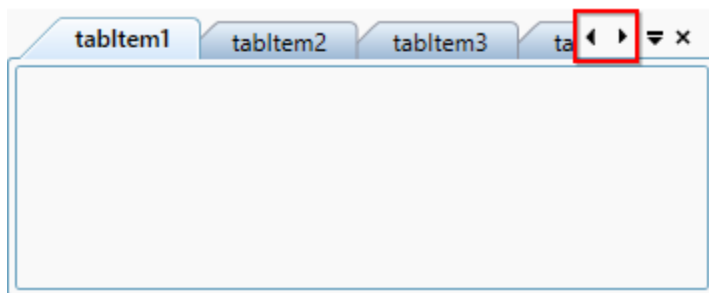

- Extended Mode - Provides the Next, Previous, Last and First navigation options
- Normal Mode – Provides the Next and Previous navigation options only

XML

```
<syncfusion:TabControlExt TabScrollButtonVisibility="Auto"
Width="300"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.TabScrollButtonVisibility = TabScrollButtonVisibility.Auto;
```

Navigate using scroll button in extended mode

You can easily navigate to first or last or next or previous tab items by setting the [TabScrollStyle](#) property value as `Extended`, then it will show the `First`, `Last`, `Next`, `Previous` button options in the scroll button. The default value of the `TabScrollStyle` property is `Normal`.

XML

```
<syncfusion:TabControlExt TabScrollButtonVisibility="Auto"
TabScrollStyle="Extended"
Width="300"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.TabScrollStyle = TabScrollStyle.Extended;
```

Note: View [Sample](#) in GitHub

Navigate using tab list menu

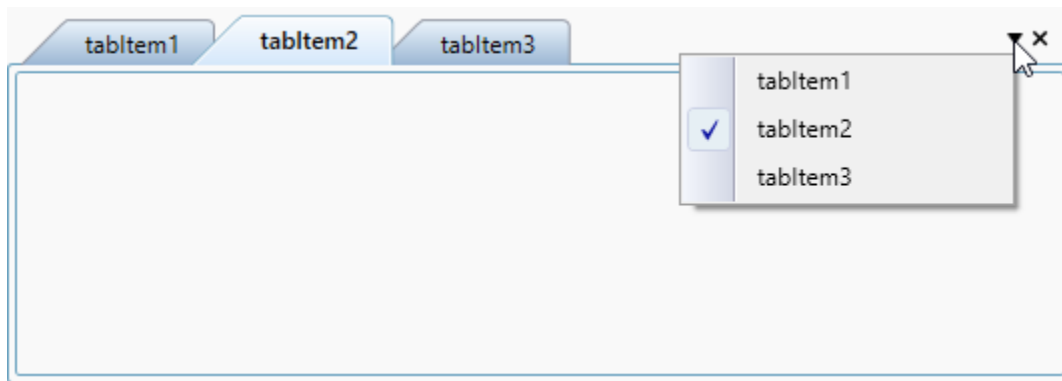

You can easily navigate to any tab item by using the tab list menu which is placed in the top-right corner of the tab header panel. The header of all tab item's are shown as a menu item in the tab list menu. You can hide this tab list menu by using the [ShowTabListContextMenu](#) property value as `false`. The default value of `ShowTabListContextMenu` property is `true`.

XML

```
<syncfusion:TabControlExt ShowTabListContextMenu="True"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.ShowTabListContextMenu = true;
```

Note: View [Sample](#) in GitHub

Scroll items using mouse wheel

You can scroll the tab items in `TabItemLayout.SingleLine` layout mode, by mouse over tab header and scroll the mouse backward or forward direction.

Pin and Unpin TabItems in WPF TabControl (TabControlExt)

This section explains the pin and unpin tab items in [TabControl](#).

Enabling pin and unpin behaviors

If you want to pin or unpin the tab items, use the `TabItemExt.AllowPin` property as `true`. When this property is set to `false`, the pin and unpin behaviors of tab item will be disabled. The default value of the `TabItemExt.AllowPin` property is `false`.

XML

```
<syncfusion:TabControlExt Name="tabControlExt">
  <syncfusion:TabItemExt AllowPin="True"
    Header="tabItem1" Name="tabItemExt1"/>
  <syncfusion:TabItemExt AllowPin="True"
    Header="tabItem2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
tabItemExt1.AllowPin = true;
tabItemExt2.AllowPin = true;
```

Note: View [Sample](#) in GitHub

Functionality of PinButton

When the corresponding tab item is pinned, it will be inserted at first position of the tab header panel(if its not have any pinned tab. Otherwise, the pinned tab item will be added next to last pinned item). When the tab item is unpinned, it will be placed after to the pinned tab items.

Pin and Unpin tab items using PinButton

If you want to pin or unpin the tab item using the pin button, use the [TabItemExt.ShowPin](#) property value as `true` and set the [TabItemExt.AllowPin](#) property value as `true`. The default value of [TabItemExt.ShowPin](#) property is `false`, so the PinButton is collapsed from header panel of the tab item.

XML

```
<syncfusion:TabControlExt Name="tabControlExt">
  <syncfusion:TabItemExt ShowPin="True"
    AllowPin="True"
    Header="tabItem1" Name="tabItemExt1"/>
  <syncfusion:TabItemExt ShowPin="True"
    AllowPin="True"
    Header="tabItem2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
//Showing the pin buttons
tabItemExt1.ShowPin = true;
tabItemExt2.ShowPin = true;
//Enabling the pin buttons
tabItemExt1.AllowPin = true;
tabItemExt2.AllowPin = true;
```

Note: If the [ShowPin](#) property is `true`, and the [AllowPin](#) property is `false`, the PinButton will be displayed as a disabled button.

Note: View [Sample](#) in GitHub

Pin and Unpin the tab items programmatically

You can pin or unpin the tab items programmatically by using the [TabItemExt.IsPinned](#) property. If the [TabItemExt.IsPinned](#) property is set to `true`, the corresponding item will be pinned. Also, if the [TabItemExt.IsPinned](#) property is set as `false` and the item is pinned, then it will be unpinned. The default value of [TabItemExt.IsPinned](#) property is `false`.

XML

```
<syncfusion:TabControlExt Name="tabControlExt">
```

```
<syncfusion:TabItemExt ShowPin="True"
AllowPin="True"
IsPinned="False"
Header="tabItem1" Name="tabItemExt1"/>
<syncfusion:TabItemExt ShowPin="True"
AllowPin="True"
IsPinned="True"
Header="tabItem2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
//Pin or unpin the tab items programmatically
tabItemExt1.IsPinned = false;
tabItemExt2.IsPinned = true;
//Showing the pin buttons
tabItemExt1.ShowPin = true;
tabItemExt2.ShowPin = true;
//Enabling the pin buttons
tabItemExt1.AllowPin = true;
tabItemExt2.AllowPin = true;
```

Note: View [Sample](#) in GitHub

Pin and Unpin tab items using ContextMenu

You can pin or unpin the tab items using the context menu. You can enable it by setting the `TabItemExt.AllowPin` property value as `true`. If the `TabItemExt.AllowPin` property is `true`, and the tab item is not pinned, "Pin Tab" option will be visible. If the tab item is pinned already, "Unpin Tab" option will be visible in the context menu.

Note: If you want to show the pin and unpin buttons, use the `TabItemExt.ShowPin` value as `true`.

XML

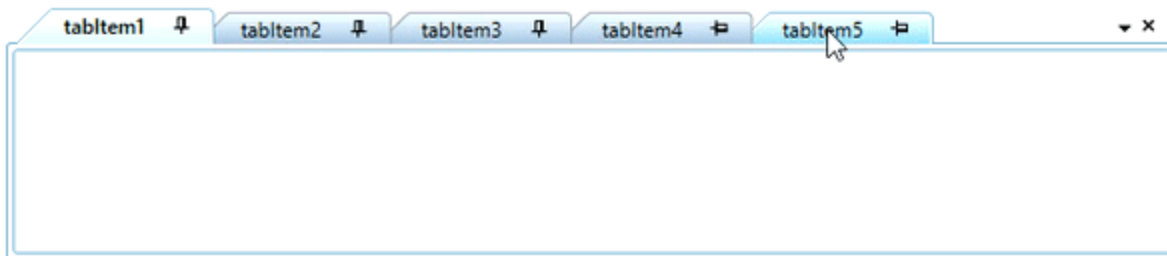

```
<syncfusion:TabControlExt Name="tabControlExt">
<syncfusion:TabItemExt ShowPin="True"
AllowPin="True"
IsPinned="False"
Header="tabItem1" Name="tabItemExt1"/>
<syncfusion:TabItemExt ShowPin="True"
AllowPin="True"
IsPinned="True"
Header="tabItem2" Name="tabItemExt2"/>
</syncfusion:TabControlExt>
```

C#

```
//Pin or unpin the tab items programmatically
tabItemExt1.IsPinned = false;
tabItemExt2.IsPinned = true;
//Showing the pin buttons
tabItemExt1.ShowPin = true;
tabItemExt2.ShowPin = true;
//Enabling the pin buttons
tabItemExt1.AllowPin = true;
tabItemExt2.AllowPin = true;
```

**Re-order pinned tabs**

You can re-order the pinned item within the pinned items and re-order the un-pinned item within the unpinned, but re-ordering between pinned and unpinned or unpinned and pinned has been restricted. If the pinned tab item is dropped inside the unpinned tab items, the dragged item will be inserted at the last position of pinned tab item and if the unpinned tab item is dropped inside pinned tab items, the dragged item will be inserted after the last pinned item. You can disable this reordering by using the `AllowDragDrop` property as `false`.

**NewButton Feature in WPF TabControl (TabControlExt)**

This section explains how to create new tab items using new button and its UI customization in the [TabControl](#).

Adding New tab button and new tab item

You can add a new tab item at runtime by clicking the new button. You can enable it by using the `IsNewButtonEnabled` property. You should handle the click action of the New Button and add a new tab items to `TabControl` by using the `NewButtonClick` event. The new button can be aligned first or last position in the tab item header panel by using the `NewButtonAlignment` property. The default value of `IsNewButtonEnabled` property is `false` and `NewButtonAlignment` property is `Last`.

XML

```
<syncfusion:TabControlExt NewButtonClick="tabControlExt_NewButtonClick"
IsNewButtonEnabled="True"
```

```

NewButtonAlignment="First"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>

```

C#

```

tabControlExt.NewButtonClick += tabControlExt_NewButtonClick;
tabControlExt.IsNewButtonEnabled = true;
tabControlExt.NewButtonAlignment = NewButtonAlignment.First;

```

You can handle the event as follows:

C#

```

private void tabControlExt_NewButtonClick(object sender, EventArgs e) {
    TabItemExt tabItemExt1 = new TabItemExt()
    {
        Header = "tabItem"+ (tabControlExt.Items.Count + 1),
        Content = new TextBlock() { Text = "This is the content area of TabItem" }
    };
    //Adding new tab item into the TabControl.
    tabControlExt.Items.Add(tabItemExt1);
}

```

Note: View [Sample](#) in GitHub

Select a new tab item while creating it by new button

If you want to select the recently creating tab item as the selected item that is created by the new button click, use [SelectOnCreatingNewItem](#) property value as `true`. You can restrict it by setting the [SelectOnCreatingNewItem](#) property value as `false`. The default value of [SelectOnCreatingNewItem](#) property is `true`.

XML

```

<syncfusion:TabControlExt SelectOnCreatingNewItem="True"
NewButtonClick="tabControlExt_NewButtonClick"
IsNewButtonEnabled="True"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>

```

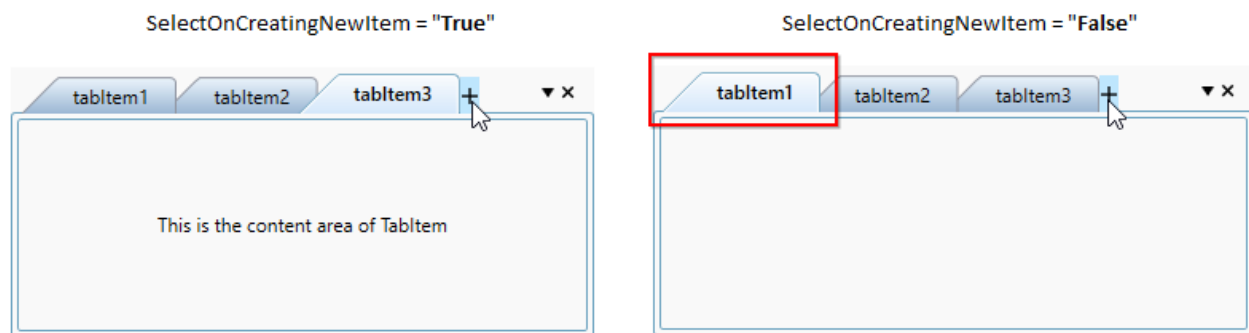

C#

```
tabControlExt.NewButtonClick += tabControlExt_NewButtonClick;
tabControlExt.IsNewButtonEnabled = true;
tabControlExt.SelectOnCreatingNewItem = true;
```

You can handle the event as follows:

C#

```
private void tabControlExt_NewButtonClick(object sender, EventArgs e) {
    TabItemExt tabItemExt1 = new TabItemExt()
    {
        Header = "tabItem" + (tabControlExt.Items.Count + 1),
        Content = new TextBlock() { Text = "This is the content area of TabItem" }
    };
    //Adding new tab item into the TabControl.
    tabControlExt.Items.Add(tabItemExt1);
}
```

Note: View [Sample](#) in GitHub

Auto hide new button when no child tab item

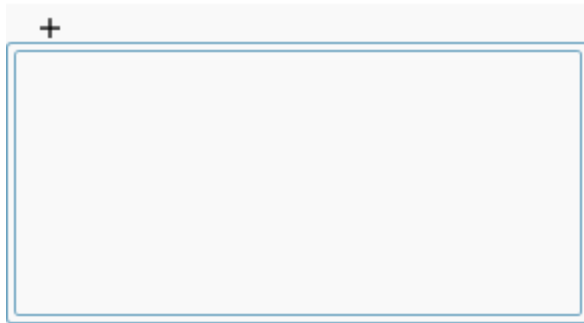

The **TabControl** automatically hides the new button on when no child tab item present in the **TabControl**. If you want to always show the new button, use the [IsNewButtonClosedonNoChild](#) property value as **false**. The default value of **IsNewButtonClosedonNoChild** property is **true**.

XML

```
<syncfusion:TabControlExt IsNewButtonClosedonNoChild="False"
IsNewButtonEnabled="True"
Name="tabControlExt">
<syncfusion:TabItemExt Content="This is the first tab item"
Header="tabItem1"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.IsNewButtonClosedonNoChild = false;
tabControlExt.IsNewButtonEnabled = true;
```

Note: View [Sample](#) in GitHub

Custom template for the new button

If you want to change the UI for the new button, use the [NewTabButtonTemplate](#) property.

XML

```
<syncfusion:TabControlExt IsNewButtonEnabled="True"
x:Name="tabControlExt">
  <syncfusion:TabControlExt.NewTabButtonTemplate>
    <DataTemplate>
      <TextBlock Background="Red"
        FontSize="14"
        TextAlignment="Center"
        Width="25" Height="25"
        Text=" + " />
    </DataTemplate>
  </syncfusion:TabControlExt.NewTabButtonTemplate>
  <syncfusion:TabItemExt Header="tabItem1" Name="tabItemExt1" />
  <syncfusion:TabItemExt Header="tabItem2" Name="tabItemExt2" />
</syncfusion:TabControlExt>
```

Note: View [Sample](#) in GitHub

Change background and border thickness of new button

If you want to change the background and border thickness of the new button, use the [NewButtonBackground](#) and [NewButtonBorderThickness](#) properties. The default value of [NewButtonBackground](#) property is `null` and property is .

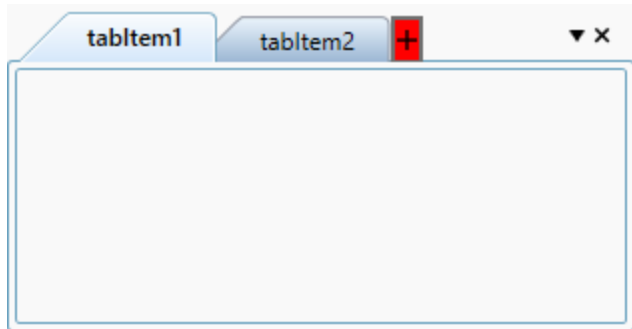

XML

```
<syncfusion:TabControlExt NewButtonBackground="Red"
  NewButtonBorderThickness="2">
```

```
Name="tabControlExt">
<syncfusion:TabItemExt Content="This is the first tab item"
Header="tabItem1"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.NewButtonBackground = Brushes.Red;
tabControlExt.NewButtonBorderThickness = new Thickness(2);
```

Note: View [Sample](#) in GitHub

Context menu in WPF TabControl (TabControlExt)

This section explains how to show the tab list and tab item context menu and add custom context menu in [TabControl](#).

Default tab item context menu

You can close the one or more tab items by using the context menu. You can enable it by using the [ShowTabItemContextMenu](#) property to true. You can open this context menu by right click on tab header. The default value of ShowTabItemContextMenu property is false.

The built-in tabitem context menu has the following menu items:

- **Close** - Closes the selected tab item.
- **Close All But This** - Closes all the tab items, except the selected tab item.
- **Close All** - Closes all the tab items.

Note: The [CloseMode](#) in [TabControl](#) is an enum that includes option **Hide** and **Delete**. When you click any default options (Close, Close All and Close All But This) in tabitem context menu and when the [CloseMode](#) is set to **Hide**, the tabitem moves to the hidden state or when the [CloseMode](#) is set to **Delete**, the tabitem is completely deleted from [TabControl](#).

XML

```
<syncfusion:TabControlExt ShowTabItemContextMenu="True"
CloseMode="Hide"
Name="tabControlExt">
<syncfusion:TabItemExt Content="This is the first tab item"
Header="tabItem1"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.ShowTabItemContextMenu = true;
tabControlExt.CloseMode = CloseMode.Hide;
```

Note: View [Sample](#) in GitHub

Tab item context menu events

Closing the tab items using the context menu can be notified by following events.

- Close option - [OnCloseButtonClick](#) event
- Close All But This option - [OnCloseOtherTabs](#) event
- Close All option - [OnCloseAllTabs](#) event.

You can use the [CloseTabEventArgs.ClosingTabItems](#) property to find out which tabitem is closing from the [OnCloseOtherTabs](#) and [OnCloseAllTabs](#) events and use the [CloseTabEventArgs.TargetTabItem](#) property to find out which tabitem is closing from the [OnCloseButtonClick](#) event.

XML

```
<syncfusion:TabControlExt OnCloseAllTabs="TabControlExt_OnCloseAllTabs"
OnCloseButtonClick="TabControlExt_OnCloseButtonClick"
OnCloseOtherTabs="TabControlExt_OnCloseAllTabs"
Name="tabControlExt">
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.OnCloseAllTabs += TabControlExt_OnCloseAllTabs;
tabControlExt.OnCloseButtonClick += TabControlExt_OnCloseButtonClick;
tabControlExt.OnCloseOtherTabs += TabControlExt_OnCloseOtherTabs;
```

You can handle this events as follows,

C#

```
private void TabControlExt_OnCloseAllTabs(object sender, CloseTabEventArgs
e) {
var closingTabItems = e.ClosingTabItems;
}
```

```
private void TabControlExt_OnCloseButtonClick(object sender,
CloseTabEventArgs e) {
    var closingTabItem = e.TargetTabItem;
}
private void TabControlExt_OnCloseOtherTabs(object sender, CloseTabEventArgs
e) {
    var closingTabItems = e.ClosingTabItems;
}
```

Custom context menu item for the tab items

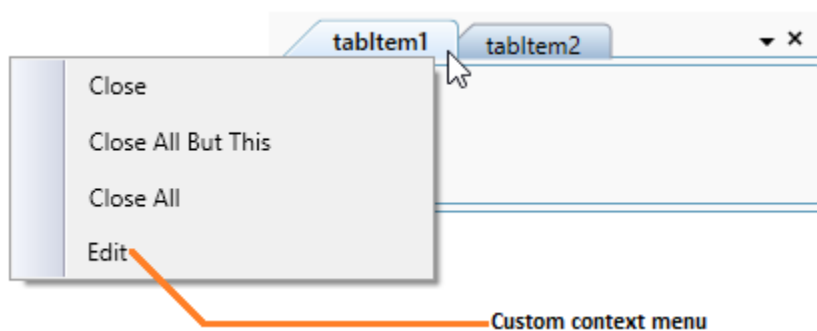

You can add the custom context menu item for the tab item using the [TabItemExt.ContextMenuItems](#) property. You can perform any operation by handling the [CustomMenuItem.Click](#) event. You can enable it by setting the [TabControlExt.IsCustomTabItemContextMenuEnabled](#) property to true. The default value of [TabControlExt.IsCustomTabItemContextMenuEnabled](#) property is false.

XML

```
<syncfusion:TabControlExt IsCustomTabItemContextMenuEnabled="True"
Name="tabControlExt" >
    <syncfusion:TabItemExt Header="tabItem1">
        <!--Adding custom context menu items-->
        <syncfusion:TabItemExt.ContextMenuItems>
            <syncfusion:CustomMenuItem Header="Edit" />
        </syncfusion:TabItemExt.ContextMenuItems>
    </syncfusion:TabItemExt>
</syncfusion:TabControlExt>
```

C#

```
// Enable custom tabitem context menu
tabControlExt.IsCustomTabItemContextMenuEnabled = true;
// Adding custom context menu for the tabitem
CustomMenuItem customMenuItem = new CustomMenuItem();
customMenuItem.Header = "Edit";
tabItemExt1.ContextMenuItems.Add(customMenuItem);
```

Note: View [Sample](#) in GitHub

Check or uncheck the custom context menu items

You can check or uncheck the custom menu items by using [CustomMenuItem.IsChecked](#) property. You can disable the checkable functionalities of the custom context menu item by using the

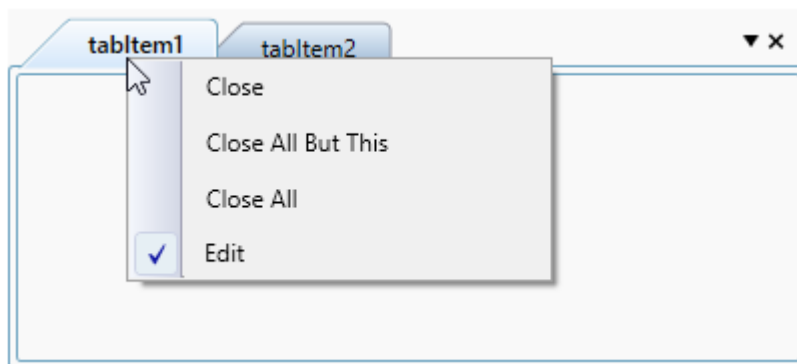

CustomMenuItem.IsCheckedable property value as false. The default value of CustomMenuItem.IsCheckedable property is true and CustomMenuItem.IsChecked property value is false.

XML

```
<syncfusion:TabControlExt IsCustomTabItemContextMenuEnabled="True"
Name="tabControlExt" >
<syncfusion:TabItemExt Header="tabItem1">
<!--Adding custom context menu items-->
<syncfusion:TabItemExt.ContextMenuItems>
<syncfusion:CustomMenuItem Header="Edit"
IsChecked="True"
IsCheckable="True" />
</syncfusion:TabItemExt.ContextMenuItems>
</syncfusion:TabItemExt>
</syncfusion:TabControlExt>
```

C#

```
// Enable custom tabitem context menu
tabControlExt.IsCustomTabItemContextMenuEnabled = true;
// Adding custom context menu for the tabitem
CustomMenuItem customMenuItem = new CustomMenuItem();
customMenuItem.Header = "Edit";
customMenuItem.IsCheckedable = true;
customMenuItem.IsChecked = true;
tabItemExt1.ContextMenuItems.Add(customMenuItem);
```

Note: View [Sample](#) in GitHub

Adding sub menu items for custom context menu item

You can add sub menu items for custom context menu item with any level by adding that sub CustomMenuItem to the parent CustomMenuItem.

XML

```
<syncfusion:TabControlExt IsCustomTabItemContextMenuEnabled="True"
Name="tabControlExt" >
<syncfusion:TabItemExt Name="tabItem1" Header="tabItem1">
<syncfusion:TabItemExt.ContextMenuItems>
<syncfusion:CustomMenuItem Header="Edit">
<!--Adding sub custom context menu items-->
```

```

<syncfusion:CustomMenuItem Header="SubItem0"/>
<syncfusion:CustomMenuItem Header="SubItem1"/>
<syncfusion:CustomMenuItem Header="SubItem2">
<syncfusion:CustomMenuItem Header="Level 2"/>
</syncfusion:CustomMenuItem>
</syncfusion:CustomMenuItem>
</syncfusion:TabItemExt.ContextMenuItems>
</syncfusion:TabItemExt>
<syncfusion:TabItemExt Name="tabItem2" Header="tabItem2">
<syncfusion:TabItemExt.ContextMenuItems>
<syncfusion:CustomMenuItem Header="Edit">
<!--Adding sub custom context menu items-->
<syncfusion:CustomMenuItem Header="SubItem0"/>
<syncfusion:CustomMenuItem Header="SubItem1"/>
<syncfusion:CustomMenuItem Header="SubItem2">
<syncfusion:CustomMenuItem Header="Level 2"/>
</syncfusion:CustomMenuItem>
</syncfusion:CustomMenuItem>
</syncfusion:TabItemExt.ContextMenuItems>
</syncfusion:TabItemExt>
</syncfusion:TabControlExt>

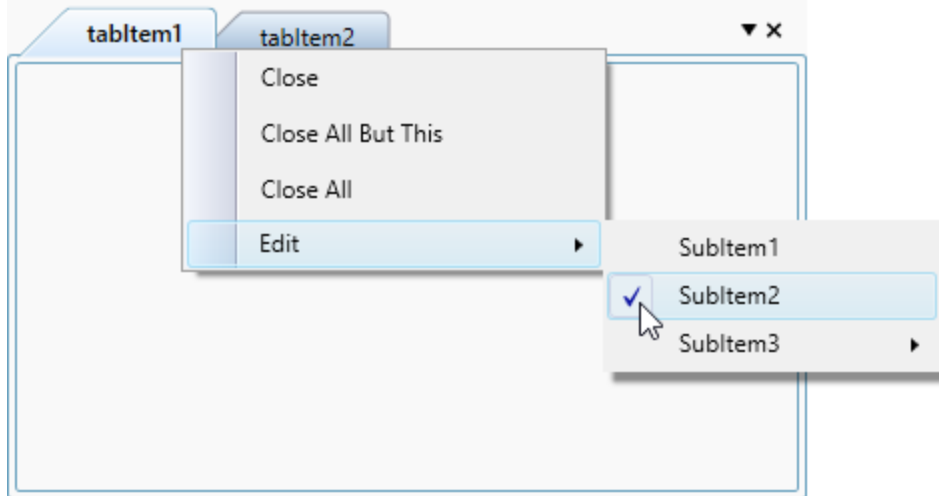

```

C#

```

// Enable custom tabitem context menu
tabControlExt.IsCustomTabItemContextMenuEnabled = true;
CustomMenuItem editMenuItem = new CustomMenuItem() { Header = "Edit" };
CustomMenuItem customMenuItem1 = new CustomMenuItem() { Header = "SubItem1"
};
CustomMenuItem customMenuItem2 = new CustomMenuItem() { Header = "SubItem2"
};
CustomMenuItem customMenuItem3 = new CustomMenuItem() { Header = "SubItem3"
};
//Adding sub menu items for 'SubItem3' custom menu item
CustomMenuItem level2_customMenuItem = new CustomMenuItem() { Header =
"Level 2" };
customMenuItem3.Items.Add(level2_customMenuItem);
//Adding sub menu items
editMenuItem.Items.Add(customMenuItem1);
editMenuItem.Items.Add(customMenuItem2);
editMenuItem.Items.Add(customMenuItem3);
tabItem1.ContextMenuItems.Add(editMenuItem);
tabItem2.ContextMenuItems.Add(editMenuItem);

```

Note: View [Sample](#) in GitHub

Hide default context menu items

If you want to show only custom context menu items in the default context menu, then you can hide the default context menu item using [TabControlExt.DefaultContextMenuItemsVisibility](#) property value as false. The default value of [TabControlExt.DefaultContextMenuItemsVisibility](#) property is true.

XML

```
<syncfusion:TabControlExt IsCustomTabItemContextMenuEnabled="True"
DefaultContextMenuItemsVisibility="Collapsed"
Name="tabControlExt" >
  <syncfusion:TabItemExt Header="tabItemExt1">
    <syncfusion:TabItemExt.ContextMenuItems>
      <syncfusion:CustomMenuItem Header="Edit" />
      <syncfusion:CustomMenuItem Header="Copy" />
      <syncfusion:CustomMenuItem Header="Paste" />
    </syncfusion:TabItemExt.ContextMenuItems>
  </syncfusion:TabItemExt>
</syncfusion:TabControlExt>
```

C#

```
//Collapse the default contextmenu visibility
tabControlExt.DefaultContextMenuItemsVisibility = Visibility.Collapsed;
//Adding custom context menu for the first tabitem
CustomMenuItem customMenuItem1 = new CustomMenuItem() { Header = "Edit"};
CustomMenuItem customMenuItem2 = new CustomMenuItem() { Header = "Copy"};
CustomMenuItem customMenuItem3 = new CustomMenuItem() { Header = "Paste"};
tabItemExt1.ContextMenuItems.Add(customMenuItem1);
tabItemExt1.ContextMenuItems.Add(customMenuItem2);
tabItemExt1.ContextMenuItems.Add(customMenuItem3);
```

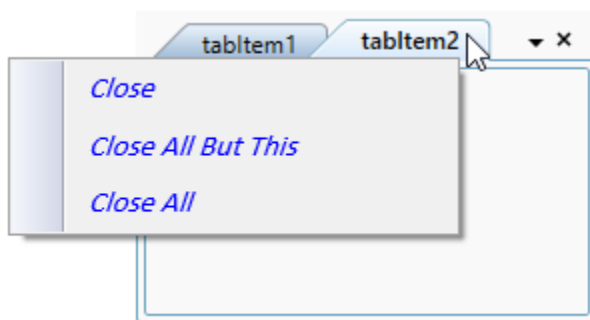

Note: View [Sample](#) in GitHub

Custom template for default tab item context menu

You can customize the default tab item context menu appearance for the each tab items by using the [TabControlExt.TabItemContextMenuItemTemplate](#) property.

XML

```
<Window.Resources>
  <!--Custom data template for the TabItem ContextMenu-->
  <DataTemplate x:Key="TabItemContextMenuItemTemplate"
    DataType="syncfusion:TabItemExt">
    <TextBlock FontFamily="Calibri"
      Foreground="Blue"
      FontStyle="Oblique"
      Text="{Binding}" />
  </DataTemplate>
</Window.Resources>
<syncfusion:TabControlExt ShowTabItemContextMenu="True"
  Name="tabControlExt">
  <syncfusion:TabItemExt TabItemContextMenuItemTemplate=
    "{StaticResource TabItemContextMenuItemTemplate}"
    Header="tabItem1" />
  <syncfusion:TabItemExt TabItemContextMenuItemTemplate=
    "{StaticResource TabItemContextMenuItemTemplate}"
    Header="tabItem2" />
</syncfusion:TabControlExt>
```

Note: View [Sample](#) in GitHub

Tab list context menu for switching tabs

You can easily navigate to any tab item by using the tab list menu which is placed in the top-right corner of the tab header panel. The header of all visible tab item's are shown as a menu item in the tab list menu. You can hide this tab list menu by using the [ShowTabListContextMenu](#) property value as `false`. The default value of `ShowTabListContextMenu` property is `true`.

Note: The currently selected tab item has a tick mark on the TabListContextMenu.

XML

```
<syncfusion:TabControlExt ShowTabListContextMenu="True"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.ShowTabListContextMenu = true;
```

Note: View [Sample](#) in GitHub

Show hidden tab items in tab list context menu

By default, all the tab items except hidden items are listed in the tab list context menu. If you want to show the hidden tab items into tab list context menu to navigate, use the [TabListContextMenuOptions](#) property value as `Default, ShowHiddenItems`.

You can set the multiple options for the `TabListContextMenuOptions` to show different types of tab items into the context menu. The default value of `TabListContextMenuOptions` property is `Default`.

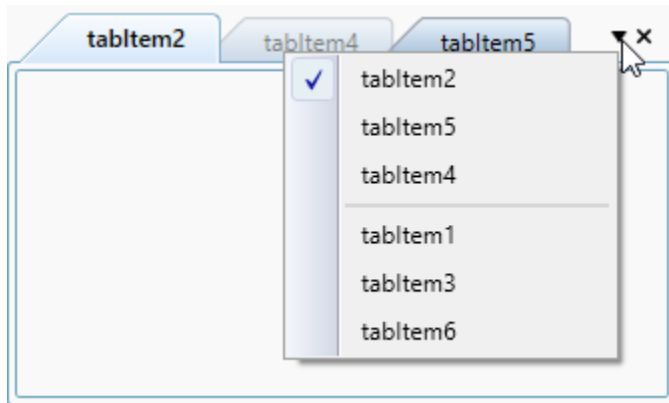

XML

```
<syncfusion:TabControlExt TabListContextMenuOptions="Default,
ShowHiddenItems"
ShowTabListContextMenu="True"
Name="tabControlExt">
<syncfusion:TabItemExt Header="tabItem1" Visibility="Collapsed"/>
<syncfusion:TabItemExt Header="tabItem2"/>
<syncfusion:TabItemExt Header="tabItem3" Visibility="Collapsed"/>
<syncfusion:TabItemExt Header="tabItem4" IsEnabled="False"/>
<syncfusion:TabItemExt Header="tabItem5"/>
<syncfusion:TabItemExt Header="tabItem6" Visibility="Collapsed"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.ShowTabListContextMenu = true;
```

```
tabControlExt.TabListContextMenuOptions = TabListContextMenuOptions.Default
|
TabListContextMenuOptions.ShowHiddenItems;
```

Show specific type tab items in tab list context menu

If you want to show the specific type tab items in tab list context menu, set the single option to the `TabListContextMenuOptions` property. If you want to show only the hidden tab items into tab list context menu to navigate, use the `TabListContextMenuOptions` property value as `ShowHiddenItems`. If you want to show only the enabled tab items into tab list context menu to navigate, use the `TabListContextMenuOptions` property value as `ShowEnabledItems`. If you want to show only the disabled tab items into tab list context menu to navigate, use the `TabListContextMenuOptions` property value as `ShowDisabledItems`.

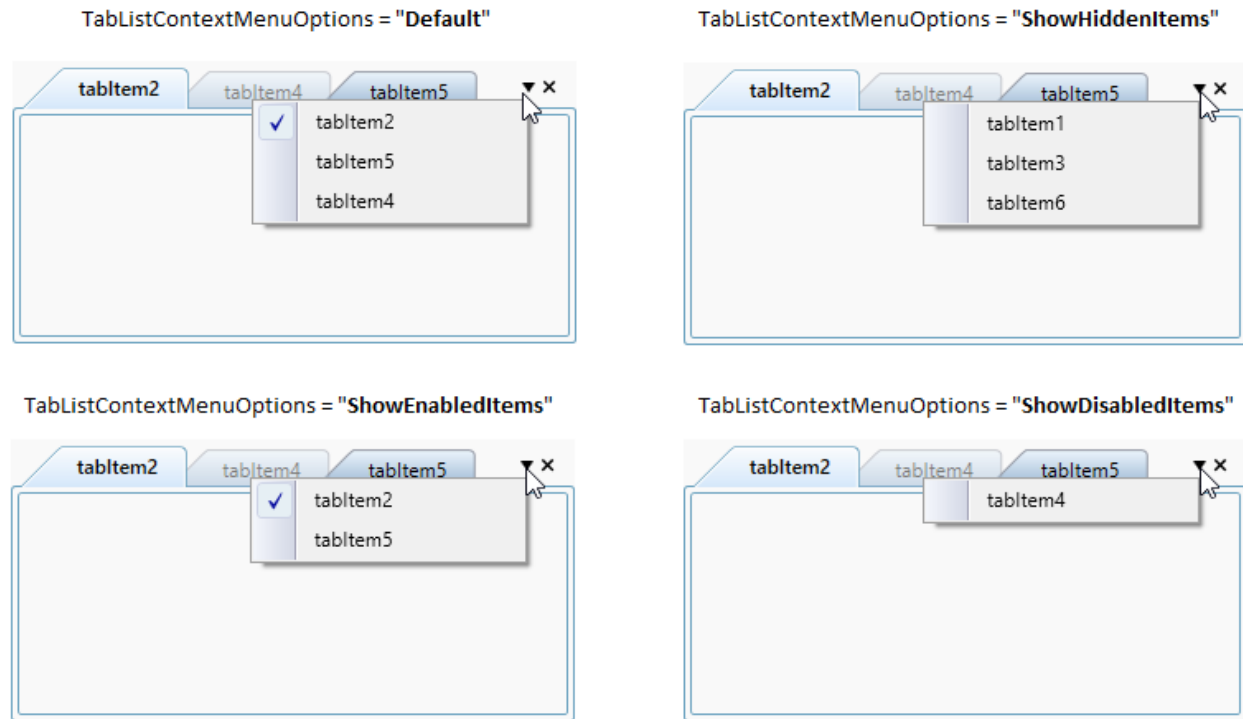

XML

```
<syncfusion:TabControlExt TabListContextMenuOptions="ShowEnabledItems"
ShowTabListContextMenu="True"
Name="tabControlExt">
  <syncfusion:TabItemExt Header="tabItem1" Visibility="Collapsed"/>
  <syncfusion:TabItemExt Header="tabItem2"/>
  <syncfusion:TabItemExt Header="tabItem3" Visibility="Collapsed"/>
  <syncfusion:TabItemExt Header="tabItem4" IsEnabled="False"/>
  <syncfusion:TabItemExt Header="tabItem5"/>
  <syncfusion:TabItemExt Header="tabItem6" Visibility="Collapsed"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.ShowTabListContextMenu = true;
tabControlExt.TabListContextMenuOptions =
TabListContextMenuOptions.ShowEnabledItems;
```

Single options

Note: View [Sample](#) in GitHub

Show multi-type tab items in tab list context menu

If you want to show the multiple type of tab items like enabled, disabled or hidden tab items together in tab list context menu, set the multiple options for the `TabListContextMenuOptions` property.

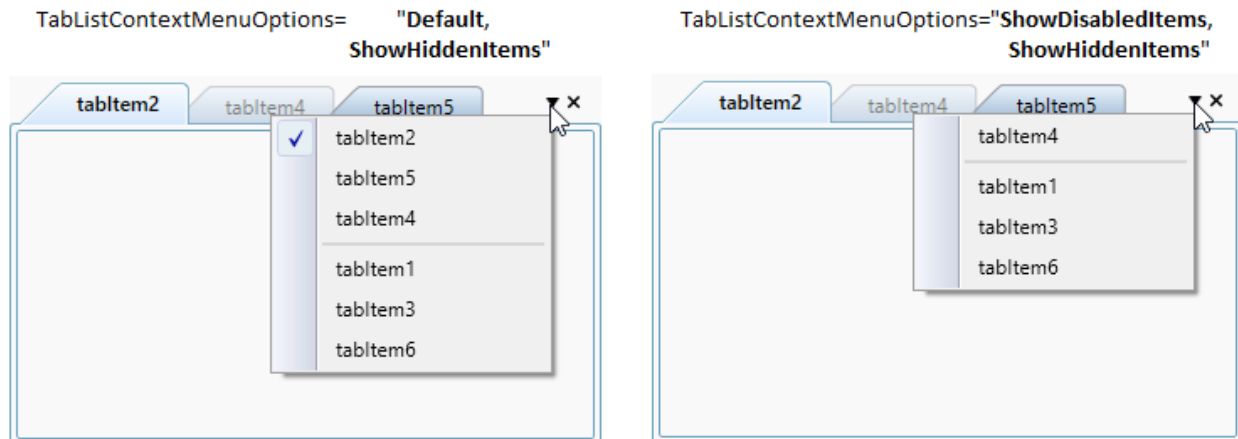

XML

```
<syncfusion:TabControlExt
  TabListContextMenuOptions="ShowDisabledItems, ShowHiddenItems"
  ShowTabListContextMenu="True"
  Name="tabControlExt">
  <syncfusion:TabItemExt Header="tabItem1" Visibility="Collapsed"/>
  <syncfusion:TabItemExt Header="tabItem2"/>
  <syncfusion:TabItemExt Header="tabItem3" Visibility="Collapsed"/>
  <syncfusion:TabItemExt Header="tabItem4" IsEnabled="False"/>
  <syncfusion:TabItemExt Header="tabItem5"/>
  <syncfusion:TabItemExt Header="tabItem6" Visibility="Collapsed"/>
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.ShowTabListContextMenu = true;
tabControlExt.TabListContextMenuOptions =
  TabListContextMenuOptions.ShowDisabledItems |
  TabListContextMenuOptions.ShowHiddenItems
```

Multiple options

Custom tab list context menu item

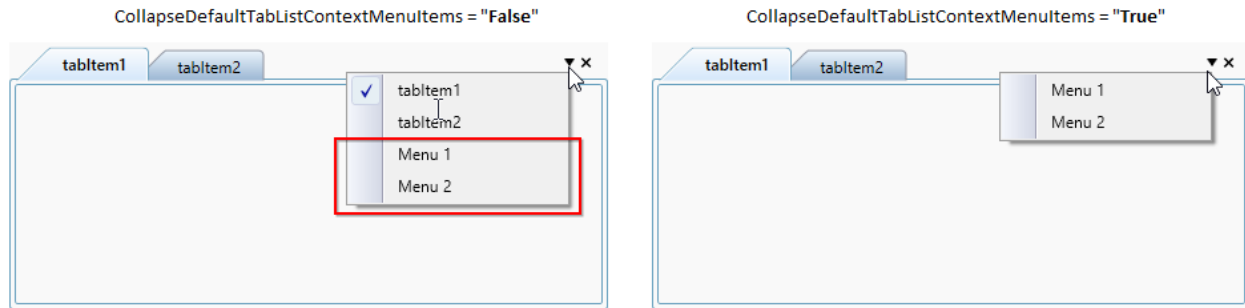

You can add the custom tab list context menu items by using the [TabControlExt.TabListContextMenuItems](#) property. You can show only the custom tab list context menu items by setting the [CollapseDefaultTabListContextMenuItems](#) property to `true`. The default value of [CollapseDefaultTabListContextMenuItems](#) property is `false`.

XML

```
<syncfusion:TabControlExt CollapseDefaultTabListContextMenuItems="True"
Name="tabControlExt" >
  <syncfusion:TabControlExt.TabListContextMenuItems>
    <!--Adding custom context menu items-->
    <syncfusion:CustomMenuItem Header="Menu 1" />
    <syncfusion:CustomMenuItem Header="Menu 2" />
  </syncfusion:TabControlExt.TabListContextMenuItems>
  <syncfusion:TabItemExt Header="tabItem1"/>
  <syncfusion:TabItemExt Header="tabItem2"/>
</syncfusion:TabControlExt>
```

C#

```
// Display only the custom tab list context menu items
tabControlExt.CollapseDefaultTabListContextMenuItems = true;
// Adding custom tab list context menu items
CustomMenuItem customMenuItem1 = new CustomMenuItem();
customMenuItem1.Header = "Menu 1";
CustomMenuItem customMenuItem2 = new CustomMenuItem();
customMenuItem2.Header = "Menu 2";
tabControlExt.TabListContextMenuItems.Add(customMenuItem1);
tabControlExt.TabListContextMenuItems.Add(customMenuItem2);
```

Note: [View Sample in GitHub](#)

Check or uncheck the custom tab list menu items

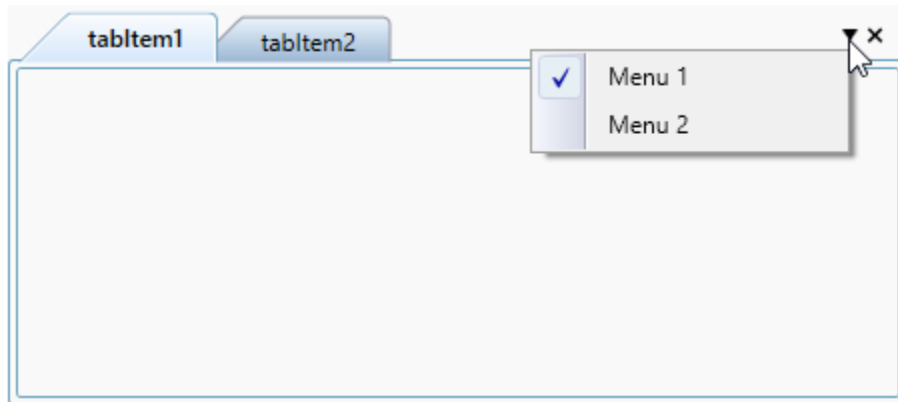

You can check or uncheck the custom tab list menu items by using `CustomMenuItem.IsChecked` property. You can disable the checkable functionalities of the tab list menu items by using the `CustomMenuItem.IsCheckable` property value as `false`. The default value of `CustomMenuItem.IsCheckable` property is `true` and `CustomMenuItem.IsChecked` property value is `false`.

XML

```
<syncfusion:TabControlExt CollapseDefaultTabListContextMenuItems="True"
Name="tabControlExt" >
  <!--Adding custom tab list context menu items-->
  <syncfusion:TabControlExt.TabListContextMenuItems>
    <!--Adding custom context menu items-->
    <syncfusion:CustomMenuItem Header="Menu 1"
IsCheckable="True"
IsChecked="True"/>
    <syncfusion:CustomMenuItem Header="Menu 2"
IsCheckable="False"/>
  </syncfusion:TabControlExt.TabListContextMenuItems>
  <syncfusion:TabItemExt Header="tabItem1"/>
  <syncfusion:TabItemExt Header="tabItem2"/>
</syncfusion:TabControlExt>
```

C#

```
// Display only the custom tab list context menu
tabControlExt.CollapseDefaultTabListContextMenuItems = true;
// Adding custom tab list context menu items
CustomMenuItem customMenuItem1 = new CustomMenuItem();
customMenuItem1.Header = "Menu 1";
customMenuItem1.IsCheckable = true;
customMenuItem1.IsChecked = true;
CustomMenuItem customMenuItem2 = new CustomMenuItem();
customMenuItem2.Header = "Menu 2";
customMenuItem2.IsCheckable = false;
tabControlExt.TabListContextMenuItems.Add(customMenuItem1);
tabControlExt.TabListContextMenuItems.Add(customMenuItem2);
```

Note: [View Sample in GitHub](#)

Adding sub menu items for custom context menu item

You can add sub menu items for custom context menu item with any level by adding that sub `CustomMenuItem` to the parent `CustomMenuItem`.

XML

```
<syncfusion:TabControlExt CollapseDefaultTabListContextMenuItems="True"
Name="tabControlExt" >
  <!--Adding custom tab list context menu items-->
  <syncfusion:TabControlExt.TabListContextMenuItems>
    <!--Adding custom context menu items-->
    <syncfusion:CustomMenuItem Header="Menu 1">
      <!--Adding sub custom context menu items-->
      <syncfusion:CustomMenuItem Header="SubMenu 1"/>
      <syncfusion:CustomMenuItem Header="SubMenu 2">
        <!--Adding sub custom context menu items for 'SubMenu 2'-->
        <syncfusion:CustomMenuItem Header="Level 2"/>
      </syncfusion:CustomMenuItem>
      <syncfusion:CustomMenuItem Header="SubMenu 3"/>
    </syncfusion:CustomMenuItem>
    <syncfusion:CustomMenuItem Header="Menu 2">
      <!--Adding sub custom context menu items-->
      <syncfusion:CustomMenuItem Header="SubMenu 1"/>
      <syncfusion:CustomMenuItem Header="SubMenu 2"/>
      <syncfusion:CustomMenuItem Header="SubMenu 3">
        <!--Adding sub custom context menu items for 'SubMenu 3'-->
        <syncfusion:CustomMenuItem Header="Level 2"/>
      </syncfusion:CustomMenuItem>
    </syncfusion:CustomMenuItem>
  </syncfusion:TabControlExt.TabListContextMenuItems>
  <syncfusion:TabItemExt Header="tabItem1"/>
  <syncfusion:TabItemExt Header="tabItem2"/>
</syncfusion:TabControlExt>
```

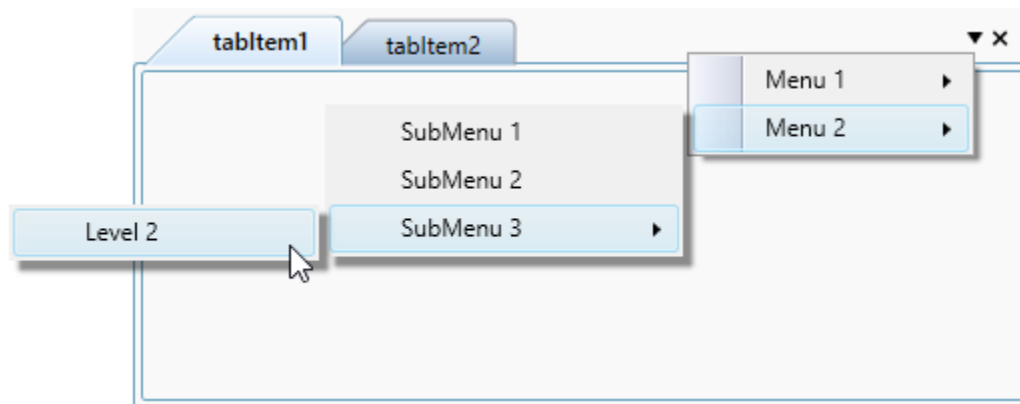

C#

```
// Display only the custom tab list context menu
tabControlExt.CollapseDefaultTabListContextMenuItems = true;
// Adding custom tab list context menu items
CustomMenuItem menu1 = new CustomMenuItem();
menu1.Header = "Menu 1";
```

```

CustomMenuItem menu2 = new CustomMenuItem();
menu2.Header = "Menu 2";
// Creating custom sub menu tab list context menu items
CustomMenuItem customMenuItem1 = new CustomMenuItem() { Header = "SubMenu 1" };
};
CustomMenuItem customMenuItem2 = new CustomMenuItem() { Header = "SubMenu 2" };
};
CustomMenuItem customMenuItem3 = new CustomMenuItem() { Header = "SubMenu 3" };
};
//Adding sub menu items for 'SubMenu 2' and 'SubMenu 3' custom tablist menu item
CustomMenuItem level2_customMenuItem = new CustomMenuItem() { Header = "Level 2" };
customMenuItem3.Items.Add(level2_customMenuItem);
menu2.Items.Add(customMenuItem1);
menu2.Items.Add(customMenuItem2);
menu2.Items.Add(customMenuItem3);
tabControlExt.TabListContextMenuItems.Add(menu1);
tabControlExt.TabListContextMenuItems.Add(menu2);

```

Note: [View Sample in GitHub](#)

CustomMenuItem as Separator

You can display the separator between custom menu items by using [CustomMenuItem.IsSeparator](#) property. If `IsSeparator` property is set to true, the `CustomMenuItem` will act as separator. The default value of `CustomMenuItem.IsSeparator` property is false.

XML

```

<syncfusion:TabControlExt CollapseDefaultTabListContextMenuItems="True"
Name="tabControlExt" >
  <!--Adding custom tab list context menu items-->
  <syncfusion:TabListContextMenuItems>
    <!--Adding custom context menu items-->
    <syncfusion:CustomMenuItem Header="Menu 1">
      <!--Adding sub custom context menu items-->
      <syncfusion:CustomMenuItem Header="SubMenu 1"/>
      <syncfusion:CustomMenuItem Header="SubMenu 2">
        <!--Adding sub custom context menu items for 'SubMenu 2'-->
        <syncfusion:CustomMenuItem Header="Level 2"/>
      </syncfusion:CustomMenuItem>
      <syncfusion:CustomMenuItem Header="SubMenu 3"/>
    </syncfusion:CustomMenuItem>
  </syncfusion:TabListContextMenuItems>

```

```

</syncfusion:CustomMenuItem>
<!--Adding custom context menu item as Seperator-->
<syncfusion:CustomMenuItem IsSeparator="True"
Height="1"/>
<syncfusion:CustomMenuItem Header="Menu 2">
<!--Adding sub custom context menu items-->
<syncfusion:CustomMenuItem Header="SubMenu 1"/>
<syncfusion:CustomMenuItem Header="SubMenu 2"/>
<syncfusion:CustomMenuItem Header="SubMenu 3">
<!--Adding sub custom context menu items for 'SubMenu 3'-->
<syncfusion:CustomMenuItem Header="Level 2"/>
</syncfusion:CustomMenuItem>
</syncfusion:CustomMenuItem>
</syncfusion:TabControlExt.TabListContextMenuItems>
<syncfusion:TabItemExt Header="tabItem1"/>
<syncfusion:TabItemExt Header="tabItem2"/>
</syncfusion:TabControlExt>

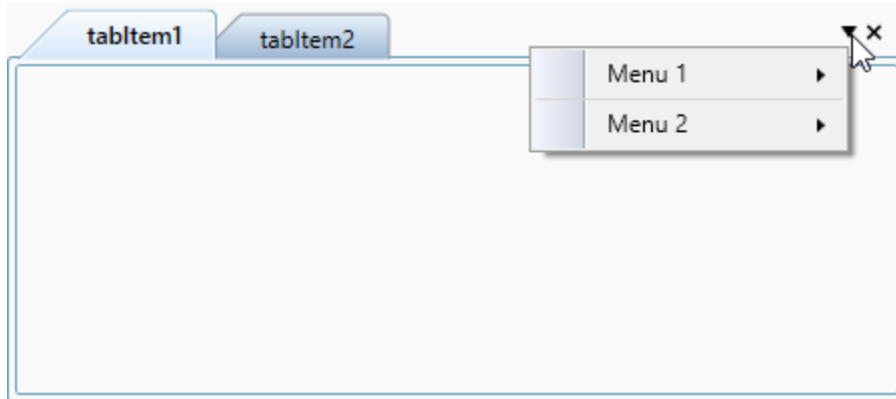

```

C#

```

// Disaply only the custom tab list context menu
tabControlExt.CollapseDefaultTabListContextMenuItems = true;
// Adding custom tab list context menu items
CustomMenuItem menu1 = new CustomMenuItem();
menu1.Header = "Menu 1";
CustomMenuItem menu2 = new CustomMenuItem();
menu2.Header = "Menu 2";
// Adding custom tab list context menu item as Seperator
CustomMenuItem separator = new CustomMenuItem();
separator.Seperator = true;
separator.Height = 1;
// Creating custom sub menu tab list context menu items
CustomMenuItem customMenuItem1 = new CustomMenuItem() { Header = "SubMenu 1"
};
CustomMenuItem customMenuItem2 = new CustomMenuItem() { Header = "SubMenu 2"
};
CustomMenuItem customMenuItem3 = new CustomMenuItem() { Header = "SubMenu 3"
};
//Adding sub menu items for 'SubMenu 2' and 'SubMenu 3' custom tablist menu
item
CustomMenuItem level2_customMenuItem = new CustomMenuItem() { Header =
"Level 2" };
customMenuItem3.Items.Add(level2_customMenuItem);
menu2.Items.Add(customMenuItem1);
menu2.Items.Add(customMenuItem2);
menu2.Items.Add(customMenuItem3);
tabControlExt.TabListContextMenuItems.Add(menu1);
tabControlExt.TabListContextMenuItems.Add(separator);
tabControlExt.TabListContextMenuItems.Add(menu2);

```

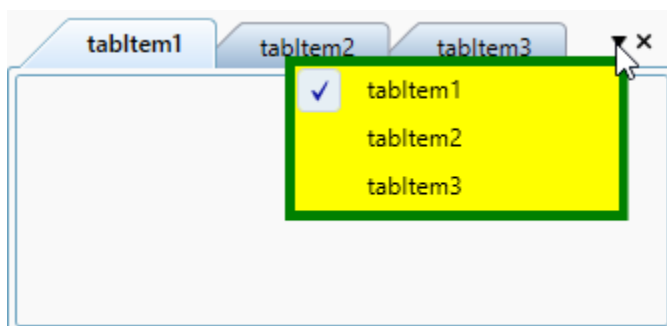

Note: [View Sample in GitHub](#)

Custom template for the tab list context menu

You can customize the tab list menu appearance by using the [TabListContextMenuTemplate](#) property.

XML

```
<syncfusion:TabControlExt ShowTabListContextMenu="True"
Name="tabControlExt" >
<syncfusion:TabControlExt.TabListContextMenuTemplate>
<ControlTemplate>
<Border Background="Green">
<Border Background="Yellow"
Margin="5">
<Grid>
<ItemsPresenter/>
</Grid>
</Border>
</Border>
</ControlTemplate>
</syncfusion:TabControlExt.TabListContextMenuTemplate>
<syncfusion:TabItemExt Header="tabItem1"/>
<syncfusion:TabItemExt Header="tabItem2"/>
<syncfusion:TabItemExt Header="tabItem3"/>
</syncfusion:TabControlExt>
```

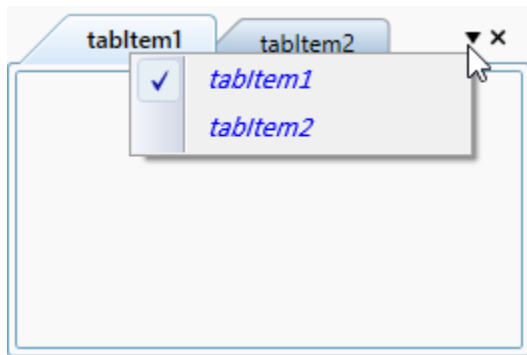

Custom template for the tab list menu item

You can customize the tab list menu items appearance by using the [TabListContextMenuTemplate](#) property.

XML

```
<syncfusion:TabControlExt ShowTabListContextMenu="True"
Name="tabControlExt" >
<syncfusion:TabControlExt.TabListContextMenuItemsTemplate>
<DataTemplate>
<TextBlock FontFamily="Calibri"
Foreground="Blue"
FontStyle="Oblique"
Text="{Binding}" />
</DataTemplate>
</syncfusion:TabControlExt.TabListContextMenuItemsTemplate>
<syncfusion:TabItemExt Header="tabItem1" />
<syncfusion:TabItemExt Header="tabItem2" />
</syncfusion:TabControlExt>
```

Note: View [Sample](#) in GitHub

Appearance in WPF TabControl (TabControlExt)

This section explains different UI customization and theming options available in [TabControl](#).

Change flow direction

You can change the flow direction of the **TabControl** layout from right to left by setting the **FlowDirection** property value as **RightToLeft**. The default value of **FlowDirection** property is **LeftToRight**.

XML

```
<syncfusion:TabControlExt FlowDirection="RightToLeft"
Name="tabControlExt">
<syncfusion:TabItemExt Content="This is the first tab item"
Header="tabItem1" />
</syncfusion:TabControlExt>
```

C#

```
tabControlExt.FlowDirection = FlowDirection.RightToLeft;
```

Note: View [Sample](#) in GitHub

Theme

TabControl supports various built-in themes. Refer to the below links to apply themes for the TabControl,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

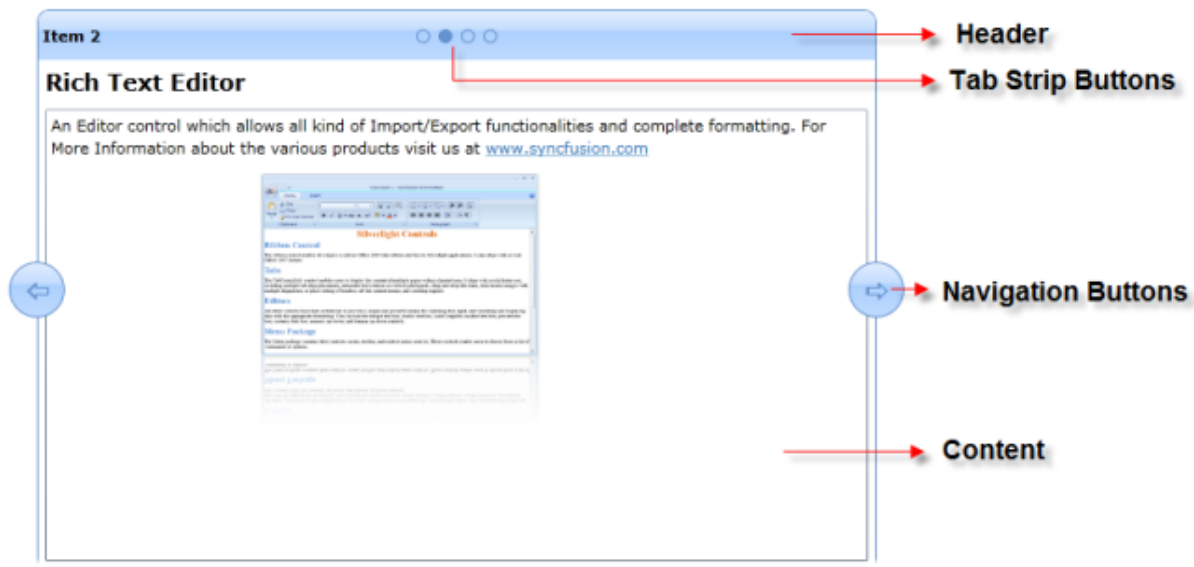

TabNavigation

WPF Tab Navigation Overview

Tab Navigation is a new control for displaying the contents of the control with transition effects. Tab navigation control facilitates the display of pages/items (with transition effects) like an Ad rotator in web applications, thereby enhancing the UI's look and feel. It supports only .NET Framework version 4.0.

Appearance and structure of the control

The following are the key features of this control:

Items source binding

It helps the control to be applicable to all MVVM based Silverlight applications. It supports the following:

- Observable Collection—any modification done to the collection items will get reflected on the UI of the control. Such a collection is bound to the control.
- IList binding—this list is based on all collections such as List, Queue, Stack and so on, that are bound to the control.
- XML binding—the XML data are bound to the control.

Item templates

- Data Templates—this is used to display data visually on the UI in a predefined format.
- Template Selectors—this allows you to choose templates for data items that will be displayed on the UI

Transition effects

This enhances navigation by providing different navigation or transition effects. The following effects are supported:

- Slide

- Fade
- Zoom
- Blur
- Push
- PushIn
- Wipe

Use case scenario

Tab navigation control helps you to use information as banners in web applications such as Picasa. Therefore, it can be used as website banners. As it has virtualization support, it can also be used as tab control.

Getting Started with WPF Tab Navigation

Assembly deployment

Refer [control dependencies](#) section to get the list of assemblies or NuGet package needs to be added as reference to use the control in WPF application.

Creating simple application with TabNavigation

You can create the WPF application with TabNavigation control as follows:

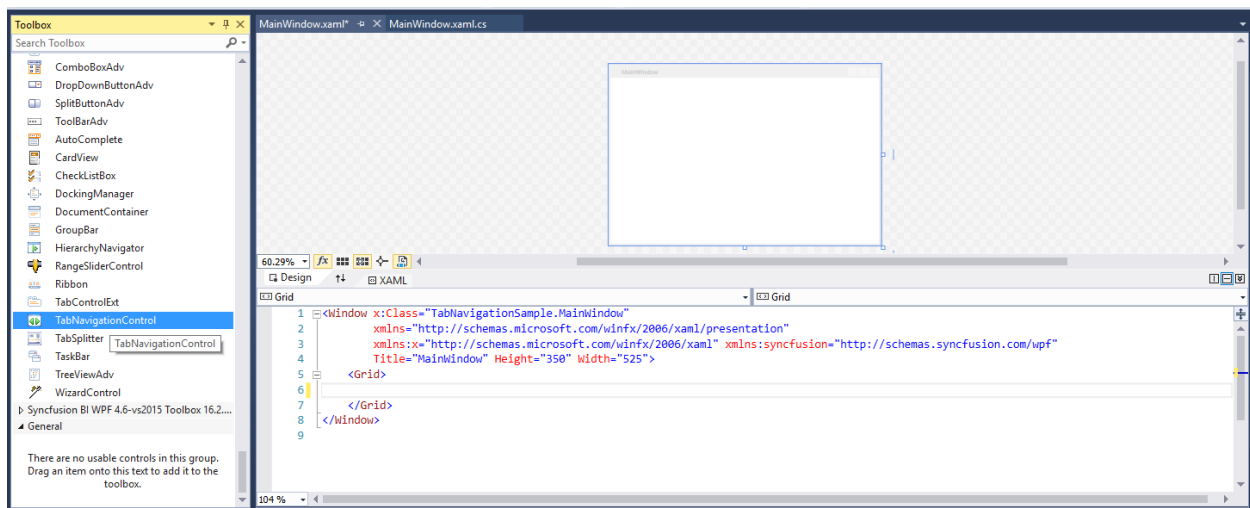

1. [Creating project](#)
2. [Adding control via Designer](#)
3. [Adding control manually in XAML](#)
4. [Adding control manually in C#](#)

Creating the project

Create a new WPF project in the Visual Studio to display the TabNavigation with functionalities.

Adding control via Designer

The TabNavigation control can be added to the application by dragging it from the toolbox and dropping it in a designer view. The required assembly references will be added automatically.

Adding control manually in XAML

In order to add control manually in XAML, do the below steps,

1. Add the below required assembly references to the project,
 - Syncfusion.Tools.WPF
 - Syncfusion.Shared.WPF
2. Import Syncfusion WPF schema <http://schemas.syncfusion.com/wpf> in XAML page.
3. Declare TabNavigation control in XAML page.

XML

```
<Window xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="WpfApplication1.MainWindow"
Title="MainWindow" Height="350" Width="525">
<Grid>
<!-- TabNavigation Control -->
<syncfusion:TabNavigationControl x:Name="tabNavigation"/>
</Grid>
</Window>
```

Adding control manually in C#

In order to add control manually in C#, do the below steps,

1. Add the below required assembly references to the project,
 - Syncfusion.Tools.WPF
 - Syncfusion.Shared.WPF
2. Import TabNavigationControl namespace **using Syncfusion.Windows.Tools.Controls;**
3. Create TabNavigationControl instance and add it to the window.

C#

```
using Syncfusion.Windows.Tools.Controls;
namespace TabNavigationSample
{
    /// <summary>
    /// Interaction logic for MainWindow.xaml
    /// </summary>
    public partial class MainWindow : Window
    {
        public MainWindow()
        {
            InitializeComponent();
            //For adding TabNavigation Control
            TabNavigationControl tabNavigation = new TabNavigationControl();
            grid.Children.Add(tabNavigation);
        }
    }
}
```

Adding Items using TabNavigationItem

You can populate the TabNavigation control by adding objects directly to the [Items](#) collection. Items added to the TabNavigation are wrapped in [TabNavigationItem](#) containers.

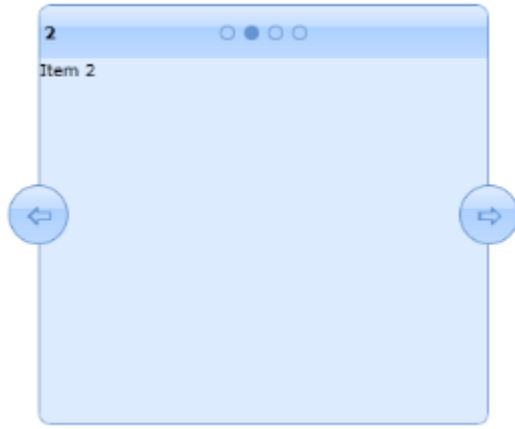

XML

```
<!-- TabNavigationControl -->
<syncfusion:TabNavigationControl x:Name="tabNavigation">
  <!-- TabNavigationItem 1 -->
  <syncfusion:TabNavigationItem Header="1">
    <syncfusion:TabNavigationItem.Content>
      <Grid>
        <TextBlock Text="Item 1"/>
      </Grid>
    </syncfusion:TabNavigationItem.Content>
  </syncfusion:TabNavigationItem>
  <!-- TabNavigationItem 2 -->
  <syncfusion:TabNavigationItem Header="2">
    <syncfusion:TabNavigationItem.Content>
      <Grid>
        <TextBlock Text="Item 2"/>
      </Grid>
    </syncfusion:TabNavigationItem.Content>
  </syncfusion:TabNavigationItem>
  <!-- TabNavigationItem 3 -->
  <syncfusion:TabNavigationItem Header="3">
    <syncfusion:TabNavigationItem.Content>
      <Grid>
        <TextBlock Text="Item 3"/>
      </Grid>
    </syncfusion:TabNavigationItem.Content>
  </syncfusion:TabNavigationItem>
  <!-- TabNavigationItem 4 -->
  <syncfusion:TabNavigationItem Header="4">
    <syncfusion:TabNavigationItem.Content>
      <Grid>
        <TextBlock Text="Item 4"/>
      </Grid>
    </syncfusion:TabNavigationItem.Content>
  </syncfusion:TabNavigationItem>
</syncfusion:TabNavigationControl>
```

C#

```
TabNavigationControl tabNavigation = new TabNavigationControl();
//TabNavigationItem
TabNavigationItem item1 = new TabNavigationItem();
item1.Header = "1";
item1.Content = "Item 1";
TabNavigationItem item2 = new TabNavigationItem();
item2.Header = "2";
item2.Content = "Item 2";
TabNavigationItem item3 = new TabNavigationItem();
item3.Header = "3";
item3.Content = "Item 3";
TabNavigationItem item4 = new TabNavigationItem();
item4.Header = "4";
item4.Content = "Item 4";
//Adding items to TabNavigationControl
tabNavigation.Items.Add(item1);
```

```
tabNavigation.Items.Add(item2);  
tabNavigation.Items.Add(item3);  
tabNavigation.Items.Add(item4);
```

Binding ItemsSource

TabNavigationControl supports binding data to different data sources such as IList Data Source, XML Data Source, Observable Collection Data Source. Refer [Data binding](#) section for more details.

XML

```
<syncfusion:TabNavigationControl TransitionEffect="Slide"  
ItemsSource="{Binding MyCollection}"/>
```

C#

```
namespace TabNavigationSample  
{  
    /// <summary>  
    /// Interaction logic for MainWindow.xaml  
    /// </summary>  
    public partial class MainWindow : Window  
    {  
        TabNavigationItem temp;  
        public MainWindow()  
        {  
            InitializeComponent();  
            MyCollection = new ObservableCollection<TabNavigationItem>();  
            for (int i = 0; i < 10; i++)  
            {  
                temp = new TabNavigationItem();  
                temp.Header = i;  
                temp.Content= "Item " + i.ToString();  
                MyCollection.Add(temp);  
            }  
            this.DataContext = this;  
        }  
        public ObservableCollection<TabNavigationItem> MyCollection  
        {  

```

```

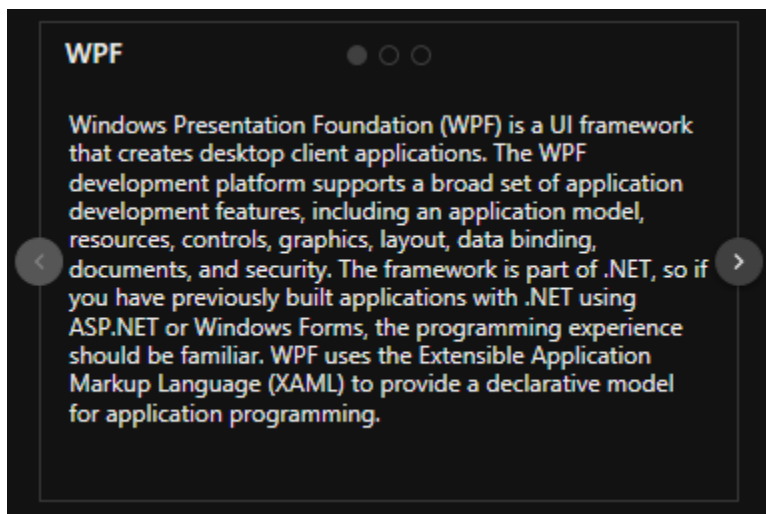

get { return
    (ObservableCollection<TabNavigationItem>)GetValue(MyCollectionProperty); }
set { SetValue(MyCollectionProperty, value); }
}
// Using a DependencyProperty as the backing store for MyCollection. This
enables animation, styling, binding and so on
public static readonly DependencyProperty MyCollectionProperty =
DependencyProperty.Register("MyCollection",
    typeof(ObservableCollection<TabNavigationItem>), typeof(MainWindow), new
PropertyMetadata(null));
}
}

```

Theme

TabNavigation control supports various built-in themes. Refer to the below links to apply themes for the TabNavigation control,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Data binding in WPF Tab Navigation

Business object collections can be easily bound to the TabNavigation control using [ItemsSource](#) property.

Binding IEnumerable

XML

```

<syncfusion:TabNavigationControl TransitionEffect="Slide"
ItemsSource="{Binding MyCollection}"/>

```

C#

```

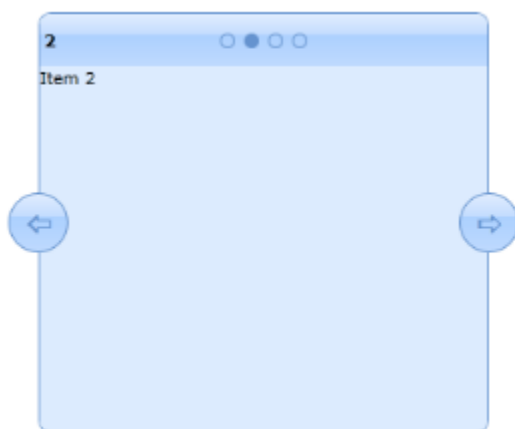

namespace TabNavigationSample
{
    /// <summary>
    /// Interaction logic for MainWindow.xaml

```

```

/// </summary>
public partial class MainWindow : Window
{
    TabNavigationItem temp;
    public MainWindow()
    {
        InitializeComponent();
        MyCollection = new ObservableCollection<TabNavigationItem>();
        for (int i = 0; i < 10; i++)
        {
            temp = new TabNavigationItem();
            temp.Header = i;
            temp.Content= "Item " + i.ToString();
            MyCollection.Add(temp);
        }
        this.DataContext = this;
    }
    public ObservableCollection<TabNavigationItem> MyCollection
    {
        get { return
            (ObservableCollection<TabNavigationItem>)GetValue(MyCollectionProperty); }
        set { SetValue(MyCollectionProperty, value); }
    }
    // Using a DependencyProperty as the backing store for MyCollection. This
    // enables animation, styling, binding and so on
    public static readonly DependencyProperty MyCollectionProperty =
        DependencyProperty.Register("MyCollection",
            typeof(ObservableCollection<TabNavigationItem>), typeof(MainWindow), new
            PropertyMetadata(null));
}

```

Binding data from XML

To bind XML data to a TabNavigation control, convert the XML data to a collection like ObservableCollection or IList collection, and then bind the collection by using the ItemsSource property of the TabNavigation control.

- **Create a xml file**

XML

```
<?xml version="1.0" encoding="utf-8" ?>
<Books>
<book>
<title>XML Developer's Guide</title>
<description>An indent look at creating applications with XML.</description>
</book>
<book>
<title>Midnight Rain</title>
<description>A former architect battles corporate zombies, an evil
sorceress, and her own childhood to become queen of the world.</description>
</book>
<book>
<title>Oberon's Legacy</title>
<description>In post apocalypse England, the mysterious agent known only as
Oberon helps to create a new life for the inhabitants of London. Sequel to
Mae Ascendant.</description>
</book>
<book>
<title>Lover Birds</title>
<description>When Carla meets Paul at an ornithology conference, tempers fly
as feathers get ruffled.</description>
</book>
<book>
<title>Split Splash</title>
<description>A deep sea diver finds true love twenty thousand leagues
beneath the sea.</description>
</book>
</Books>
```

- **Model.cs**

C#

```
namespace TabNavigationXMLBinding
{
    public class Model : NotificationObject
    {
    }
    public class BookModel : NotificationObject
    {
    }
    private string bookName;
    public string BookName
    {
        get
        {
            return bookName;
        }
    }
}
```

```
set
{
    bookName = value;
    this.RaisePropertyChanged("BookName");
}
}
private string description;
public string Description
{
    get
    {
        return description;
    }
    set
    {
        description = value;
        this.RaisePropertyChanged("Description");
    }
}
}
```

- ViewModel.cs

C#

```
namespace TabNavigationXMLBinding
{
    public class ViewModel : NotificationObject
    {
        private ObservableCollection<Model> modelItems;
        public ObservableCollection<Model> ModelItems
        {
            get
            {
                return modelItems;
            }
            set
            {
                modelItems = value;
            }
        }
        private ObservableCollection<BookModel> bookModelItems;
        public ObservableCollection<BookModel> BookModelItems
        {
            get
            {
                return bookModelItems;
            }
            set
            {
                bookModelItems = value;
            }
        }
        public ViewModel()
    }
}
```

```

{
    modelItems = new ObservableCollection<Model>();
    bookModelItems = new ObservableCollection<BookModel>();
    XDocument xDocument = XDocument.Load(@"assets\Books.xml");
    IEnumerable<XElement> query = from xElement in xDocument.Descendants("book")
    select xElement;
    foreach (XElement xElement in query)
    {
        BookModel bookModel = new BookModel
        {
            BookName = xElement.Element("title").Value,
            Description = xElement.Element("description").Value
        };
        bookModelItems.Add(bookModel);
    }
}
}
}

```

- **MainWindow.Xaml.cs**

C#

```

namespace TabNavigationXMLBinding
{
    /// <summary>
    /// Interaction logic for MainWindow.xaml
    /// </summary>
    public partial class MainWindow : ChromelessWindow
    {
        public MainWindow()
        {
            InitializeComponent();
            TabNavigationItem tab;
            ViewModel view = new ViewModel();
            BookCollection = new ObservableCollection<TabNavigationItem>();
            for (int i = 0; i < view.BookModelItems.Count; i++)
            {
                tab = new TabNavigationItem();
                tab.Header = view.BookModelItems[i].BookName;
                tab.Content = view.BookModelItems[i].Description;
                BookCollection.Add(tab);
            }
            this.DataContext = this;
        }
        public ObservableCollection<TabNavigationItem> BookCollection
        {
            get { return
                (ObservableCollection<TabNavigationItem>)GetValue(BookCollectionProperty); }
            set
            {
                SetValue(BookCollectionProperty, value);
            }
        }
    }
}

```

```
// Using a DependencyProperty as the backing store for MyCollection. This
// enables animation, styling, binding and so on
public static readonly DependencyProperty BookCollectionProperty =
DependencyProperty.Register("BookCollection",
typeof(ObservableCollection<TabNavigationItem>), typeof(MainWindow), new
PropertyMetadata(null));
}
```

- **MainWindow.Xaml**

XML

```
<Window.DataContext>
<local:ViewModel/>
</Window.DataContext>
<!--TabNavigationControl-->
<syncfusion:TabNavigationControl x:Name="TabNavigation" Grid.Column="1"
Grid.Row="1" ItemsSource="{Binding BookCollection}"/>
```

Appearance in WPF Tab Navigation

Show/hide the Header

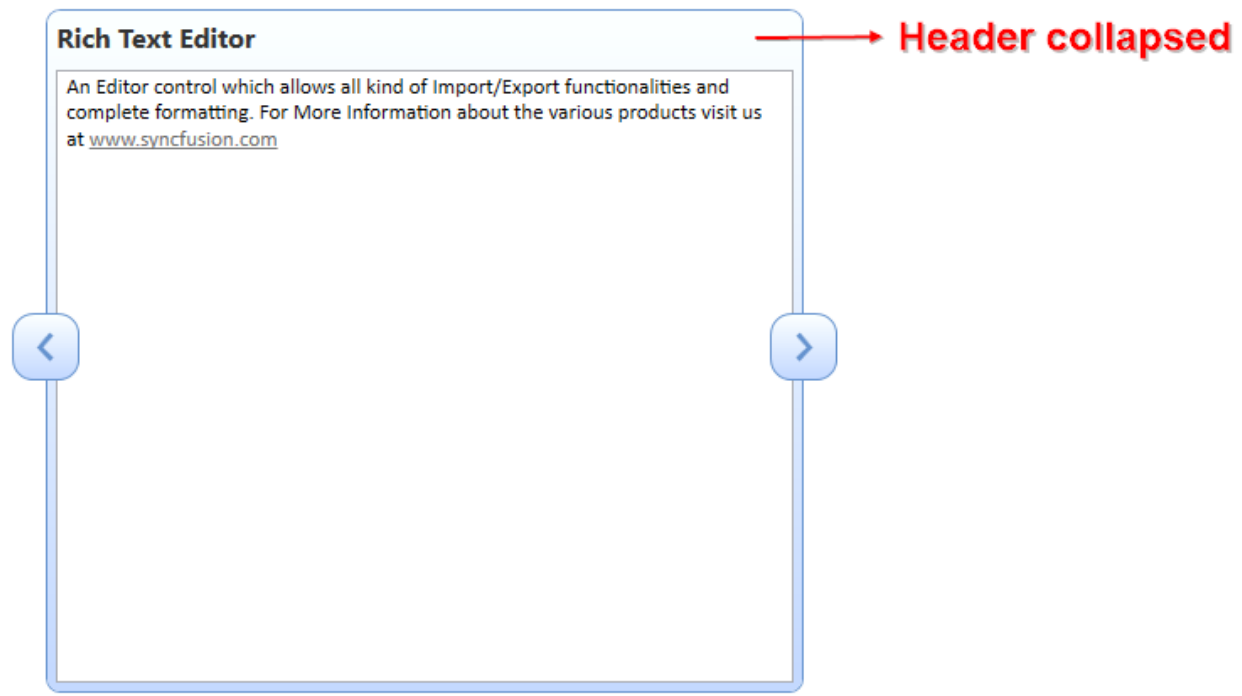

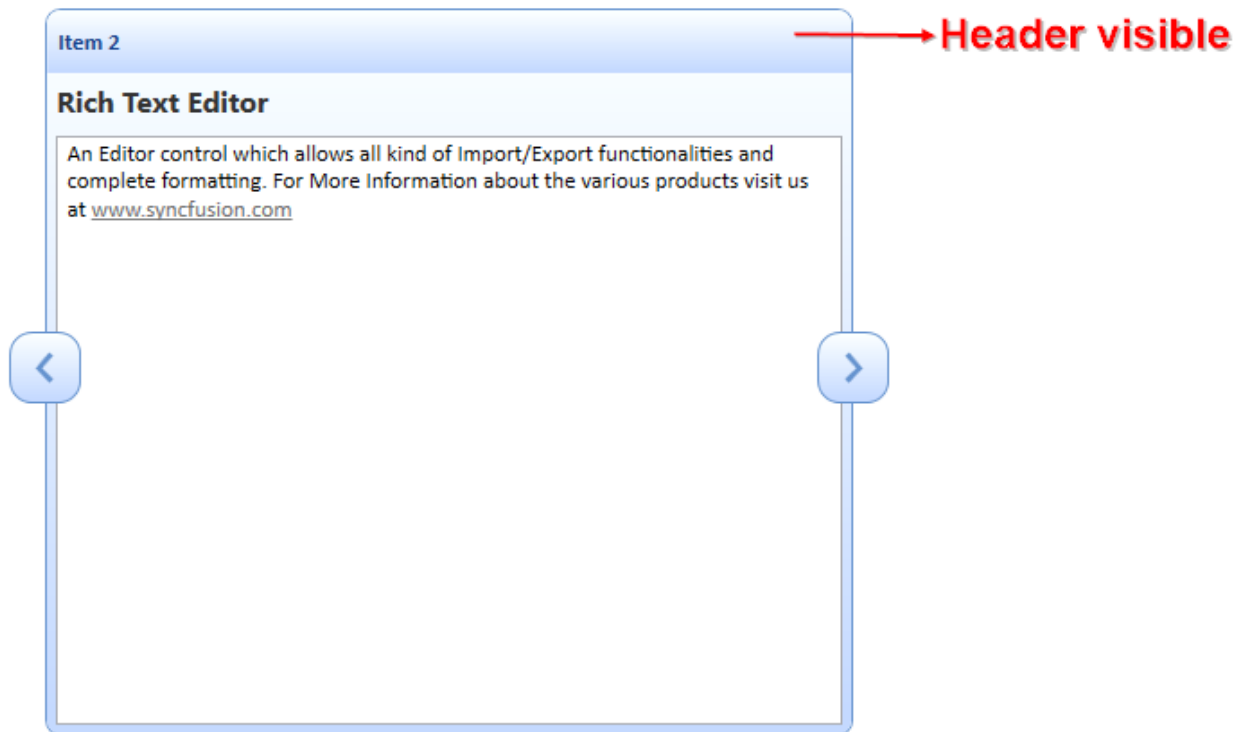

You can enable/disable the visibility of header by setting [HeaderVisibility](#) property of TabNavigationControl.

XML

```
<!-- TabNavigation Control -->
<syncfusion:TabNavigationControl x:Name="TabNavigation"
HeaderVisibility="Collapsed" >
<syncfusion:TabNavigationItem Header="TabItem1" Content="TabNavigationItem
1"/>
<syncfusion:TabNavigationItem Header="TabItem2" Content="TabNavigationItem
2"/>
<syncfusion:TabNavigationItem Header="TabItem3" Content="TabNavigationItem
3"/>
</syncfusion:TabNavigationControl>
```

C#

```
//Hide the header
tabNavigation.HeaderVisibility = Visibility.Collapsed;
```

Show/hide the NavigationButton

You can enable/disable the visibility of navigation button by setting [NavigationButtonVisibility](#) property of TabNavigationControl.

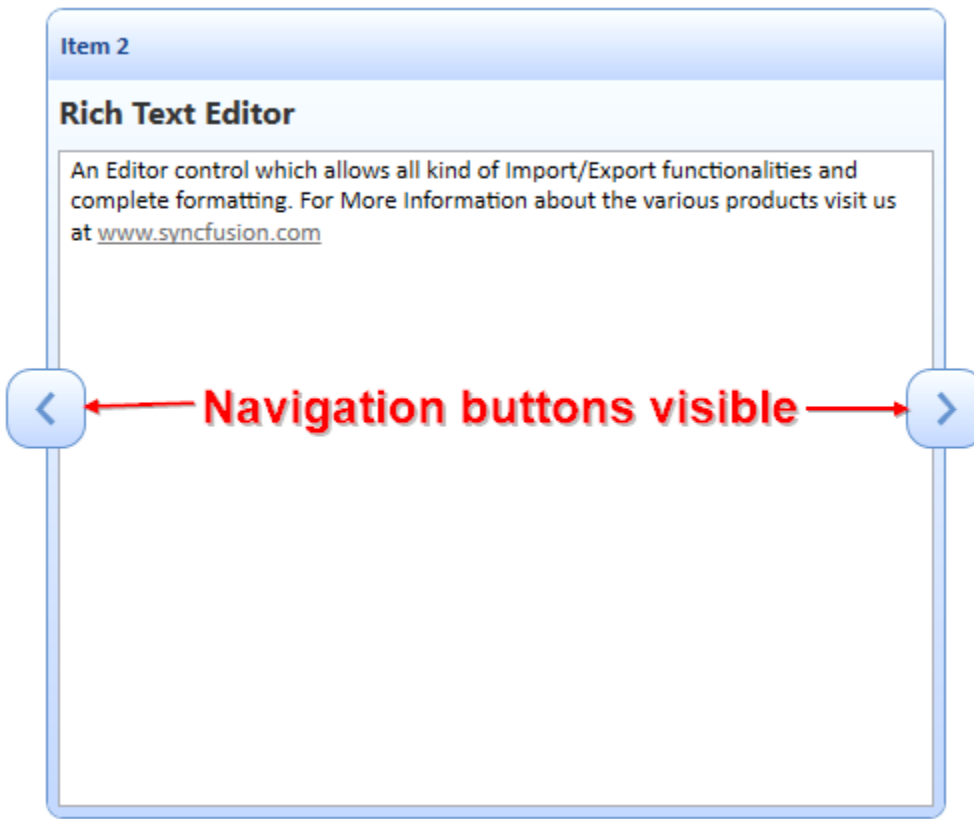

XML

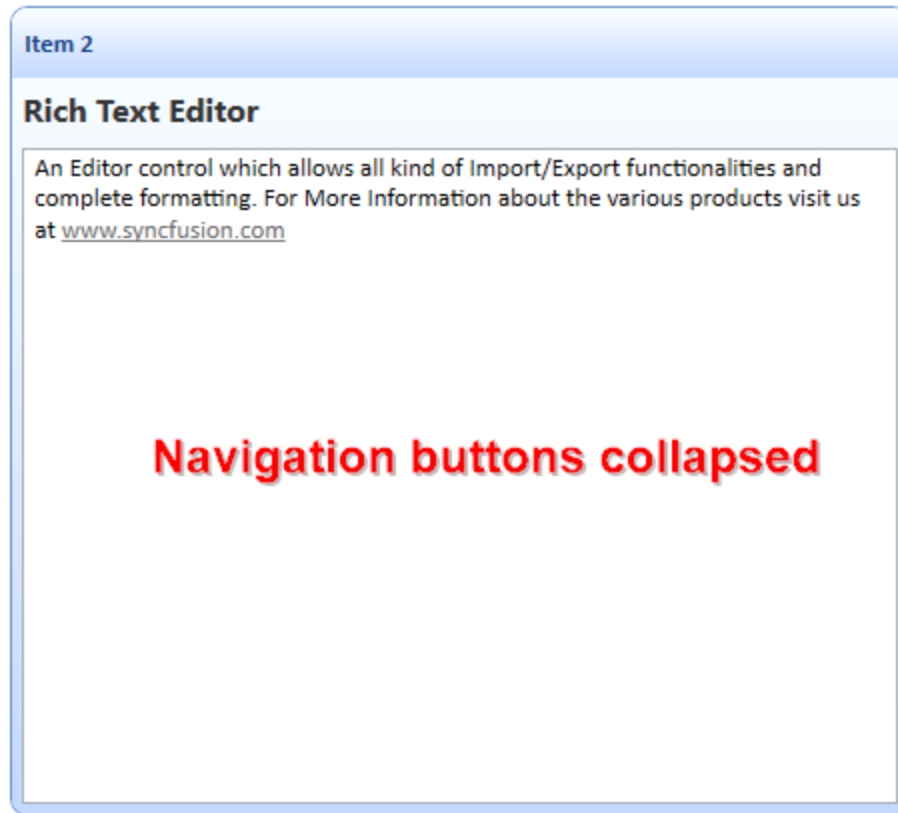

```
<!-- TabNavigation Control -->
```

```
<syncfusion:TabNavigationControl x:Name="TabNavigation"
TabStripVisibility="Visible" NavigationButtonVisibility="Collapsed" >
<syncfusion:TabNavigationItem Header="TabItem1" Content="TabNavigationItem
1"/>
<syncfusion:TabNavigationItem Header="TabItem2" Content="TabNavigationItem
2"/>
</syncfusion:TabNavigationControl>
```

C#

```
//Hide the navigation button
tabNavigation.NavigationButtonVisibility = Visibility.Collapsed;
```

Show/hide the TabStrip

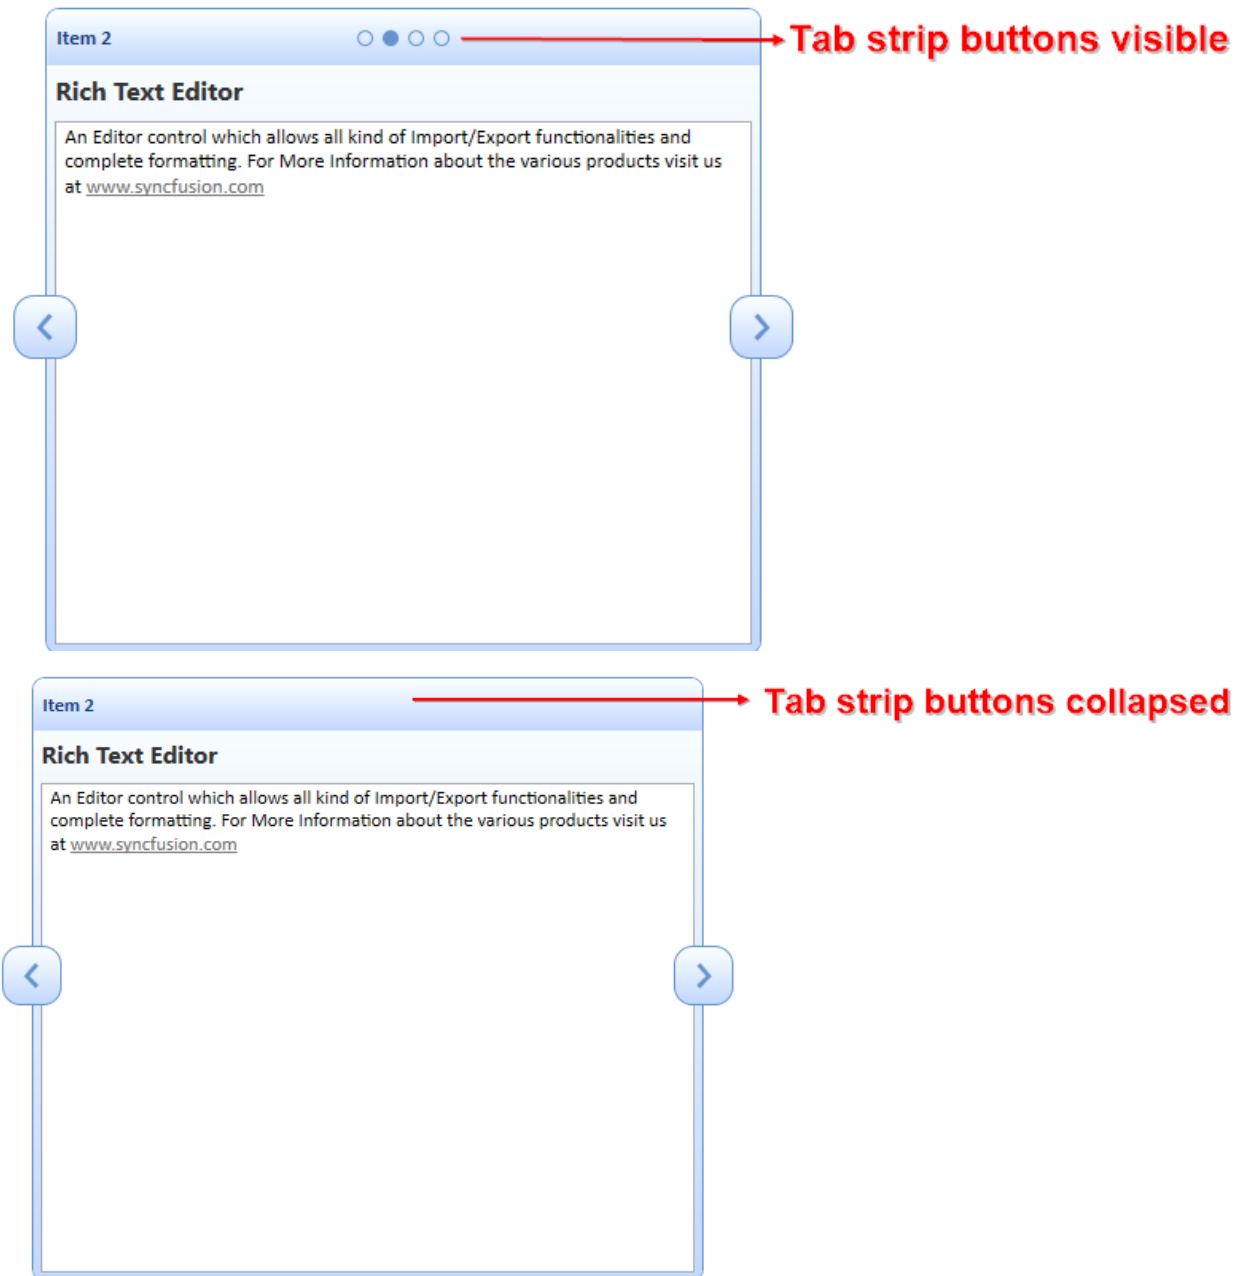

You can enable/disable the visibility of tab strip by setting [TabStripVisibility](#) property of TabNavigationControl.

XML

```
<!-- TabNavigation Control -->
<syncfusion:TabNavigationControl x:Name="TabNavigation"
TabStripVisibility="Visible">
<syncfusion:TabNavigationItem Header="TabItem1" Content="TabNavigationItem
1"/>
<syncfusion:TabNavigationItem Header="TabItem2" Content="TabNavigationItem
2"/>
</syncfusion:TabNavigationControl>
```

C#

```
//Enable the tab strip visibility
tabNavigation.TabStripVisibility = Visibility.Visible;
```

Animation in WPF Tab Navigation

Transition Effect property is used to set the animation effect for the tab navigation control. The Transition effect is an enum that contains five values namely:

- Slide – The item/page navigates with slide effect.

XML

```
<syncfusion:TabNavigationControl TransitionEffect="Slide" ItemsSource="{Binding MyCollection}">
</syncfusion:TabNavigationControl>
```

- Fade – During navigation, the previous item fades out and the new item appears with variation in opacity.

XML

```
<syncfusion:TabNavigationControl TransitionEffect="Fade" ItemsSource="{Binding MyCollection}">
</syncfusion:TabNavigationControl>
```

- Zoom – The new item appears with a zooming effect.

XML

```
<syncfusion:TabNavigationControl TransitionEffect="Zoom" ItemsSource="{Binding MyCollection}">
</syncfusion:TabNavigationControl>
```

- Blur – The new item appears with blur effect.

XML

```
<syncfusion:TabNavigationControl TransitionEffect="Blur" ItemsSource="{Binding MyCollection}">
</syncfusion:TabNavigationControl>
```

- Push – The new item descends from the top

XML

```
<syncfusion:TabNavigationControl TransitionEffect="Push" ItemsSource="{Binding MyCollection}">
</syncfusion:TabNavigationControl>
```

- PushIn – The new item ascends from the bottom

XML

```
<syncfusion:TabNavigationControl TransitionEffect="PushIn" ItemsSource="{Binding MyCollection}">
</syncfusion:TabNavigationControl>
```

- Wipe – The old item gets washed out and the new item appears.

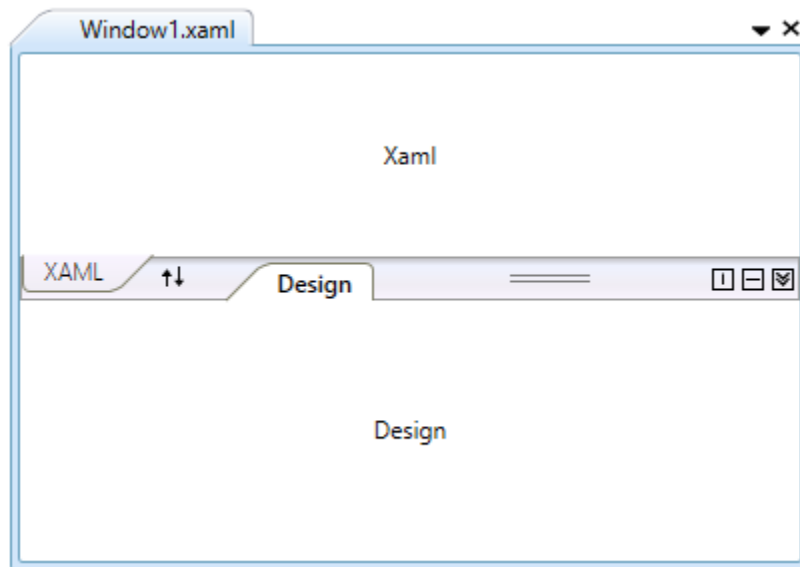

XML

```
<syncfusion:TabNavigationControl TransitionEffect="Wipe"
ItemsSource="{Binding MyCollection}">
</syncfusion:TabNavigationControl>
```

TabSplitter

WPF Tab Splitter Overview

TabSplitter is similar to VS 2008 style Split view of Tabbed Groups.

Features

Swap - Provides support to swapping the two tab groups.

Collapse and Expand - Provides support to collapse and expand the tab groups.

Layout - Provides support to toggle between vertical and horizontal layouts.

Appearance - Provides support to set the Background, Foreground color to TabSplitter.

Getting Started with WPF Tab Splitter

This section explains about how to create [TabSplitter](#) control.

Assembly deployment

Refer to the [control dependencies](#) section to get the list of assemblies or NuGet package that needs to be added as a reference to use the control in any application.

[Click here](#) to find more details on how to install nuget packages in WPF application.

Adding the TabSplitter control via XAML

Note: Download demo application from [GitHub](#)

1) Create a new WPF application via Visual Studio. 2) Add the following assembly reference to this project. *Syncfusion.Shared.WPF* *Syncfusion.Tools.WPF* 3) Import Syncfusion WPF schema <http://schemas.syncfusion.com/wpf>, and declare the [TabSplitter](#) control in XAML page.

XML

```
<Window x:Class="TabSplitter.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
```

```
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
xmlns:local="clr-namespace:TabSplitter"
mc:Ignorable="d"
Title="MainWindow" Height="450" Width="800">
<Grid Name="grid">
<syncfusion:TabSplitter Name="tabSplitter" Height="280" Width="400" />
</Grid>
```

Adding the TabSplitter control via C#

1) Create a new WPF application via Visual Studio. 2) Add the following required assembly references to the project. *Syncfusion.Shared.WPF* *Syncfusion.Tools.WPF* 3) Include the required namespace.

C#

```
using Syncfusion.Windows.Tools.Controls;
```

4) Create an instance of [TabSplitter](#) control and add it to the window.

C#

```
//Instance of TabSplitter
TabSplitter tabSplitter = new TabSplitter();
tabSplitter.Height = 280;
tabSplitter.Width = 400;
//Add control into the window
grid.Children.Add(tabSplitter);
```

Adding splitter item

1) You can add the splitter item into the TabSplitter control by using [Header](#) property. The TabSplitter items contains a collection of panel items. The panel items are [TopPanelItems](#) and [BottomPanelItems](#). You can also split the pages in TabSplitter item by using the [SplitterPage](#).

XML

```
<syncfusion:TabSplitterItem Header="Window1.xaml">
<syncfusion:TabSplitterItem.TopPanelItems>
<syncfusion:SplitterPage Header="XAML" />
</syncfusion:TabSplitterItem.TopPanelItems>
<syncfusion:TabSplitterItem.BottomPanelItems>
<syncfusion:SplitterPage Header="Design" />
</syncfusion:TabSplitterItem.BottomPanelItems>
</syncfusion:TabSplitterItem>
```

C#

```
//Create an instances of splitter page
SplitterPage splitterPage = new SplitterPage();
splitterPage.Header = "XAML";
SplitterPage splitterPage1 = new SplitterPage();
splitterPage1.Header = "Design";
//Create the tab splitter item
TabSplitterItem tabSplitterItem1 = new TabSplitterItem();
tabSplitterItem1.Header = "MainWindow.XAML";
//Add the splitter page into the tabSplitterItem
tabSplitterItem1.TopPanelItems.Add(splitterPage);
tabSplitterItem1.BottomPanelItems.Add(splitterPage1);
//Add tabSplitterItem into the tabSplitter
tabSplitter.Items.Add(tabSplitterItem1);
```

2) Add any one of the control to the splitter page of TabSplitter and add the content into the splitter page.

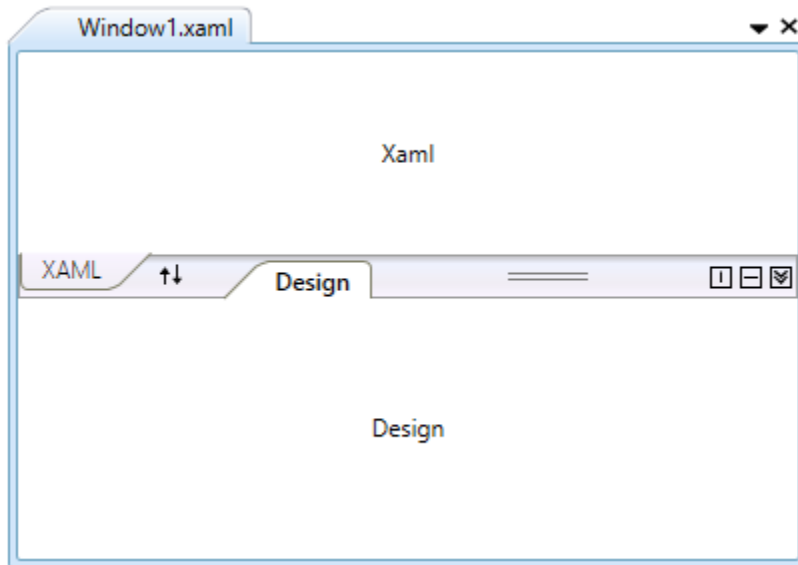

XML

```
<syncfusion:TabSplitterItem Header="Window1.xaml">
<syncfusion:TabSplitterItem.TopPanelItems>
<syncfusion:SplitterPage Header="XAML">
<Label Content="Xaml" HorizontalContentAlignment="Center"
VerticalContentAlignment="Center" />
</syncfusion:SplitterPage>
</syncfusion:TabSplitterItem.TopPanelItems>
<syncfusion:TabSplitterItem.BottomPanelItems>
<syncfusion:SplitterPage Header="Design">
<Label Content="Design" HorizontalContentAlignment="Center"
VerticalContentAlignment="Center" />
</syncfusion:SplitterPage>
</syncfusion:TabSplitterItem.BottomPanelItems>
</syncfusion:TabSplitterItem>
```

C#

```
Label label = new Label();
label.Content = "XAML";
label.HorizontalContentAlignment = HorizontalAlignment.Center;
label.VerticalContentAlignment = VerticalAlignment.Center;
Label label1 = new Label();
label1.Content = "Design";
```

```
label1.HorizontalContentAlignment = HorizontalAlignment.Center;  
label1.VerticalContentAlignment = VerticalAlignment.Center;  
splitterPage.Content = label;  
splitterPage1.Content = label1;
```

Tab orientation

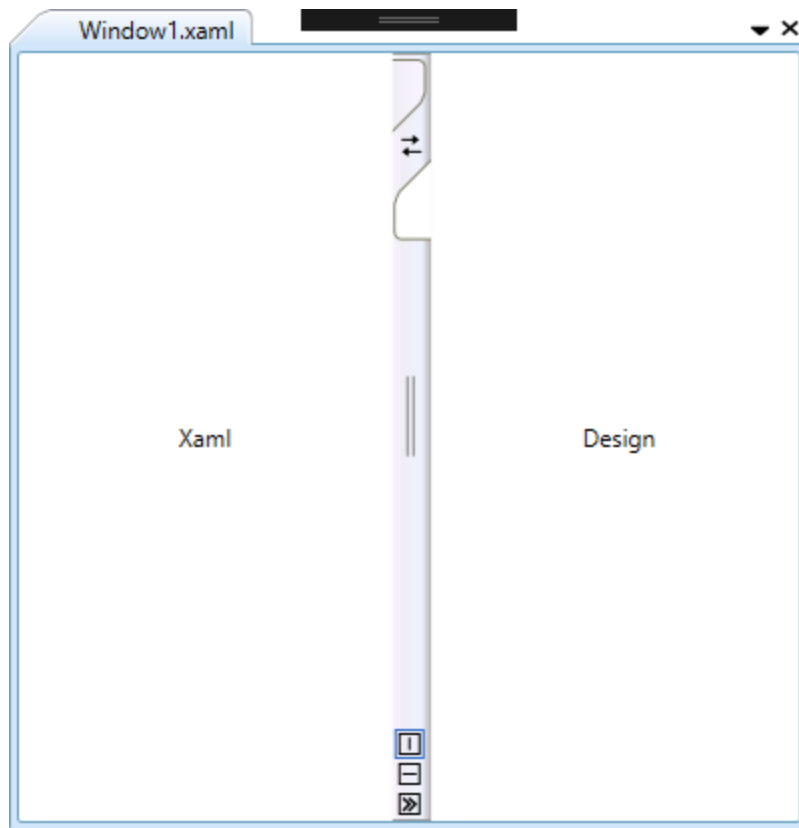

The TabSplitter items are placed horizontally or vertically by using the [Orientation](#) property.

XML

```
<syncfusion:TabSplitterItem Header="Window1.xaml" Orientation="Vertical">  
</syncfusion:TabSplitterItem>
```

C#

```
tabSplitterItem1.Orientation = Orientation.Vertical;
```

Collapsing bottom panel

You can collapse or expand the bottom panel by setting the [IsCollapsedBottomPanel](#) property to `true`. The default value is `false`.

XML

```
<syncfusion:TabSplitterItem Header="Window1.xaml"
    IsCollapsedBottomPanel="True">
</syncfusion:TabSplitterItem>
```

C#

```
tabSplitterItem1.IsCollapsedBottomPanel = true;
```

Theme

TabSplitter supports various built-in themes. Refer to the below links to apply themes for the TabSplitter,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Interactive Features in WPF Tab Splitter

This section illustrates the following interactive features of TabSplitter control.

Adding TabSplitterItem to the TabSplitter Control

TabSplitter contains one or more pages that are defined as TabSplitter Items. Use the following code to add a TabSplitter Item to the TabSplitter control.

XML

```
<!-- Adding TabSplitter -->
<syncfusion:TabSplitter Name="tabsplitter">
  <!-- Adding TabSplitterItem -->
  <syncfusion:TabSplitterItem Header="Window1.xml" Name="tabSplitterItem1">
  </syncfusion:TabSplitterItem>
</syncfusion:TabSplitter>
```

C#

```
// Creating an instance of TabSplitter
TabSplitter tabSplitter = new TabSplitter();
// Creating an instance of TabSplitterItem
TabSplitterItem tabSplitterItem1 = new TabSplitterItem();
```

```
// Adding header of the TabSplitterItem
tabSplitterItem1.Header = "Window1.xml";
// Adding TabSplitter Item to TabSplitter
tabSplitter.Items.Add(tabSplitterItem1);
// Adding TabSplitter to Window
this.Content = tabsplitter;
```

Panel Items

TabSplitter Items contains a collection of pages. These pages are defined as Panel Items.

There are two types of panel Items:

- [TopPanelItems](#): consists of collection of pages that are placed at the top panel of the TabSplitter
- [BottomPanelItems](#): consists of collection of pages that are placed at the bottom panel of the TabSplitter

The following code example can be used to add Panel Items to the TabSplitter Item:

XML

```
<!-- Adding TabSplitter -->
<syncfusion:TabSplitter Name="tabsplitter">
  <!-- Adding TabSplitterItem -->
  <syncfusion:TabSplitterItem Header="Window1.xml" Name="tabSplitterItem1">
    <!-- Adding TopPanelItems -->
    <syncfusion:TabSplitterItem.TopPanelItems>
      <!-- Adding SplitterPage -->
      <syncfusion:SplitterPage Name="splitterPage1" Header="XAML">
      </syncfusion:SplitterPage>
    </syncfusion:TabSplitterItem.TopPanelItems>
    <!-- Adding BottomPanelItems -->
    <syncfusion:TabSplitterItem.BottomPanelItems>
      <!-- Adding SplitterPage -->
      <syncfusion:SplitterPage Name="splitterPage2" Header="Design">

```

```
</syncfusion:SplitterPage>  
</syncfusion:TabSplitterItem.BottomPanelItems>  
</syncfusion:TabSplitterItem>  
</syncfusion:TabSplitter>
```

C#

```
// Creating an instance of TabSplitter  
TabSplitter tabSplitter = new TabSplitter();  
// Creating an instance of TabSplitterItem  
TabSplitterItem tabSplitterItem1 = new TabSplitterItem();  
// Adding header of the TabSplitterItem  
tabSplitterItem1.Header = "Window1.xml";  
// Creating an instance splitter page  
SplitterPage splitterPage1 = new SplitterPage();  
splitterPage1.Header = "XAML";  
// Adding SplitterPage to TopPanelItem  
tabSplitterItem1.TopPanelItems.Add(splitterPage1);  
// Creating an instance SplitterPage  
SplitterPage splitterPage2 = new SplitterPage();  
splitterPage2.Header = "Design";  
// Adding SplitterPage to BottomPanelItem  
tabSplitterItem1.BottomPanelItems.Add(splitterPage2);  
// Adding TabSplitter Item to TabSplitter  
tabSplitter.Items.Add(tabSplitterItem1);  
// Adding TabSplitter to Window  
this.Content = tabSplitter;
```

Splitter Page

You can split the pages in the TabSplitter Item by using the [SplitterPage](#). The following code example illustrates how to add a SplitterPage to the TabSplitter Item.

XML

```
<!-- Adding TabSplitter -->
<syncfusion:TabSplitter Name="tabsplitter">
  <!-- Adding TabSplitterItem -->
  <syncfusion:TabSplitterItem Header="Window1.xml" Name="tabSplitterItem1">
    <!-- Adding TopPanelItems -->
    <syncfusion:TabSplitterItem.TopPanelItems>
      <!-- Adding SplitterPage -->
      <syncfusion:SplitterPage Name="splitterPage1" Header="XAML">
        </syncfusion:SplitterPage>
      </syncfusion:TabSplitterItem.TopPanelItems>
    <!-- Adding BottomPanelItems -->
    <syncfusion:TabSplitterItem.BottomPanelItems>
      <!-- Adding Splitter Page -->
      <syncfusion:SplitterPage Name="splitterPage2" Header="Design">
        </syncfusion:SplitterPage>
      </syncfusion:TabSplitterItem.BottomPanelItems>
    </syncfusion:TabSplitterItem>
  </syncfusion:TabSplitter>
```

C#

```
// Creating an instance of TabSplitter
TabSplitter tabSplitter = new TabSplitter();
// Creating an instance of TabSplitterItem
TabSplitterItem tabSplitterItem1 = new TabSplitterItem();
// Adding header of the TabSplitterItem
tabSplitterItem1.Header = "Window1.xml";
// Creating an instance SplitterPage
SplitterPage splitterPage1 = new SplitterPage();
splitterPage1.Header = "XAML";
// Adding SplitterPage to TopPanelItem
tabSplitterItem1.TopPanelItems.Add(splitterPage1);
// Creating an instance SplitterPage
SplitterPage splitterPage2 = new SplitterPage();
splitterPage2.Header = "Design";
// Adding SplitterPage to BottomPanelItem
tabSplitterItem1.BottomPanelItems.Add(splitterPage2);
// Adding TabSplitter Item to TabSplitter
tabSplitter.Items.Add(tabSplitterItem1);
// Adding TabSplitter to Window
this.Content = tabSplitter;
```

Collapsing Bottom Panel

You can collapse or expand the Bottom Panel by using the [IsCollapsedBottomPanel](#) property. The default value is *false*. To collapse the Bottom Panel, refer to the following code snippet:

XML

```
<!-- Adding TabSplitter -->
<syncfusion:TabSplitter Name="tabsplitter">
  <!-- Adding TabSplitterItem -->
  <syncfusion:TabSplitterItem Header="Window1.xml"
    IsCollapsedBottomPanel="True" Name="tabSplitterItem1">
    <!-- Adding TopPanelItems -->
    <syncfusion:TabSplitterItem.TopPanelItems>
      <!-- Adding SplitterPage -->
      <syncfusion:SplitterPage Name="splitterPage1" Header="XAML">
      </syncfusion:SplitterPage>
    </syncfusion:TabSplitterItem.TopPanelItems>
    <!-- Adding BottomPanelItems -->
    <syncfusion:TabSplitterItem.BottomPanelItems>
      <!-- Adding SplitterPage -->
      <syncfusion:SplitterPage Name="splitterPage2" Header="Design">
      </syncfusion:SplitterPage>
    </syncfusion:TabSplitterItem.BottomPanelItems>
  </syncfusion:TabSplitterItem>
</syncfusion:TabSplitter>
```

C#

```
// Enable IsCollapseBottomPanel property.
tabSplitterItem1.IsCollapsedBottomPanel = true;
```

Setting BottomPanelHeight of TabSplitter

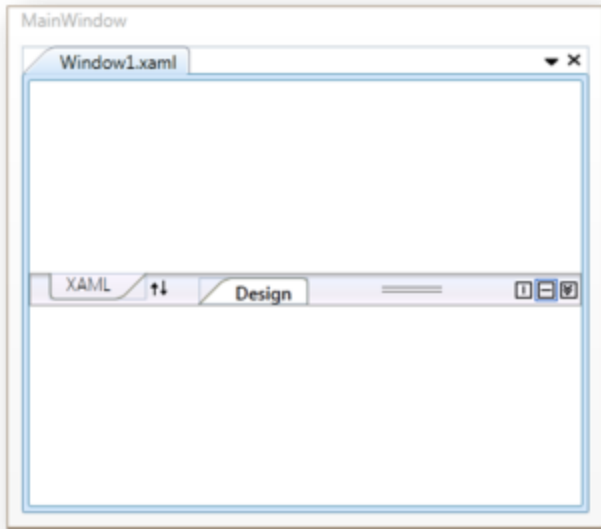

You can set the height of the BottomPanel in TabSplitter using [BottomPanelHeight](#) property. To set the height of the BottomPanel, refer the following code snippet:

XML

```
<!-- Adding TabSplitter -->
<syncfusion:TabSplitter BottomPanelHeight="150">
  <!-- Adding TabSplitterItem -->
  <syncfusion:TabSplitterItem Header="MainWindow.xml">
    <!-- Adding TopPanelItems -->
    <syncfusion:TabSplitterItem.TopPanelItems>
      <syncfusion:SplitterPage Header="Design" />
    </syncfusion:TabSplitterItem.TopPanelItems>
    <!-- Adding BottomPanelItems -->
    <syncfusion:TabSplitterItem.BottomPanelItems>
      <syncfusion:SplitterPage Header="XAML" />
    </syncfusion:TabSplitterItem.BottomPanelItems>
  </syncfusion:TabSplitterItem>
</syncfusion:TabSplitter>
```

C#

```
// Creating an instance of TabSplitter
TabSplitter tabSplitter = new TabSplitter();
//Setting BottomPanelHeight property
tabSplitter.BottomPanelHeight = 150;
```

Orientation in WPF Tab Splitter

TabSplitter Items are placed horizontally or vertically by using the [Orientation](#) property. This is a dependency property which sets the orientation of the TabSplitter Item. It supports the following types of orientation.

- Horizontal: TabSplitter Item in the TabSplitter is placed horizontally
- Vertical: TabSplitter Item in the TabSplitter is placed vertically

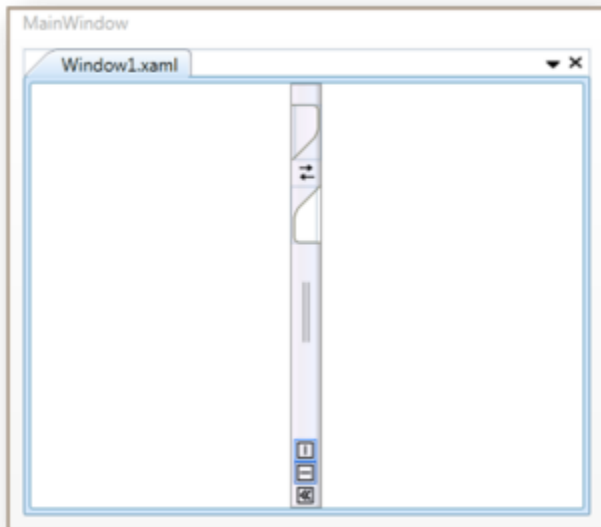

Set the orientation using the code given below:

XML

```
<!-- Adding TabSplitter -->
<syncfusion:TabSplitter Name="tabsplitter">
  <!-- Adding TabSplitterItem -->
  <syncfusion:TabSplitterItem Header="Window1.xml" Orientation="Vertical"
  Name="tabSplitterItem1">
    <!-- Adding TopPanelItems -->
    <syncfusion:TabSplitterItem.TopPanelItems>
      <!-- Adding SplitterPage -->
      <syncfusion:SplitterPage Name="splitterPage1" Header="XAML">
      </syncfusion:SplitterPage>
    </syncfusion:TabSplitterItem.TopPanelItems>
    <!-- Adding BottomPanelItems -->
    <syncfusion:TabSplitterItem.BottomPanelItems>
      <!-- Adding SplitterPage -->
      <syncfusion:SplitterPage Name="splitterPage2" Header="Design">
      </syncfusion:SplitterPage>
    </syncfusion:TabSplitterItem.BottomPanelItems>
  </syncfusion:TabSplitterItem>
</syncfusion:TabSplitter>
```

C#

```
// Set the Orientation
tabSplitterItem1.Orientation = Orientation.Vertical;
```

Selected Page in WPF Tab Splitter

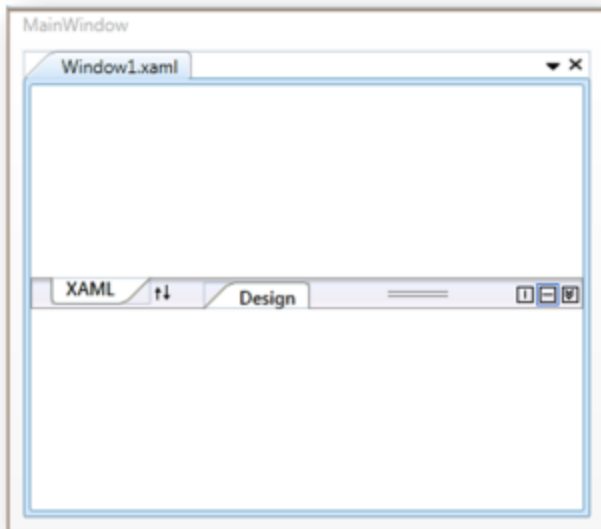

You can set the selected page by using the [IsSelectedPage](#) property. If this property is set to *true*, the page is selected, else it is not selected.

XML

```
<!-- Adding TabSplitter -->
<syncfusion:TabSplitter Name="tabsplitter">
  <!-- Adding TabSplitterItem -->
  <syncfusion:TabSplitterItem Header="Window1.xml" Name="tabSplitterItem1">
    <!-- Adding TopPanelItems -->
    <syncfusion:TabSplitterItem.TopPanelItems>
      <!-- Adding SplitterPage -->
      <syncfusion:SplitterPage IsSelectedPage="True" Name="splitterPage1"
      Header="XAML">
    </syncfusion:SplitterPage>
    </syncfusion:TabSplitterItem.TopPanelItems>
    <!-- Adding BottomPanelItems -->
    <syncfusion:TabSplitterItem.BottomPanelItems>
      <!-- Adding SplitterPage -->
      <syncfusion:SplitterPage Name="splitterPage2" Header="Design">
    </syncfusion:SplitterPage>
    </syncfusion:TabSplitterItem.BottomPanelItems>
  </syncfusion:TabSplitterItem>
</syncfusion:TabSplitter>
```

C#

```
// Enable the IsSelectedPage property.
splitterPage1.IsSelectedPage = true;
```

Layout Related Features in WPF Tab Splitter

This section illustrates the following Layout-related feature of [TabSplitter](#) control.

Customizing the Appearance of TabSplitter

The appearance of the [TabSplitter](#) control is customized by using the appearance properties available in the control. You can set the color for the [MouseOverBackground](#), [MouseOverForeground](#), [SelectedForeground](#) and [SelectedBackground](#) of the TabSplitter control. Here is the code snippet.

XML

```
<Grid>
  <!-- Adding TabSplitter With Selected Brush -->
  <syncfusion:TabSplitter Name="tabsplitter" MouseOverBackground="Green"
  MouseOverForeground="Yellow" SelectedBackground="Red"
  SelectedForeground="YellowGreen">
    <!-- Adding TabSplitterItem -->
    <syncfusion:TabSplitterItem Header="Window1.xml" Name="tabSplitterItem1">
      <!-- Adding TopPanelItems -->
      <syncfusion:TabSplitterItem.TopPanelItems>
        <syncfusion:SplitterPage Name="splitterPage1" Header="XAML" />
      </syncfusion:TabSplitterItem.TopPanelItems>
      <!-- Adding BottomPanelItems -->
      <syncfusion:TabSplitterItem.BottomPanelItems>
        <syncfusion:SplitterPage Name="splitterPage2" Header="Design" />
      </syncfusion:TabSplitterItem.BottomPanelItems>
    </syncfusion:TabSplitterItem>
  </syncfusion:TabSplitter>
</Grid>
```

C#

```
// Set the selected background.
tabsplitter.SelectedBackground = Brushes.Red;
// Set the selected foreground.
tabsplitter.SelectedForeground = Brushes.YellowGreen;
```

```
// Set the MouseOverBackground.
tabsplitter.MouseOverBackground = Brushes.Green;
// Set the MouseOverForeground.
tabsplitter.MouseOverForeground = Brushes.Yellow;
```

Hide TabSplitterItem header tab in TabSplitter

You can hide the [TabSplitterItem](#) header tab in [TabSplitter](#) by enabling the [HideHeaderOnSingleChild](#) property. This property works only if TabSplitter control has one TabSplitterItem in it.

XML

```
<Grid>
<syncfusion:TabSplitter Name="tabsplitter" HideHeaderOnSingleChild="True">
<syncfusion:TabSplitterItem Header="Window1.xml" Name="tabSplitterItem1">
<syncfusion:TabSplitterItem.TopPanelItems>
<syncfusion:SplitterPage Name="splitterPage1" Header="XAML" />
</syncfusion:TabSplitterItem.TopPanelItems>
<syncfusion:TabSplitterItem.BottomPanelItems>
<syncfusion:SplitterPage Name="splitterPage2" Header="Design" />
</syncfusion:TabSplitterItem.BottomPanelItems>
</syncfusion:TabSplitterItem>
</syncfusion:TabSplitter>
</Grid>
```

C#

```
TabSplitter tabSplitter = new TabSplitter() { HideHeaderOnSingleChild =
true};
TabSplitterItem tabSplitterItem = new TabSplitterItem() { Header=
"Window1.xml" };
SplitterPage page1 = new SplitterPage() { Header = "XAML" };
SplitterPage page2 = new SplitterPage() { Header = "Design" };
tabSplitterItem.TopPanelItems.Add(page1);
tabSplitterItem.BottomPanelItems.Add(page2);
```

```
tabSplitter.Items.Add(tabSplitterItem);
```

TaskBar

WPF TaskBar Overview

TaskBar control has the capability to provide an UI that is similar to the Windows Explorer TaskBar. It provides a consistent UI for placing commonly used functionalities as grouped items. You can place any Container Panel control inside the TaskBar. For example, when the customized Grid Panel with other controls are placed inside the TaskBar Item, it will be automatically arranged inside the TaskBar Items collection. TaskBar supports the Office2007Black, Blue, Silver, Office2003 and Blend themes.

Features

- Windows Explorer TaskBar look and feel.
- Horizontal / Vertical layouts for TaskBar Boxes.
- Provides support to customize the background, header size, and collapse / expand the TaskBar Header.
- Keyboard navigation support.
- Ability to specify custom group margin and padding.
- Supports built-in visual styles - Default, Win XP, Zune, Aero, Office2007Blue, Office2007Black, Office2007Silver, Office2003, Blend, LunaRoyale, LunaHomestead and LunaMetallic.

Getting Started with WPF TaskBar

This section guides you on getting started with TaskBar control. It covers the following topics:

Overview of Taskbar control

TaskBar control has the capability to provide a UI that is similar to the Windows Explorer TaskBar. It provides a consistent UI for placing commonly used functionalities as grouped items. You can place any Container Panel control inside the TaskBar. For example, when the customized Grid Panel with other controls are placed inside the TaskBar Item, it will be automatically arranged inside the TaskBar Items collection. TaskBar supports the Office2007Black, Office2007Blue, Office2007Silver, Office2003 and Blend themes.

Why to use our TaskBar control

Here are some highlights of our TaskBar control.

- Windows Explorer TaskBar appearance can be achieved
- Horizontal/Vertical layouts for TaskBar Boxes
- Provides support to customize the background, header size, and collapse / expand the TaskBar Header
- Keyboard navigation support
- Ability to specify custom group margin and padding
- Supports built-in visual styles - Default, Win XP, Zune, Aero, Office2007Blue, Office2007Black, Office2007Silver, Office2003, Blend, LunaRoyale, LunaHomestead and LunaMetallic

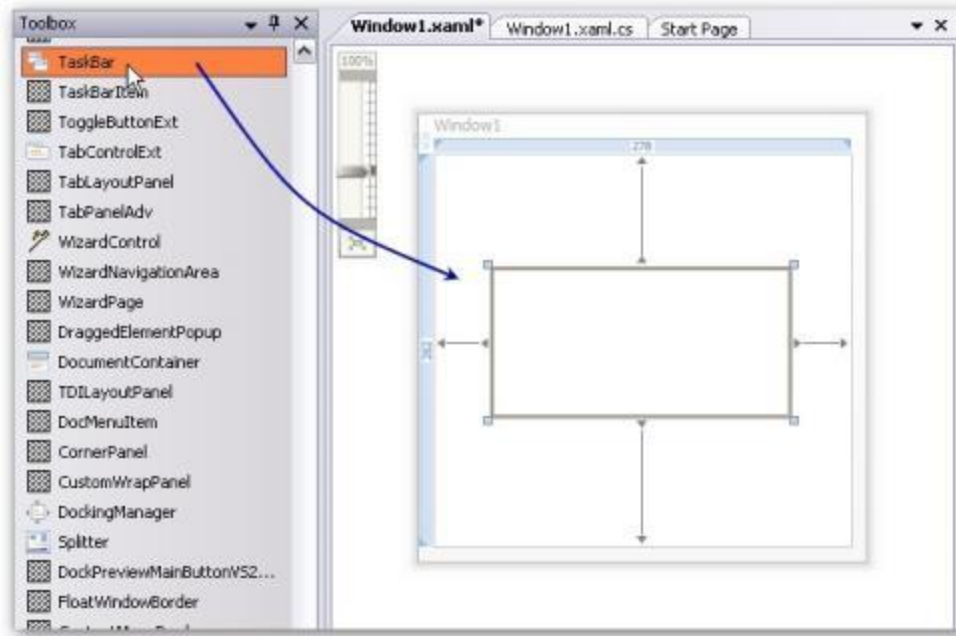

Creating the Taskbar and its children element using Docking Manager

There are two possible ways to create a simple TaskBar control.

Through Designer

To create the TaskBar control through designer, do the following steps:

1. Drag the TaskBar control from the toolbox onto your WPF application.

2. Set the properties for the TaskBar in design mode by using the Smart Tag feature.

Programmatically

TaskBar control is created by using either XAML or C# code. The following lines of code can be used to create a TaskBar control.

XML

```
<!-- Adding TaskBar -->
<syncfusion:TaskBar Name="taskBar" >
</syncfusion:TaskBar>
```

C#

```
//Creating an instance for TaskBar
TaskBar taskBar = new TaskBar();
//Adding TaskBar as content of window
this.Content = taskBar;
```

Note: To display the TaskBar by using C# code, you must already have a panel in which you are going to add the control. Otherwise, the control cannot be displayed.

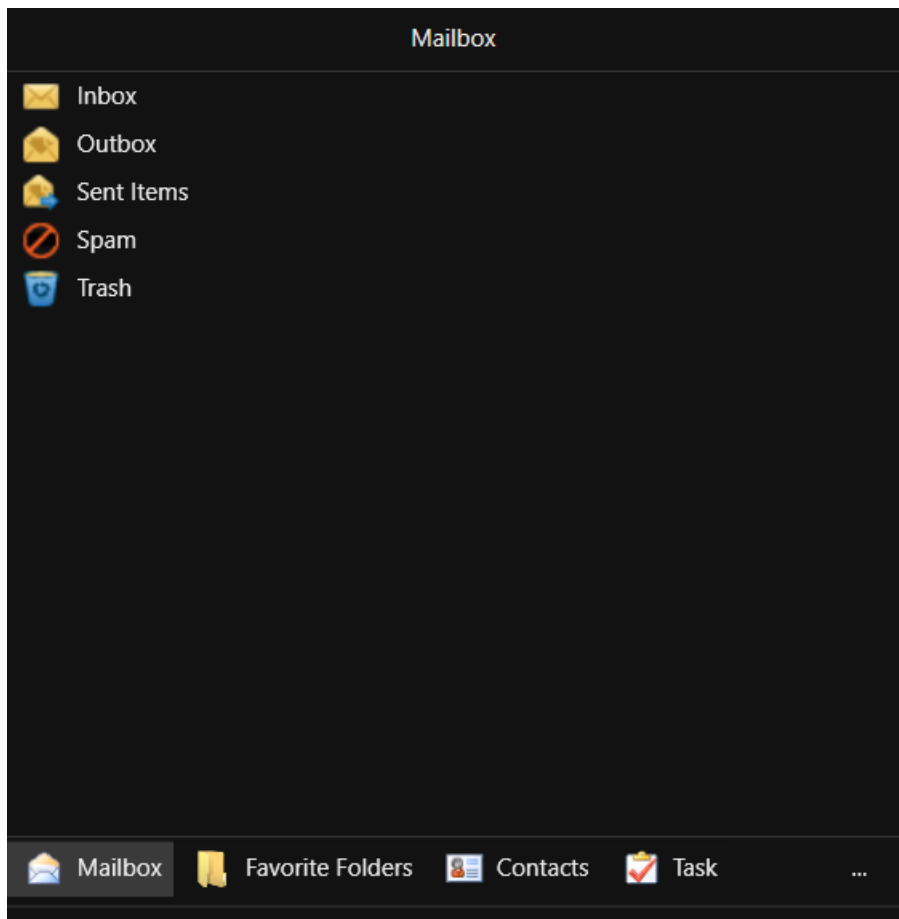

The following screen shot shows the TaskBar control.

Theme

TaskBar supports various built-in themes. Refer to the below links to apply themes for the TaskBar,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Adding a TaskBar Item in WPF TaskBar control

The Task Bar Item is added to the Task Bar by using either XAML or C# coding. Use the following code to add a Task Bar Item to the Task Bar control.

XML

```
<!-- Adding TaskBar -->  
<syncfusion:TaskBar Name="taskBar" >
```

```
<!-- Adding TaskBarItem -->
<syncfusion:TaskBarItem Name="taskBarItem1" Header="TaskBarItem1">
</syncfusion:TaskBarItem>
</syncfusion:TaskBar>
```

C#

```
//Creating an instance for TaskBar
TaskBar taskBar = new TaskBar();
//Creating an instance for TaskBarItem
TaskBarItem taskBarItem1 = new TaskBarItem();
//Setting the header of TaskBarItem1
taskBarItem1.Header = "TaskBarItem1";
//Adding the TaskBarItem to TaskBar
taskBar.Items.Add(taskBarItem1);
//Adding TaskBar as content of window
this.Content = taskBar;
```

The following screen shot shows the TaskBar control with TaskBar Item.

**Adding Content to TaskBar Item**

To add text to the TaskBar Item, use the below code

XML

```
<!-- Adding TaskBar -->
<syncfusion:TaskBar Name="taskBar" >
<!-- Adding TaskBarItem -->
<syncfusion:TaskBarItem Name="taskBarItem1" Header="TaskBarItem1">
<!-- Adding content to TaskBarItem -->
<StackPanel Margin="10" HorizontalAlignment="Center"
VerticalAlignment="Stretch">
<TextBlock TextWrapping="Wrap"> This TaskBar that have a
TaskBarItem.</TextBlock>
</StackPanel>
</syncfusion:TaskBarItem>
</syncfusion:TaskBar>
```

C#

```
//Creating an instance for TaskBar
TaskBar taskBar = new TaskBar();
//Creating an instance for TaskBarItem
TaskBarItem taskBarItem1 = new TaskBarItem();
//Setting the header of TaskBarItem1
taskBarItem1.Header = "TaskBarItem1";
// Creating instance for TextBlock
```

```

TextBlock textBlock1 = new TextBlock();
// Adding text to textblock
textBlock1.Text = "This TaskBar that have a TaskBarItem.";
// Adding textblock to taskbaritem
taskBarItem1.Items.Add(textBlock1);
//Adding the TaskBarItem to TaskBar
taskBar.Items.Add(taskBarItem1);
//Adding TaskBar as content of window
this.Content = taskBar;

```

Note: To display the TaskBar Item, you must already have the TaskBar in which you are going to add the TaskBar Item.

The following screen shot illustrates how text has been added to the TaskBar Item.

Setting Header Image in WPF TaskBar

You can set a custom header image for the TaskBarItem. Use the following code snippet to set an image for the header.

XML

```

<!-- Adding TaskBar that have group orientation as horizontal -->
<syncfusion:TaskBar Name="taskBar" GroupMargin="5">
  <!-- Adding TaskBarItem -->
  <syncfusion:TaskBarItem Name="taskBarItem1">
    <!-- Adding header with image -->
    <syncfusion:TaskBarItem.Header>
      <DockPanel Margin="0">
        <Image Height="16" Width="16" Source="App.ico"/>
        <TextBlock Foreground="White" Margin="5,0,0,0"

          Text="Header" />
      </DockPanel>
    </syncfusion:TaskBarItem.Header>
    <!-- Adding content to taskbaritem -->
    <StackPanel Margin="10" HorizontalAlignment="Center"

      VerticalAlignment="Stretch">
      <TextBlock TextWrapping="Wrap">This taskbar provides an UI similar to that
of Windows XP.</TextBlock>
    </StackPanel>
  </syncfusion:TaskBarItem>
</syncfusion:TaskBar>

```

Group Padding for the TaskBar Item

Setting Group Padding in WPF TaskBar

You can set the padding for the TaskBar Items by using the [GroupPadding](#) property. This is an attached property, which sets the padding for adjusting the TaskBarItems by using the [SetGroupPadding](#) method. You can enhance the appearance of the content in the taskbar items by using this property.

You can also set the value for Left, Right, Bottom and Top group padding.

To set the group padding, use the below code

XML

```
<!-- Adding TaskBar that have group padding as 20 -->
<syncfusion:TaskBar Name="taskBar" GroupMargin="5"

        syncfusion:TaskBar.GroupPadding="20">
<!-- Adding TaskBarItem -->
<syncfusion:TaskBarItem Name="taskBarItem1" Header="TaskBarItem1">
<!-- Adding content to taskbaritem -->
<StackPanel Margin="10" HorizontalAlignment="Center"
VerticalAlignment="Stretch">
<TextBlock TextWrapping="Wrap">This taskbar provides an UI similar to that
of Windows XP.</TextBlock>
</StackPanel>
</syncfusion:TaskBarItem>
<!-- Adding TaskBarItem -->
<syncfusion:TaskBarItem Name="taskBarItem2" Header="TaskBarItem2">
<!-- Adding content to TaskBarItem -->
<StackPanel Margin="10" HorizontalAlignment="Center"

        VerticalAlignment="Stretch">
<TextBlock TextWrapping="Wrap">Specify and customize the group
margin.</TextBlock>
</StackPanel>
</syncfusion:TaskBarItem>
</syncfusion:TaskBar>
```

C#

```
//Setting group padding for TaskBar
TaskBar.SetGroupPadding(taskBar, new Thickness(20));
```

TaskBar Item Header Image

Changing the size of Expander Button in WPF TaskBar

You can change the size of the Expander button in the TaskBar control. This is achieved by using the [ButtonSize](#) attached property, which sets the height of the Expander button in the TaskBar by handling the [SetButtonSize](#) method.

To set the size of the Expander button, use the below code

XML

```
<!-- Adding TaskBar that have button size is 20 -->
<syncfusion:TaskBar Name="taskBar" GroupMargin="5"
syncfusion:TaskBar.ButtonSize="20">
<!-- Adding TaskBarItem -->
<syncfusion:TaskBarItem Name="taskBarItem1" Header="TaskBarItem1">
<!-- Adding content to taskbaritem -->
<StackPanel Margin="10" HorizontalAlignment="Center"

        VerticalAlignment="Stretch">
<TextBlock TextWrapping="Wrap">This taskbar provides an UI similar to that
of Windows XP.</TextBlock>
</StackPanel>
</syncfusion:TaskBarItem>
<!-- Adding TaskBarItem -->
<syncfusion:TaskBarItem Name="taskBarItem2" Header="TaskBarItem2">
<!-- Adding content to taskbaritem -->
<StackPanel Margin="10" HorizontalAlignment="Center"

        VerticalAlignment="Stretch">
<TextBlock TextWrapping="Wrap">Specify and customize the group
margin.</TextBlock>
</StackPanel>
</syncfusion:TaskBarItem>
</syncfusion:TaskBar>
```

C#

```
// Setting button size
TaskBar.SetButtonSize(taskBar, 20);
```

Collapsing the TaskBar

Collapsing the TaskBar in WPF TaskBar

You can expand or collapse the TaskBar control similar to the Windows Taskbar. This is done by using the [IsOpened](#) property. This is an attached property, which is used to expand or collapse the TaskBarItems by using the [SetIsOpened](#) method.

This property is used in both TaskBar and TaskBarItems.

Use the following code snippet to expand or collapse the TaskBar.

XML

```
<!-- Adding TaskBar that have collapsed TaskBarItem -->
<syncfusion:TaskBar Name="taskBar" GroupMargin="5"
syncfusion:TaskBar.IsOpened="False">
<!-- Adding TaskBarItem -->
<syncfusion:TaskBarItem Name="taskBarItem1" Header="TaskBarItem1">
<!-- Adding content to TaskBarItem -->
<StackPanel Margin="10" HorizontalAlignment="Center"

    VerticalAlignment="Stretch">
<TextBlock TextWrapping="Wrap">This taskbar provides an UI similar to that
of Windows XP.</TextBlock>
</StackPanel>
</syncfusion:TaskBarItem>
<!-- Adding TaskBarItem -->
<syncfusion:TaskBarItem Name="taskBarItem2" Header="TaskBarItem2">
<!-- Adding content to TaskBarItem -->
<StackPanel Margin="10" HorizontalAlignment="Center"

    VerticalAlignment="Stretch">
<TextBlock TextWrapping="Wrap">Specify and customize the group
margin.</TextBlock>
</StackPanel>
</syncfusion:TaskBarItem>
</syncfusion:TaskBar>
```

C#

```
// To Collapse the TaskBarItem in TaskBar.
TaskBar.SetIsOpened(taskBar, false);
```

Expander Button Size

Setting Group Margin in WPF TaskBar

You can set the margin for the items in the TaskBar control by using the [GroupMargin](#) property. This is a dependency property, which sets the margin for all TaskBar Items in the TaskBar control. You can enhance the appearance of the TaskBar Items by using this property.

You can also set the value for Left, Right, Bottom and Top group margins.

Use the below code for setting the group margin.

XML

```
<!-- Adding TaskBar that have group margin is 5 -->
<syncfusion:TaskBar Name="taskBar" GroupMargin="5">
  <!-- Adding TaskBarItem -->
  <syncfusion:TaskBarItem Name="taskBarItem1" Header="TaskBarItem1">
    <!-- Adding content to TaskBarItem -->
    <StackPanel Margin="10" HorizontalAlignment="Center"
      VerticalAlignment="Stretch">
      <TextBlock TextWrapping="Wrap">
        This taskbar provides an UI similar to that of Windows XP.</TextBlock>
      </StackPanel>
    </syncfusion:TaskBarItem>
    <!-- Adding TaskBarItem -->
    <syncfusion:TaskBarItem Name="taskBarItem2" Header="TaskBarItem2">
      <!-- Adding content to TaskBarItem -->
      <StackPanel Margin="10" HorizontalAlignment="Center"
        VerticalAlignment="Stretch">
        <TextBlock TextWrapping="Wrap">
          Specify and customize the group margin.</TextBlock>
        </StackPanel>
      </syncfusion:TaskBarItem>
    </syncfusion:TaskBar>
```

C#

```
//Creating an instance for TaskBar
TaskBar taskBar = new TaskBar();
//Creating an instance for TaskBarItem
TaskBarItem taskBarItem1 = new TaskBarItem();
//Setting the header of TaskBarItem1
taskBarItem1.Header = "TaskBarItem1";
// Creating instance for TextBlock
TextBlock textBlock1 = new TextBlock();
```

```
// Adding text to textblock
textBlock1.Text = "This taskbar provides an UI similar to that of Windows
XP.";
// Adding textblock to TaskBarItem
taskBarItem1.Items.Add(textBlock1);
//Creating an instance for TaskBarItem
TaskBarItem taskBarItem2 = new TaskBarItem();
//Setting the header of TaskBarItem1
taskBarItem2.Header = "TaskBarItem2";
// Creating instance for TextBlock
TextBlock textBlock2 = new TextBlock();
// Adding text to textblock
textBlock2.Text = "Specify and customize the group margin.";
// Adding textblock to TaskBarItem
taskBarItem2.Items.Add(textBlock2);
//Adding the TaskBarItem to TaskBar
taskBar.Items.Add(taskBarItem1);
taskBar.Items.Add(taskBarItem2);
//Setting Group Margin
taskBar.GroupMargin = new Thickness(5);
//Adding TaskBar as content of window
this.Content = taskBar;
```

Group Width for the TaskBar

Setting Group Width in WPF TaskBar

The width of the TaskBar is customized by using the [GroupWidth](#) property. This is a dependency property, which sets the group width of the TaskBar. It displays all the TaskBar Items in the TaskBar control with the same width.

The following code snippet illustrates how to set the group width.

XML

```
<!-- Adding TaskBar that have group width as 150 -->
<syncfusion:TaskBar Name="taskBar" GroupMargin="5" GroupWidth="150">
  <!-- Adding TaskBarItem -->
  <syncfusion:TaskBarItem Name="taskBarItem1" Header="TaskBarItem1">
    <!-- Adding content to TaskBarItem-->
    <StackPanel Margin="10" HorizontalAlignment="Center"
      VerticalAlignment="Stretch">
      <TextBlock TextWrapping="Wrap">This taskbar provides an UI similar to that
of Windows XP.</TextBlock>
    </StackPanel>
  </syncfusion:TaskBarItem>
</syncfusion:TaskBar>
```

```

</syncfusion:TaskBarItem>
<!-- Adding TaskBarItem -->
<syncfusion:TaskBarItem Name="taskBarItem2" Header="TaskBarItem2">
<!-- Adding content to TaskBarItem-->
<StackPanel Margin="10" HorizontalAlignment="Center"

        VerticalAlignment="Stretch">
<TextBlock TextWrapping="Wrap">Specify and customize the group
margin.</TextBlock>
</StackPanel>
</syncfusion:TaskBarItem>
</syncfusion:TaskBar>

```

C#

```

//Creating an instance for TaskBar
TaskBar taskBar = new TaskBar();
//Creating an instance for TaskBarItem
TaskBarItem taskBarItem1 = new TaskBarItem();
//Setting the header of TaskBarItem1
taskBarItem1.Header = "TaskBarItem1";
// Creating instance for TextBlock
TextBlock textBlock1 = new TextBlock();
// Adding text to textblock
textBlock1.Text = "This taskbar provides an UI similar to that of Windows
XP.";
// Adding textblock to TaskBarItem
taskBarItem1.Items.Add(textBlock1);
//Creating an instance for TaskBarItem
TaskBarItem taskBarItem2 = new TaskBarItem();
//Setting the header of TaskBarItem1
taskBarItem2.Header = "TaskBarItem2";
// Creating instance for TextBlock
TextBlock textBlock2 = new TextBlock();
// Adding text to textblock
textBlock2.Text = "Specify and customize the group margin.";
// Adding textblock to TaskBarItem
taskBarItem2.Items.Add(textBlock2);
//Adding the TaskBarItem to TaskBar
taskBar.Items.Add(taskBarItem1);
taskBar.Items.Add(taskBarItem2);
//Setting group orientation to TaskBar
taskBar.GroupWidth = 150;
//Adding TaskBar as content of window
this.Content = taskBar;

```

Group Margin for the TaskBar

Changing Orientation of Taskbar in WPF TaskBar

TaskBar control is placed horizontally or vertically by using the [GroupOrientation](#) property. This is a dependency property, which sets the orientation of the TaskBar.

TaskBar control supports the following types of orientation.

- Horizontal–TaskBar Items in the TaskBar are placed horizontally
- Vertical–TaskBar Items in the TaskBar are placed vertically

Use the below code snippet to set the orientation.

XML

```
<!-- Adding TaskBar that have group orientation as horizontal -->
<syncfusion:TaskBar Name="taskBar" GroupMargin="5"
GroupOrientation="Horizontal">
<!-- Adding TaskBarItem -->
<syncfusion:TaskBarItem Name="taskBarItem1" Header="TaskBarItem1">
<!-- Adding content to TaskBarItem -->
<StackPanel Margin="10" HorizontalAlignment="Center"

        VerticalAlignment="Stretch">
<TextBlock TextWrapping="Wrap">
This taskbar provides an UI similar to that of Windows XP.</TextBlock>
</StackPanel>
</syncfusion:TaskBarItem>
<!-- Adding TaskBarItem -->
<syncfusion:TaskBarItem Name="taskBarItem2" Header="TaskBarItem2">
<!-- Adding content to TaskBarItem -->
<StackPanel Margin="10" HorizontalAlignment="Center"

        VerticalAlignment="Stretch">
<TextBlock TextWrapping="Wrap">
Specify and customize the group margin.</TextBlock>
</StackPanel>
</syncfusion:TaskBarItem>
</syncfusion:TaskBar>
```

C#

```
//Creating an instance for TaskBar
TaskBar taskBar = new TaskBar();
//Creating an instance for TaskBarItem
TaskBarItem taskBarItem1 = new TaskBarItem();
//Setting the header of TaskBarItem1
taskBarItem1.Header = "TaskBarItem1";
// Creating instance for TextBlock
TextBlock textBlock1 = new TextBlock();
// Adding text to textblock
```

```

textBlock1.Text = "This taskbar provides an UI similar to that of Windows
XP.";
// Adding textblock to TaskBarItem
taskBarItem1.Items.Add(textBlock1);
//Creating an instance for TaskBarItem
TaskBarItem taskBarItem2 = new TaskBarItem();
//Setting the header of TaskBarItem1
taskBarItem2.Header = "TaskBarItem2";
// Creating instance for TextBlock
TextBlock textBlock2 = new TextBlock();
// Adding text to textblock
textBlock2.Text = "Specify and customize the group margin.";
// Adding textblock to TaskBarItem
taskBarItem2.Items.Add(textBlock2);
//Adding the TaskBarItem to TaskBar
taskBar.Items.Add(taskBarItem1);
taskBar.Items.Add(taskBarItem2);
//setting group orientation to TaskBar
taskBar.GroupOrientation = Orientation.Horizontal;
//Adding TaskBar as content of window
this.Content = taskBar;

```

GroupOrientationChanged Event

This [GroupOrientationChanged](#) event is handled when the [GroupOrientation](#) property is changed.

While setting the orientation of the TaskBar, you may want to change the position of the TaskBar for proper alignment. This can be achieved by changing the group margin of the TaskBar along with the orientation.

The following code snippet illustrates handling the GroupOrientationChanged event.

C#

```

/// <summary>
/// Tasks the bar_ group orientation changed.
/// </summary>
/// <param name="d">The d.</param>
/// <param name="e">The <see
cref="System.Windows.DependencyPropertyChangedEventArgs"/> instance
    containing the event data.</param>
private void taskBar_GroupOrientationChanged(DependencyObject d,
DependencyPropertyChangedEventArgs e)
{
    if (taskBar.GroupOrientation == Orientation.Horizontal)
        taskBar.GroupMargin = new Thickness(5, 0, 0, 0);
    else
        taskBar.GroupMargin = new Thickness(0, 0, 0, 5);
}

```

Changing the flow directions in WPF TaskBar

The flow direction for the TaskBar is set through the [FlowDirection](#) property.

Here is the code for setting this property.

XML

```
<!-- Adding TaskBar -->
<syncfusion:TaskBar Name="taskBar" FlowDirection="RightToLeft">
  <!-- Adding TaskBarItem -->
  <syncfusion:TaskBarItem Name="taskBarItem1" Header="TaskBarItem1">
    <!-- Adding content to TaskBarItem -->
    <StackPanel Margin="10" HorizontalAlignment="Center"

      VerticalAlignment="Stretch">
        <TextBlock TextWrapping="Wrap">
          This is TaskBar that have a TaskBarItem</TextBlock>
        </StackPanel>
      </syncfusion:TaskBarItem>
    </syncfusion:TaskBar>
```

C#

```
// Setting flow direction as right to left
taskBar.FlowDirection = FlowDirection.RightToLeft;
```

FlowDirection = "RightToLeft"

Setting the Animation Speed in WPF TaskBar

You can set the animation speed, which controls the time taken to expand or collapse the taskbar items in the TaskBar, using the [Speed](#) property. This is an attached property, which controls the time taken to expand or collapse the TaskBarItems in the TaskBar by using the SetSpeed method.

Use the following code snippet to set this property.

XML

```
<!-- Adding TaskBar that have animation speed as 10 -->
<syncfusion:TaskBar Name="taskBar" GroupMargin="5"
  syncfusion:TaskBar.Speed="10">
  <!-- Adding TaskBarItem -->
  <syncfusion:TaskBarItem Name="taskBarItem1" Header="TaskBarItem1">
    <!-- Adding content to TaskBarItem -->
    <StackPanel Margin="10" HorizontalAlignment="Center"

      VerticalAlignment="Stretch">
        <TextBlock TextWrapping="Wrap">This taskbar provides an UI similar to that
          of Windows XP.</TextBlock>
        </StackPanel>
      </syncfusion:TaskBarItem>
    <!-- Adding TaskBarItem -->
    <syncfusion:TaskBarItem Name="taskBarItem2" Header="TaskBarItem2">
      <!-- Adding content to TaskBarItem -->
```

```
<StackPanel Margin="10" HorizontalAlignment="Center"
    VerticalAlignment="Stretch">
    <TextBlock TextWrapping="Wrap">Specify and customize the group
    margin.</TextBlock>
</StackPanel>
</syncfusion:TaskBarItem>
</syncfusion:TaskBar>
```

C#

```
// Setting the speed
TaskBar.SetSpeed(taskBar, 10);
```

Methods handled with Speed Property

GetSpeed

This [GetSpeed](#) method is used to get the animation speed, which controls the time taken to expand or collapse the TaskBarItems in the TaskBar. It has one argument, which returns the speed value of type, double.

C#

```
double speed;
//Getting speed
speed = TaskBar.GetSpeed(taskBar);
```

SetSpeed

This [SetSpeed](#) method is used to set the animation speed, which controls the time taken to expand or collapse the TaskBarItems in the TaskBar. It has two arguments. The first argument specifies the object, while the second argument specifies the value of speed of type double.

C#

```
//Setting the speed
TaskBar.SetSpeed(taskBar, 10);
```

Appearance in WPF TaskBar

This section deals with the appearance of TaskBar control and contains the following topic:

Theme

TaskBar supports various built-in themes. Refer to the below links to apply themes for the TaskBar,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

SfTextBoxExt

WPF Autocomplete (SfTextBoxExt) Overview

Description

[SfTextBoxExt](#) is an extended version of the [TextBox](#) control. Most of the functionality of [SfTextBoxExt](#) is inherited from the [TextBox](#) class.

Key features

- **AutoComplete modes:** The control provides the suggestions based on a predefined collection while typing.
- **Watermark:** The control will prompt some information when it is not in focus and contains an empty string.
- **Filtering suggestion items:** Suggestions can be filtered in 18 different modes like StartsWith, EndWith, Contains, Equals, and Custom. AutoComplete provides both the case-sensitive and insensitive modes.
- **Popup delay:** The filtering process can be delayed. Displaying filtered suggestions from a drop-down list may also be delayed for a period of time.
- **Minimum prefix characters:** Instead of displaying suggestion list on every character entry, matches can be filtered and displayed after a few character entries.
- **Customization support:** AutoComplete provides the options to customize both text box and drop-down list.

- **Diacritic sense:** The control provides the populating the items from a language with letters containing diacritics, and search for them with English characters from an en-US keyboard.
- **Highlighting Text:** The control provides the highlighting the matching text in the suggestion list based on the input given in it.
- **Custom filter:** AutoComplete provides filter the items in the suggestion list based on their filtering condition.
- **Multi selection support:** Selecting multiple items from a suggestion list.
- **Suggestion box adjustment:** Adjust the position of popup relative to the control.
- **Enable auto size:** Auto sizing can be enabled in AutoComplete control so that the control will extend its layout based on the tokens size in wrap mode.
- **AutoComplete template:** It can be used for own template.
- **NoResults found template:** Set the desire text, if the typing item does not exists in the collection.
- **Retrieving the selection:** Retrieve the selected item, index, and value.

Getting Started with WPF Autocomplete (SfTextBoxExt)

Assembly deployment

Refer to this [Control Dependencies](#) section to get the list of assemblies or NuGet package that needs to be added as a reference to use the control in any application.

Refer to this [How to install nuget packages](#) documentation to find more details about installing the NuGet package in a WPF application.

Creating a simple application

Create a WPF application with [SfTextBoxExt](#) control using the following steps:

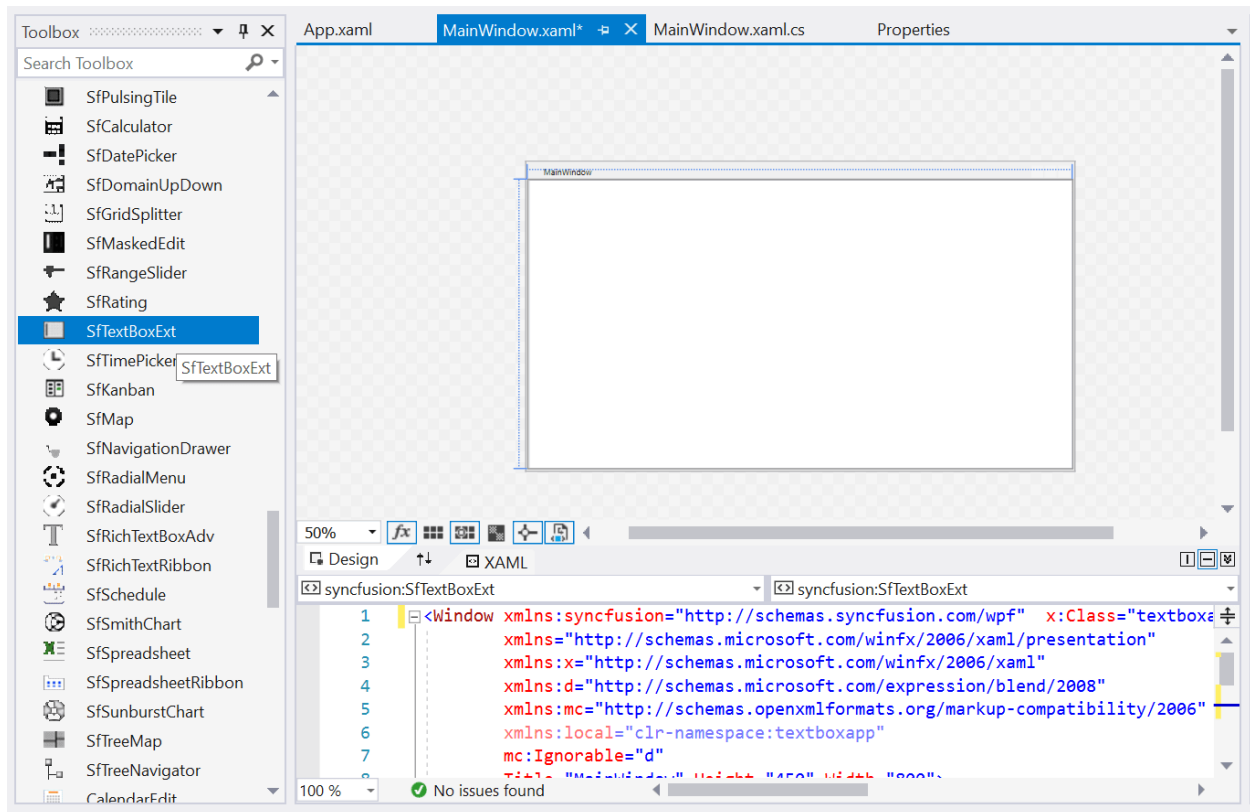

Create a project

Create a new WPF project in Visual Studio to display the [SfTextBoxExt](#) control with their functionalities.

Add a control using the designer

The [SfTextBoxExt](#) control can be added to an application by dragging it from the toolbox to a designer view. The following required assembly references will be added automatically:

- Syncfusion.SfInput.WPF
- Syncfusion.SfShared.WPF

Adding control manually in XAML

To add the control manually in XAML, follow the given steps:

1. Add the following required assembly references to the project:
 - Syncfusion.SfInput.WPF
 - Syncfusion.SfShared.WPF
2. Import Syncfusion WPF schema <http://schemas.syncfusion.com/wpf> in the XAML page.
3. Declare the [SfTextBoxExt](#) control in the XAML page.

XAML

```

<Window x:Class="TextBoxExt.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:TextBoxExt"
mc:Ignorable="d"
xmlns:editors="http://schemas.syncfusion.com/wpf"
Title="MainWindow" Height="450" Width="800">
  <editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
HorizontalContentAlignment="Center"
Height="40"
Width="200"
Text="Hello! World..." />
</Window>

```

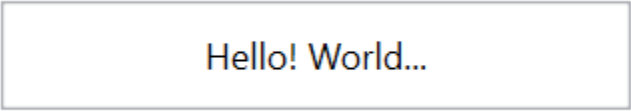

Add a control manually in C#

To add the control manually in C#, follow the given steps:

1. Add the following required assembly references to the project:
 - Syncfusion.SfInput.WPF
 - Syncfusion.SfShared.WPF
2. Import the [SfTextBoxExt](#) namespace using **Syncfusion.Windows.Controls.Input**;
3. Create an [SfTextBoxExt](#) instance, and add it to the window.

C#

```
using System.Windows;
using Syncfusion.Windows.Controls.Input;
namespace TextBoxExt
{
    public partial class MainWindow : Window
    {
        public MainWindow()
        {
            InitializeComponent();
            SfTextBoxExt textBoxExt = new SfTextBoxExt();
            textBoxExt.HorizontalContentAlignment = HorizontalAlignment.Center;
            textBoxExt.HorizontalAlignment = HorizontalAlignment.Center;
            textBoxExt.VerticalAlignment = VerticalAlignment.Center;
            textBoxExt.Width = 200;
            textBoxExt.Height = 40;
            textBoxExt.Text = "Hello! World...";
            this.Content = textBoxExt;
        }
    }
}
```

Populating AutoComplete with Data

AutoComplete is a data-bound control. So before create binding to the control, you must create data model for Application.

For illustration, let us create a textbox, which will populate a list of employees.

1. Create data object class named **Employee** and declare properties as shown below,

C#

```
public class Employee
{
    string name;
    string email;
    public string Name
```

```
{
get { return name; }
set { name = value; }
}
public string Email
{
get { return email; }
set { email = value; }
}
}
```

2. Create a **EmployeeViewModel** class with Employees property and Employees property is initialized with several data objects in constructor.

C#

```
public class EmployeeViewModel
{
private List<Employee> employees;
public List<Employee> Employees
{
get { return employees; }
set { employees = value; }
}
public EmployeeViewModel()
{
Employees = new List<Employee>();
Employees.Add(new Employee() { Name = "Eric", Email = "Eric@syncfusion.com"
});
Employees.Add(new Employee() { Name = "James", Email =
"James@syncfusion.com" });
Employees.Add(new Employee() { Name = "Jacob", Email =
"Jacob@syncfusion.com" });
Employees.Add(new Employee() { Name = "Lucas", Email =
"Lucas@syncfusion.com" });
Employees.Add(new Employee() { Name = "Mark", Email = "Mark@syncfusion.com"
});
Employees.Add(new Employee() { Name = "Aldan", Email =
"Aldan@syncfusion.com" });
Employees.Add(new Employee() { Name = "Aldrin", Email =
"Aldrin@syncfusion.com" });
Employees.Add(new Employee() { Name = "Alan", Email = "Alan@syncfusion.com"
});
Employees.Add(new Employee() { Name = "Aaron", Email =
"Aaron@syncfusion.com" });
}
}
```

3. To populate the AutoComplete with data, set the [AutoCompleteSource](#) property to **IEnumerable** implementation.

Bind the collection created in previous step to [AutoCompleteSource](#) property in XAML by setting EmployeeViewModel as **DataContext**.

XML

```

<Window x:Class="TextBoxExt.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:TextBoxExt"
mc:Ignorable="d"
xmlns:editors="http://schemas.syncfusion.com/wpf"
Title="MainWindow" Height="450" Width="800">
<Window.DataContext>
<local:EmployeeViewModel/>
</Window.DataContext>
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="300"
Height="40"
SearchItemPath="Name"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}" />
</Window>

```

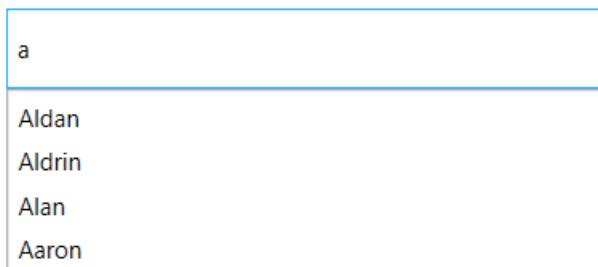

C#

```

EmployeeViewModel viewModel = new EmployeeViewModel();
this.DataContext = viewModel;
SfTextBoxExt textBoxExt = new SfTextBoxExt();
textBoxExt.HorizontalAlignment = HorizontalAlignment.Center;
textBoxExt.VerticalAlignment = VerticalAlignment.Center;
textBoxExt.Width = 200;
textBoxExt.Height = 40;
textBoxExt.SearchItemPath = "Name";
textBoxExt.AutoCompleteMode = AutoCompleteMode.Suggest;
textBoxExt.AutoCompleteSource = viewModel.Employees;
this.Content = textBoxExt;

```

For further details, refer to [AutoComplete source](#).

AutoComplete modes

Suggestions can be shown in number of ways. [SfTextBoxExt](#) supports the following.

AutoCompleteMode	Description
Suggest	Shows the suggestion in the drop-down list user.

Append	Appends the first suggestion to the text.
SuggestAppend	Shows the suggestion in the drop-down list and appends the first suggestion to the text.
None	In None mode, the search algorithm starts even when the item is not available in the data source.

Note: The default value of [AutoCompleteMode](#) is None. So, running the control without specifying this property will not show any suggestions.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="300"
Height="40"
SearchItemPath="Name"
AutoCompleteMode="Suggest"
SuggestionMode="StartsWith"
AutoCompleteSource="{Binding Employees}" />
```

C#

```
textBoxExt.AutoCompleteMode = AutoCompleteMode.Suggest;
```

Selection

By default single selection is enable in AutoComplete control. It can set the [MultiSelectMode](#) property to specify whether a single or multiple selection.

Index of the selected items can be retrieved using the [SuggestionIndex](#) property.

The selected items of the AutoComplete can be retrieved using the [SelectedItem](#) property for single selection.

In Multi-selection, [SelectedItems](#) property contains the items that are selected in the control.

The selected values of the AutoComplete can be retrieved using the [SelectedValue](#) property.

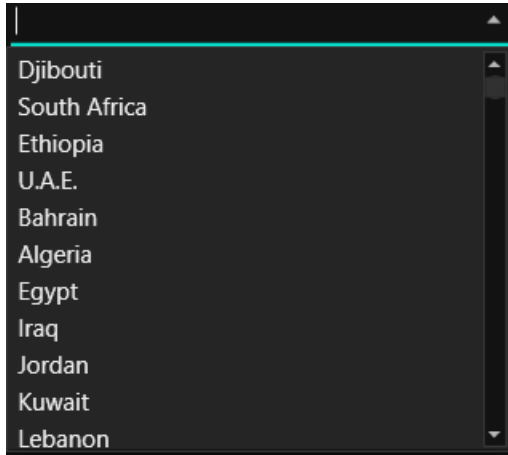

For further details, refer to the [Retrieving SelectedValue](#) and [Setting and retrieving SelectedItem](#).

Note: View [sample](#) in GitHub

Theme

SfTextBoxExt supports various built-in themes. Refer to the below links to apply themes for the SfTextBoxExt,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Autocomplete and filtering in WPF Autocomplete (SfTextBoxExt)

The AutoComplete functionality provides several modes of suggestions while typing. The suggested text can be appended to the original text, or can be displayed in a drop-down list so that searched item can be chosen based on the filtering option set.

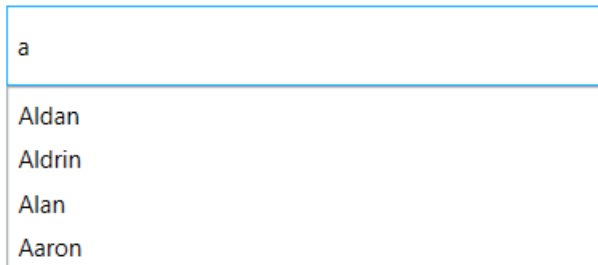

AutoComplete source

The [SfTextBoxExt](#) control can be populated with a predefined list of items bind to the [AutoCompleteSource](#) property. The data can be either a list of strings or a custom data.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="300"
Height="40"
SearchItemPath="Name"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}" />
```

For further details, refer to [Populating Autocomplete with Data](#).

Custom data

The [SearchItemPath](#) property specifies the property path, by which the filtering has to be done when a custom data is bound to the [AutoCompleteSource](#) property. This property defines the value to be displayed in the drop-down suggestion box.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="300"
Height="40"
SearchItemPath="Name"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}" />
```

C#

```
textBoxExt.SearchItemPath = "Name";
```

Customize using the ItemTemplate

By default the drop-down window lists the filtered items as a text based on the [SearchItemPath](#) property set for the data. The [AutoCompleteItemTemplate](#) property helps to decorate the filtered items with visual elements. The following code block explains how to add an image to the drop-down list items.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="400"
Height="40"
SearchItemPath="Name"
AutoCompleteMode="SuggestAppend"
AutoCompleteSource="{Binding Employees}" >
  <editors:SfTextBoxExt.AutoCompleteItemTemplate>
    <DataTemplate>
      <StackPanel Orientation="Horizontal">
        <Image Source="User.png" Margin="2" Stretch="Uniform" Width="12"/>
        <TextBlock Text="{Binding Name}" Margin="5 2"/>
      </StackPanel>
    </DataTemplate>
  </editors:SfTextBoxExt.AutoCompleteItemTemplate>
</editors:SfTextBoxExt>
```

Filtering options

The phenomenon of string comparison for filtering suggestions can be changed using the [SuggestionMode](#) property. The default filtering strategy is “StartsWith” and it is case-insensitive.

SuggestionMode	Description
None	The control returns the entire collection without filtering.
StartsWith	Displays all matches that begins with the typed characters in the text field. This strategy is case-insensitive.
StartsWithCaseSensitive	Displays all matches that begins with the typed characters in the text field. This strategy is case-sensitive.
StartsWithOrdinal	The control returns all possible matches that begins with the typed text based on the OrdinalIgnoreCase.
StartsWithOrdinalCaseSensitive	The control returns all possible matches that begins with the typed text based on the Ordinal, which is case-sensitive.
Contains	Displays all matches that contains typed characters in the text field. This strategy is case-insensitive.
ContainsCaseSensitive	The control returns all possible matches that contains the typed text, which is culture and case-sensitive.
ContainsOrdinal	The control returns all possible matches that contains the typed text based on the OrdinalIgnoreCase.
ContainsOrdinalCaseSensitive	The control returns all possible matches that contains the typed text based on the Ordinal, which is case-sensitive.
Equals	Displays all words that completely matches the typed characters in the text field. This strategy is case-insensitive.
EqualsCaseSensitive	Displays all words that completely matches the typed characters in the text field. This strategy is case-sensitive.
EqualsOrdinal	The control returns all possible matches that equals the typed text based on the OrdinalIgnoreCase.
EqualsOrdinalCaseSensitive	The control returns all possible matches that equals the typed text based on the Ordinal, which is case-sensitive.

Custom	The control returns all possible matches based on the Filter property. Filter property is of type SuggestionPredicate. In the MyFilter method, filtration is done by checking whether the collection contains the typed text.
EndsWith	Displays all matches that ends with the typed characters in the text field. This strategy is case-insensitive.
EndsWithCaseSensitive	Displays all matches that ends with the typed characters in the text field. This strategy is case-sensitive.
EndsWithOrdinal	The control returns all possible matches ending with the typed text based on the OrdinalIgnoreCase.
EndsWithOrdinalCaseSensitive	The control returns all possible matches ending with the typed text based on the Ordinal, which is case-sensitive.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="400"
Height="40"
SearchItemPath="Name"
SuggestionMode="Contains"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}"/>
```

C#

```
textBoxExt.SuggestionMode = SuggestionMode.Contains;
```

e

Eric

James

Custom

Filter items in the suggestion list based on the users' custom search. This will help you to apply our typo toleration functionality to the control.

    }
    return true;
}
catch (Exception)
{
    return (text.Contains(search));
}
else
    return false;
}
```

Prefix characters constraint

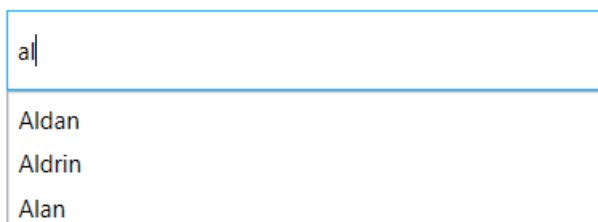

Instead of displaying suggestion list on every character entry, matches can be filtered and displayed after a few character entries. This can be done using the [MinimumPrefixCharacter](#) property. By default the constraint is set for each character entry.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="300"
Height="40"
SearchItemPath="Name"
AutoCompleteMode="Suggest"
MinimumPrefixCharacters="2"
AutoCompleteSource="{Binding Employees}" />
```

C#

```
textBoxExt.MinimumPrefixCharacters = 2;
```

a
Aldan
Aldrin
Alan

Working with case sensitivity

[IgnoreCase](#) option allows the control to filter the suggestions by ignoring the case. The default value is false.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="400"
Height="40"
SearchItemPath="Name"
IgnoreCase="True"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}"/>
```

C#

```
textBoxExt.IgnoreCase = true;
```

Showing image in token and drop-down

To display image in token use the [ImageMemberPath](#) property.

Note: This feature is applicable only for MultiSelectMode with Token mode.

To display image for each drop-down item a custom template can be assigned to [AutoCompleteItemTemplate](#) support.

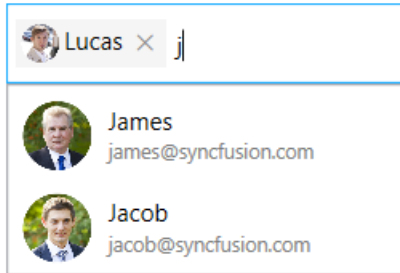

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Left"
AutoCompleteMode="Suggest"
SearchItemPath="Name"
ImageMemberPath="Image"
MultiSelectMode="Token"
TokensWrapMode="None"
Height="40"
AutoCompleteSource="{Binding Employees}"
VerticalAlignment="Center"
Width="200">
  <editors:SfTextBoxExt.AutoCompleteItemTemplate>
    <DataTemplate>
      <StackPanel Orientation="Horizontal" Height="40">
        <Image Source="{Binding Image}" Margin="2" Height="35" Stretch="Uniform"
Width="35"/>
        <StackPanel Margin="2"
Orientation="Vertical">
```

```

<TextBlock Text="{Binding Name}" Margin="4,2,4,0" FontSize="12"
Foreground="Black"/>
<TextBlock Text="{Binding Email}" Margin="4,1,2,2" FontSize="10"
Foreground="Gray"/>
</StackPanel>
</StackPanel>
</DataTemplate>
</editors:SfTextBoxExt.AutoCompleteItemTemplate>
</editors:SfTextBoxExt>

```

Note: View [sample](#) in GitHub

Display a message when suggestions are empty

When the entered item is not in the suggestion list, AutoComplete displays a text indicating that there is no search results found. The text to be displayed for this can be customized using the [NoResultsFoundTemplate](#) property.

XML

```

<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Height="40"
Width="400"
SearchItemPath="Name"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}">
<editors:SfTextBoxExt.NoResultsFoundTemplate>
<DataTemplate>
<Label Content="No Results Found" HorizontalAlignment="Center"
VerticalAlignment="Center"/>
</DataTemplate>
</editors:SfTextBoxExt.NoResultsFoundTemplate>
</editors:SfTextBoxExt>

```

Restricting the maximum items filtered

The [MaximumSuggestionsCount](#) property is used to restrict the number of suggestions displayed in the suggestion box.

XML

```
<editors:SfTextBoxExt
Width="300"
Height="40"
HorizontalAlignment="Center"
VerticalAlignment="Center"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}"
MaximumSuggestionsCount="3"
SearchItemPath="Name" />
```

C#

```
textBoxExt.MaximumSuggestionsCount = 3;
```

Note: View [sample](#) in GitHub

Single and multiple selection in WPF Autocomplete (SfTextBoxExt)

In AutoComplete selection can be performed using single selection or multi-selection. This can be handled by [MultiSelectMode](#) property. The default value of `MultiSelectMode` is `None` which performs single selection.

Single selection

The single selection can be performed by setting the [MultiSelectMode](#) property to `None`. In this mode we can set and retrieve the selected item using the [SelectedItem](#) property.

Multi selection

The multi-selection, there are two ways to display the selection in the control.

- Token
- Delimiter

Multiple selection using tokens

Each selected items can be displayed as a token representation having a close button for each token.

In token representation the control behavior of arranging the items can be done in two ways which is handled by the property [TokensWrapMode](#).

- **Wrap** - The selected items will be wrapped to the next line of the AutoComplete.
- **None** - The selected items will be arranged in horizontal layout in single line.

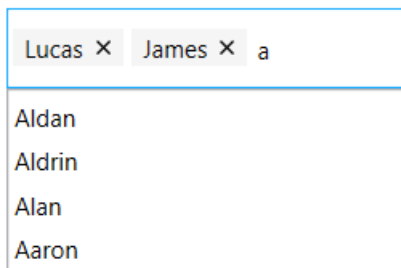

The [SelectedItems](#) property can be used to set and retrieve the items in **MultiSelectMode**.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Left"
AutoCompleteMode="Suggest"
SearchItemPath="Name"
MultiSelectMode="Token"
Height="40"
AutoCompleteSource="{Binding Employees}"
VerticalAlignment="Center"
Width="200"/>
```

C#

```
textBoxExt.MultiSelectMode = MultiSelectMode.Token;
```

Customization of Tokens

The token can be customized by overriding the default style targeting the **TokenItem** class.

XML

```
<Window.Resources>
<Style TargetType="editors:TokenItem">
<Setter Property="Template">
<Setter.Value>
<ControlTemplate TargetType="editors:TokenItem">
<Border x:Name="TokenBorder" Margin="4,4,2,4" Background="Black"
CornerRadius="10" Height="{TemplateBinding Height}" >
<Grid Margin="2" x:Name="TokenGrid">
<Grid.ColumnDefinitions>
<ColumnDefinition Width="auto"/>
<ColumnDefinition Width="*/>
<ColumnDefinition Width="auto"/>
</Grid.ColumnDefinitions>
<TextBlock x:Name="TokenTextBlock" Text="{TemplateBinding Text}"
Foreground="White" Grid.Column="1" Margin="2,0,2,3"
VerticalAlignment="Center" Padding="4,0,0,0" />
<Button Grid.Column="2" Margin="2" x:Name="TokenCloseButton"
IsTabStop="False" Background="White" CommandParameter="{Binding
RelativeSource={RelativeSource Mode=TemplatedParent}}" >
```

```

<Button.Content>
<TextBlock x:Name="TokenButtonContent" Text="&#xE711;"
VerticalAlignment="Center" FontSize="10" Foreground="Black"
FontFamily="Segoe MDL2 Assets" />
</Button.Content>
<Button.Resources>
<Style TargetType="{x:Type Border}">
<Setter Property="CornerRadius" Value="13"/>
</Style>
</Button.Resources>
</Button>
</Grid>
</Border>
</ControlTemplate>
</Setter.Value>
</Setter>
</Style>
</Window.Resources>
<editors:SfTextBoxExt HorizontalAlignment="Left"
AutoCompleteMode="Suggest"
SearchItemPath="Name"
MultiSelectMode="Token"
Height="40"
AutoCompleteSource="{Binding Employees}"
VerticalAlignment="Center"
Width="200"/>

```

Enable autosize in token mode

In token representation when we have set **Wrap** mode enabling the [EnableAutoSize](#) property re-renders the control height based on the number of lines the tokens are wrapped inside the control.

To use this feature, it is need to set the **MultiSelectMode** as **Token** and **TokensWrapMode** as **Wrap**. By default this feature is disabled.

XML

```

<editors:SfTextBoxExt HorizontalAlignment="Left"
AutoCompleteMode="Suggest"
SearchItemPath="Name"
MultiSelectMode="Token"
TokensWrapMode="Wrap"
EnableAutoSize="True"
AutoCompleteSource="{Binding Employees}"
VerticalAlignment="Center"
Width="200"/>

```

C#

```
textBoxExt.MultiSelectMode = MultiSelectMode.Token;  
textBoxExt.TokensWrapMode = TokensWrapMode.Wrap;  
textBoxExt.EnableAutoSize = true;
```

ShowClearButton:

This feature allows to show or hide the clear button in Token mode for the AutoComplete control using the [ShowClearButton](#) property.

XML

```
<editors:SfTextBoxExt  
x:Name="textBoxExt"  
Width="200"  
HorizontalAlignment="Center"  
VerticalAlignment="Center"  
AutoCompleteMode="Suggest"  
AutoCompleteSource="{Binding Employees}"  
MultiSelectMode="Token"  
SearchItemPath="Name"  
ShowClearButton="True" />
```

C#

```
textBoxExt.ShowClearButton = true;
```

Note: The default `ShowClearButton` property value is false. It will be only applicable for `MultiSelectMode` is `Token`.

See also [Multiple selection using tokens](#) topic in AutoComplete.

Multiple selection using delimiter

In `Delimiter` mode, each item is separated by a character that is set to the [Delimiter](#) property. By default the items are separated by `,`(Comma).

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
```

```
VerticalAlignment="Center"  
Width="300"  
Height="40"  
MultiSelectMode="Delimiter"  
SearchItemPath="Name"  
AutoCompleteMode="Suggest"  
AutoCompleteSource="{Binding Employees}" />
```

C#

```
textBoxExt.MultiSelectMode = MultiSelectMode.Delimiter;
```

Setting and retrieving SelectedItem

The [SelectedItem](#) property is used to select a particular item from the suggestion list or to retrieve the item that is selected. The [SelectedItem](#) property can be used in single selection where the [MultiSelectMode](#) as [None](#). For multi-selection where the [MultiSelectMode](#) is set either as [Token](#) or [Delimiter](#) the selected items can be set or retrieved using the [SelectedItems](#) property.

The [SelectedItem](#) and [SelectedItems](#) contains the object of the custom data and using the [SearchItemPath](#) property the value displayed in the text field can be retrieved.

Model Class:

C#

```
public class Employee  
{  
    string name;  
    string email;  
    public string Name  
    {  
        get { return name; }  
        set { name = value; }  
    }  
    public string Email  
    {  
        get { return email; }  
        set { email = value; }  
    }  
}
```

In EmployeeViewModel class the [SelectedItem](#) updated initially from the Employees collection.

C#

```
public class EmployeeViewModel
{
    private List<Employee> employees;
    public List<Employee> Employees
    {
        get { return employees; }
        set { employees = value; }
    }
    private object selectedItem;
    public object SelectedItem
    {
        get { return selectedItem; }
        set { selectedItem = value; }
    }
    public EmployeeViewModel()
    {
        Employees = new List<Employee>();
        Employees.Add(new Employee() { Name = "Eric", Email = "Eric@syncfusion.com" });
        Employees.Add(new Employee() { Name = "James", Email = "James@syncfusion.com" });
        Employees.Add(new Employee() { Name = "Jacob", Email = "Jacob@syncfusion.com" });
        Employees.Add(new Employee() { Name = "Jackson", Email = "Jackson@syncfusion.com" });
        Employees.Add(new Employee() { Name = "Lucas", Email = "Lucas@syncfusion.com" });
        SelectedItem = Employees[0];
    }
}
```

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
x:Name="autoComplete"
MaxDropDownHeight="100"
MultiSelectMode="None"
AutoCompleteMode="Suggest"
SearchItemPath="Name"
SelectedItem="{Binding SelectedItem}"
AutoCompleteSource="{Binding Employees}"
VerticalAlignment="Center"
Height="40"
Width="200"/>
```

C#

```
private void TextBoxExt_SelectedItemChanged(DependencyObject d,
DependencyPropertyChangedEventArgs e)
{
    SfTextBoxExt textBoxExt = d as SfTextBoxExt;
```

```
string selectedItem = "";
if (textBoxExt.SelectedItem != null)
{
    selectedItem = ((textBoxExt.SelectedItem as Employee).Name).ToString();
}
MessageBox.Show(selectedItem, "SelectedItem", MessageBoxButton.OK,
    MessageBoxImage.None);
}
```

Model Class:

C#

```
public class Employee
{
    string name;
    string email;
    public string Name
    {
        get { return name; }
        set { name = value; }
    }
    public string Email
    {
        get { return email; }
        set { email = value; }
    }
}
```

In EmployeeViewModel class the [SelectedItems](#) updated initially from the Employees collection.

C#

```
public class EmployeeViewModel
{
    private List<Employee> employees;
    public List<Employee> Employees
    {
        get { return employees; }
        set { employees = value; }
    }
    private ObservableCollection<object> selectedItems;
    public ObservableCollection<object> SelectedItems
    {
        get { return selectedItems; }
        set { selectedItems = value; }
    }
    public EmployeeViewModel()
    {
        Employees = new List<Employee>();
        SelectedItems = new ObservableCollection<object>();
        Employees.Add(new Employee() { Name = "Eric", Email = "Eric@syncfusion.com" });
        Employees.Add(new Employee() { Name = "James", Email = "James@syncfusion.com" });
    }
}
```

```

Employees.Add(new Employee() { Name = "Jacob", Email =
"Jacob@syncfusion.com" });
Employees.Add(new Employee() { Name = "Jackson", Email =
"Jackson@syncfusion.com" });
Employees.Add(new Employee() { Name = "Lucas", Email =
"Lucas@syncfusion.com" });
SelectedItems.Add(Employees[2]);
SelectedItems.Add(Employees[0]);
SelectedItems.Add(Employees[1]);
}
}

```

XML

```

<editors:SfTextBoxExt HorizontalAlignment="Center"
x:Name="autoComplete"
MaxDropDownHeight="100"
MultiSelectMode="Token"
AutoCompleteMode="Suggest"
SearchItemPath="Name"
SelectedItems="{Binding SelectedItems}"
AutoCompleteSource="{Binding Employees}"
VerticalAlignment="Center"
Height="40"
Width="200"/>

```

Retrieving SelectedValue

The [SelectedValue](#) property is used to retrieve the selected values from the suggestion list. We have to set the [ValueMemberPath](#) property when using custom data for the value we want to retrieve from [SelectedValue](#) based on the [SelectedItem](#) object.

XML

```

<editors:SfTextBoxExt HorizontalAlignment="Left"
x:Name="autoComplete"
MaxDropDownHeight="100"
MultiSelectMode="None"
AutoCompleteMode="Suggest"
SearchItemPath="Name"
ValueMemberPath="Email"
AutoCompleteSource="{Binding Employees}"
VerticalAlignment="Center"
SelectedItemChanged="AutoComplete_SelectedItemChanged"
Height="40"
Width="200"/>

```

C#

```

private void AutoComplete_SelectedItemChanged(DependencyObject d,
DependencyPropertyChangedEventArgs e)

```

```
{
    SfTextBoxExt textBoxExt = d as SfTextBoxExt;
    if (textBoxExt.SelectedValue != null)
    {
        MessageBox.Show(textBoxExt.SelectedValue.ToString(), "SelectedValue",
            MessageBoxButton.OK, MessageBoxImage.None);
    }
}
```

Retrieving SuggestionIndex

When an item is selected from suggestion list, their index can be retrieved using the [SuggestionIndex](#) property.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Left"
    x:Name="autoComplete"
    MaxDropDownHeight="100"
    MultiSelectMode="None"
    AutoCompleteMode="Suggest"
    SearchItemPath="Name"
    ValueMemberPath="Email"
    AutoCompleteSource="{Binding Employees}"
    VerticalAlignment="Center"
    SelectedItemChanged="AutoComplete_SelectedItemChanged"
    Height="40"
    Width="200"/>
```

C#

```
private void AutoComplete_SelectedItemChanged(DependencyObject d,
    DependencyPropertyChangedEventArgs e)
{
    string suggestionIndex = "";
    suggestionIndex = ((d as SfTextBoxExt).SuggestionIndex).ToString();
    MessageBoxResult messageBoxResult = MessageBox.Show(suggestionIndex,
        "SuggestionIndex");
}
```

Displaying images

This feature allows to provide the path for the image to be displayed in the text box control using the [ImageMemberPath](#) property.

Note: This feature is applicable only for MultiSelectMode with Token mode.

For further details, refer to [Showing image in token and dropdown](#).

Note: View [sample](#) in GitHub

Diacritic Sensitivity in WPF Autocomplete (SfTextBoxExt)

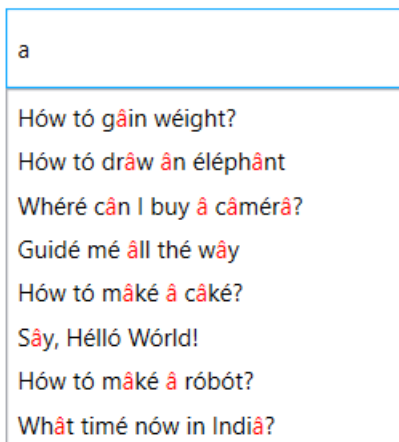

The control does not stick with one type of keyboard, so it can be populated with the items from a language with letters containing diacritics, and search for them with English characters from an en-US keyboard. Enable or disable the diacritic sensitivity using the [IgnoreDiacritic](#) property. The following code example demonstrates how to enable the diacritic sensitivity.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Height="40"
Width="200"
AutoCompleteMode="Suggest"
SuggestionMode="Contains"
IgnoreDiacritic="False"
HighlightedTextColor="Red"
TextHighlightMode="MultipleOccurrence"
SearchItemPath="Item"
AutoCompleteSource="{Binding DiacriticCollenction}"/>
```

C#

```
textBoxExt.IgnoreDiacritic = false;
```

Note: View [sample](#) in GitHub

Highlighting Matched Text in WPF Autocomplete (SfTextBoxExt)

By using the [TextHighlightMode](#) property, highlight matching and unmatched characters in a suggestion list to pick an item with more clarity. The default value is None. The matching text can be highlighted in the following two ways:

- First occurrence
- Multiple occurrence
- Unmatched

The text highlight can be indicated by customizing the color of the characters using [HighlightedTextColor](#) property and style of the characters using [HighlightedTextStyle](#) property.

Note: The [HighlightedTextStyle](#) property style target type is [Run](#).

First occurrence

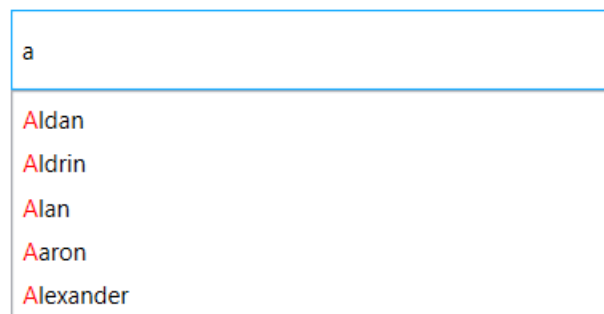

It highlights the first position of the matching characters in the suggestion list.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="300"
Height="40"
SearchItemPath="Name"
AutoCompleteMode="Suggest"
HighlightedTextColor="Red"
TextHighlightMode="FirstOccurrence"
AutoCompleteSource="{Binding Employees}" />
```

C#

```
textBoxExt.TextHighlightMode = OccurrenceMode.FirstOccurrence;
```

Multiple occurrence

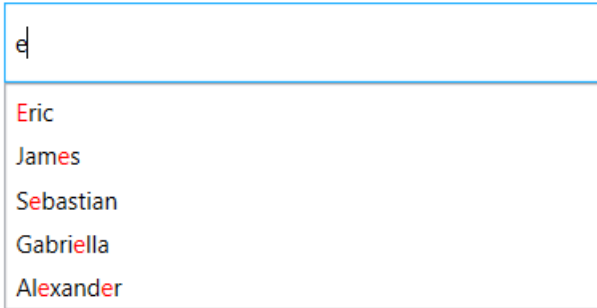

It highlights the matching character that presents everywhere in the suggestion list for "Contains" case in SuggestionMode.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="300"
Height="40"
SearchItemPath="Name"
AutoCompleteMode="Suggest"
SuggestionMode="Contains"
HighlightedTextColor="Red"
TextHighlightMode="MultipleOccurrence"
AutoCompleteSource="{Binding Employees}" />
```

C#

```
textBoxExt.TextHighlightMode = OccurrenceMode.MultipleOccurrence;
```

Unmatched

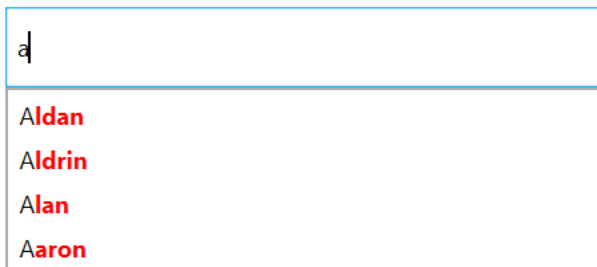

It highlights unmatched characters in the suggestion list.

XML

```
<Window.Resources>
<Style x:Key="highlightedTextStyle" TargetType="Run">
<Setter Property="FontWeight" Value="Bold" />
</Style>
</Window.Resources>
<editors:SfTextBoxExt
Width="300"
Height="40"
HorizontalAlignment="Center"
VerticalAlignment="Center"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}"
HighlightedTextColor="Red"
HighlightedTextStyle="{StaticResource highlightedTextStyle}"
SearchItemPath="Name"
SuggestionMode="StartsWith"
TextHighlightMode="Unmatched" />
```

C#

```
textBoxExt.TextHighlightMode = OccurrenceMode.Unmatched;
```

Note: View [sample](#) in GitHub

Textbox customization in WPF Autocomplete (SfTextBoxExt)

AutoComplete provides the user-friendly customizing options for text box. This section explains how to customize the entire AutoComplete control.

Water mark

[Watermark](#) property, allows to specify some information when the text is empty. For illustration, let us create a simple textbox and indicate enter names separated by a comma.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="300"
Height="50"
Watermark="Enter names separated by comma (Ex : John, Kate)"/>
```

C#

```
textBoxExt.Watermark= "Enter names separated by comma (Ex : John, Kate)";
```

Note: The Watermark property is of the object type. So, any framework elements can be hosted as Watermark content. The following example shows how to host an image and text as Watermark content.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Height="50"
Width="300">
  <editors:SfTextBoxExt.Watermark>
    <StackPanel Orientation="Horizontal">
      <Image Source="Windows 8.png"
Margin="2"/>
      <TextBlock Text="Search Windows"
HorizontalAlignment="Center"
VerticalAlignment="Center"
Opacity="0.5"/>
    </StackPanel>
  </editors:SfTextBoxExt.Watermark>
</editors:SfTextBoxExt>
```

Water mark template

Any business object can be bound to the Watermark property and that object can be decorated by applying the [WatermarkTemplate](#) property.

XML

```
<Window.Resources>
<DataTemplate x:Key="WatermarkTemplate">
<TextBlock Text="{Binding}"
FontStyle="Italic"
Opacity="1"/>
</DataTemplate>
</Window.Resources>
<Window.Content>
<Grid>
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="200"
Height="40"
Watermark="Type here"
WatermarkTemplate="{StaticResource WatermarkTemplate}">
</editors:SfTextBoxExt>
</Grid>
</Window.Content>
```

Customizing the TextBox

The [Text](#), [FontSize](#), [FontWeight](#), and [FontFamily](#) properties are used to customize the text in the AutoComplete control.

XML

```
<editors:SfTextBoxExt x:Name="textBoxExt"
Text="TextBox"
FontSize="20"
FontWeight="Bold"
FontFamily="Times New Roman"
HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="200">
</editors:SfTextBoxExt>
```

C#

```
textBoxExt.Text = "TextBox";
textBoxExt.FontSize = 20;
textBoxExt.FontWeight = FontWeights.Bold;
textBoxExt.FontFamily = new FontFamily("Times New Roman");
```

Setting the Dropdown Icon

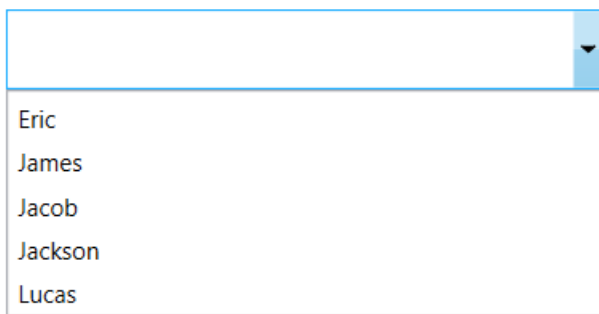

This feature allows to set the drop-down icon for the TextBox control using the [ShowDropDownButton](#).

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="300"
Height="40"
ShowDropDownButton="True"
SearchItemPath="Name"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}" />
```

C#

```
textBoxExt.ShowDropDownButton = true;
```

Setting the ClearButton

This feature allows to set the ClearButton for the [SfTextBoxExt](#) control using the [ShowClearButton](#).

XML

```
<editors:SfTextBoxExt
Width="300"
Height="40"
HorizontalAlignment="Center"
VerticalAlignment="Center"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}"
SearchItemPath="Name"
ShowClearButton="True"
ShowDropDownButton="True" />
```

C#

```
textBoxExt.ShowClearButton = true;
```

Note: View [sample](#) in GitHub

Dropdown customization in WPF Autocomplete (SfTextBoxExt)

Suggestion box is the drop-down list box, which displays the filtered suggestions inside a pop-up. This section explains the properties and customizations that deals with drop-down list in the **AutoComplete** control.

Customize the background

The [DropDownBackground](#) property is used to modify the background color of suggestion box. The following code example demonstrates how to change the background color of suggestion box.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="300"
Height="40"
SearchItemPath="Name"
AutoCompleteMode="Suggest"
DropDownBackground="AliceBlue"
AutoCompleteSource="{Binding Employees}" />
```

C#

```
textBoxExt.DropDownBackground = new SolidColorBrush(Colors.AliceBlue);
```

Drop-down placement

The [SuggestionBoxPlacement](#) property, defines the position of pop-up relative to the control. It contains three built-in options:

1. Top
2. Bottom
3. None

The default value is bottom.

Top

The drop-down list will open at the top of the text field.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
```

```
Width="300"  
Height="40"  
SearchItemPath="Name"  
SuggestionBoxPlacement="Top"  
AutoCompleteMode="Suggest"  
SuggestionMode="StartsWith"  
AutoCompleteSource="{Binding Employees}"/>
```

C#

```
textBoxExt.SuggestionBoxPlacement = SuggestionBoxPlacement.Top;
```

Bottom

The drop-down list will open at the bottom of the text field.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"  
VerticalAlignment="Center"  
Width="300"  
Height="40"  
SearchItemPath="Name"  
SuggestionBoxPlacement="Bottom"  
AutoCompleteMode="Suggest"  
SuggestionMode="StartsWith"  
AutoCompleteSource="{Binding Employees}"/>
```

C#

```
textBoxExt.SuggestionBoxPlacement = SuggestionBoxPlacement.Bottom;
```

None

The drop-down list will show the filtered items.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="300"
Height="40"
SearchItemPath="Name"
SuggestionBoxPlacement="None"
AutoCompleteMode="Suggest"
SuggestionMode="StartsWith"
AutoCompleteSource="{Binding Employees}"/>
```

C#

```
textBoxExt.SuggestionBoxPlacement = SuggestionBoxPlacement.None;
```

Setting the maximum height

The maximum height of the suggestion box in the AutoComplete control can be changed using the [MaximumDropDownHeight](#) property.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="400"
SearchItemPath="Name"
MaxDropDownHeight="500"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}"/>
```

C#

```
textBoxExt.MaxDropDownHeight = 500;
```

Open the drop-down on focus

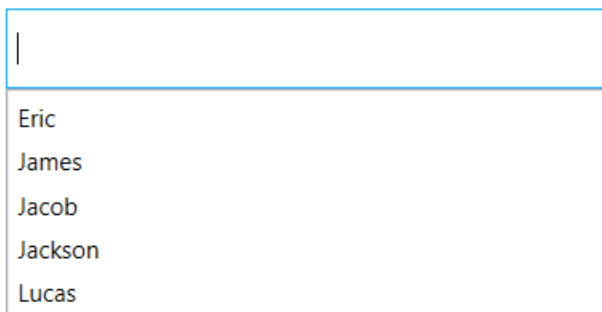

Suggestion box can be shown whenever the control receives focus using the [ShowSuggestionsOnFocus](#) property. At that time, suggestion list is the complete list of data source.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="400"
SearchItemPath="Name"
ShowSuggestionsOnFocus="True"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}"/>
```

C#

```
textBoxExt.ShowSuggestionsOnFocus = true;
```

Open drop-down with a delay

The [PopupDelay](#) specifies the delay after, which the suggestion pop-up should open.

XML

```
<editors:SfTextBoxExt HorizontalAlignment="Center"
VerticalAlignment="Center"
Width="400"
SearchItemPath="Name"
PopupDelay="00:00:02"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}"/>
```

C#

```
textBoxExt.PopupDelay = new TimeSpan(00, 00, 02);
```

Customizing the SelectedItem background

The [SelectionBackgroundColor](#) property is used to set the background color of the selected item in the suggestion box.

XML

```
<editors:SfTextBoxExt
Width="300"
Height="40"
HorizontalAlignment="Center"
VerticalAlignment="Center"
```

```
AutoCompleteMode="Suggest"  
AutoCompleteSource="{Binding Employees}"  
SearchItemPath="Name"  
SelectionBackgroundColor="Red"  
ShowDropDownButton="True" />
```

C#

```
textBoxExt.SelectionBackgroundColor = new SolidColorBrush(Colors.Red);
```

Note: View [sample](#) in GitHub

How to

Perform multi-path search in WPF Autocomplete

Multi-path search can be achieved using the custom search feature by setting the [SuggestionMode](#) property as **Custom**. Users can define a custom filter and can be assigned to the [Filter](#) property.

Model

C#

```
public class Model  
{  
    private int id;  
    public int ID  
    {  
        get { return id; }  
        set { id = value; }  
    }  
    private string name;  
    public string Name  
    {  
        get { return name; }  
        set { name = value; }  
    }  
}
```

View model

C#

```
public class Viewmodel  
{  
    public ICommand ControlLoaded  
    {  
        get;
```

```

set;
}
private ObservableCollection<Model> employees;
public ObservableCollection<Model> Employees
{
    get { return employees; }
    set { employees = value; }
}
public ViewModel()
{
    ControlLoaded = new DelegateCommand(Loaded);
    Employees = new ObservableCollection<Model>();
    Employees.Add(new Model() { ID = 1, Name = "Eric" });
    Employees.Add(new Model() { ID = 2, Name = "James" });
    Employees.Add(new Model() { ID = 3, Name = "Jacob" });
    Employees.Add(new Model() { ID = 4, Name = "Lucas" });
    Employees.Add(new Model() { ID = 5, Name = "Mark" });
    Employees.Add(new Model() { ID = 6, Name = "Aldan" });
    Employees.Add(new Model() { ID = 7, Name = "Aldrin" });
    Employees.Add(new Model() { ID = 8, Name = "Alan" });
    Employees.Add(new Model() { ID = 9, Name = "Aaron" });
}
private void Loaded(object obj)
{
    var autocomplete = obj as SfTextBoxExt;
    if (autocomplete != null)
    {
        autocomplete.Filter = Filtering;
    }
}
public bool Filtering(string search, object item)
{
    var model = item as Model;
    if (model != null)
    {
        if ((model.Name.ToLower().Contains(search.ToLower())) ||
            (model.ID.ToString().ToLower().Contains(search.ToLower())))
        {
            return true;
        }
    }
    return false;
}
}

```

XML

```

<Window.DataContext>
<local:ViewModel />
</Window.DataContext>
<StackPanel Margin="10" VerticalAlignment="Center">
<editors:SfTextBoxExt
x:Name="autocomplete"
AutoCompleteMode="Suggest"
AutoCompleteSource="{Binding Employees}"
SearchItemPath="Name"

```

```

SuggestionMode="Custom">
<editors:SfTextBoxExt.AutoCompleteItemTemplate>
<DataTemplate>

<interaction:InvokeCommandAction Command="{Binding ControlLoaded}"
CommandParameter="{Binding ElementName=autocomplete}" />
</interaction:EventTrigger>
</interaction:Interaction.Triggers>
</editors:SfTextBoxExt>
</StackPanel>

```

C#

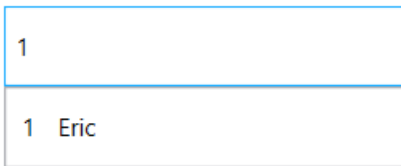

```

Viewmodel viewmodel = new Viewmodel();
this.DataContext = viewmodel;
StackPanel stackPanel = new StackPanel()
{
    Margin = new Thickness(10),
    VerticalAlignment = VerticalAlignment.Center
};
SfTextBoxExt autocomplete = new SfTextBoxExt()
{
    Width = 200,
    Height = 40,
    HorizontalAlignment = HorizontalAlignment.Center,
    VerticalAlignment = VerticalAlignment.Center,
    AutoCompleteMode = AutoCompleteMode.Suggest,
    AutoCompleteSource = viewmodel.Employees,
    Filter= viewmodel.Filtering,
    SearchItemPath = "Name",
    SuggestionMode = SuggestionMode.Custom
}

```

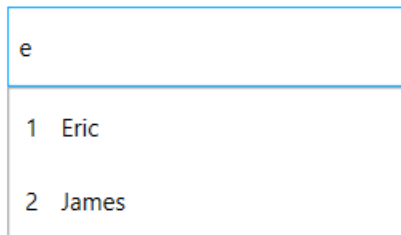

```
};  
FrameworkElementFactory grid = new FrameworkElementFactory(typeof(Grid));  
grid.SetValue(Grid.HorizontalAlignmentProperty,  
HorizontalAlignment.Stretch);  
FrameworkElementFactory firstColumn = new  
FrameworkElementFactory(typeof(ColumnDefinition));  
firstColumn.SetValue(ColumnDefinition.WidthProperty, new GridLength(20.0));  
FrameworkElementFactory secondColumn = new  
FrameworkElementFactory(typeof(ColumnDefinition));  
secondColumn.SetValue(ColumnDefinition.WidthProperty, new GridLength(0.0,  
GridUnitType.Auto));  
FrameworkElementFactory textBlockID = new  
FrameworkElementFactory(typeof(TextBlock));  
textBlockID.SetBinding(TextBlock.TextProperty, new Binding("ID"));  
FrameworkElementFactory textBlockName = new  
FrameworkElementFactory(typeof(TextBlock));  
textBlockName.SetValue(TextBlock.TextProperty, new Binding("Name"));  
grid.AppendChild(textBlockID);  
grid.AppendChild(textBlockName);  
DataTemplate template = new DataTemplate { VisualTree = grid };  
autoComplete.AutoCompleteItemTemplate = template;  
stackPanel.Children.Add(autoComplete);  
this.Content = stackPanel;
```

Search the items with ID:

The screenshot shows a search interface with a text input field at the top containing the number '1'. Below the input field is a list of results. The first result is '1 Eric', where '1' is the ID and 'Eric' is the name. The list is currently showing one item.

Search the items with Name:

The screenshot shows a search interface with a text input field at the top containing the letter 'e'. Below the input field is a list of results. The first result is '1 Eric' and the second result is '2 James', where the first number is the ID and the second is the name. The list is currently showing two items.

Note: View [sample](#) in GitHub.

SfTextInputLayout

WPF TextInputLayout (SfTextInputLayout) Overview

The text input layout control for WPF adds decorative elements such as floating labels, icons, and assistive labels on the top of [TextBox](#) control.

Key features

- Displays floating labels when the input view is focused.
- Displays help labels.
- Displays error labels.
- Displays character count.
- Displays leading and trailing icons.
- Supports filled, outlined, and none container types.
- Provides options to customize the thickness of the base line.
- Provides option to customize the corner radius of the outlined border.
- Provides RTL support.

Getting Started with WPF TextInputLayout (SfTextInputLayout)

This section explains the steps needed to configure the control of the text input layout.

Adding TextInputLayout reference

Refer to this [document](#) to learn how to add Syncfusion controls in Visual Studio projects through various ways. Refer to this [document](#) to learn about the assemblies required for adding TextInputLayout to your project.

Initialize TextInputLayout

Import the namespace of the text input layout as shown in the following code snippet.

XML

```
xmlns:inputLayout="clr-namespace:Syncfusion.UI.Xaml.TextInputLayout;assembly=Syncfusion.SfTextInputLayout.WPF"
```

C#

```
using Syncfusion.UI.Xaml.TextInputLayout;
```

You can either use the below schemas or the above mentioned namespace to refer the TextInputLayout control in xaml.

XML

```
xmlns:inputLayout="http://schemas.syncfusion.com/wpf"
```

Then, initialize the text input layout as demonstrated in the following code snippet.

XML

```
<inputLayout:SfTextInputLayout>  
<TextBox/>  
</inputLayout:SfTextInputLayout>
```

C#

```
SfTextInputLayout inputLayout = new SfTextInputLayout();  
inputLayout.InputView = new TextBox();
```

Adding hint

Floating label for the text input layout can be added by setting the `Hint` property. We can specify the display state of the hint label using the `HintVisibility` property, the type of which is [Visibility](#).

XML

```
<inputLayout:SfTextInputLayout
Hint="Name">
<TextBox />
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.InputView = new TextBox();
```

When focusing the input view, the hint label will be moved to the top position; it will be returned to the original position when proceeding further (on unfocused) without entering any value.

Run the project, and check if you get following output to make sure that the project has been configured properly to add the text input layout control.

Theme

SfTextInputLayout supports various built-in themes. Refer to the below links to apply themes for the SfTextInputLayout,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Supported Input Views in WPF TextInputLayout (SfTextInputLayout)

Input views can be added to the text input layout control by setting the `InputView` property. To reduce the XAML syntax, the `InputView` property is applied with the `ContentPropertyAttribute`. The [SfTextInputLayout](#) has the following controls as the supported input views.

- `TextBox`
- `PasswordBox`
- `ComboBox`
- [ComboBoxAdv](#)

- [SfTextBoxExt](#)

TextBox

You can enter the text as an input by adding the [TextBox](#) in the [SfTextInputLayout](#).

XML

```
<inputLayout:SfTextInputLayout Hint="Name" HelperText="Enter your name">
  <TextBox/>
</inputLayout:SfTextInputLayout>
```

C#

```
SfTextInputLayout inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.HelperText = "Enter your name";
inputLayout.InputView = new TextBox();
this.Content = inputLayout;
```

PasswordBox

You can enter the password characters as an input by adding the [PasswordBox](#) in the [SfTextInputLayout](#).

XML

```
<inputLayout:SfTextInputLayout Hint="Password" HelperText="Enter your
password">
  <PasswordBox/>
</inputLayout:SfTextInputLayout>
```

C#

```
SfTextInputLayout inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Password";
inputLayout.HelperText = "Enter your password";
inputLayout.InputView = new PasswordBox();
this.Content = inputLayout;
```

ComboBox

You can use the [ComboBox](#) control as an input in the [SfTextInputLayout](#).

XML

```
<inputLayout:SfTextInputLayout Hint="Name" VerticalAlignment="Center"
HorizontalAlignment="Center">
<ComboBox x:Name="comboBox" Width="150" Height="10" ItemsSource="{Binding
Countries}"/>
</inputLayout:SfTextInputLayout>
```

C#

```
SfTextInputLayout sfTextInputLayout = new SfTextInputLayout() { Hint =
"Name" };
sfTextInputLayout.HorizontalAlignment = HorizontalAlignment.Center;
sfTextInputLayout.VerticalAlignment = VerticalAlignment.Center;
ComboBox comboBox = new ComboBox();
comboBox.Width = 150;
comboBox.Height = 10;
comboBox.ItemsSource = viewModel.Countries;
sfTextInputLayout.InputView = comboBox;
this.Content = sfTextInputLayout;
```

**ComboBoxAdv**

You can use the [ComboBoxAdv](#) control as an input in the [SfTextInputLayout](#).

XML

```
<inputLayout:SfTextInputLayout Hint="Name" VerticalAlignment="Center"
HorizontalAlignment="Center">
<inputLayout:ComboBoxAdv x:Name="comboBox" ItemsSource="{Binding Countries}"
Width="150" Height="10"/>
</inputLayout:SfTextInputLayout>
```

C#

```
SfTextInputLayout sfTextInputLayout = new SfTextInputLayout() { Hint =
"Name" };
sfTextInputLayout.HorizontalAlignment = HorizontalAlignment.Center;
sfTextInputLayout.VerticalAlignment = VerticalAlignment.Center;
ComboBoxAdv comboBox = new ComboBoxAdv();
comboBox.Width = 150;
comboBox.Height = 10;
comboBox.ItemsSource = viewModel.Countries;
sfTextInputLayout.InputView = comboBox;
this.Content = sfTextInputLayout;
```

Autocomplete (SfTextBoxExt)

You can use the [SfTextBoxExt](#) control to enter the text as an input in the [SfTextInputLayout](#).

XML

```
<inputLayout:SfTextInputLayout Hint="Name" VerticalAlignment="Center"
HorizontalAlignment="Center">
<inputLayout:SfTextBoxExt AutoCompleteMode="Suggest" Width="250"
AutoCompleteSource="{Binding Countries}">
</inputLayout:SfTextBoxExt>
</inputLayout:SfTextInputLayout>
```

C#

```
SfTextInputLayout sfTextInputLayout = new SfTextInputLayout() { Hint =
"Name" };
sfTextInputLayout.HorizontalAlignment = HorizontalAlignment.Center;
sfTextInputLayout.VerticalAlignment = VerticalAlignment.Center;
SfTextBoxExt sfTextBoxExt = new SfTextBoxExt();
sfTextBoxExt.AutoCompleteMode = AutoCompleteMode.Suggest;
sfTextBoxExt.Width = 250;
sfTextBoxExt.AutoCompleteSource = viewModel.Countries;
sfTextInputLayout.InputView = sfTextBoxExt;
this.Content = sfTextInputLayout;
```

Container Type in WPF TextInputLayout (SfTextInputLayout)

Containers enhance the discoverability of the input view by creating a contrast between the input view and the assistive elements.

Note: The default value of the `ContainerType` is `Outlined`.

Outlined

The container will be covered with a rounded border.

XML

```
<inputLayout:SfTextInputLayout  
Hint="Name"  
ContainerType="Outlined">  
<TextBox Text="John" />  
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();  
inputLayout.Hint = "Name";  
inputLayout.ContainerType = ContainerType.Outlined;  
inputLayout.InputView = new TextBox() { Text = "John" };
```

Filled

The background of the input view will be filled with container color, and the base line stroke and thickness will be changed based on the state of the input view.

XML

```
<inputLayout:SfTextInputLayout  
Hint="Name"  
ContainerType="Filled">  
<TextBox Text="John" />  
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();  
inputLayout.Hint = "Name";  
inputLayout.ContainerType = ContainerType.Filled;  
inputLayout.InputView = new TextBox() { Text = "John" };
```

None

The container will have an empty background and enough space.

XML

```
<inputLayout:SfTextInputLayout  
Hint="Name"  
ContainerType="None">  
<TextBox Text="John" />  
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ContainerType = ContainerType.None;
inputLayout.InputView = new TextBox() { Text = "John" };
```

Name

John

Hint Position in WPF TextInputLayout (SfTextInputLayout)

We can decide how the floating label will display by setting the `HintFloatMode` property.

NOTE

The default value of the `HintFloatMode` is `Float`.

Float

The hint label will be float to the top of input view get focused.

XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
HintFloatMode="Float"
HelperText="Enter your name">
<TextBox />
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.HintFloatMode = HintFloatMode.Float;
inputLayout.HelperText = "Enter your name";
inputLayout.InputView = new TextBox();
```

Name

Enter your name

AlwaysFloat

The hint label will be positioned always at the top of input view.

XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
HintFloatMode="AlwaysFloat">
```

```
HelperText="Enter your name">
<TextBox />
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.HintFloatMode = HintFloatMode.AlwaysFloat;
inputLayout.HelperText= "Enter your name";
inputLayout.InputView = new TextBox();
```

None

The hint label will be hidden when the input view is focused.

XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
HintFloatMode= "None"
HelperText="Enter your name">
<TextBox />
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.HintFloatMode = HintFloatMode.None;
inputLayout.HelperText= "Enter your name";
inputLayout.InputView = new TextBox();
```

Assistive Labels in WPF TextInputLayout (SfTextInputLayout)

Assistive labels provide additional information about the text entered in the control of the input view.

Helper text

Helper text provides additional guidance on the **Input** field, such as **How to use it?** and can be set using the **HelperText** property.

XML

```
<inputLayout:SfTextInputLayout  
Hint="Name"  
HelperText="Enter your name">  
<TextBox />  
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();  
inputLayout.Hint = "Name";  
inputLayout.HelperText = "Enter your name";  
inputLayout.InputView = new TextBox();
```

Helper text visibility

We can specify the display state of the helper text using the `HelperTextVisibility` property, the type of which is [Visibility](#).

Error message

If the text `Input` is not acknowledged, the troubleshooting instructions will be shown in the error message. Error messages are shown below the input line until the correct text has been entered. It can be set using the `ErrorText` property, but it will only be shown when the `HasError` property is set to `true`.

XML

```
<inputLayout:SfTextInputLayout  
Hint="Email"  
HelperText="Enter your email address"  
ErrorText="Invalid email"  
HasError="true">  
<TextBox />  
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();  
inputLayout.Hint = "Email";  
inputLayout.HelperText = "Enter your email address";  
inputLayout.ErrorText = "Invalid email";  
inputLayout.HasError = true;  
inputLayout.InputView = new TextBox();
```

Note: Error validations should be done in the application level.

Character counter

Character counter is used when characters need to be limited. Use the `CharMaxLength` property to set the limit for characters. We can specify the display state of the character count using the `CharCountVisibility` property, the type of which is [Visibility](#).

XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
CharCountVisibility="Visible"
CharMaxLength="7"
HelperText="Enter 5 to 7 characters">
<TextBox />
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.CharMaxLength = 7;
inputLayout.CharCountVisibility = Visibility.Visible;
inputLayout.HelperText = "Enter 5 to 7 characters";
inputLayout.InputView = new TextBox();
```

Without CharMaxLength

With CharMaxLength

Note: When the number of characters to be entered in the input view exceeds the `CharMaxLength`, the `ErrorForeground` value will be applied to the hint label, base line, border and counter label.

Custom Icons in WPF TextInputLayout (SfTextInputLayout)

Any custom icons can be added to the leading edge or the trailing edge of the input view in the text input layout control. Events and commands linked to custom icons should be handled at the application level.

Unicode or font icons for labels can be shown as icons.

Leading view

A label can be added as a leading icon to the input view by setting the `LeadingView` property. It can be placed inside or outside the container by setting the `LeadingViewPosition` property. By default, it is placed `Outside`.

XML

```
<inputLayout:SfTextInputLayout
Hint="Birth date"
```

```

LeadingViewPosition="Inside" >
<TextBox />
<inputLayout:SfTextInputLayout.LleadingView>
<Label
FontFamily="/Assets/Sync FontIcons.ttf#Sync FontIcons"
Text="&#x1F5D3;">
</Label>
</inputLayout:SfTextInputLayout.LleadingView>
</inputLayout:SfTextInputLayout>

```

C#

```

var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Birth date";
inputLayout.LleadingViewPosition = ViewPosition.Inside;
inputLayout.LleadingView = new Label() { Text = "\U0001F5D3" };
inputLayout.InputView = new TextBox();

```

**Trailing view**

A label can be added as a trailing icon to the input view by setting the `TrailingView` property. It can be placed either inside or outside the input view container by setting the `TrailingViewPosition` property. By default, it is placed `Inside`.

XML

```

<inputLayout:SfTextInputLayout
Hint="Birth date"
TrailingViewPosition="Outside">
<TextBox />
<inputLayout:SfTextInputLayout.TrailingView>
<Label
FontFamily="/Assets/Sync FontIcons.ttf#Sync FontIcons"
Text="&#x1F5D3;">
</Label>
</inputLayout:SfTextInputLayout.TrailingView>
</inputLayout:SfTextInputLayout>

```

C#

```

var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Birth date";
inputLayout.TrailingViewPosition = ViewPosition.Outside;
inputLayout.TrailingView = new Label() { Text = "\U0001F5D3" };
inputLayout.InputView = new TextBox();

```

Customization in WPF TextInputLayout (SfTextInputLayout)

Based on the text input layout state, the colors will be applied to the hint label, base line, border and assistive labels.

Focused color

When the input view is focused, the value of the **FocusedForeground** property will be added to the hint label, base line and border.

Information: The cursor color of the input view is the same as the **Accent** color of the application.

XML

```
<inputLayout:SfTextInputLayout
Hint="User name"
FocusedForeground="Green"
HelperText="Enter your name"
<TextBox Text="John" />
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "User name";
inputLayout.FocusedForeground = Brushes.Green;
inputLayout.InputView = new TextBox() { Text = "John" };
```

Note: The current active color of the text input layout can be obtained from the **ActiveForeground** property.

Since error is not a state, the error color will not be set to **ActiveForeground** when **HasError** property is set to **true**.

Unfocused color

When the input view is unfocused, the **Foreground** property value will be applied to the hint label, base line and border.

XML

```
<inputLayout:SfTextInputLayout
Hint="User name"
Foreground="Gray"
HelperText="Enter your name"
<TextBox Text="John" />
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "User name";
inputLayout.Foreground = Brushes.Gray;
inputLayout.InputView = new TextBox() { Text = "John" };
```

Error color

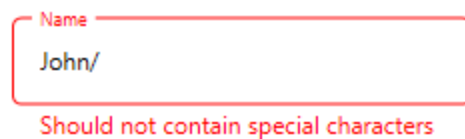

When the input layout is set to error state, the `ErrorForeground` property value will be added to the hint label, base line, border and error text.

XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
ErrorForeground="Red"
ErrorText="Should not contain special characters"
HasError="True">
<TextBox Text="John/" />
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ErrorForeground = Brushes.Red;
inputLayout.ErrorText = "Should not contain special characters";
inputLayout.HasError = true;
inputLayout.InputView = new TextBox() { Text = "John/" };
```

Container color

The color of the container can be customized by setting the `ContainerBackground` property. It is applicable when the `ContainerType` property is set to `Filled` and `Outlined`.

XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
FocusedForeground="Blue"
ContainerType="Outlined"
ContainerBackground="LightBlue">
```

```
<TextBox Text="John" />
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.FocusedColor = Brushes.Blue;
inputLayout.ContainerBackground = Brushes.LightBlue;
inputLayout.ContainerType = ContainerType.Outlined;
inputLayout.InputView = new Entry() { TextBox = "John" };
```

Note: Container color is not applicable for 'None' type.

Outline corner radius

The corner radius of the outlined border can be customized by setting `OutlineCornerRadius` property.

XML

```
<inputLayout:SfTextInputLayout
Hint="Name"
ContainerType="Outlined"
OutlineCornerRadius="8">
<TextBox />
</inputLayout:SfTextInputLayout>
```

C#

```
var inputLayout = new SfTextInputLayout();
inputLayout.Hint = "Name";
inputLayout.ContainerType = ContainerType.Outlined;
inputLayout.OutlineCornerRadius = 8;
inputLayout.InputView = new TextBox();
```

NOTE

It is only applicable to the `Outlined` type of container.

Right to Left in WPF TextInputLayout (SfTextInputLayout)

The `TextInputLayout` supports to change the flow of text to the right-to-left direction by setting the `FlowDirection` to `RightToLeft`.

XML

```
<inputLayout:SfTextInputLayout
x:Name="textinputlayout"
FlowDirection="RightToLeft"
ContainerType="Outlined"
Hint="نام"
HelperText="اپنا نام درج کریں" >
<TextBox Text="جانسن" />
</inputLayout:SfTextInputLayout>
```

C#

```
textinputlayout.FlowDirection = FlowDirection.RightToLeft;
textinputlayout.ContainerType = ContainerType.Outlined;
textinputlayout.Hint = "نام";
textinputlayout.HelperText = "اپنا نام درج کریں";
textinputlayout.InputView = new TextBox() { Text = "جانسن"};
```

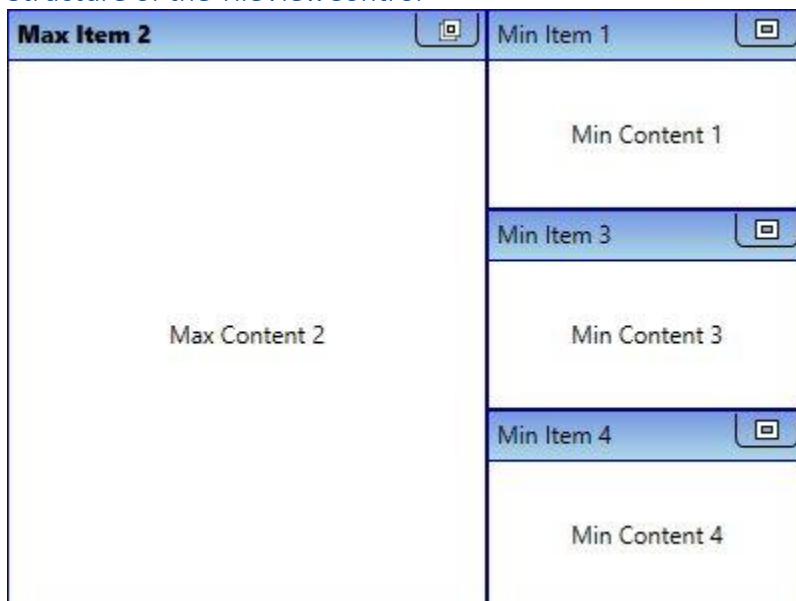

TileView

WPF Tile View Overview

The [TileViewControl](#) acts as a container that holds a set of [TileViewItem](#)s, in which you can host rich information. You can maximize, minimize and drag the items of the [TileViewControl](#) in a matrix position to achieve the best layout.

Structure of the TileViewControl

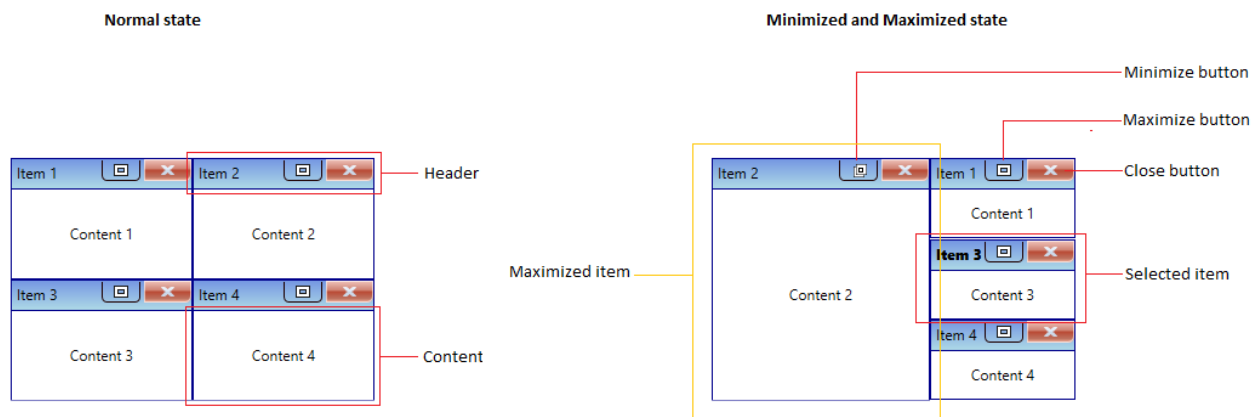

Key features

- Auto arrangements in the matrix order.
- Drag-drop support - To arrange the TileViewItem's.
- Maximizing and minimizing support.
- The minimized position of the TileViewItems horizontal and vertical positions.
- Separate custom UI for minimized and maximized TileViewItem
- Header and content UI customization
- Closing support
- Scroll bar support

Getting Started with WPF Tile View

This section describes how to create a [TileViewControl](#) control in a WPF application and overview of its basic functionalities.

Structure of TileViewControl

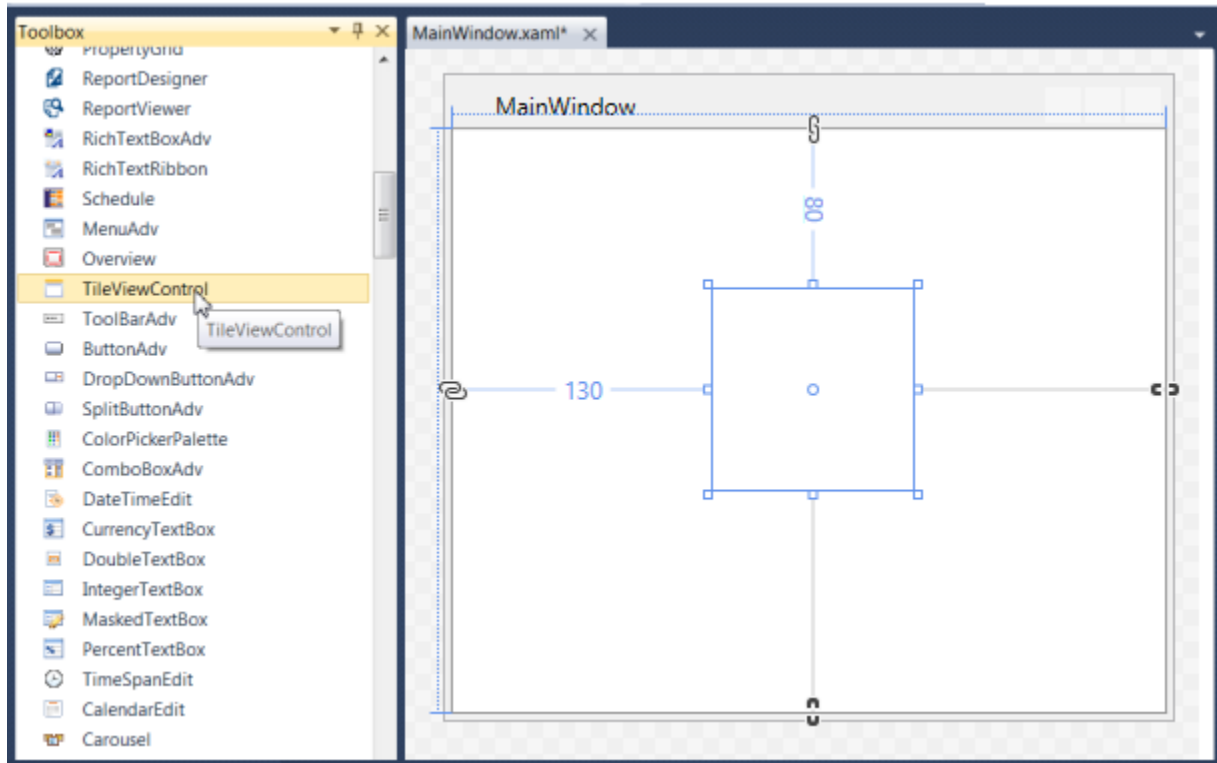

Assembly deployment

Refer to the [Control Dependencies](#) section to get the list of assemblies or NuGet package that needs to be added as a reference to use the control in any application.

Refer to this [documentation](#) to find more details about installing nuget packages in a WPF application.

Adding WPF TileViewControl via designer

1) The **TileViewControl** can be added to an application by dragging it from the toolbox to a designer view. The following dependent assemblies will be added automatically: * Syncfusion.Shared.WPF

2) Set the properties for **TileViewControl** in design mode using the SmartTag feature.

Adding WPF TileViewControl via XAML

To add the **TileViewControl** manually in XAML, follow these steps:

1) Create a new WPF project in Visual Studio. 2) Add the following required assembly references to the project: * Syncfusion.Shared.WPF 3) Import Syncfusion WPF schema <http://schemas.syncfusion.com/wpf>, and declare the **TileViewControl** in XAML page.

XML

```
<Window x:Class="TileViewControl_sample.MainWindow"
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:d="http://schemas.microsoft.com/expression/blend/2008"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006"
xmlns:local="clr-namespace:TileViewControl_sample"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
mc:Ignorable="d"
Title="MainWindow" Height="450" Width="800">
<Grid Name="grid">
<syncfusion:TileViewControl Name="tileViewControl"
Height="200"
Width="200"/>
</Grid>
</Window>
```

Adding WPF TileViewControl via C#

To add the **TileViewControl** manually in C#, follow these steps:

1) Create a new WPF application via Visual Studio. 2) Add the following required assembly references to the project: * Syncfusion.Shared.WPF 3) Include the required namespace.

C#

```
using Syncfusion.Windows.Shared;
```

4) Create an instance of `TileViewControl`, and add it to the window.

C#

```
// Creating an instance of the TileViewControl
TileViewControl tileViewControl = new TileViewControl();
// Setting height and width to TileViewControl
tileViewControl.Height = 200;
tileViewControl.Width = 300;
```

Note: [View Sample in GitHub](#)

Populating items using `TileViewItem`

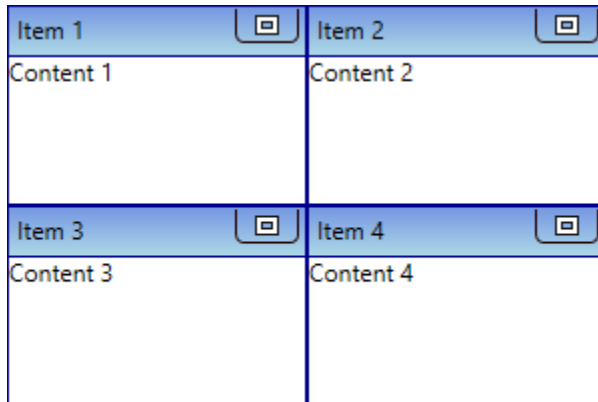

You can add the tileview items inside the control by adding the [TileViewItem](#) into the `TileViewControl.Items` collection property.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem Content="Content 1" Header="Item 1" />
<syncfusion:TileViewItem Content="Content 2" Header="Item 2" />
<syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
<syncfusion:TileViewItem Content="Content 4" Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Content="Content 1",
Header = "Item 1" });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 2",
Header = "Item 2" });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 3",
Header = "Item 3" });
tileViewControl.Items.Add(new TileViewItem() { Content = "Content 4",
Header = "Item 4" });
```

Note: [View Sample in GitHub](#)

Populating items using collection binding

You can populate items to the `TileViewControl` by setting the collection value to the `ItemsSource` property.

C#

```
// Model.cs
public class TileItem {
    public string Header { get; set; }
    public string Content { get; set; }
    public TileItem() {
    }
}

//ViewModel.cs
public class ViewModel : NotificationObject {
    private ObservableCollection<TileItem> tileViewItems;
    public ObservableCollection<TileItem> TileViewItems {
        get { return tileViewItems; }
        set {
            tileViewItems = value;
            this.RaisePropertyChanged(nameof(TileViewItems));
        }
    }

    public ViewModel() {
        tileViewItems = new ObservableCollection<TileItem>();
        PopulateCollection();
    }

    public void PopulateCollection() {
        //Adding the tileview items into the collection
        TileViewItems.Add(new TileItem() { Header = "Item 1", Content = "Content 1"
    });
        TileViewItems.Add(new TileItem() { Header = "Item 2", Content = "Content 2"
    });
        TileViewItems.Add(new TileItem() { Header = "Item 3", Content = "Content 3"
    });
        TileViewItems.Add(new TileItem() { Header = "Item 4", Content = "Content 4"
    });
    }
}
```

XML

```
<syncfusion:TileViewControl ItemsSource="{Binding TileViewItems}"
Name="tileViewControl">
<syncfusion:TileViewControl.ItemContainerStyle>
<Style TargetType="{x:Type syncfusion:TileViewItem}">
<Setter Property="Header" Value="{Binding Header}" />
<Setter Property="Content" Value="{Binding Content}" />
</Style>
</syncfusion:TileViewControl.ItemContainerStyle>
<syncfusion:TileViewControl.DataContext>
<local:ViewModel/>
</syncfusion:TileViewControl.DataContext>
</syncfusion:TileViewControl>
```

Item 1	Item 2
Content 1	Content 2
Item 3	Item 4
Content 3	Content 4

Note: [View Sample in GitHub](#)

Select a TileViewItem

You can select any `TileViewItem` by mouse click on the specific `TileViewItem`. You can get the selected item by using the `SelectedItem` property. You can also get the selected value and its index by using the `SelectedValue` and `SelectedIndex` properties. The default value of `SelectedItem` property is `null`.

Note: You can select only one item at a time.

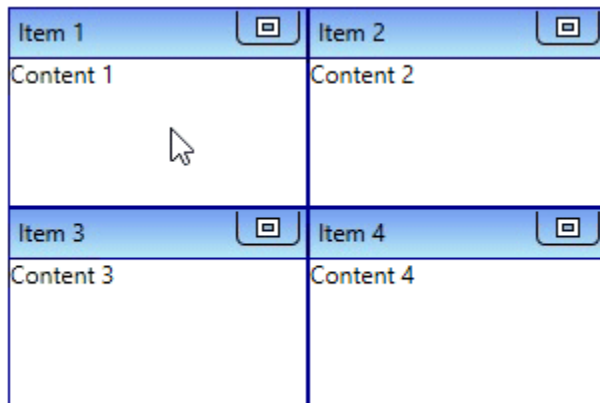

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem Content="Content 1" Header="Item 1" />
<syncfusion:TileViewItem Content="Content 2" Header="Item 2" />
<syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
<syncfusion:TileViewItem Content="Content 4" Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Content="Content 1",
Header = "Item 1" });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 2",
Header = "Item 2" });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 3",
Header = "Item 3" });
```

```
tileViewControl.Items.Add(new TileViewItem() { Content = "Content 4",
Header = "Item 4" });
```

Note: [View Sample in GitHub](#)

Select TileViewItem programmatically using property

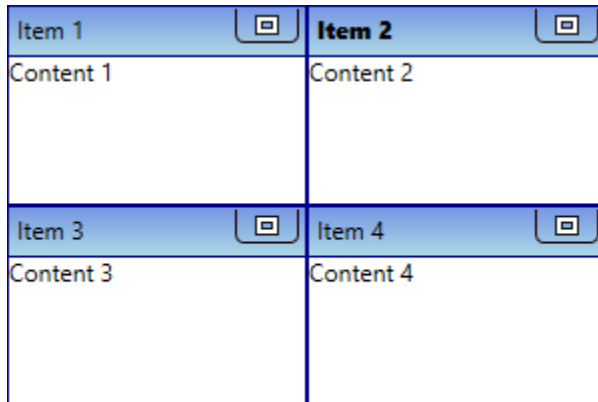

You can select a particular `TileViewItem` programmatically by using the [TileViewItem.IsSelected](#) property.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem Content="Content 1" Header="Item 1" />
<syncfusion:TileViewItem IsSelected="True"
Content="Content 2" Header="Item 2" />
<syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
<syncfusion:TileViewItem Content="Content 4" Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Content="Content 1",
Header = "Item 1" });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 2",
Header = "Item 2", IsSelected = true });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 3",
Header = "Item 3" });
tileViewControl.Items.Add(new TileViewItem() { Content = "Content 4",
Header = "Item 4" });
```

Note: [View Sample in GitHub](#)

Selected item changed notification

The selected item changed in `TileViewControl` can be examined using `SelectionChanged` event. The `SelectionChanged` event contains the old and newly selected item in the `RemovedItems` and `AddedItems` properties.

XML

```
<syncfusion:TileViewControl
  SelectionChanged="TileViewControl_SelectionChanged"
  Name="tileViewControl">
  <syncfusion:TileViewItem Content="Content 1" Header="Item 1" />
  <syncfusion:TileViewItem Content="Content 2" Header="Item 2" />
  <syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
  <syncfusion:TileViewItem Content="Content 4" Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.SelectionChanged += TileViewControl_SelectionChanged;
```

You can handle the event as follows,

C#

```
private void TileViewControl_SelectionChanged(object sender,
  SelectionChangedEventArgs e) {
  //Get old and new selected TileView item
  var oldItem = e.RemovedItems;
  var newItem = e.AddedItems;
}
```

Arrange TileViewItem in rows and columns

You can change the number of tileview items displayed in view by setting the value to `RowCount` and `ColumnCount` properties. The default value of `RowCount` and `ColumnCount` properties is 0.

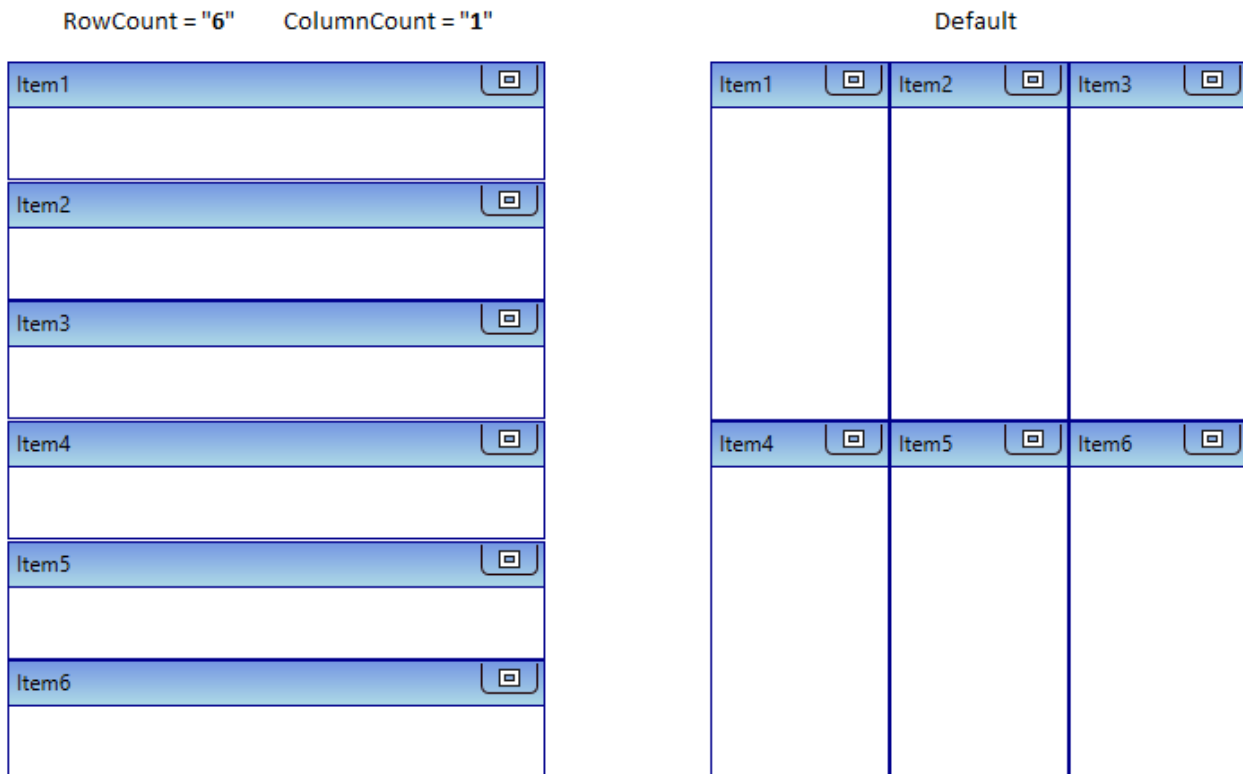

XML

```
<syncfusion:TileViewControl RowCount="6" ColumnCount="1"
  Name="tileViewControl" >
```

```
<syncfusion:TileViewItem Header="Item1"/>
<syncfusion:TileViewItem Header="Item2"/>
<syncfusion:TileViewItem Header="Item3"/>
<syncfusion:TileViewItem Header="Item4"/>
<syncfusion:TileViewItem Header="Item5"/>
<syncfusion:TileViewItem Header="Item6"/>
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.RowCount = 6;
tileViewControl.ColumnCount = 1;
```

Note: [View Sample in GitHub](#)

Minimize or maximize the TileViewItem

You can minimize or maximize the `TileViewItem` by clicking on the `MinMaxButton`. you can change the header and content for the minimized and maximized items separately by using the `TileViewItem.MinimizedHeader`, `TileViewItem.MinimizedItemContent` and `TileViewItem.MaximizedHeader`, `TileViewItem.MaximizedItemContent` properties.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem Header="Item 1" Content="Content 1"
MinimizedItemContent="Min Content 1"
MaximizedItemContent="Max Content 1"
MinimizedHeader="Min Item 1"
MaximizedHeader="Max Item 1"/>
```

```

<syncfusion:TileViewItem Header="Item2" Content="Content 2"
MinimizedItemContent="Min Content 2"
MaximizedItemContent="Max Content 2"
MinimizedHeader="Min Item 2"
MaximizedHeader="Max Item 2"/>
<syncfusion:TileViewItem Header="Item3" Content="Content 3"
MinimizedItemContent="Min Content 3"
MaximizedItemContent="Max Content 3"
MinimizedHeader="Min Item 3"
MaximizedHeader="Max Item 3"/>
<syncfusion:TileViewItem Header="Item4" Content="Content 4"
MinimizedItemContent="Min Content 4"
MaximizedItemContent="Max Content 4"
MinimizedHeader="Min Item 4"
MaximizedHeader="Max Item 4"/>
</syncfusion:TileViewControl>

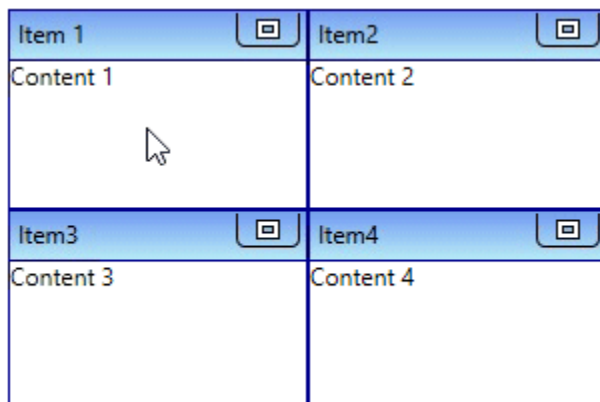

```

C#

```

TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
Content = "Content 1", MaximizedItemContent = "Max Content 1",
MinimizedItemContent = "Min Content 1",
MinimizedHeader="Min Item 1", MaximizedHeader="Max Item 1"});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
Content = "Content 2", MaximizedItemContent = "Max Content 2",
MinimizedItemContent = "Min Content 1",
MinimizedHeader="Min Item 2", MaximizedHeader="Max Item 2"});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
Content = "Content 3", MaximizedItemContent = "Max Content 3",
MinimizedItemContent = "Min Content 1",
MinimizedHeader="Min Item 3", MaximizedHeader="Max Item 3"});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
Content = "Content 4", MaximizedItemContent = "Max Content 4",
MinimizedItemContent = "Min Content 1",
MinimizedHeader="Min Item 4", MaximizedHeader="Max Item 4"});

```

Note: [View Sample in GitHub](#)

Closing TileViewItem

You can close the `TileViewItem` by clicking the close button which is placed top-right corner of the header panel. If you want to display the close button on `TileViewItem`, use the [TileViewItem.CloseButtonVisibility](#) property value as `Visible`.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item 1"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 2"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 3"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 4"
    CloseButtonVisibility="Visible"/>
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
    CloseButtonVisibility= Visibility.Visible});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
    CloseButtonVisibility = Visibility.Visible });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
    CloseButtonVisibility = Visibility.Visible });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
    CloseButtonVisibility = Visibility.Visible });
```

Note: [View Sample in GitHub](#)

Custom UI of TileViewItem

You can customize the header and content of `TileViewItem` appearance by using the [HeaderTemplate](#) and [ItemTemplate](#) properties. The `DataContext` of the `HeaderTemplate` property is `TileViewItem.Header` and `dataContext` of the `ItemTemplate` property is `TileViewItem.Content`.

XML

```
<Window.Resources>
```

```

<DataTemplate x:Key="contentTemplate">
  <Grid>
    <TextBlock VerticalAlignment="Center"
      HorizontalAlignment="Center"
      Text="{Binding}"
      Foreground="Blue"/>
  </Grid>
</DataTemplate>
<DataTemplate x:Key="headerTemplate">
  <Grid>
    <TextBlock VerticalAlignment="Center"
      HorizontalAlignment="Center"
      Text="{Binding}"
      Foreground="Red"/>
  </Grid>
</DataTemplate>
</Window.Resources>
<Grid>
  <syncfusion:TileViewControl HeaderTemplate="{StaticResource headerTemplate}"
    ItemTemplate="{StaticResource contentTemplate}"
    Name="tileViewControl">
    <syncfusion:TileViewItem Header="Item 1" Content="Content 1"/>
    <syncfusion:TileViewItem Header="Item 2" Content="Content 2" />
    <syncfusion:TileViewItem Header="Item 3" Content="Content 3"/>
    <syncfusion:TileViewItem Header="Item 4" Content="Content 4"/>
  </syncfusion:TileViewControl>
</Grid>

```

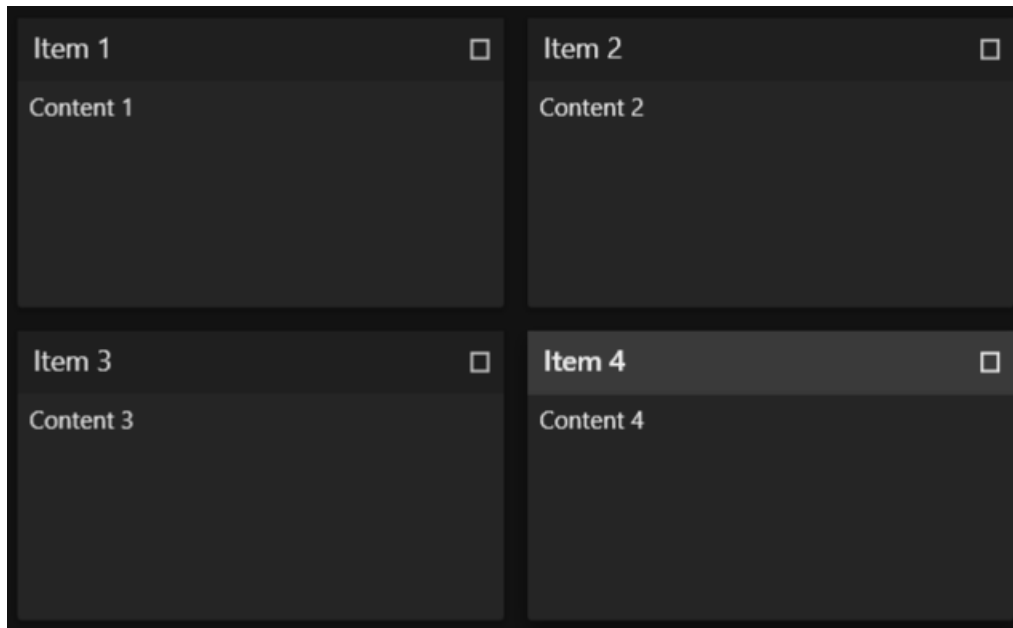

Item 1	Item 2
Content 1	Content 2
Item 3	Item 4
Content 3	Content 4

Note: [View Sample in GitHub](#)

Theme

TileViewControl supports various built-in themes. Refer to the below links to apply themes for the TileViewControl,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Data Binding in WPF Tile View

You can add a [TileViewItem](#) using data binding in the WPF [TileViewControl](#).

Data binding to Objects

The `TileViewControl` can bound to an external source to auto create `TileViewItem` and display the data using `ItemsSource` property. When you are auto generating `TileViewItem` using `ItemsSource`, you need to set `Header` property or `HeaderTemplate` in `ItemContainerStyle` to define header and use `Content` property or `ContentTemplate` in `ItemContainerStyle` to display the content of the `TileViewItem` item.

Note: To bind `ItemsSource` to `TileViewControl`, you need to have collection with data object which holds header and content details.

Here, `TileItem` class defined with `Header` and `Content` properties and `ViewModel` class has `ItemsSource` property of type `ObservableCollection<TileItem>`.

C#

```
// Model.cs
public class TileItem {
    public string Header { get; set; }
    public string Content { get; set; }
    public TileItem() {
    }
}

//ViewModel.cs
public class ViewModel : NotificationObject {
    private ObservableCollection<TileItem> tileViewItems;
    public ObservableCollection<TileItem> TileViewItems {
        get { return tileViewItems; }
        set {
            tileViewItems = value;
            this.RaisePropertyChanged(nameof(TileViewItems));
        }
    }
}
```

```

}
public ViewModel() {
    tileViewItems = new ObservableCollection<TileItem>();
    PopulateCollection();
}
public void PopulateCollection() {
    //Adding the tileview items into the collection
    TileViewItems.Add(new TileItem() { Header = "Item 1", Content = "Content 1"
});
    TileViewItems.Add(new TileItem() { Header = "Item 2", Content = "Content 2"
});
    TileViewItems.Add(new TileItem() { Header = "Item 3", Content = "Content 3"
});
    TileViewItems.Add(new TileItem() { Header = "Item 4", Content = "Content 4"
});
}
}

```

XML

```

<syncfusion:TileViewControl ItemsSource="{Binding TileViewItems}"
    Name="tileViewControl">
    <syncfusion:TileViewControl.ItemContainerStyle>
    <Style TargetType="{x:Type syncfusion:TileViewItem}">
    <Setter Property="Header" Value="{Binding Header}" />
    <Setter Property="Content" Value="{Binding Content}" />
    </Style>
    </syncfusion:TileViewControl.ItemContainerStyle>
    <syncfusion:TileViewControl.DataContext>
    <local:ViewModel/>
    </syncfusion:TileViewControl.DataContext>
</syncfusion:TileViewControl>

```

Item 1	Item 2
Content 1	Content 2
Item 3	Item 4
Content 3	Content 4

Note: [View Sample in GitHub](#)

Data binding with XML

You can bind the XML file as `ItemsSource` for creating the `TileViewItem` in the `TileViewControl`. You can easily populate the items from the XML files using the `ItemTemplate` and `ContentTemplate` or `ItemContainerStyle` properties.

1. Create an XML file with the required details and name it as `Data.xml`.

XML

```
<?xml version="1.0" encoding="utf-8" ?>
<Books>
  <Book Name="Programming C# 4.0"
    Description="Learn C# fundamentals, such as variables,
    flow control, loops, and methods"/>
  <Book Name="Programming WPF"
    Description="A tutorial on XAML, the new HTML-like markup
    language for declaring Windows UI"/>
  <Book Name="Essential WPF"
    Description="Visuals and media, including 2D, 3D, video,
    and animation"/>
  <Book Name="WPF Unleashed"
    Description="Examines the WPF feature areas in incredible
    depth: controls, layout, resources, data binding,
    styling, graphics, animation, and more"/>
</Books>
```

2. Add `XmlDataProvider` for the above `Data.xml` document and bind the data to `ItemsSource` property for the `TileViewControl`.

XML

```
<Window.Resources>
  <XmlDataProvider Source="Data.xml" x:Key="xmlSource" XPath="Books"/>
</Window.Resources>
<Grid>
  <syncfusion:TileViewControl Name="tileViewControl"
    ItemsSource="{Binding Source={StaticResource xmlSource},
    XPath=Book}" />
  <syncfusion:TileViewControl.ItemContainerStyle>
    <Style TargetType="{x:Type syncfusion:TileViewItem}">
      <Setter Property="Header" Value="{Binding XPath=@Name}" />
      <Setter Property="ContentTemplate">
        <Setter.Value>
          <DataTemplate>
            <TextBlock Text="{Binding XPath=@Description}" />
          </DataTemplate>
        </Setter.Value>
      </Setter>
    </Style>
  </syncfusion:TileViewControl.ItemContainerStyle>
</syncfusion:TileViewControl>
</Grid>
```

Programming C# 4.0  Learn C# fundamentals, such as variables, flow control, loops, and methods	Programming WPF  A tutorial on XAML, the new HTML-like markup language for declaring Windows UI
Essential WPF  Visuals and media, including 2D, 3D, video, and animation	WPF Unleashed  Examines the WPF feature areas in incredible depth: controls, layout, resources, data binding, styling, graphics, animation, and more

Note: [View Sample in GitHub](#)

Virtualization support

You can enable the UI virtualization support in `TileViewControl`, which allows the users to load large sets of data without affecting loading or scrolling performance by setting the `IsVirtualizing` property value as `true`. This feature allows users to reduce the loading time of `TileView` items regardless of items count. The default value of `IsVirtualizing` property is `false`.

XML

```
<syncfusion:TileViewControl IsVirtualizing="True"
Name="tileViewControl"/>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.IsVirtualizing = true;
```

TileViewItem header

You can define the `TileViewItem` header using `HeaderTemplate` or `TileViewItem.ItemContainerStyle` property. Otherwise, `TileViewItem` header will display the data object class name which is associated with `TileViewItem`. The `DataContext` of the `HeaderTemplate` property is `TileViewItem.Header`.

C#

```
// Model.cs
public class TileItem {
    public string Header { get; set; }
    public string Content { get; set; }
    public TileItem() {
    }
}

// ViewModel.cs
public class ViewModel : NotificationObject {
    private ObservableCollection<TileItem> tileViewItems;
    public ObservableCollection<TileItem> TileViewItems {
```

```
get { return tileViewItems; }
set {
    tileViewItems = value;
    this.RaisePropertyChanged(nameof(TileViewItems));
}
}

public ViewModel() {
    tileViewItems = new ObservableCollection<TileItem>();
    PopulateCollection();
}

public void PopulateCollection() {
    //Adding the tileview items into the collection
    TileViewItems.Add(new TileItem() { Header = "Item 1", Content = "Content 1"
});
    TileViewItems.Add(new TileItem() { Header = "Item 2", Content = "Content 2"
});
    TileViewItems.Add(new TileItem() { Header = "Item 3", Content = "Content 3"
});
    TileViewItems.Add(new TileItem() { Header = "Item 4", Content = "Content 4"
});
}
}
```

XML

```
<syncfusion:TileViewControl Name="tileViewControl"
ItemsSource="{Binding TileViewItems}">
<syncfusion:TileViewControl.HeaderTemplate>
<DataTemplate>
<TextBlock Text="{Binding Header}"
HorizontalAlignment="Center"
VerticalAlignment="Center" />
</DataTemplate>
</syncfusion:TileViewControl.HeaderTemplate>
<syncfusion:TileViewControl.ItemContainerStyle>
<Style TargetType="syncfusion:TileViewItem">
<Setter Property="Content" Value="{Binding Content}"/>
</Style>
</syncfusion:TileViewControl.ItemContainerStyle>
<syncfusion:TileViewControl.DataContext>
<viewModel:ViewModel/>
</syncfusion:TileViewControl.DataContext>
</syncfusion:TileViewControl>
```

Item 1 	Item 2 
Content 1	Content 2
Item 3 	Item 4 
Content 3	Content 4

Note: [View Sample in GitHub](#)

TileViewItem content

You can define the `TileViewItem` content using `ItemTemplate` or `TileViewItem.ItemContainerStyle` property. Otherwise, `TileViewItem` content will display the data object class name which is associated with `TileViewItem`. The `DataContext` of the `ItemTemplate` property is `TileViewItem.Content`.

XML

```
<syncfusion:TileViewControl Name="tileViewControl"
ItemsSource="{Binding TileViewItems}">
<syncfusion:TileViewControl.ItemTemplate>
<DataTemplate>
<TextBlock Text="{Binding Content}"
HorizontalAlignment="Center"
VerticalAlignment="Center" />
</DataTemplate>
</syncfusion:TileViewControl.ItemTemplate>
<syncfusion:TileViewControl.ItemContainerStyle>
<Style TargetType="syncfusion:TileViewItem">
<Setter Property="Header" Value="{Binding Header}" />
</Style>
</syncfusion:TileViewControl.ItemContainerStyle>
<syncfusion:TileViewControl.DataContext>
<viewModel:ViewModel/>
</syncfusion:TileViewControl.DataContext>
</syncfusion:TileViewControl>
```

Item 1 	Item 2 
Content 1	Content 2
Item 3 	Item 4 
Content 3	Content 4

Note: [View Sample in GitHub](#)

Different UI for TileViewItem content

You can change the various UI for the content of `TileViewItem` based on the provided logic by using the `ItemTemplateSelector`. You can also use the `ItemContainerStyleSelector` property to apply the different UI for the `TileViewItem` content. The `DataContext` of the `ItemTemplate` property is `TileViewItem.Content`.

C#

```
//ItemTemplateSelector class for select a DataTemplate
public class MyTemplateSelector : DataTemplateSelector {
    public DataTemplate Template1 { get; set; }
    public DataTemplate Template2 { get; set; }
    public DataTemplate Template3 { get; set; }
    public override DataTemplate SelectTemplate(object item, DependencyObject container) {
        if (item is TileItem && (item as TileItem).Header == "Item 1")
            return Template1;
        else if (item is TileItem && (item as TileItem).Header == "Item 4")
            return Template2;
        else
            return Template3;
    }
}
```

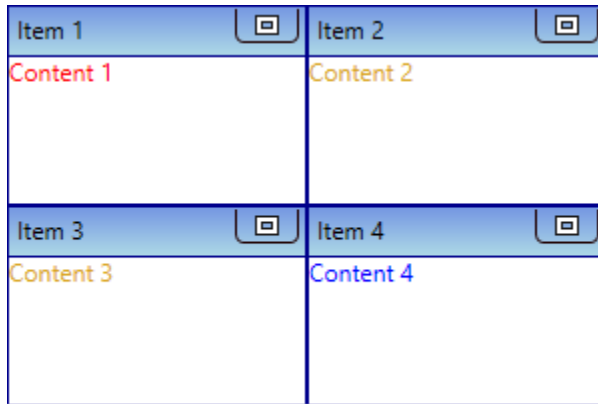

XML

```
<Window.Resources>
    <local:MyTemplateSelector x:Key="Mytemplate">
        <local:MyTemplateSelector.Template1>
            <DataTemplate>
                <TextBlock Text="{Binding Content}" Foreground="Red"/>
            </DataTemplate>
        </local:MyTemplateSelector.Template1>
        <local:MyTemplateSelector.Template2>
            <DataTemplate>
                <TextBlock Text="{Binding Content}" Foreground="Blue"/>
            </DataTemplate>
        </local:MyTemplateSelector.Template2>
        <local:MyTemplateSelector.Template3>
            <DataTemplate>
                <TextBlock Text="{Binding Content}" Foreground="Goldenrod"/>
            </DataTemplate>
        </local:MyTemplateSelector.Template3>
    </local:MyTemplateSelector>
</Window.Resources>
<Grid>
    <syncfusion:TileViewControl ItemTemplateSelector="{StaticResource Mytemplate}"
        ItemsSource="{Binding TileViewItems}"
        Name="tileViewControl">
        <syncfusion:TileViewControl.ItemContainerStyle>
            <Style TargetType="syncfusion:TileViewItem">
                <Setter Property="Header" Value="{Binding Header}"/>
            </Style>
        </syncfusion:TileViewControl.ItemContainerStyle>
    </syncfusion:TileViewControl>
</Grid>
```

```

</syncfusion:TileViewControl.ItemContainerStyle>
<syncfusion:TileViewControl.DataContext>
<viewModel:ViewModel/>
</syncfusion:TileViewControl.DataContext>
</syncfusion:TileViewControl>
</Grid>

```

Note: [View Sample in GitHub](#)

Working with TileView in WPF Tile View

This section explains different UI customization and common features available in [TileViewControl](#) control.

Populating items using TileViewItem

You can add the tileview items inside the control by adding the [TileViewItem](#) into the `TileViewControl.Items` collection property.

XML

```

<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem Content="Content 1" Header="Item 1" />
<syncfusion:TileViewItem Content="Content 2" Header="Item 2" />
<syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
<syncfusion:TileViewItem Content="Content 4" Header="Item 4" />
</syncfusion:TileViewControl>

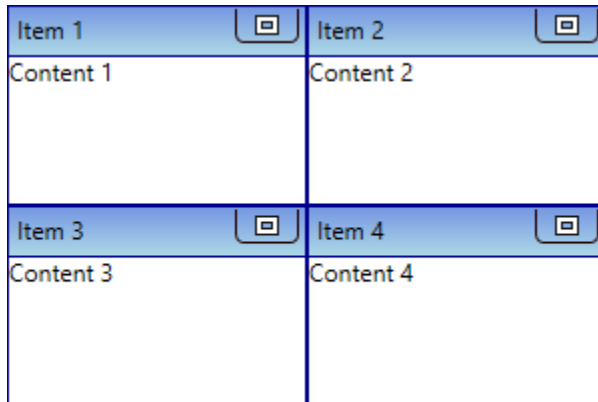

```

C#

```

TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Content="Content 1",
Header = "Item 1" });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 2",
Header = "Item 2" });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 3",
Header = "Item 3" });
tileViewControl.Items.Add(new TileViewItem() { Content = "Content 4",
Header = "Item 4" });

```

Note: [View Sample in GitHub](#)

Populating items using binding

You can populate items to the `TileView` control by setting the collection value to the `ItemsSource` property.

Note: Please refer [Data Binding](#) page to know more details about binding support available in the `TileViewControl`.

Select a `TileViewItem`

You can select any `TileViewItem` by mouse click on the specific `TileViewItem`. You can get the selected item by using the `SelectedItem` property. You can also get the selected value and its index by using the `SelectedValue` and `SelectedIndex` properties. The default value of `SelectedItem` property is `null`.

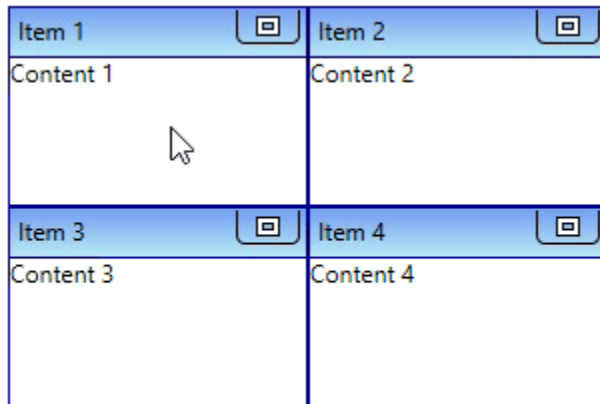

Note: You can select only one item at a time.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Content="Content 1" Header="Item 1" />
  <syncfusion:TileViewItem Content="Content 2" Header="Item 2" />
  <syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
  <syncfusion:TileViewItem Content="Content 4" Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Content="Content 1",
Header = "Item 1" });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 2",
Header = "Item 2" });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 3",
Header = "Item 3" });
tileViewControl.Items.Add(new TileViewItem() { Content = "Content 4",
Header = "Item 4" });
```

Note: [View Sample in GitHub](#)

Select TileViewItem programmatically using property

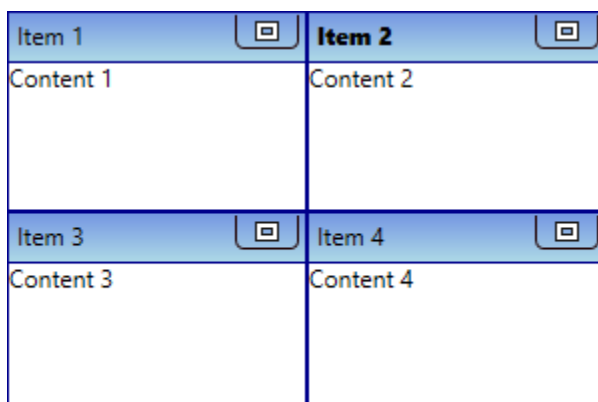

You can select a particular `TileViewItem` programmatically by using the `TileViewItem.IsSelected` property.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Content="Content 1" Header="Item 1" />
  <syncfusion:TileViewItem IsSelected="True"
    Content="Content 2" Header="Item 2" />
  <syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
  <syncfusion:TileViewItem Content="Content 4" Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Content="Content 1",
Header = "Item 1" });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 2",
Header = "Item 2", IsSelected = true });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 3",
Header = "Item 3" });
tileViewControl.Items.Add(new TileViewItem() { Content = "Content 4",
Header = "Item 4" });
```

Note: [View Sample in GitHub](#)

Selected item changed notification

The selected item changed in `TileViewControl` can be examined using `SelectionChanged` event. The `SelectionChanged` event contains the old and newly selected item in the `RemovedItems` and `AddedItems` properties.

XML

```
<syncfusion:TileViewControl
  SelectionChanged="TileViewControl_SelectionChanged"
  Name="tileViewControl">
  <syncfusion:TileViewItem Content="Content 1" Header="Item 1" />
  <syncfusion:TileViewItem Content="Content 2" Header="Item 2" />
  <syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
  <syncfusion:TileViewItem Content="Content 4" Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.SelectionChanged += TileViewControl_SelectionChanged;
```

You can handle the event as follows,

C#

```
private void TileViewControl_SelectionChanged(object sender,
  SelectionChangedEventArgs e) {
  //Get old and new selected TileView item
  var oldItem = e.RemovedItems;
  var newItem = e.AddedItems;
}
```

Display TileViewItem splitter

If you want to display the splitter between maximized and each minimized items, use the [SplitterVisibility](#) property value as `Visible`. You can also change the splitter color and thickness by using the [SplitterColor](#) and [SplitterThickness](#) properties. The default value of `SplitterVisibility` is `Collapsed`, `SplitterColor` value is `Gray` and `SplitterThickness` value is `0`.

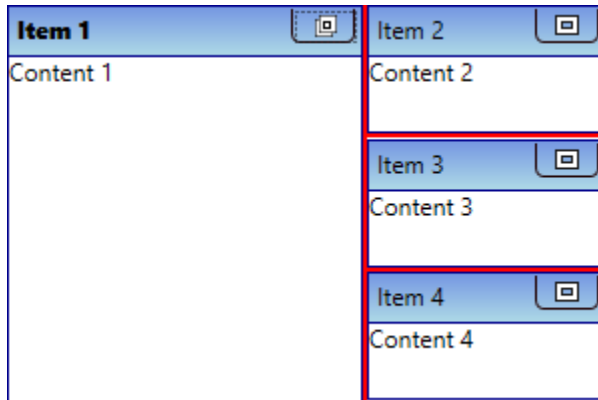

XML

```
<syncfusion:TileViewControl SplitterColor="Red"
  SplitterThickness="2"
  SplitterVisibility="Visible"
  Name="tileViewControl">
  <syncfusion:TileViewItem Content="Content 1" Header="Item 1" />
  <syncfusion:TileViewItem Content="Content 2" Header="Item 2" />
  <syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
  <syncfusion:TileViewItem Content="Content 4" Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.SplitterColor = Brushes.Red;
```

```
tileViewControl.SplitterThickness = 2;  
tileViewControl.SplitterVisibility = Visibility.Visible;
```

Note: [View Sample in GitHub](#)

Custom UI of TileViewItem header

You can customize the appearance of `TileViewItem` headers by using the [HeaderTemplate](#) property. The `DataContext` of the `HeaderTemplate` property is `TileViewItem.Header`.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">  
  <syncfusion:TileViewItem Header="Item 1" />  
  <syncfusion:TileViewItem Header="Item 2" />  
  <syncfusion:TileViewItem Header="Item 3" />  
  <syncfusion:TileViewItem Header="Item 4" />  
  <syncfusion:TileViewControl.HeaderTemplate>  
    <DataTemplate x:Name="headerTemplate">  
      <Grid>  
        <TextBlock HorizontalAlignment="Center"  
          Text="{Binding}"  
          FontFamily="Verdana"  
          Background="Yellow"  
          Foreground="Red" />  
      </Grid>  
    </DataTemplate>  
  </syncfusion:TileViewControl.HeaderTemplate>  
</syncfusion:TileViewControl>
```

Note: [View Sample in GitHub](#)

Custom UI of specific TileViewItem header

You can customize the appearance of specific `TileViewItem` headers by using the `TileViewItem.HeaderTemplate` property. The `DataContext` of the `TileViewItem.HeaderTemplate` property is `TileViewItem.Header`.

XML

```
<Window.Resources>
<DataTemplate x:Key="headerTemplate">
<Grid>
<TextBlock HorizontalAlignment="Center"
Text="{Binding}"
FontFamily="Verdana"
Background="Yellow"
Foreground="Red"/>
</Grid>
</DataTemplate>
</Window.Resources>
<Grid>
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem Header="Item 1"
HeaderTemplate="{StaticResource headerTemplate}" />
<syncfusion:TileViewItem Header="Item 2" />
<syncfusion:TileViewItem Header="Item 3" />
<syncfusion:TileViewItem Header="Item 4"
HeaderTemplate="{StaticResource headerTemplate}" />
</syncfusion:TileViewControl>
</Grid>
```

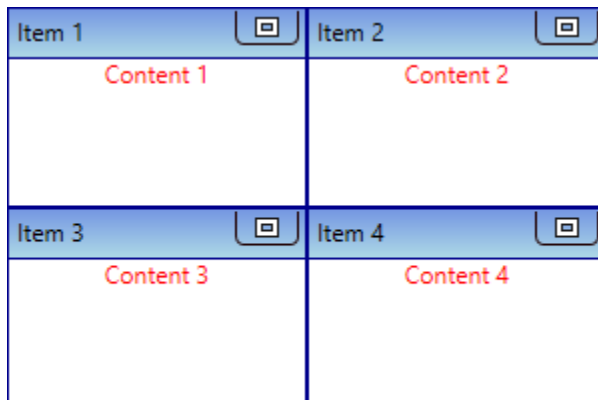

Note: [View Sample in GitHub](#)

Custom UI of TileViewItem content

You can customize the appearance of `TileViewItem` content by using the `ItemTemplate` property. The `DataContext` of the `ItemTemplate` property is `TileViewItem.Content`.

XML

```
<Window.Resources>
<DataTemplate x:Key="contentTemplate">
<Grid>
<TextBlock HorizontalAlignment="Center"
Text="{Binding}"
Foreground="Red"/>
</Grid>
</DataTemplate>
</Window.Resources>
<Grid>
<syncfusion:TileViewControl ItemTemplate="{StaticResource contentTemplate}"
Name="tileViewControl">
<syncfusion:TileViewItem Content="Content 1" Header="Item 1" />
<syncfusion:TileViewItem Content="Content 2" Header="Item 2" />
<syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
<syncfusion:TileViewItem Content="Content 4" Header="Item 4" />
</syncfusion:TileViewControl>
</Grid>
```

Note: [View Sample in GitHub](#)

Custom UI of specific TileViewItem content

You can customize the appearance of specific `TileViewItem` content by using the `TileViewItem.ContentTemplate` property. The `DataContext` of the `TileViewItem.ContentTemplate` property is `TileViewItem.Content`.

XML

```
<Window.Resources>
<DataTemplate x:Key="contentTemplate">
<Grid>
<TextBlock HorizontalAlignment="Center"
Text="{Binding}"
Foreground="Red"/>
</Grid>
</DataTemplate>
</Window.Resources>
<Grid>
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem ContentTemplate="{StaticResource contentTemplate}"
Content="Content 1" Header="Item 1" />
<syncfusion:TileViewItem Content="Content 2" Header="Item 2" />
<syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
<syncfusion:TileViewItem ContentTemplate="{StaticResource contentTemplate}"
Content="Content 4" Header="Item 4" />
</syncfusion:TileViewControl>
</Grid>
```

Item 1	Item 2
Content 1	Content 2
Item 3	Item 4
Content 3	Content 4

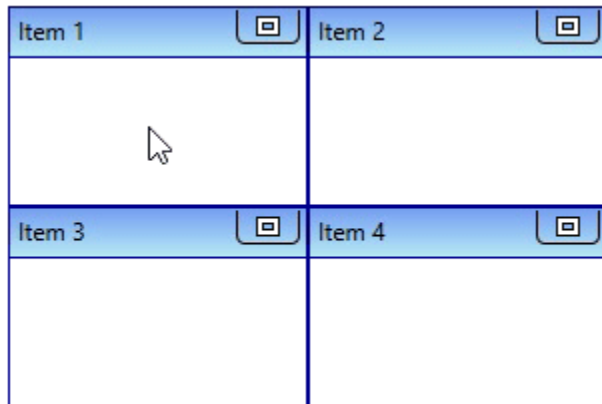

Note: [View Sample in GitHub](#)

Arrange TileViewItem in WPF Tile View

This section explains how to arrange and navigate to the `TileView` item and its alignment functionalities in the `TileViewControl`.

Rearrange position of TileViewItem

If you want to rearrange the `TileViewItem` position, drag that item and drop to anywhere you want to place it in the `TileViewControl`.

Note: [View Sample in GitHub](#)

Restrict rearranging of TileViewItem

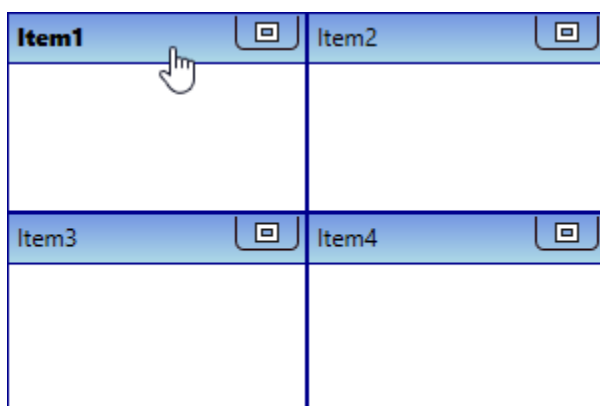

You can restrict the rearranging of `TileViewItem` by setting the `AllowItemRepositioning` property value as `false`. The default value of `AllowItemRepositioning` property is `true`.

XML

```
<syncfusion:TileViewControl AllowItemRepositioning="False"
Name="tileViewControl">
<syncfusion:TileViewItem Header="Item 1" />
<syncfusion:TileViewItem Header="Item 2" />
<syncfusion:TileViewItem Header="Item 3" />
<syncfusion:TileViewItem Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.AllowItemRepositioning = false;
```

Note: [View Sample in GitHub](#)

Arrange TileViewItem in rows and columns

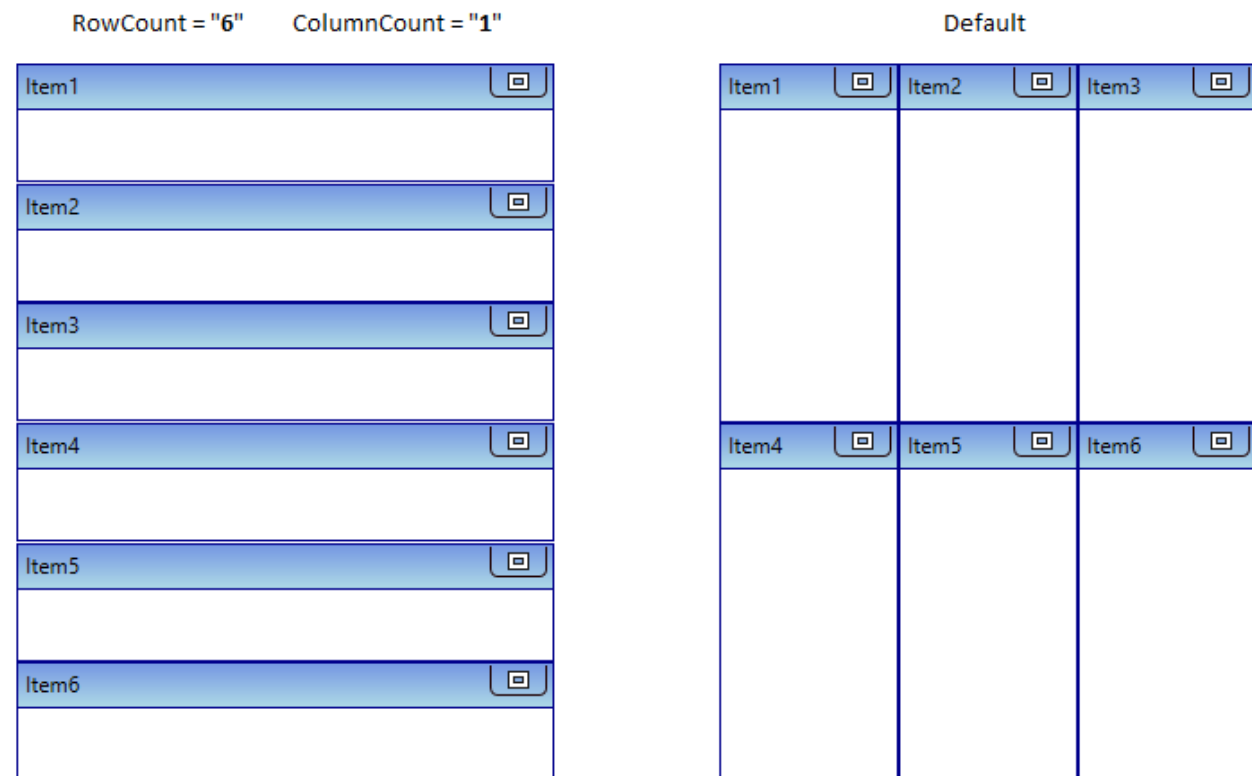

You can change the number of tileview items displayed in view by setting the value to `RowCount` and `ColumnCount` properties. The default value of `RowCount` and `ColumnCount` properties is `0`.

XML

```
<syncfusion:TileViewControl RowCount="6" ColumnCount="1"
Name="tileViewControl" >
<syncfusion:TileViewItem Header="Item1"/>
<syncfusion:TileViewItem Header="Item2"/>
<syncfusion:TileViewItem Header="Item3"/>
<syncfusion:TileViewItem Header="Item4"/>
<syncfusion:TileViewItem Header="Item5"/>
<syncfusion:TileViewItem Header="Item6"/>
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.RowCount = 6;
tileViewControl.ColumnCount = 1;
```

Note: [View Sample in GitHub](#)

Arrange TileViewItem in custom order

You can change the order in which the items are displayed in **TileView** control using the [CurrentItemsOrder](#) list property. By default, the value of **CurrentItemsOrder** property is **null**.

Note: **CurrentItemsOrder** property works only when Virtualization is disabled i.e., **IsVirtualizing** property value is **false**.

Note: **CurrentItemsOrder** list property should contain position of all the items in the **TileView** control i.e., the count of **CurrentItemsOrder** list should be same as the count of **TileView** items.

Note: The `CurrentItemsOrder` list property should not contain same position for more than one item.

XML

```
<Grid>
<Grid.DataContext>
<local:ViewModel />
</Grid.DataContext>
<syncfusion:TileViewControl Height="250" CurrentItemsOrder="{Binding
CustomItemOrders, Mode=TwoWay}"
Width="300">
<syncfusion:TileViewItem Header="Item 1"/>
<syncfusion:TileViewItem Header="Item 2"/>
<syncfusion:TileViewItem Header="Item 3"/>
<syncfusion:TileViewItem Header="Item 4"/>
<syncfusion:TileViewItem Header="Item 5"/>
<syncfusion:TileViewItem Header="Item 6"/>
</syncfusion:TileViewControl>
</Grid>
```

C#

```
public class ViewModel : NotificationObject
{
    private List<int> customItemOrders;
    public List<int> CustomItemOrders
    {
        get { return customItemOrders; }
        set
        {
            customItemOrders = value;
            this.RaisePropertyChanged(nameof(this.CustomItemOrders));
        }
    }
    public ViewModel()
    {
        CustomItemOrders = new List<int>();
        CustomItemOrders.Add(4);
        CustomItemOrders.Add(5);
        CustomItemOrders.Add(0);
        CustomItemOrders.Add(1);
        CustomItemOrders.Add(2);
        CustomItemOrders.Add(3);
    }
}
```

Change row and column size

By default, `TileViewItem` rows and columns size are allocated based on the control size and number of items in a control. You can change the row and column size of the `TileViewItem` by setting the value to `RowHeight` and `ColumnWidth` properties. The default value of `RowHeight` and `ColumnWidth` properties is `auto`.

XML

```
<syncfusion:TileViewControl RowHeight="100"
ColumnWidth="100"
Name="tileViewControl">
<syncfusion:TileViewItem Header="Item1"/>
<syncfusion:TileViewItem Header="Item2"/>
<syncfusion:TileViewItem Header="Item3"/>
<syncfusion:TileViewItem Header="Item4"/>
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.RowHeight = 100;
tileViewControl.ColumnWidth = 100;
```

RowHeight = "100" ColumnWidth = "100"

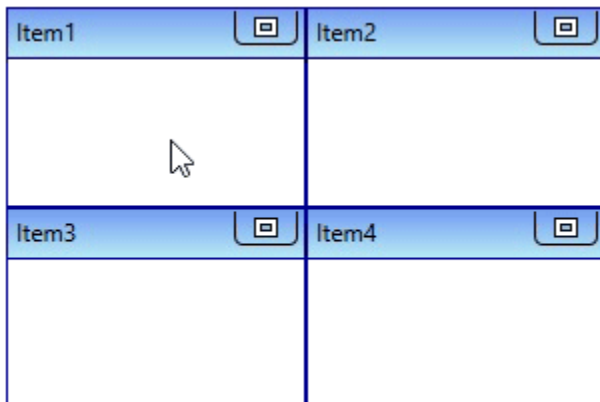

Default

Note: [View Sample in GitHub](#)

Navigate to TileViewItem

You can navigate from one `TileViewItem` to any other `TileViewItem` by using the mouse click on the specific `TileViewItem`.

Navigate to hidden items using scroll bar

If you add more items and set the row and column size to place the items that exceeds the control size, then some items are hidden from the view. You can easily navigate to the hidden items by using the scroll bar. You can enable the vertical and horizontal scroll bars by using the [HorizontalScrollBarVisibility](#) and [VerticalScrollBarVisibility](#) properties value as `auto` or `Visible`. The default value of `HorizontalScrollBarVisibility` and `VerticalScrollBarVisibility` properties is `Disabled`.

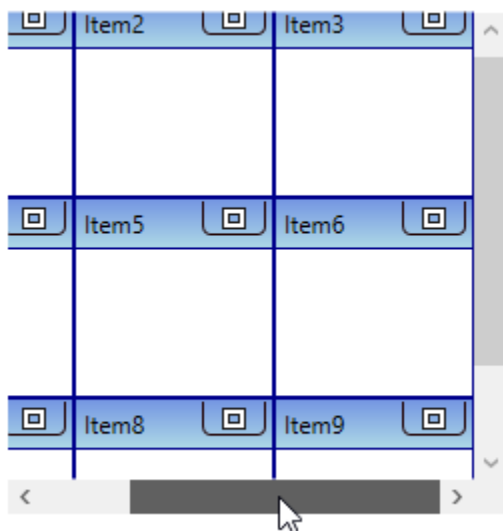

XML

```
<syncfusion:TileViewControl ColumnWidth="100"
RowHeight="100"
HorizontalScrollBarVisibility="Auto"
```

```
VerticalScrollBarVisibility="Auto"  
Name="tileViewControl">  
<syncfusion:TileViewItem Header="Item1"/>  
<syncfusion:TileViewItem Header="Item2"/>  
<syncfusion:TileViewItem Header="Item3" />  
<syncfusion:TileViewItem Header="Item4"/>  
<syncfusion:TileViewItem Header="Item5"/>  
<syncfusion:TileViewItem Header="Item6"/>  
<syncfusion:TileViewItem Header="Item7" />  
<syncfusion:TileViewItem Header="Item8"/>  
<syncfusion:TileViewItem Header="Item9"/>  
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.RowHeight = 100;  
tileViewControl.ColumnWidth = 100;  
tileViewControl.HorizontalScrollBarVisibility = Visibility.Auto;  
tileViewControl.VerticalScrollBarVisibility = Visibility.Auto;
```

Note: [View Sample in GitHub](#)

Change built-in animation duration

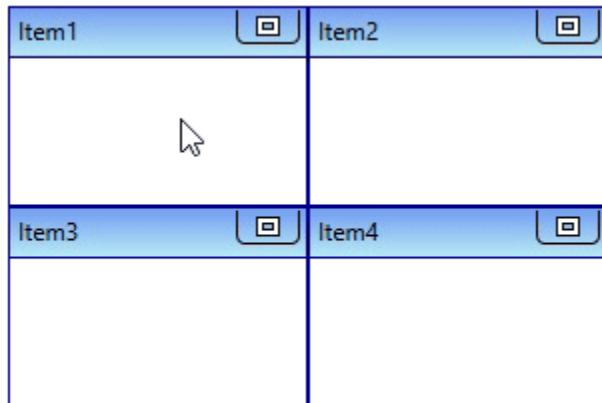

If you want to change the animation duration of navigation, use the [AnimationDuration](#) property. The default value of `AnimationDuration` property is `{00:00:00.7000000}`.

XML

```
<syncfusion:TileViewControl AnimationDuration="00:00:00.300"  
Name="tileViewControl">  
<syncfusion:TileViewItem Header="Item1"/>  
<syncfusion:TileViewItem Header="Item2"/>  
<syncfusion:TileViewItem Header="Item3" />  
<syncfusion:TileViewItem Header="Item4"/>  
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.AnimationDuration = new TimeSpan(0, 0, 0, 0, 300);
```

Note: [View Sample in GitHub](#)

Disable built-in navigation animation

By default, navigation of `TileViewItem` animation is enabled. If you want to disable the animation while navigation of `TileViewItem`, use the [EnableAnimation](#) property value as `false`.

XML

```
<syncfusion:TileViewControl EnableAnimation="False"
Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item1"/>
  <syncfusion:TileViewItem Header="Item2"/>
  <syncfusion:TileViewItem Header="Item3" />
  <syncfusion:TileViewItem Header="Item4"/>
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.EnableAnimation = false;
```

Note: [View Sample in GitHub](#)

Close TileViewItem in WPF Tile View

This section explains how to closing the [TileViewItem](#) and its functionalities in the [TileViewControl](#).

Show close button

By default, the close button is not displayed in the [TileViewItem](#). If you want to display the close button on specific [TileViewItem](#), use the [TileViewItem.CloseButtonVisibility](#) property value as [Visible](#). The default value of [TileViewItem.CloseButtonVisibility](#) property is [Collapsed](#).

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item 1"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 2"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 3"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 4"
    CloseButtonVisibility="Collapsed"/>
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
    CloseButtonVisibility= Visibility.Visible});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
    CloseButtonVisibility = Visibility.Visible });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
    CloseButtonVisibility = Visibility.Visible });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
    CloseButtonVisibility = Visibility.Collapsed });
```

Note: [View Sample in GitHub](#)

Closing TileViewItem

You can close the [TileViewItem](#) by clicking the close button which is placed top-right corner of the header panel.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item 1"
  CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 2"
  CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 3"
  CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 4"
  CloseButtonVisibility="Visible"/>
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
CloseButtonVisibility= Visibility.Visible});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
CloseButtonVisibility = Visibility.Visible });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
CloseButtonVisibility = Visibility.Visible });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
CloseButtonVisibility = Visibility.Visible });
```

Note: [View Sample in GitHub](#)

Closing TileViewItem programmatically

If you want to close the `TileViewItem` programmatically, pass that items into the [CloseTileViewItem\(\)](#) method.

XML

```
<Button Content="Close Item"
Click="CloseItem_Click"/>
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item 1" />
  <syncfusion:TileViewItem Header="Item 2" />
  <syncfusion:TileViewItem Header="Item 3" />
  <syncfusion:TileViewItem />
</syncfusion:TileViewControl>
```

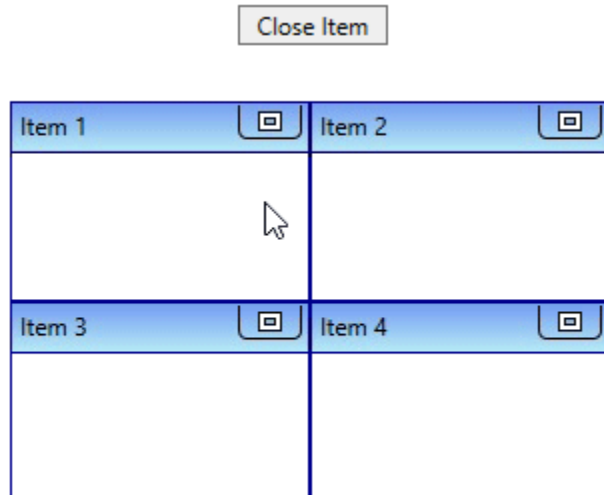

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3" });
tileViewControl.Items.Add(new TileViewItem());
Button button= new Button();
button.Click += CloseItem_Click
```

You can handle the CloseItem_Click event as follows:

C#

```
private void CloseItem_Click(object sender, RoutedEventArgs e) {
    //First item in the Items collection will be removed
    tileViewControl.CloseTileViewItem(tileViewControl.Items[0] as TileViewItem);
}
```

Hide or delete TileViewItem when closing a item

You can decide whether the `TileViewItem` can be only hidden from the view or removed from the items collection of `TileViewControl` by using the `CloseMode` property while closing it. If you set `CloseMode` property as `Hide`, the `TileViewItem` will be hidden and the selection will be moved to previous index while hiding it. Also, if the property `CloseMode` is `Delete`, the `TileViewItem` will be removed from the items collection and the selection will be retained in the same index while removing it. The default value of the `CloseMode` property is `Hide`.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item 1" CloseMode="Delete"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 2" CloseMode="Delete"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 3" CloseMode="Delete"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Header="Item 4" CloseMode="Delete"
```

```
CloseButtonVisibility="Visible"/>
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
CloseButtonVisibility= Visibility.Visible, CloseMode= CloseMode.Delete});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
CloseButtonVisibility = Visibility.Visible, CloseMode= CloseMode.Delete});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
CloseButtonVisibility = Visibility.Visible, CloseMode= CloseMode.Delete});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
CloseButtonVisibility = Visibility.Visible, CloseMode= CloseMode.Delete});
```

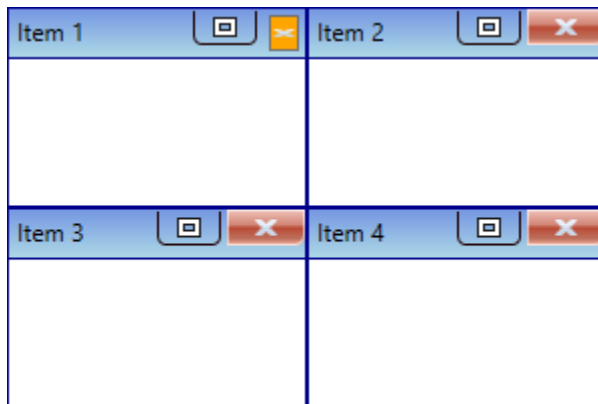

Note: [View Sample in GitHub](#)

Custom UI of close button

You can customize the appearance of particular `TileViewItem`'s close button by using the [CloseButtonStyle](#) property. You can also change the margin of the `TileViewItem` close button by using the [CloseButtonMargin](#) property. The `DataContext` of the `CloseButtonStyle` property is [TileViewItemCloseButton](#).

XML

```
<Window.Resources>
<Style x:Key="closeButtonStyle"
TargetType="syncfusion:TileViewItemCloseButton">
<Setter Property="Background" Value="Orange"/>
</Style>
</Window.Resources>
<Grid>
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem CloseButtonMargin="3"
CloseButtonStyle="{StaticResource closeButtonStyle}"
Header="Item 1" CloseButtonVisibility="Visible"/>
<syncfusion:TileViewItem Header="Item 2" CloseButtonVisibility="Visible"/>
<syncfusion:TileViewItem Header="Item 3" CloseButtonVisibility="Visible"/>
<syncfusion:TileViewItem Header="Item 4" CloseButtonVisibility="Visible"/>
</syncfusion:TileViewControl>
</Grid>
```

Note: [View Sample in GitHub](#)

TileViewItem closing notification

When the `TileViewItem` is closing, it will be notified by using the [TileViewItem.Closing](#) event. You can restrict the closing of `TileViewItem` by using the [CloseEventArgs.Cancel](#) property value as `true`.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Closing="TileViewItem_Closing"
    Header="Item 1"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Closing="TileViewItem_Closing"
    Header="Item 2"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Closing="TileViewItem_Closing"
    Header="Item 3"
    CloseButtonVisibility="Visible"/>
  <syncfusion:TileViewItem Closing="TileViewItem_Closing"
    Header="Item 4"
    CloseButtonVisibility="Visible"/>
</syncfusion:TileViewControl>
```

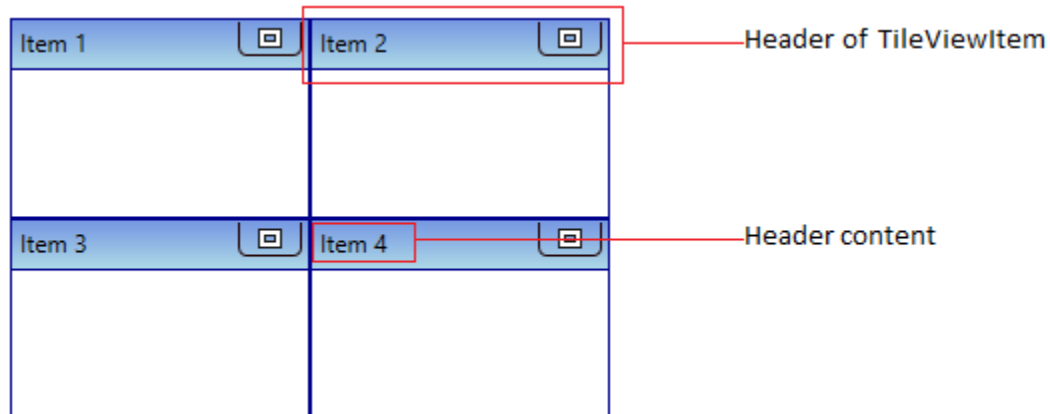

You can handle the event as follows:

C#

```
private void TileViewItem_Closing(object sender, TileViewItem.CloseEventArgs
args) {
    //Restrict closing
    args.Cancel = true;
}
```

TileViewItem Header in WPF Tile View

This section explains how to set header text and UI customization of the `TileViewItem` header in the [TileViewControl](#).

Setting TileViewItem header

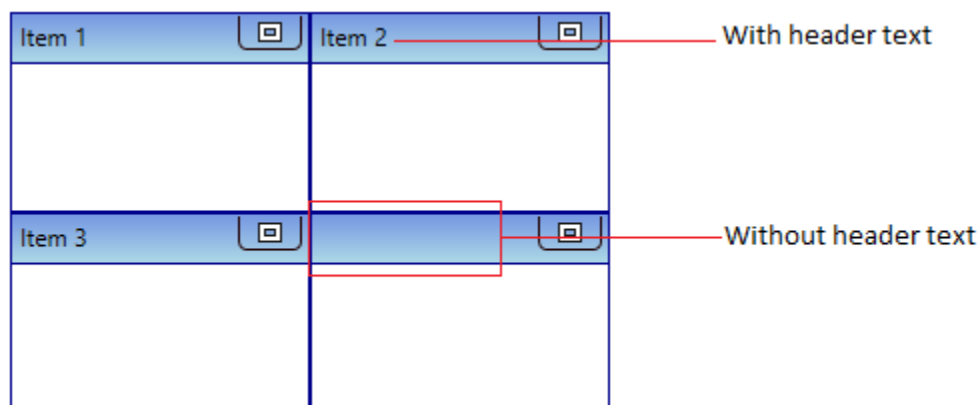

You can add a text for the each [TileViewItem](#) header by using the `TileViewItem.Header` property. The default value of `TileViewItem.Header` property is `null`.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item 1" />
  <syncfusion:TileViewItem Header="Item 2" />
  <syncfusion:TileViewItem Header="Item 3" />
  <syncfusion:TileViewItem />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3" });
tileViewControl.Items.Add(new TileViewItem());
```

Note: [View Sample in GitHub](#)

Change minimized and maximized header

By default, the `TileViewItem.Header` property value is displayed as `TileViewItem` header text. If you want to change the header text on minimized and maximized state, use the

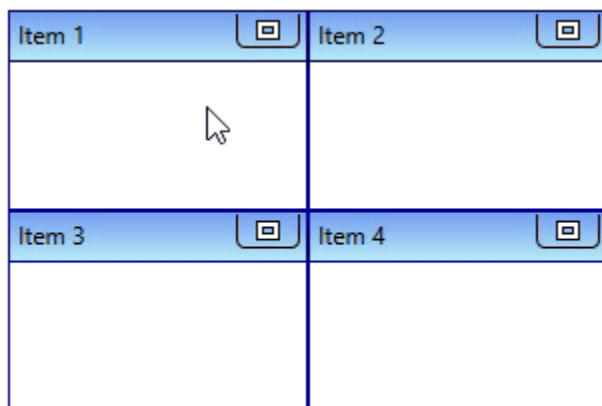

[TileViewItem.MinimizedHeader](#) and [TileViewItem.MaximizedHeader](#) properties. Based on the minimized and maximized state of the [TileViewItem](#), respective header text is displayed. The default value of [TileViewItem.MinimizedHeader](#) and [TileViewItem.MaximizedHeader](#) property is .

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item 1" MinimizedHeader="Min Item 1"
    MaximizedHeader="Max Item 1" />
  <syncfusion:TileViewItem Header="Item 2" MinimizedHeader="Min Item 2"
    MaximizedHeader="Max Item 2" />
  <syncfusion:TileViewItem Header="Item 3" MinimizedHeader="Min Item 3"
    MaximizedHeader="Max Item 3" />
  <syncfusion:TileViewItem Header="Item 4" MinimizedHeader="Min Item 4"
    MaximizedHeader="Max Item 4" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
    MinimizedHeader = "Min Item 1", MaximizedHeader = "Max Item 1"});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
    MinimizedHeader = "Min Item 2", MaximizedHeader = "Max Item 2"});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
    MinimizedHeader = "Min Item 3", MaximizedHeader = "Max Item 3"});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
    MinimizedHeader = "Min Item 4", MaximizedHeader = "Max Item 4"});
```

Note: [View Sample in GitHub](#)

Hide the [TileViewItem](#) header

If you want to hide the specific [TileViewItem](#)'s header panel, use the [TileViewItem.HeaderVisibility](#) property value as [Collapsed](#). The default value of [TileViewItem.HeaderVisibility](#) property is [Visible](#).

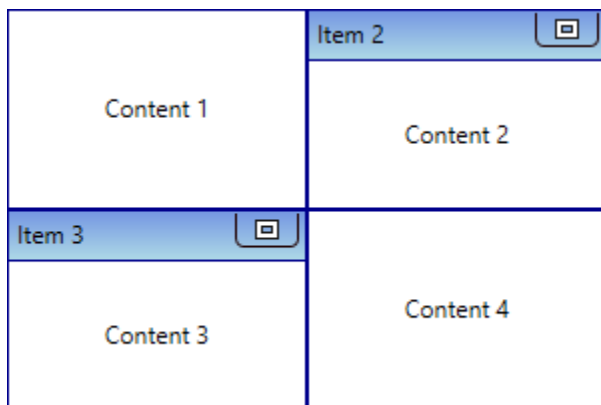

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Content="Content 1" Header="Item 1"
    HeaderVisibility="Collapsed"/>
  <syncfusion:TileViewItem Content="Content 2" Header="Item 2" />
</syncfusion:TileViewControl>
```

```
<syncfusion:TileViewItem Content="Content 3" Header="Item 3" />
<syncfusion:TileViewItem Content="Content 4" Header="Item 4"
HeaderVisibility="Collapsed"/>
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Content="Content 1",
Header = "Item 1", HeaderVisibility= Visibility.Collapsed });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 2",
Header = "Item 2", });
tileViewControl.Items.Add(new TileViewItem() { Content="Content 3",
Header = "Item 3" });
tileViewControl.Items.Add(new TileViewItem() { Content = "Content 4",
Header = "Item 4", HeaderVisibility = Visibility.Collapsed });
```

Note: [View Sample in GitHub](#)

Change TileViewItem header height

If you want to change height of the specific `TileViewItem`'s header panel, use the [TileViewItem.HeaderHeight](#) property. The default value of `TileViewItem.HeaderHeight` property is 25.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem Header="Item 1" HeaderHeight="50" />
<syncfusion:TileViewItem Header="Item 2" />
<syncfusion:TileViewItem Header="Item 3" />
<syncfusion:TileViewItem Header="Item 4" HeaderHeight="50" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
HeaderHeight = 50 });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
HeaderHeight = 50 });
```

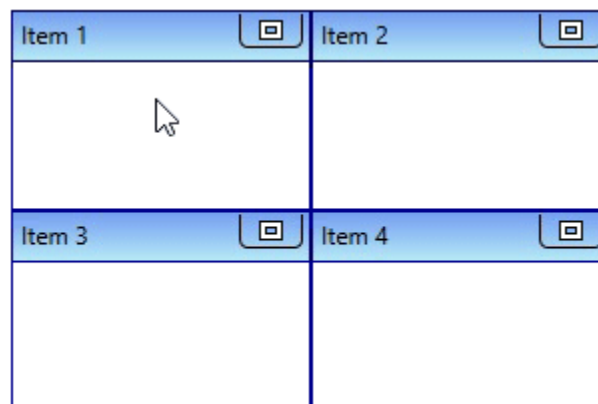

Note: [View Sample in GitHub](#)

Change TileViewItem header cursor

If you want to change specific `TileViewItem` header's mouse hover cursor, use the `TileViewItem.HeaderCursor` property. The default value of `TileViewItem.HeaderCursor` property is `Cursors.Hand`.

C#

```
TileViewControl tileViewControl = new TileViewControl();  
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",  
HeaderCursor = Cursors.UpArrow });  
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",  
HeaderCursor = Cursors.ArrowCD });  
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",  
HeaderCursor = Cursors.Cross });  
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",  
HeaderCursor = Cursors.Help });
```

Custom appearance of TileViewItem header

You can change the foreground, background and border appearance of the `TileViewItem` header.

Change foreground for TileViewItem header

You can change the foreground color of the each `TileViewItem` header separately by using the [TileViewItem.HeaderForeground](#) property. The default value of `TileViewItem.HeaderForeground` property is `Black`.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem HeaderForeground="Red" Header="Item1" />
<syncfusion:TileViewItem HeaderForeground="Blue" Header="Item2" />
<syncfusion:TileViewItem HeaderForeground="Green" Header="Item3" />
<syncfusion:TileViewItem HeaderForeground="Yellow" Header="Item4" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
HeaderForeground = Brushes.Red });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
HeaderForeground = Brushes.Blue});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
HeaderForeground = Brushes.Green });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
HeaderForeground = Brushes.Yellow });
```

Note: [View Sample in GitHub](#)

Change background for TileViewItem header

You can change the background color of the each `TileViewItem` header separately by using the [TileViewItem.HeaderBackground](#) property. The default value of `TileViewItem.HeaderBackground` property is `Cornflower Blue`.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem HeaderBackground="Red" Header="Item1"/>
<syncfusion:TileViewItem HeaderBackground="Blue" Header="Item2"/>
<syncfusion:TileViewItem HeaderBackground="Green" Header="Item3"/>
<syncfusion:TileViewItem HeaderBackground="Yellow" Header="Item4"/>
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
HeaderBackground = Brushes.Red });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
HeaderBackground = Brushes.Blue});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
HeaderBackground = Brushes.Green });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
HeaderBackground = Brushes.Yellow });
```

Note: [View Sample in GitHub](#)

Change border for TileViewItem header

You can change the border color of the each `TileViewItem` header separately by using the `TileViewItem.HeaderBorderBrush` property. You can also change the header border thickness by using the `TileViewItem.HeaderBorderThickness` property. The default value of `TileViewItem.HeaderBorderBrush` property is Dark Blue and `TileViewItem.HeaderBorderThickness` property is `{0,0,0,1}`.

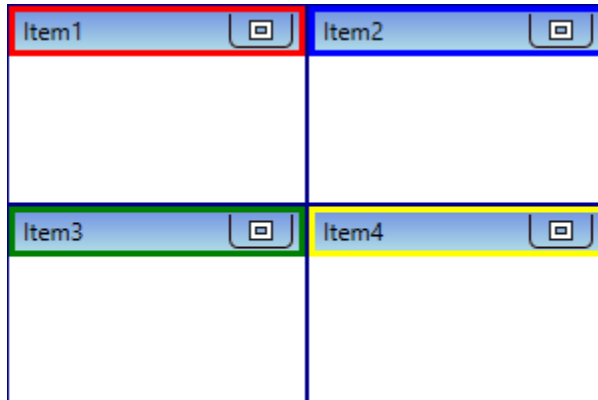

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem HeaderBorderThickness="3" Header="Item1"
HeaderBorderBrush="Red"/>
<syncfusion:TileViewItem HeaderBorderThickness="3" Header="Item2"
HeaderBorderBrush="Blue"/>
<syncfusion:TileViewItem HeaderBorderThickness="3" Header="Item3"
HeaderBorderBrush="Green"/>
<syncfusion:TileViewItem HeaderBorderThickness="3" Header="Item4"
HeaderBorderBrush="Yellow"/>
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
HeaderBorderBrush = Brushes.Red, HeaderBorderThickness= new Thickness(3) });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
```

```
HeaderBorderBrush = Brushes.Blue, HeaderBorderThickness= new Thickness(3));
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
HeaderBorderBrush = Brushes.Green, HeaderBorderThickness= new
Thickness(3)});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
HeaderBorderBrush = Brushes.Yellow, HeaderBorderThickness= new
Thickness(3)});
```

Note: [View Sample in GitHub](#)

Custom UI of TileViewItem header

You can customize the appearance of TileViewItem headers by using the [HeaderTemplate](#) property. The [DataContext](#) of the [HeaderTemplate](#) property is [TileViewItem.Header](#).

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item 1" />
  <syncfusion:TileViewItem Header="Item 2" />
  <syncfusion:TileViewItem Header="Item 3" />
  <syncfusion:TileViewItem Header="Item 4" />
  <syncfusion:TileViewControl.HeaderTemplate>
    <DataTemplate x:Name="headerTemplate">
      <Grid>
        <TextBlock HorizontalAlignment="Center"
          Text="{Binding}"
          FontFamily="Verdana"
          Background="Yellow"
          Foreground="Red" />
      </Grid>
    </DataTemplate>
  </syncfusion:TileViewControl.HeaderTemplate>
</syncfusion:TileViewControl>
```

Note: [View Sample in GitHub](#)

Custom UI of specific TileViewItem header

You can customize the appearance of specific `TileViewItem` headers by using the `TileViewItem.HeaderTemplate` property. The `DataContext` of the `TileViewItem.HeaderTemplate` property is `TileViewItem.Header`.

XML

```
<Window.Resources>
<DataTemplate x:Key="headerTemplate">
<Grid>
<TextBlock HorizontalAlignment="Center"
Text="{Binding}"
FontFamily="Verdana"
Background="Yellow"
Foreground="Red" />
</Grid>
</DataTemplate>
</Window.Resources>
<Grid>
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem Header="Item 1"
HeaderTemplate="{StaticResource headerTemplate}" />
<syncfusion:TileViewItem Header="Item 2" />
<syncfusion:TileViewItem Header="Item 3" />
<syncfusion:TileViewItem Header="Item 4"
HeaderTemplate="{StaticResource headerTemplate}" />
</syncfusion:TileViewControl>
</Grid>
```

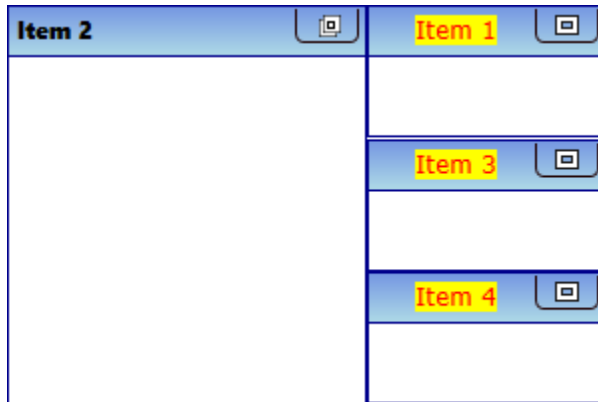

Note: [View Sample in GitHub](#)

Custom UI of minimized TileViewItem header

You can customize the appearance of minimized TileViewItem headers by using the [MinimizedHeaderTemplate](#) property. The `DataContext` of the `MinimizedHeaderTemplate` property is `TileViewItem.MinimizedHeader`.

XML

```
<Window.Resources>
<DataTemplate x:Key="minimizedHeaderTemplate">
<Grid>
<TextBlock HorizontalAlignment="Center"
Text="{Binding}"
FontFamily="Verdana"
Background="Yellow"
Foreground="Red"/>
</Grid>
</DataTemplate>
</Window.Resources>
<Grid>
<syncfusion:TileViewControl MinimizedHeaderTemplate="{StaticResource
minimizedHeaderTemplate}"
Name="tileViewControl">
<syncfusion:TileViewItem Header="Item 1" />
<syncfusion:TileViewItem Header="Item 2" />
<syncfusion:TileViewItem Header="Item 3" />
<syncfusion:TileViewItem Header="Item 4" />
</syncfusion:TileViewControl>
</Grid>
```

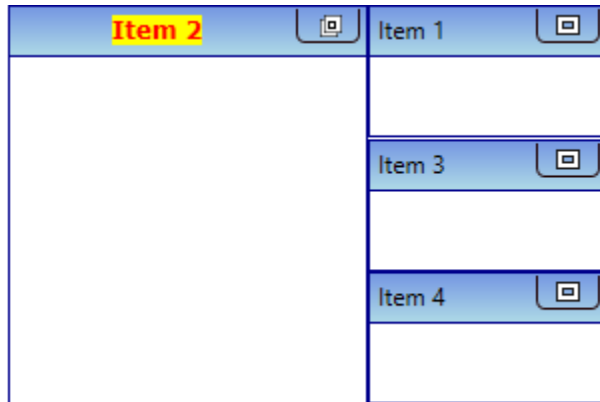

Note: [View Sample in GitHub](#)

Custom UI of maximized TileViewItem header

You can customize the appearance of maximized TileViewItem headers by using the [MaximizedHeaderTemplate](#) property. The `DataContext` of the `MaximizedHeaderTemplate` property is `TileViewItem.MaximizedHeader`.

XML

```
<Window.Resources>
<DataTemplate x:Key="maximizedHeaderTemplate">
<Grid>
<TextBlock HorizontalAlignment="Center"
Text="{Binding}"
FontFamily="Verdana"
Background="Yellow"
Foreground="Red"/>
</Grid>
</DataTemplate>
</Window.Resources>
<Grid>
<syncfusion:TileViewControl MaximizedHeaderTemplate="{StaticResource
maximizedHeaderTemplate}"
Name="tileViewControl">
<syncfusion:TileViewItem Header="Item 1" />
<syncfusion:TileViewItem Header="Item 2" />
<syncfusion:TileViewItem Header="Item 3" />
<syncfusion:TileViewItem Header="Item 4" />
</syncfusion:TileViewControl>
</Grid>
```

Note: [View Sample in GitHub](#)

Minimize TileViewItem in WPF Tile View

You can minimize the [TileViewItem](#) and change its appearance in the [TileViewControl](#).

Minimize the TileViewItem

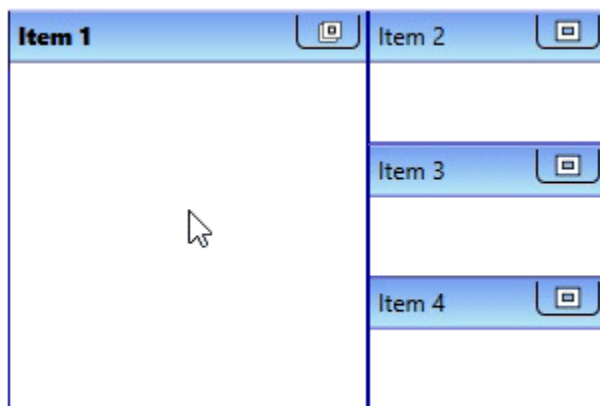

You can minimize the maximized [TileViewItem](#) by clicking on the minimize button.

XML

```
<syncfusion:TileViewControl Name="tileViewControl" >
  <syncfusion:TileViewItem Header="Item 1" />
  <syncfusion:TileViewItem Header="Item 2" />
  <syncfusion:TileViewItem Header="Item 3" />
  <syncfusion:TileViewItem Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4" });
```

Note: [View Sample in GitHub](#)

Direction for minimized items

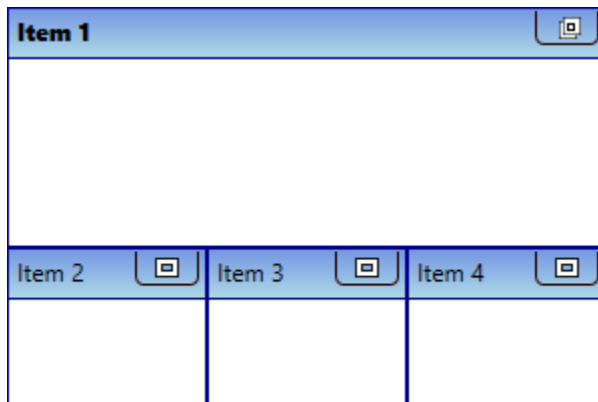

If you want to change direction of placing the minimized items, use the [MinimizedItemsOrientation](#) property. The default value of `MinimizedItemsOrientation` property is `Right`.

XML

```
<syncfusion:TileViewControl MinimizedItemsOrientation="Bottom"
Name="tileViewControl" >
<syncfusion:TileViewItem Header="Item 1" />
<syncfusion:TileViewItem Header="Item 2" />
<syncfusion:TileViewItem Header="Item 3" />
<syncfusion:TileViewItem Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.MinimizedItemsOrientation =
MinimizedItemsOrientation.Bottom;
```

Note: [View Sample in GitHub](#)

Allocate size for minimized TileViewItem

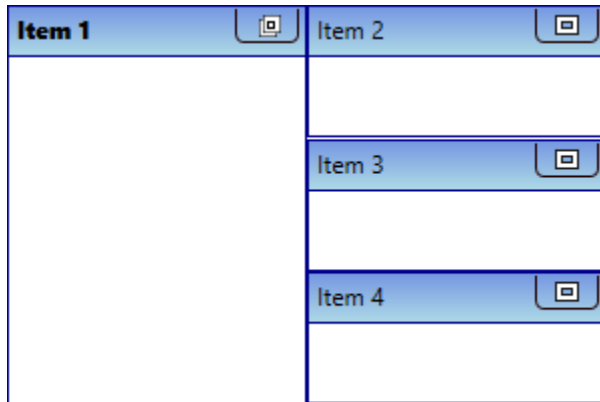

If you want to allocate a certain percentage of the total size to the minimized items, use the [MinimizedItemsPercentage](#) property. The default value of `MinimizedItemsPercentage` property is `20`.

XML

```
<syncfusion:TileViewControl MinimizedItemsPercentage="50"
Name="tileViewControl" >
<syncfusion:TileViewItem Header="Item 1" />
<syncfusion:TileViewItem Header="Item 2" />
<syncfusion:TileViewItem Header="Item 3" />
<syncfusion:TileViewItem Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.MinimizedItemsPercentage = 50;
```

Note: [View Sample in GitHub](#)

Change minimized TileViewItem content

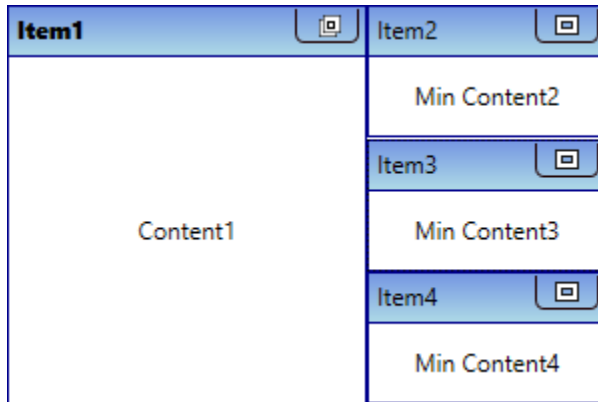

By default, `TileViewItem.Content` property values displayed as `TileViewItem` content on minimized state. If you want to change the content of the `TileViewItem` on minimized state, use the [MinimizedItemContent](#) property. The default value of `MinimizedItemContent` property is `null`.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item1" Content="Content1"
    MinimizedItemContent="Min Content1" />
  <syncfusion:TileViewItem Header="Item2" Content="Content2"
    MinimizedItemContent="Min Content2" />
  <syncfusion:TileViewItem Header="Item3" Content="Content3"
    MinimizedItemContent="Min Content3" />
  <syncfusion:TileViewItem Header="Item4" Content="Content4"
    MinimizedItemContent="Min Content4" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
  Content = "Content1", MinimizedItemContent = "Min Content1" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
  Content = "Content2", MinimizedItemContent = "Min Content2" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
  Content = "Content3", MinimizedItemContent = "Min Content3" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
  Content = "Content4", MinimizedItemContent = "Min Content4" });
```

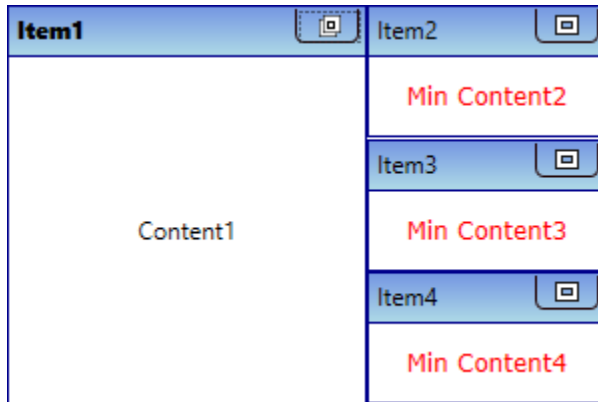

Note: [View Sample in GitHub](#)

Custom UI of minimized TileViewItem content

You can customize the appearance of minimized TileViewItem content by using the [MinimizedItemTemplate](#) property. The DataContext of the MinimizedItemTemplate property is TileViewItem.MinimizedItemContent.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item1" Content="Content1"
    MinimizedItemContent="Min Content1" />
  <syncfusion:TileViewItem Header="Item2" Content="Content2"
    MinimizedItemContent="Min Content2" />
  <syncfusion:TileViewItem Header="Item3" Content="Content3"
    MinimizedItemContent="Min Content3" />
  <syncfusion:TileViewItem Header="Item4" Content="Content4"
    MinimizedItemContent="Min Content4" />
  <syncfusion:TileViewControl.MinimizedItemTemplate>
    <DataTemplate x:Name="MinTemplate">
      <Grid>
        <TextBlock HorizontalAlignment="Center"
          Text="{Binding}"
          FontFamily="Verdana"
          Foreground="Red" />
      </Grid>
    </DataTemplate>
  </syncfusion:TileViewControl.MinimizedItemTemplate>
</syncfusion:TileViewControl>
```

Note: [View Sample in GitHub](#)

Change minimized TileViewItem header

If you want to change the header of the `TileViewItem` on minimized state, use the [MinimizedHeader](#) property. The default value of `MinimizedHeader` property is `null`.

Note: Please refer [Minimized TileViewItem header](#) topic to know more details about minimized `TileViewItem` header and its customization available in the `TileViewControl`.

Minimized state changed notification

The `TileViewControl` notifies that the minimized state changed in the `TileViewItem` by using [Minimized](#) event. You can get the minimized items by using the [Source](#) property. You can also use the [OldState](#) and [NewState](#) properties to get the old and new state of `TileViewItem`.

XML

```
<syncfusion:TileViewControl Minimized="TileViewControl_Minimized"
Name="tileViewControl" />
```

C#

```
tileViewControl.Minimized += TileViewControl_Minimized;
```

You can handle the event as follows:

C#

```
private void TileViewControl_Minimized(object sender, TileViewEventArgs
args) {
    var minimizedItem = args.Source;
    var oldState = args.OldState;
    var newState = args.NewState;
}
```

Maximize TileViewItem in WPF Tile View

You can maximize the [TileViewItem](#) and change its appearance in the [TileViewControl](#).

Maximize the TileViewItem

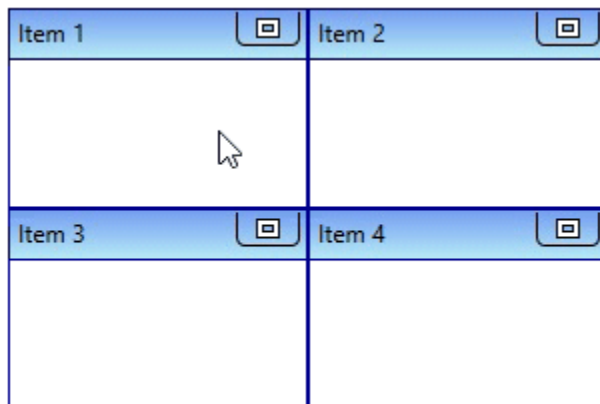

You can maximize the `TileViewItem` by clicking on the maximize button.

XML

```
<syncfusion:TileViewControl Name="tileViewControl" >
<syncfusion:TileViewItem Header="Item 1" />
<syncfusion:TileViewItem Header="Item 2" />
<syncfusion:TileViewItem Header="Item 3" />
<syncfusion:TileViewItem Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4" });
```

Note: [View Sample in GitHub](#)

Maximize on click the header

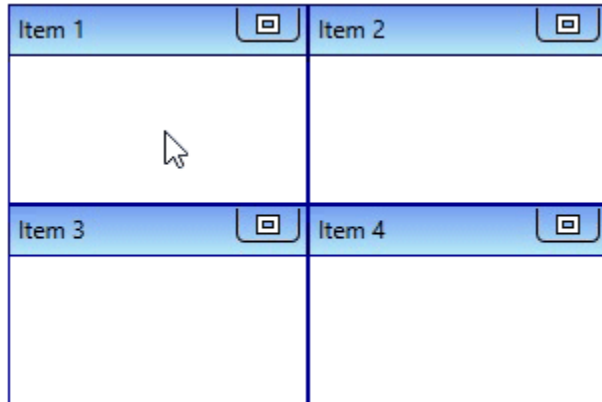

If you want to maximize the `TileViewItem` on clicking the header, use the [ClickHeaderToMaximize](#) property value as `true`. The default value of `ClickHeaderToMaximize` property is `false`.

XML

```
<syncfusion:TileViewControl ClickHeaderToMaximize="True"
Name="tileViewControl" >
<syncfusion:TileViewItem Header="Item 1" />
<syncfusion:TileViewItem Header="Item 2" />
<syncfusion:TileViewItem Header="Item 3" />
<syncfusion:TileViewItem Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.ClickHeaderToMaximize = true;
```

Note: [View Sample in GitHub](#)

Show maximize button only on mouse hover

If you want to show the maximize button only by mouse hover on the particular `TileViewItem`, use the `IsMinMaxButtonOnMouseOverOnly` property value as `true`. The default value of `IsMinMaxButtonOnMouseOverOnly` property is `false`.

XML

```
<syncfusion:TileViewControl IsMinMaxButtonOnMouseOverOnly="True"
Name="tileViewControl" >
<syncfusion:TileViewItem Header="Item 1" />
<syncfusion:TileViewItem Header="Item 2" />
<syncfusion:TileViewItem Header="Item 3" />
<syncfusion:TileViewItem Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.IsMinMaxButtonOnMouseOverOnly = true;
```

Note: [View Sample in GitHub](#)

Hide maximize button

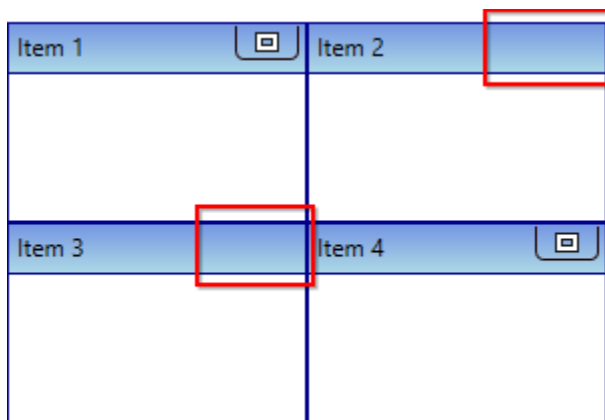

You can hide the maximize button for the specific `TileViewItem` by using the [TileViewItem.MinMaxButtonVisibility](#) property value as `Collapsed`. The default value of `TileViewItem.MinMaxButtonVisibility` property is `Visible`.

XML

```
<syncfusion:TileViewControl Name="tileViewControl" >
  <syncfusion:TileViewItem Header="Item 1" />
  <syncfusion:TileViewItem Header="Item 2"
  MinMaxButtonVisibility="Collapsed" />
  <syncfusion:TileViewItem Header="Item 3"
  MinMaxButtonVisibility="Collapsed"/>
  <syncfusion:TileViewItem Header="Item 4" />
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
MinMaxButtonVisibility= Visibility.Collapsed });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
MinMaxButtonVisibility = Visibility.Collapsed });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4" });
```

Note: [View Sample in GitHub](#)

Custom UI of the maximize button

You can customize the appearance of particular `TileViewItem`'s maximize button by using the [MinMaxButtonStyle](#) property. You can also change the margin of the `TileViewItem` maximize button by using the [MinMaxButtonMargin](#) property. The `DataContext` of the `MinMaxButtonStyle` property is [TileViewItemMinMaxButton](#).

XML

```
<Window.Resources>
  <Style x:Key="tileViewItemMinMaxButton"
  TargetType="syncfusion:TileViewItemMinMaxButton">
    <Setter Property="Background" Value="Red"/>
  </Style>
</Window.Resources>
```

```

<Setter Property="Width" Value="20"/>
<Setter Property="Height" Value="20"/>
<Setter Property="Content">
<Setter.Value>
<Border Background="Red">
<Image Source="/maximize.png" />
</Border>
</Setter.Value>
</Setter>
</Style>
</Window.Resources>
<Grid>
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem Header="Item 1"
MinMaxButtonMargin="2"
MinMaxButtonStyle="{StaticResource tileViewItemMinMaxButton}"/>
<syncfusion:TileViewItem Header="Item 2"/>
<syncfusion:TileViewItem Header="Item 3"/>
<syncfusion:TileViewItem Header="Item 4"/>
</syncfusion:TileViewControl>
</Grid>

```

Note: [View Sample in GitHub](#)

Change maximized TileViewItem content

By default, `TileViewItem.Content` property values displayed as `TileViewItem` content on maximized state. If you want to change the content of the `TileViewItem` on maximized state, use the [MaximizedItemContent](#) property. The default value of `MaximizedItemContent` property is `null`.

XML

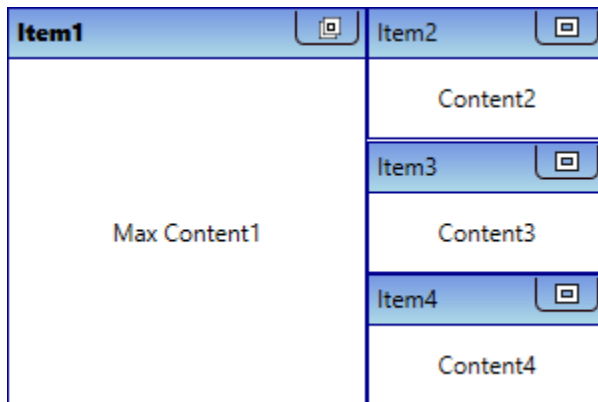

```

<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem Header="Item1" Content="Content1"
MaximizedItemContent="Max Content1" />
<syncfusion:TileViewItem Header="Item2" Content="Content2"
MaximizedItemContent="Max Content2" />
<syncfusion:TileViewItem Header="Item3" Content="Content3"
MaximizedItemContent="Max Content3" />
<syncfusion:TileViewItem Header="Item4" Content="Content4"
MaximizedItemContent="Max Content4" />
</syncfusion:TileViewControl>

```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
Content = "Content1", MaximizedItemContent = "Max Content1" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
Content = "Content2", MaximizedItemContent = "Max Content2" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
Content = "Content3", MaximizedItemContent = "Max Content3" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
Content = "Content4", MaximizedItemContent = "Max Content4" });
```

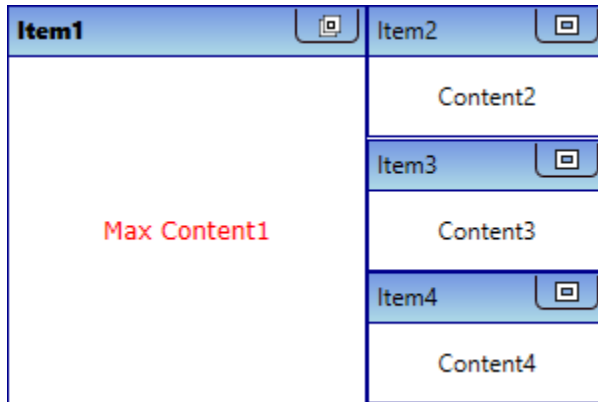

Note: [View Sample in GitHub](#)

Custom UI of maximized TileViewItem content

You can customize the appearance of maximized TileViewItem content by using the [MaximizedItemTemplate](#) property. The DataContext of the MaximizedItemTemplate property is TileViewItem.MaximizedItemContent.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Header="Item1" Content="Content1"
  MaximizedItemContent="Max Content1" />
  <syncfusion:TileViewItem Header="Item2" Content="Content2"
  MaximizedItemContent="Max Content2" />
  <syncfusion:TileViewItem Header="Item3" Content="Content3"
  MaximizedItemContent="Max Content3" />
  <syncfusion:TileViewItem Header="Item4" Content="Content4"
  MaximizedItemContent="Max Content4" />
  <syncfusion:TileViewControl.MaximizedItemTemplate>
    <DataTemplate x:Name="MaxTemplate">
      <Grid>
        <TextBlock HorizontalAlignment="Center"
        Text="{Binding}"
        FontFamily="Verdana"
        Foreground="Red"/>
      </Grid>
    </DataTemplate>
  </syncfusion:TileViewControl.MaximizedItemTemplate>
</syncfusion:TileViewControl>
```

Note: [View Sample in GitHub](#)

Change maximized TileViewItem header

If you want to change the header of the `TileViewItem` on maximized state, use the [MaximizedHeader](#) property. The default value of `MaximizedHeader` property is `null`.

Note: Please refer [Maximized TileViewItem header](#) topic to know more details about maximized `TileViewItem` header and its customization available in the `TileViewControl`.

Maximized state changed notification

The `TileViewControl` notifies that the maximized state changed in the `TileViewItem` by using [Maximized](#) event. You can get the maximized item by using the [Source](#) property. You can also use the [OldState](#) and [NewState](#) properties to get the old and new state of `TileViewItem`.

XML

```
<syncfusion:TileViewControl Maximized="TileViewControl_Maximized"
Name="tileViewControl" />
```

C#

```
tileViewControl.Maximized += TileViewControl_Maximized;
```

You can handle the event as follows:

C#

```
private void TileViewControl_Maximized(object sender, TileViewEventArgs
args) {
    var maximizedItem = args.Source;
    var oldState = args.OldState;
    var newState = args.NewState;
}
```

Appearance in WPF Tile View

This section explains different styling, theming options available in [TileViewControl](#) control.

Setting the foreground

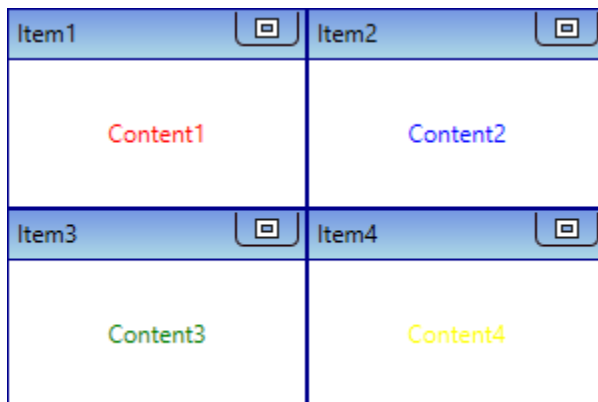

You can change the foreground color of the each `TileViewItem` separately by using the `TileViewItem.Foreground` property. The default value of `TileViewItem.Foreground` property is Black.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
  <syncfusion:TileViewItem Foreground="Red" Header="Item1"
  Content="Content1"/>
  <syncfusion:TileViewItem Foreground="Blue" Header="Item2"
  Content="Content2"/>
  <syncfusion:TileViewItem Foreground="Green" Header="Item3"
  Content="Content3"/>
  <syncfusion:TileViewItem Foreground="Yellow" Header="Item4"
  Content="Content4"/>
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
Content = "Content1", Foreground = Brushes.Red });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
Content = "Content2", Foreground = Brushes.Blue});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
Content = "Content3", Foreground = Brushes.Green });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
Content = "Content4", Foreground = Brushes.Yellow });
```

Note: [View Sample in GitHub](#)

Setting the background

You can change the background color of the each `TileViewItem` separately by using the `TileViewItem.Background` property. The default value of `TileViewItem.Background` property is White.

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
```

```
<syncfusion:TileViewItem Background="Red" Header="Item1"
Content="Content1"/>
<syncfusion:TileViewItem Background="Blue" Header="Item2"
Content="Content2"/>
<syncfusion:TileViewItem Background="Green" Header="Item3"
Content="Content3"/>
<syncfusion:TileViewItem Background="Yellow" Header="Item4"
Content="Content4"/>
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
Content = "Content1", Background = Brushes.Red });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
Content = "Content2", Background = Brushes.Blue});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
Content = "Content3", Background = Brushes.Green });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
Content = "Content4", Background = Brushes.Yellow });
```

Note: [View Sample in GitHub](#)

Setting the border

You can change the border color of the each `TileViewItem` separately by using the `TileViewItem.BorderBrush` property. You can also change the border thickness by using the `TileViewItem.BorderThickness` property. The default value of `TileViewItem.BorderBrush` property is Dark Blue and `TileViewItem.BorderThickness` property is 1.

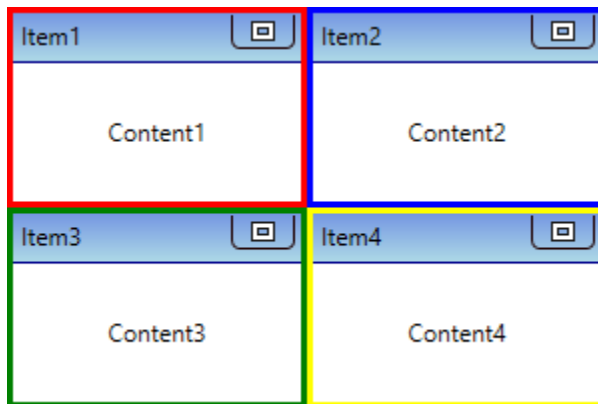

XML

```
<syncfusion:TileViewControl Name="tileViewControl">
<syncfusion:TileViewItem BorderThickness="3" BorderBrush="Red"
Header="Item1" Content="Content1"/>
<syncfusion:TileViewItem BorderThickness="3" BorderBrush="Blue"
Header="Item2" Content="Content2"/>
<syncfusion:TileViewItem BorderThickness="3" BorderBrush="Green"
Header="Item3" Content="Content3"/>
<syncfusion:TileViewItem BorderThickness="3" BorderBrush="Yellow"
Header="Item4" Content="Content4"/>
```

```
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1", Content =
"Content1",
BorderBrush = Brushes.Red, BorderThickness= new Thickness(3)});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2", Content =
"Content2",
BorderBrush = Brushes.Blue, BorderThickness= new Thickness(3)});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3", Content =
"Content3",
BorderBrush = Brushes.Green, BorderThickness= new Thickness(3)});
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4", Content =
"Content4",
BorderBrush = Brushes.Yellow, BorderThickness= new Thickness(3)});
```

Note: [View Sample in GitHub](#)

Change flow direction

You can change the flow direction of the `TileViewControl` layout from right to left by setting the `TileViewControl.FlowDirection` property value as `RightToLeft`. The default value of `TileViewControl.FlowDirection` property is `LeftToRight`.

XML

```
<syncfusion:TileViewControl FlowDirection="RightToLeft"
Name="tileViewControl" >
<syncfusion:TileViewItem Header="Item1" Content="Content1"/>
<syncfusion:TileViewItem Header="Item2" Content="Content2"/>
<syncfusion:TileViewItem Header="Item3" Content="Content3"/>
<syncfusion:TileViewItem Header="Item4" Content="Content4"/>
</syncfusion:TileViewControl>
```

C#

```
tileViewControl.FlowDirection = FlowDirection.RightToLeft;
```

 Item2	 Item1
Content2	Content1
 Item4	 Item3
Content4	Content3

Note: [View Sample in GitHub](#)

Change flow direction for specific TileViewItem

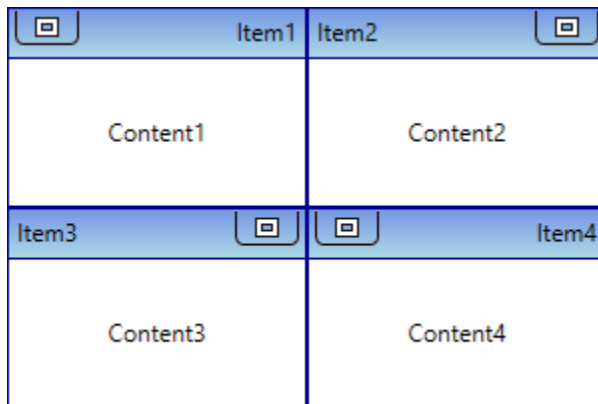

You can change the flow direction of the specific `TileViewItem` layout from right to left by setting the `TileViewItem.FlowDirection` property value as `RightToLeft`. The default value of `TileViewItem.FlowDirection` property is `LeftToRight`.

XML

```
<syncfusion:TileViewControl Name="tileViewControl" />
<syncfusion:TileViewItem FlowDirection="RightToLeft" Header="Item1"
Content="Content1"/>
<syncfusion:TileViewItem Header="Item2" Content="Content2"/>
<syncfusion:TileViewItem Header="Item3" Content="Content3"/>
<syncfusion:TileViewItem FlowDirection="RightToLeft" Header="Item4"
Content="Content4"/>
</syncfusion:TileViewControl>
```

C#

```
TileViewControl tileViewControl = new TileViewControl();
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 1",
Content = "Content1", FlowDirection = FlowDirection.RightToLeft });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 2",
Content = "Content2" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 3",
Content = "Content3" });
tileViewControl.Items.Add(new TileViewItem() { Header = "Item 4",
Content = "Content4", FlowDirection = FlowDirection.RightToLeft });
```

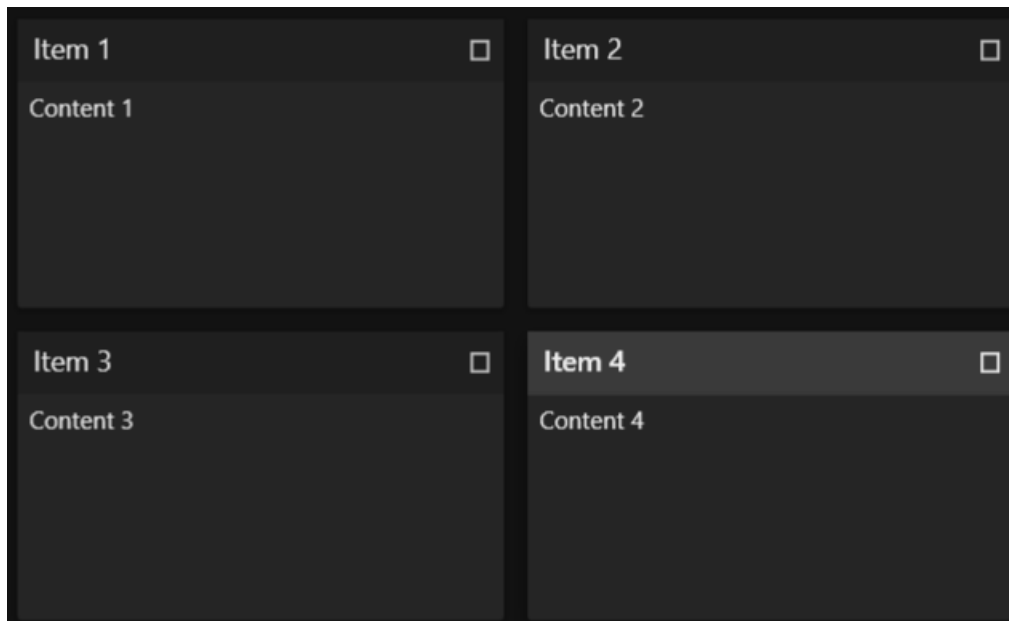

Note: [View Sample in GitHub](#)

Theme

TileViewControl supports various built-in themes. Refer to the below links to apply themes for the TileViewControl,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

SfTimePicker

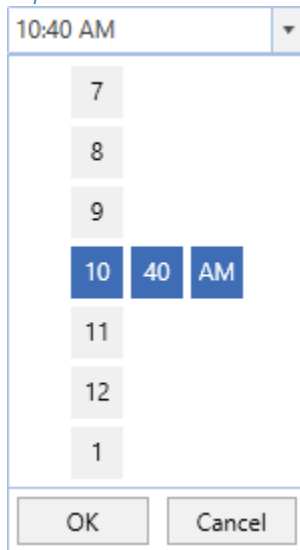

WPF TimePicker (SfTimePicker) Overview

The [SfTimePicker](#) control allows the user to select time values in a touch friendly manner.

Normal view:

Expanded view:

Key Features

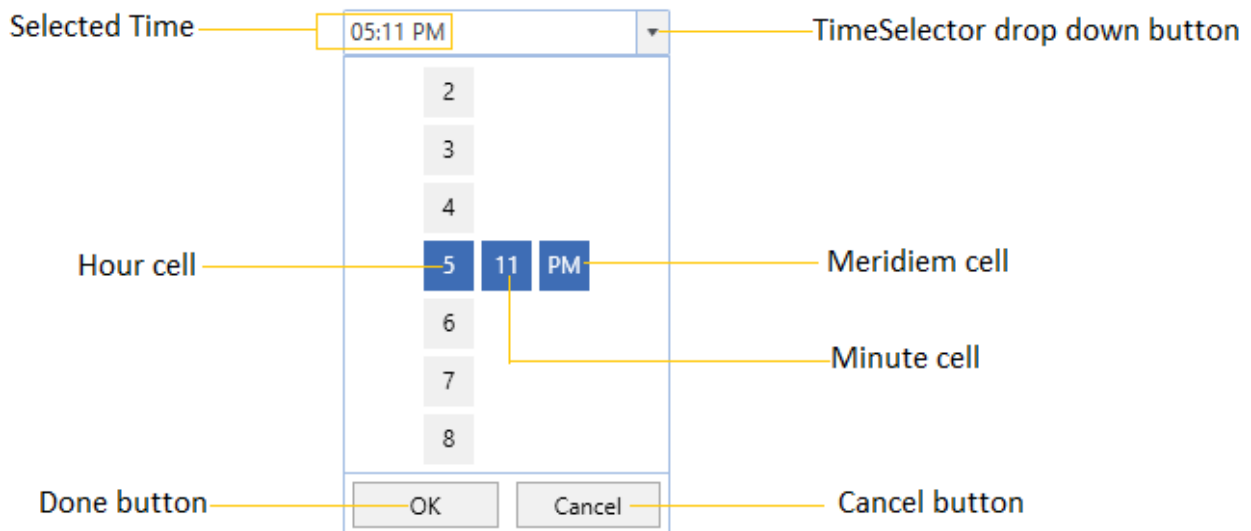

Formatting – The Control displays the selected time value in a various formats.

Time Selector – The drop-down portion used for selecting the time can be customized.

Getting Started with WPF TimePicker (SfTimePicker)

This section explains how to create a [WPF TimePicker](#) (SfTimePicker) and explains about its structure.

Structure of SfTimePicker

Assembly deployment

Refer to the [control dependencies](#) section to get the list of assemblies or NuGet package that needs to be added as a reference to use the control in any application.

You can find more details about installing the NuGet package in a WPF application in the following link:

[How to install nuget packages](#)

Add control through designer

The [WPF TimePicker](#) (SfTimePicker) control can be added to an application by dragging it from the toolbox to a designer view. The following required assembly references will be added automatically:

- Syncfusion.SfInput.WPF
- Syncfusion.SfShared.WPF

Adding control manually in XAML

To add the control manually in XAML, follow the given steps:

1. Add the following required assembly references to the project: *Syncfusion.SfInput.WPF* and *Syncfusion.SfShared.WPF*
2. Import Syncfusion WPF schema <http://schemas.syncfusion.com/wpf> in the XAML page.
3. Declare the **SfTimePicker** control in the XAML page.

XML

```
<Window xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="SfTimePickerSample.MainWindow"
Title="SfTimePicker Sample" Height="350" Width="525">
<Grid>
<!-- Adding SfTimePicker control -->
<syncfusion:SfTimePicker x:Name="sfTimePicker"
Width="200"/>
</Grid>
</Window>
```

Add control manually in C\#

To add the control manually in C#, follow the given steps:

1. Add the following required assembly references to the project: *Syncfusion.SfInput.WPF* and *Syncfusion.SfShared.WPF*
2. Import the **SfTimePicker** namespace using **Syncfusion.Windows.Controls.Input**;
3. Create an **SfTimePicker** instance, and add it to the window.

C#

```
using Syncfusion.Windows.Controls.Input;
namespace SfTimePickerSample {
public partial class MainWindow : Window {
public MainWindow() {
InitializeComponent();
//Creating an instance of SfTimePicker control
SfTimePicker sfTimePicker = new SfTimePicker();
//Adding SfTimePicker as window content
this.Content = sfTimePicker;
}
}
}
```

**Setting the time**

We can set or change the selected time by using [Value](#) property. If we not assign any value for the [Value](#) property, it will automatically assign the current system time as [Value](#) property value.

XML

```
<syncfusion:SfTimePicker Value="04:45:00"
Name="sfTimePicker" />
```

C#

```
SfTimePicker sfTimePicker= new SfTimePicker();
sfTimePicker.Value = new TimeSpan(04, 45, 00);
```

**Time changed notification**

When the selected time of [SfTimePicker](#) is changed, it will be notified by using the [ValueChanged](#) event. You can get the details about the checked item in [ItemCheckedEventArgs](#).

- **OldValue** : Gets a time which is previously selected.
- **newValue** : Gets a time which is currently selected.

XML

```
<syncfusion:SfTimePicker ValueChanged="SftimePicker_ValueChanged"
Name="sfTimePicker"/>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();
sfTimePicker.ValueChanged += SftimePicker_ValueChanged;
```

You can handle the event as follows:

C#

```
private void SftimePicker_ValueChanged(DependencyObject d,
DependencyPropertyChangedEventArgs e) {
Console.WriteLine("The Old selected time: " + e.OldValue.ToString());
Console.WriteLine("The Newly selected time: " + e.NewValue.ToString());
}
```

Display the time using the `FormatString`

We can edit and display the selected time with various formatting like short time, long time, universal time and 24 hour time formats by using the `FormatString` property. The default value of `FormatString` property is "h:mm tt".

XML

```
<syncfusion:SfTimePicker x:Name="sfTimePicker"
FormatString="HH:mm:ss"/>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();
sfTimePicker.FormatString = "HH:mm:ss";
```

Here, `SfTimePicker` with 24 hour time format

Specifying format for the `TimeSelector`

We can allow the user to select the pair of hour, minutes, seconds and meridiem selector or any single selector cell from the `SfTimeSelector` by using the `SelectorFormatString` property. The default value of `SelectorFormatString` property is "h:mm tt" and the hour, minutes and meridiem value selector is enabled in the `SfTimeSelector`.

XML

```
<syncfusion:SfTimePicker x:Name="sfTimePicker"
SelectorFormatString="h/t"/>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();  
sfTimePicker.SelectorFormatString = "h/t";
```

Here, the **SfTimeSelector** with only hour and meridiem value selector.

Click [here](#) to download the sample that showcases the edit, display time formatting and time selection formatting by the **SfTimePicker**.

Set selected value on lost focus

If we want to update the selected time of **SfTimeSelector** to the **SfTimeSelector.Value** property by moving the focus from **SfTimeSelector** to anywhere, use the [SetValueOnLostFocus](#) property value as **true**. By default, the selected time of **SfTimeSelector** can be sets to the **SfTimeSelector.Value** property only by clicking the **OK** button, otherwise the selected value not updated by the move focus.

XML

```
<syncfusion:SfTimePicker SetValueOnLostFocus="True"  
Name="sfTimePicker" />
```

C#

```
SfTimePicker sfTimePicker= new SfTimePicker();  
sfTimePicker.SetValueOnLostFocus = true;
```

Click [here](#) to download the sample that showcases the value setting support in the SfTimePicker.

Localization support

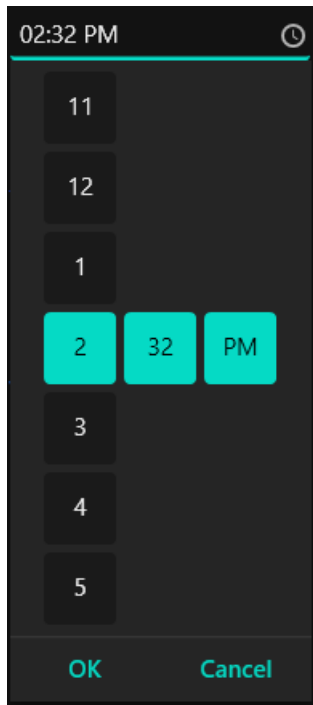

Localization is the process of translating the application resources into different language for the specific cultures. You can localize the **Ok** and **Cancel** button text in SfTimePicker control by adding resource file for each language.

Note: Refer [Localization](#) page to know more about how to provide a localization support for the SfTimePicker.

Theme

WPF TimePicker (SfTimePicker) supports various built-in themes. Refer to the below links to apply themes for the SfTimePicker,

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

Note: [View sample in GitHub.](#)

Setting Time in WPF TimePicker (SfTimePicker)

We can change the value of [SfTimePicker](#) by using the [SfTimeSelector](#) and keyboard interaction.

Setting Time using property

We can set or change the selected time by using [Value](#) property. If we not assign any value for the [Value](#) property, it will automatically assign the current system time as [Value](#) property value.

XML

```
<syncfusion:SfTimePicker Value="04:45:00"
Name="sfTimePicker" />
```

C#

```
SfTimePicker sfTimePicker= new SfTimePicker();
sfTimePicker.Value = new TimeSpan(04, 45, 00);
```

Setting Null Value

If we want to set null value for the [SfTimePicker](#), set the [AllowNull](#) property as [true](#) and [Value](#) property as [null](#). If [AllowNull](#) property is [false](#), then the current system time is updated in [Value](#) property and displayed instead of [null](#).

XML

```
<syncfusion:SfTimePicker AllowNull="True"
Value="{x:Null}"
Name="sfTimePicker" />
```

C#

```
SfTimePicker sfTimePicker= new SfTimePicker();
sfTimePicker.AllowNull = true;
sfTimePicker.Value = null;
```

**Setting WaterMark text**

We can prompt the user with some information by using the [Watermark](#) property. This will apply on when the SfTimePicker contains the [Value](#) property as `null` and [AllowNull](#) property as `true`. If [AllowNull](#) property is `false`, then the current system time is updated in [Value](#) property and displayed instead of [Watermark](#) text.

XML

```
<syncfusion:SfTimePicker Watermark="Select the Time"
AllowNull="True"
Value="{x:Null}"
Name="sfTimePicker" >
</syncfusion:SfTimePicker>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();
sfTimePicker.Watermark = "Select the Time";
sfTimePicker.AllowNull = true;
sfTimePicker.Value = null;
```

**Setting WaterMark Template**

We can change the template of the [Watermark](#) by using the [WatermarkTemplate](#) property.

XML

```
<syncfusion:SfTimePicker Name="sfTimePicker"
AllowNull="True"
Value="{x:Null}"
Watermark="Select the Time" >
<syncfusion:SfTimePicker.WatermarkTemplate >
<DataTemplate>
<Border Background="Yellow">
<TextBlock Foreground="Blue"
FontWeight="Bold"
Text="{Binding}"
TextAlignment="Center"/>
</Border>
</DataTemplate>
</syncfusion:SfTimePicker.WatermarkTemplate>
</syncfusion:SfTimePicker>
```

Set selected value on lost focus

If we want to update the selected time of `SfTimeSelector` to the `SfTimeSelector.Value` property by moving the focus from `SfTimeSelector` to anywhere, use the [SetValueOnLostFocus](#) property value as `true`. By default, the selected time of `SfTimeSelector` can be sets to the `SfTimeSelector.Value` property only by clicking the `OK` button, otherwise the selected value not updated by the move focus.

XML

```
<syncfusion:SfTimePicker SetValueOnLostFocus="True"
Name="sfTimePicker" />
```

C#

```
SfTimePicker sfTimePicker= new SfTimePicker();
sfTimePicker.SetValueOnLostFocus = true;
```

Setting the time using editing

If we want to perform the validation after the user completely entering their time inputs, use the [AllowInlineEditing](#) property value as `true`. Then the entered time value is validated with the [FormatString](#) property value by pressing the `Enter` key or lost focus. If entered value is not suit with `FormatString` property, the selected time will be set as default format value.

By default, the user entering each input numbers are automatically validated with the `FormatString` formats and assigned the proper value for it, then it will move to next input part of the time format.

XML

```
<syncfusion:SfTimePicker Name="sfTimePicker"
AllowInlineEditing="True" />
```

C#

```
SfTimePicker sfTimePicker= new SfDatePicker();
sfTimePicker.AllowInlineEditing = true;
```

Selected Time : 2:16:04 PM

02:16 PM ▾

Setting the Input Scope for the On-Screen Keyboard

We can change the input type of the on-screen keyboard by using the [InputScope](#) property. When the [InputScope](#) property set to [Number](#), only the numeric keypad will be visible in the on-screen keyboard.

Note: The [AllowInlineEditing](#) property must be set to [True](#) for this property to take effect.

XML

```
<syncfusion:SfTimePicker Name="sfTimePicker"
AllowInlineEditing="True"
InputScope="Time"/>
```

C#

```
SfTimePicker sfTimePicker= new SfTimePicker();
sfTimePicker.AllowInlineEditing = true;
sfTimePicker.InputScope = InputScopeNameValue.Time;
```

07:24 PM ▾

Restrict selecting time limit

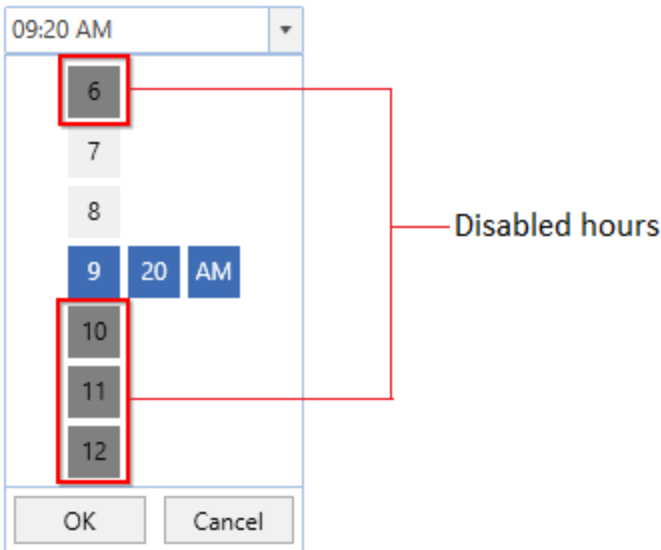

we can restrict the user to select a time in the specific time limit by setting the value for the [MinTime](#) and [MaxTime](#) properties. If we assign the value for the [Value](#) property lower than [MinTime](#), then [MinTime](#) will be the selected time. If we assign the value for the [Value](#) property higher than [MaxTime](#), then [MaxTime](#) will be the selected time.

XML

```
<syncfusion:SfTimePicker MinTime="07:00:00"
MaxTime="09:00:00"
Name="sfTimePicker"/>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();
sfTimePicker.MinTime = new TimeSpan(07, 00, 00);
sfTimePicker.MaxTime = new TimeSpan(09, 00, 00);
```

Here, the users can select the hour from 7 to 9 only.

Time changed notification

When the selected time of `SfTimePicker` is changed, it will be notified by using the [ValueChanged](#) event. You can get the details about the checked item in [ItemCheckedEventArgs](#).

- **OldValue** : Gets a time which is previously selected.
- **NewValue** : Gets a time which is currently selected.

XML

```
<syncfusion:SfTimePicker ValueChanged="SftimePicker_ValueChanged"
Name="sfTimePicker"/>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();
sfTimePicker.ValueChanged += SftimePicker_ValueChanged;
```

You can handle the event as follows:

C#

```
private void SftimePicker_ValueChanged(DependencyObject d,
DependencyPropertyChangedEventArgs e) {
    Console.WriteLine("The Old selected time: " + e.OldValue.ToString());
    Console.WriteLine("The Newly selected time: " + e.NewValue.ToString());
}
```

Click [here](#) to download the sample that showcases the input types and selected time with its notification supports.

Time Formatting in WPF TimePicker (SfTimePicker)

The [SfTimePicker](#) control allows the user to select and display the time in various formats.

Display the time using the `FormatString`

We can edit and display the selected time with various formatting like short time, long time, universal time and 24 hour time formats by using the `FormatString` property. The default value of `FormatString` property is "h:mm tt".

XML

```
<syncfusion:SfTimePicker x:Name="sfTimePicker"
FormatString="HH:mm:ss"/>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();
sfTimePicker.FormatString = "HH:mm:ss";
```

Here, `SfTimePicker` with 24 hour time format

Specifying format for the `TimeSelector`

We can allow the user to select the pair of hour, minutes, seconds and meridiem selector or any single selector cell from the `SfTimeSelector` by using the `SelectorFormatString` property. The default value of `SelectorFormatString` property is "h:mm tt" and the hour, minutes and meridiem value selector is enabled in the `SfTimeSelector`.

XML

```
<syncfusion:SfTimePicker x:Name="sfTimePicker"
SelectorFormatString="M"/>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();
sfTimePicker.SelectorFormatString = "M";
```

Here, we can only able to select the hour and meridiem value from the **SfTimeSelector**

Click [here](#) to download the sample that showcases the edit, display time formatting and time selection formatting by the **SfTimePicker**.

Note: A detailed explanation of standard time formatting is available [here](#). The result string produced by these format specifiers are influenced by the settings in the Regional Options control panel. Computers with different cultures or different time and time settings will generate different result strings.

Customizing DropDown in WPF TimePicker (SfTimePicker)

We can customize the **SfTimeSelector** visibility, drop down button visibility and height of the **SfTimeSelector**.

Change DropDown height

The height of drop down can be changed using **DropDownHeight** property.

XML

```
<syncfusion:SfTimePicker DropDownHeight="300"
Name="sfTimePicker"/>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();
sfTimePicker.DropDownHeight = 300;
```

Show or hide DropDown button

If we want to restrict the user to selecting a time from a drop down time selector, we can hide the drop down button by using the **ShowDropDownButton** property value as **false**. The default value of **ShowDropDownButton** property is **true**.

XML

```
<syncfusion:SfTimePicker ShowDropDownButton="False"
Name="sfTimePicker"/>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();
sfTimePicker.ShowDropDownButton = false;
```

ShowDropDownButton = "false"

04:08 PM

ShowDropDownButton = "true"

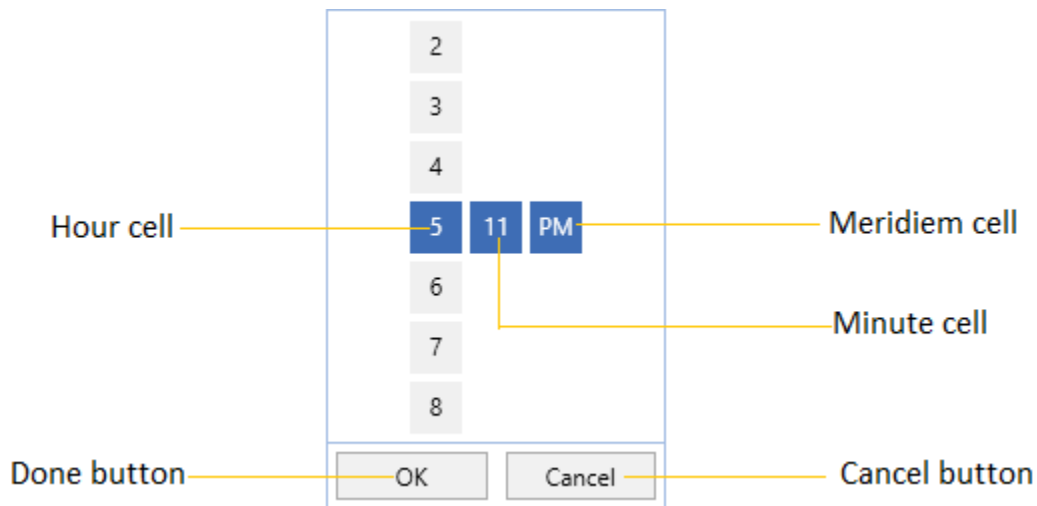

04:05 PM

Click [here](#) to download the sample that showcases the DropDown customization support.

Time Selector in WPF TimePicker (SfTimePicker)

The [SfTimeSelector](#) is a sub-control of [SfTimePicker](#) which opens inside the drop-down popup and used to select the time for the [SfTimePicker](#). It contains the hour, minutes and meridiem selection cells for select the time. The selected time of the [SfTimeSelector](#) is assigned to the [SfTimePicker.Value](#) property.

The visual elements of the time selector can be customized using the [SelectorStyle](#) property.

Change the Cell templates

We can change the template for the each hour, minute or meridiem selector by using the [HourCellTemplate](#), [MinuteCellTemplate](#) or [MeridiemCellTemplate](#) which are available in the [SfTimeSelector](#).

Note: The DataContext of Hour, Minute, Meridiem Selection cell is [DateTimeWrapper](#).

Change the HourCell Template

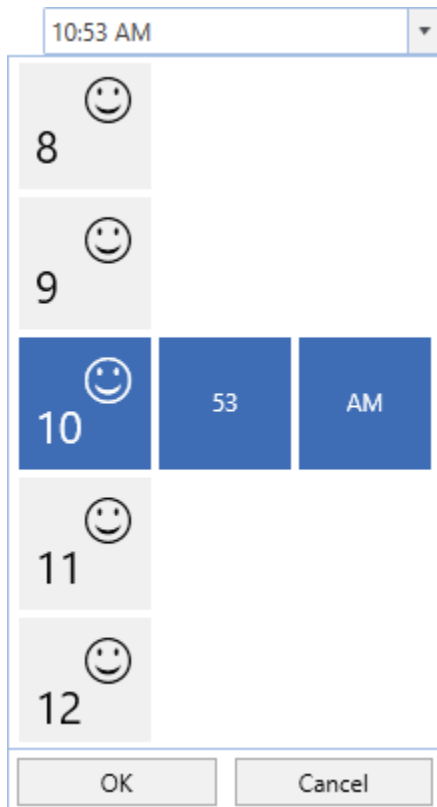

We can change the hour selector template by using the [HourCellTemplate](#) property. In that, we can add like image, icon or text with the hour values.

XML

```

<syncfusion:SfTimePicker DropDownHeight="380"
SelectorItemHeight="70"
SelectorItemWidth="70"
Width="200"
Name="sfTimePicker">
  <syncfusion:SfTimePicker.SelectorStyle>
    <Style TargetType="syncfusion:SfTimeSelector">
      <Setter Property="HourCellTemplate">
        <Setter.Value>
          <DataTemplate>
            <Grid>
              <TextBlock VerticalAlignment="Top"
HorizontalAlignment="Right"
Margin="5"
FontSize="22"
FontFamily="Segoe UI Symbol"
Text="&#xE170;" />
              <TextBlock Text="{Binding HourNumber}"
VerticalAlignment="Bottom"
Margin="5"
FontSize="22" />
            </Grid>
          </DataTemplate>
        </Setter.Value>
      </Setter>
    </Style>
  </syncfusion:SfTimePicker.SelectorStyle>
</syncfusion:SfTimePicker>

```

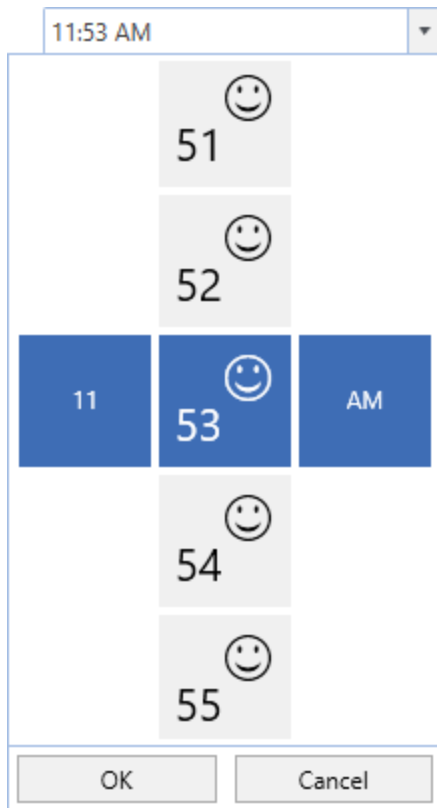

Change the MinuteCell Template

We can change the minute selector template by using the [MinuteCellTemplate](#) property. In that, we can add like image, icon or text with the minute values.

XML

```
<syncfusion:SfTimePicker DropDownHeight="380"
SelectorItemHeight="70"
SelectorItemWidth="70"
Width="200"
Name="sfTimePicker">
  <syncfusion:SfTimePicker.SelectorStyle>
    <Style TargetType="syncfusion:SfTimeSelector">
      <Setter Property="MinuteCellTemplate">
        <Setter.Value>
          <DataTemplate>
            <Grid>
              <TextBlock VerticalAlignment="Top"
HorizontalAlignment="Right"
Margin="5"
FontSize="22"
FontFamily="Segoe UI Symbol"
Text="&#xE170;" />
              <TextBlock Text="{Binding MinuteNumber}"
VerticalAlignment="Bottom"
Margin="5"
FontSize="22" />
            </Grid>
          </DataTemplate>
        </Setter.Value>
      </Setter>
    </Style>
  </syncfusion:SfTimePicker.SelectorStyle>
</syncfusion:SfTimePicker>
```

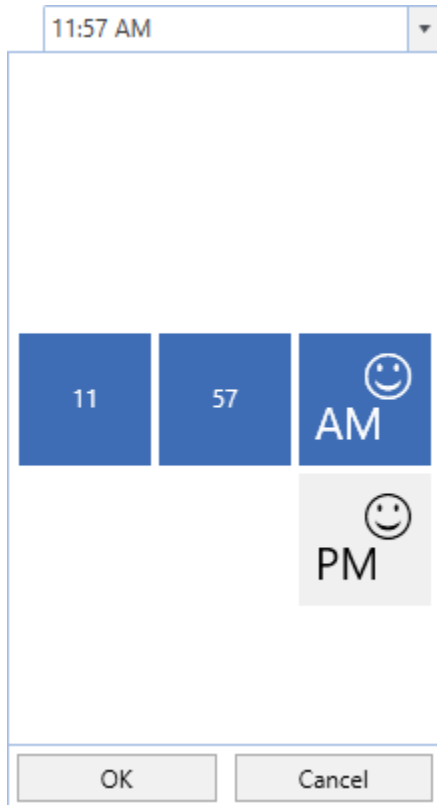

Change the MeridiemCell Template

We can change the meridiem selector template by using the [MeridiemCellTemplate](#) property. In that, we can add like image, icon or text with the meridiem values.

XML

```
<syncfusion:SfTimePicker DropDownHeight="380"
SelectorItemHeight="70"
SelectorItemWidth="70"
Width="200"
Name="sfTimePicker">
  <syncfusion:SfTimePicker.SelectorStyle>
    <Style TargetType="syncfusion:SfTimeSelector">
      <Setter Property="MeridiemCellTemplate">
        <Setter.Value>
          <DataTemplate>
            <Grid>
              <TextBlock VerticalAlignment="Top"
HorizontalAlignment="Right"
Margin="5"
FontSize="22"
FontFamily="Segoe UI Symbol"
Text="&#xE170;" />
              <TextBlock Text="{Binding AmPmString}"
VerticalAlignment="Bottom"
Margin="5"
FontSize="22" />
            </Grid>
          </DataTemplate>
        </Setter.Value>
      </Setter>
    </Style>
  </syncfusion:SfTimePicker.SelectorStyle>
</syncfusion:SfTimePicker>
```

```
</Setter.Value>
</Setter>
</Style>
</syncfusion:SfTimePicker.SelectorStyle>
</syncfusion:SfTimePicker>
```

Change size of cells

We can change the cell size in the `SfTimeSelector` control by setting the [SelectorItemWidth](#) and [SelectorItemHeight](#) properties. The default value of the `SelectorItemWidth` and `SelectorItemHeight` properties is 30 and 30.

XML

```
<syncfusion:SfTimePicker SelectorItemWidth="60"
SelectorItemHeight="60"
x:Name="sfTimePicker"/>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();
sfTimePicker.SelectorItemWidth = 60;
sfTimePicker.SelectorItemHeight = 60;
```

TimeSelector item spacing

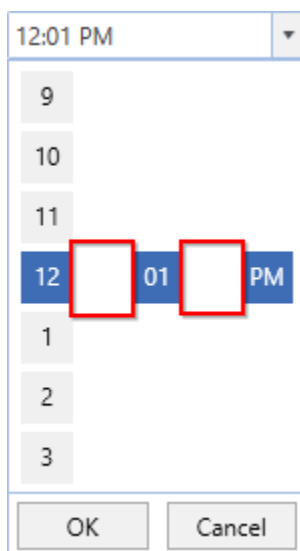

We can change the space between **SfTimeSelector** hour, minutes and meridiem items by using the [SelectorItemSpacing](#) property. The default value of the **SelectorItemSpacing** property is 4.

XML

```
<syncfusion:SfTimePicker SelectorItemSpacing="50"
x:Name="sfTimePicker"/>
```

C#

```
SfTimePicker sfTimePicker = new SfTimePicker();
sfTimePicker.SelectorItemSpacing = 50;
```

Click [here](#) to download the sample that showcases the **SfTimeSelector** template customization.

Appearance in WPF TimePicker (SfTimePicker)

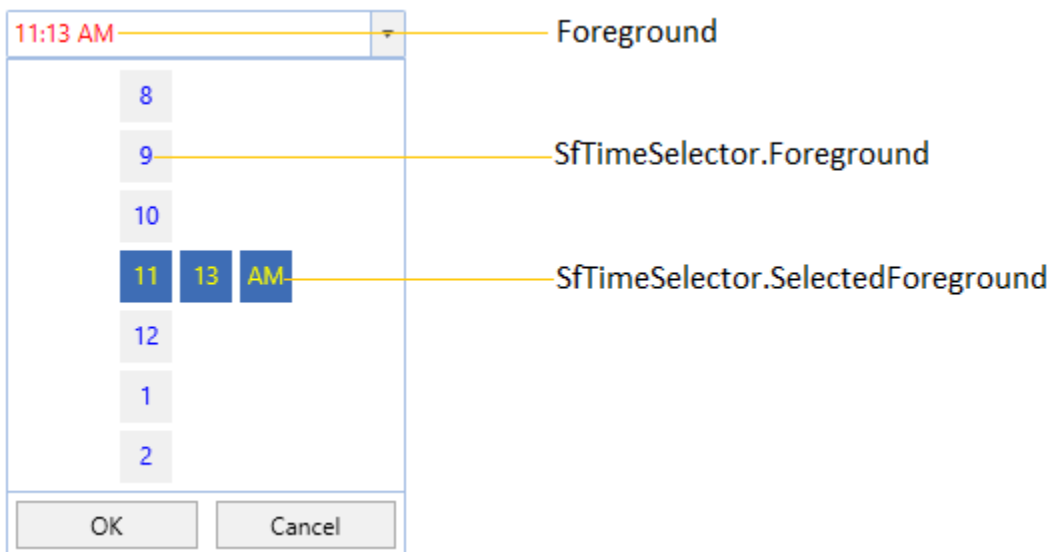

This section explains different UI customization, styling, theming options available in [SfTimePicker](#) control.

Setting the Foreground

We can change a foreground of the [SfTimePicker](#) by using the [Foreground](#) property and also we can change the [SfTimeSelector](#) items and selected time item foreground by using the [Foreground](#) and [SfTimeSelector.SelectedForeground](#) properties of [SfTimeSelector](#).

XML

```
<syncfusion:SfTimePicker Name="sfTimePicker"
Foreground="Red"
Width="200">
<syncfusion:SfTimePicker.SelectorStyle>
<Style TargetType="syncfusion:SfTimeSelector">
<Setter Property="Foreground" Value="Blue"/>
<Setter Property="SelectedForeground" Value="Yellow"/>
</Style>
</syncfusion:SfTimePicker.SelectorStyle>
</syncfusion:SfTimePicker>
```

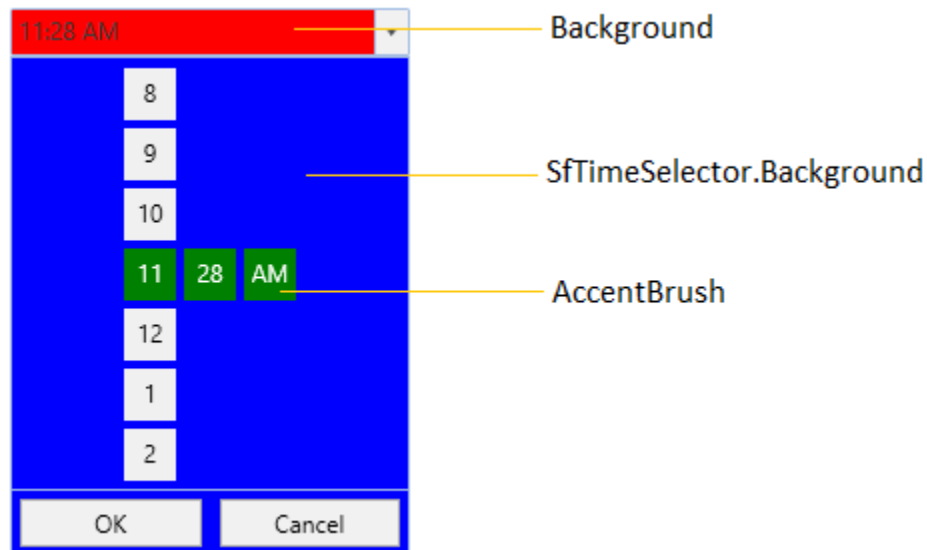

Setting the Background

We can change a background of the [SfTimePicker](#) by using the [background](#) property and also we can change the [SfTimeSelector](#) items and selected time item background by using the [Background](#) and [SfTimeSelector.AccentBrush](#) properties of [SfTimeSelector](#).

XML

```
<syncfusion:SfTimePicker Name="sfTimePicker"
Background="Red"
AccentBrush="Green"
Width="200">
<syncfusion:SfTimePicker.SelectorStyle>
<Style TargetType="syncfusion:SfTimeSelector">
```

```
<Setter Property="Background" Value="Blue"/>
</Style>
</syncfusion:SfTimePicker.SelectorStyle>
</syncfusion:SfTimePicker>
```

Change flow direction

We can change the flow direction of the SfTimePicker control from right to left by setting the FlowDirection property value as RightToLeft. The Default value of FlowDirection property is LeftToRight.

XML

```
<syncfusion:SfTimePicker FlowDirection="RightToLeft" Name="sfTimePicker"/>
```

C#

```
SfTimePicker sfTimePicker= new SfTimePicker();
sfTimePicker.FlowDirection = FlowDirection.RightToLeft;
```

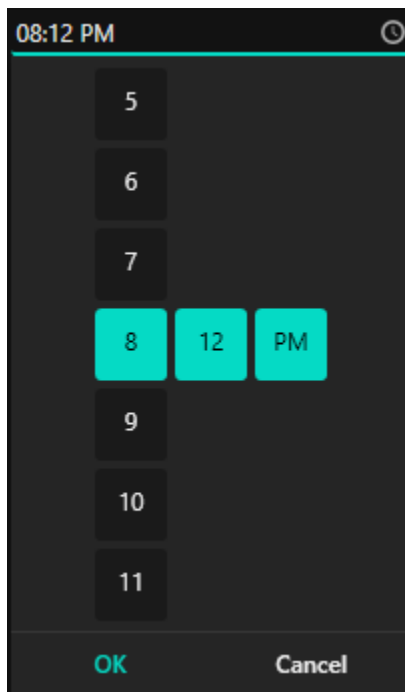

Click [here](#) to download the sample that showcases the different UI customization and styling supports.

Theme

SfTimePicker supports various built-in themes. Refer to the below links to apply themes for the SfTimePicker,

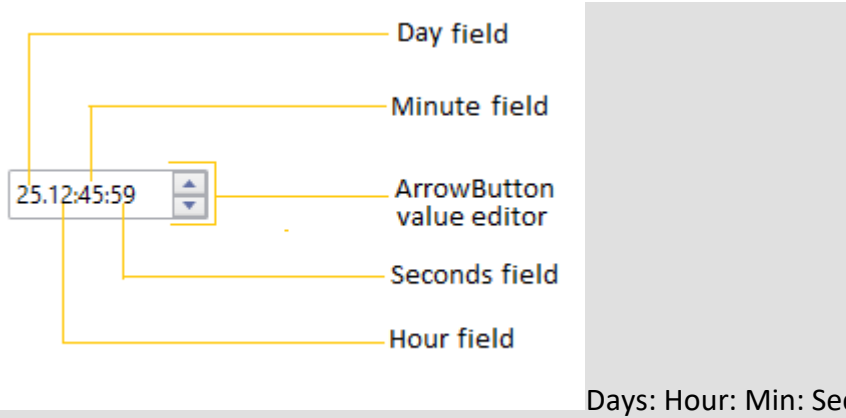

- [Apply theme using SfSkinManager](#)
- [Create a custom theme using ThemeStudio](#)

TimeSpanEdit

WPF TimeSpan Editor (TimeSpanEdit) Overview

[TimeSpanEdit](#) is a control which set or display the time as

Days: Hour: Min: Sec format. The fields can be incremented or decremented using the up/down keys.

![[TimeSpanEdit control structure]](Getting-Startedimages/Control/Structure.png)

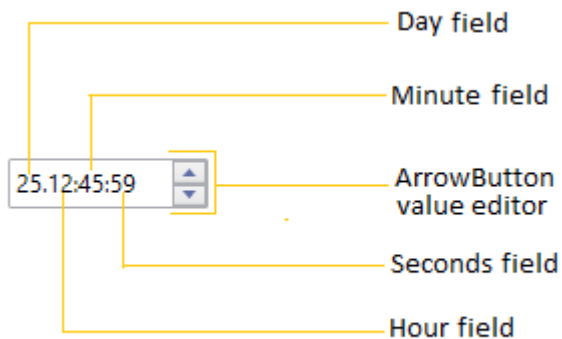

Key features

- **Custom Format String** - Supports to display the custom string for denote the numerals.
- **Keyboard Navigation** - Supports to move from one field to another using Keyboard.
- **SpinArrowButtons** - Supports to increase or decrease the values in any field.

Getting Started with WPF TimeSpan Editor (TimeSpanEdit)

This section explains how to create a [WPF TimeSpan Editor](#) (TimeSpanEdit) and explains about its structure and features.

Control Structure

Assembly deployment

Refer to the [control dependencies](#) section to get the list of assemblies or NuGet package that needs to be added as reference to use the control in any application.

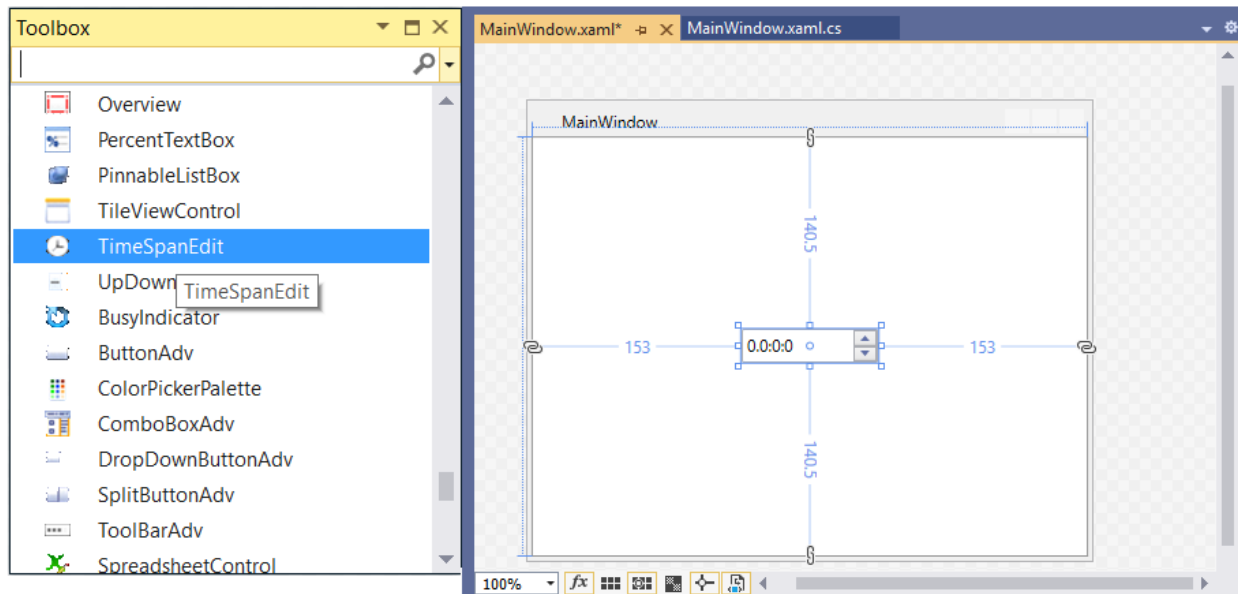

You can find more details about installing the NuGet package in a WPF application in the following link:

[How to install nuget packages](#)

Adding WPF TimeSpanEdit via designer

You can add the **WPF TimeSpan Editor (TimeSpanEdit)** control to an application by dragging it from the toolbox to a view of the designer. The following dependent assembly will be added automatically.

- Syncfusion.Shared.WPF

Adding WPF TimeSpanEdit via XAML

To add the **TimeSpanEdit** control manually in XAML, follow these steps:

1. Create a new WPF project in Visual Studio.
2. Add the following assembly references to the project,
 - Syncfusion.Shared.WPF
3. Import Syncfusion WPF schema <http://schemas.syncfusion.com/wpf> and declare the **TimeSpanEdit** control in XAML page.
4. Declare the **TimeSpanEdit** control in XAML page.

XML

```
<Window xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:syncfusion="http://schemas.syncfusion.com/wpf"
x:Class="TimeSpanEditSample.MainWindow"
Title="TimeSpanEdit Sample" Height="350" Width="525">
<Grid>
<!--Adding TimeSpanEdit control -->
<syncfusion:TimeSpanEdit x:Name="timeSpanEdit"
Width="100"
Height="25" />
</Grid>
</Window>
```

Adding WPF TimeSpanEdit via C\#

To add the **TimeSpanEdit** control manually in C#, follow these steps:

1. Create a new WPF application via Visual Studio.
2. Add the following assembly references to the project,
 - Syncfusion.Shared.WPF
3. Include the required namespace and create an instance of `TimeSpanEdit` and add it to the window.
4. Declare the `TimeSpanEdit` control using C#.

C#

```
using Syncfusion.Windows.Tools.Controls;
public partial class MainWindow : Window {
    public MainWindow() {
        InitializeComponent();
        //Creating an instance of TimeSpanEdit control
        TimeSpanEdit timeSpanEdit = new TimeSpanEdit();
        timeSpanEdit.Width = 100;
        timeSpanEdit.Height = 25;
        //Adding TimeSpanEdit as window content
        this.Content = timeSpanEdit;
    }
}
```

Set or change time span value

You can set or change the selected time of the `TimeSpanEdit` programmatically by setting the value to the `Value` property. You can also change the selected time at runtime using the mouse and keyboard interaction. Please refer the [Change time span value](#) page to know more about the mouse and keyboard interaction to change the value. The default value of `Value` property is `0.0:0:0`.

XML

```
<syncfusion:TimeSpanEdit Value="10.11:32:43"
Name="timeSpanEdit" />
```

C#

```
TimeSpanEdit timeSpanEdit = new TimeSpanEdit();
timeSpanEdit.Value = new TimeSpan(10, 11, 32, 43);
```

Note: View [Sample](#) in GitHub

Change display format of time span

You can format the each fields to show what the numerals denotes i.e. hours, minutes or days by using the `Format` property. The default value of `Format` is `d.h:m:s`. You can show only the days, hours or minutes values by using any one the following respective fields to the `Format` property.

- d - It displays the days value.
- h - It displays the hours value.
