

## Summary of the Proposed Idaho Workers Compensation Rate Filing Effective January 1, 2025

The National Council on Compensation Insurance (NCCI)<sup>1</sup> is pleased to provide this summary of the accompanying proposed workers compensation insurance rate filing that was filed under separate cover on October 2, 2024, with the Idaho Department of Insurance for its review and approval.

The filing recommends a -6.7% rate decrease in the voluntary market and a -10% decrease to the surcharge, from 60% to 50%, in the assigned risk market, effective January 1, 2025.

### Idaho Overview

This filing is based on premium and loss experience as of year-end 2023 from Policy Years 2020, 2021, and 2022 which shows continued improvement relative to the data underling the January 1, 2024 voluntary market rate filing. NCCI has observed a trend of improving loss experience in Idaho, driven in part by a reduction in claim frequency.

This filing proposes a decrease in the assigned risk market surcharge from 60% to 50% based on a review of the long-term relationship between experience in the assigned risk market and statewide markets.

### Countrywide Overview

The workers compensation (WC) system remains healthy. The Calendar Year 2023 combined ratio for workers compensation was 86%, a sign of underwriting profitability, where the net written premium increased by 1%.

Frequency has continued its long-term decline and on a countrywide basis, while claim severity changes were considered moderate for 2023. The continued focus on worker safety and technological advancements are regarded as contributing to fewer workplace injuries over time. The latest medical severity change aligns with projected medical inflation, while indemnity severity tracked with changes in average weekly wages.

Payroll increased by 6% between 2022 and 2023, driven by increases in both employment and wages. Conversely, WC system costs have increased at a slower pace than wages during the same period. The great reshuffle of jobs has also slowed significantly as employee turnover settles near pre-pandemic levels and we see signs of the labor market normalizing rather than deteriorating.

Economic inflation as measured with the popular Consumer Price Index has been elevated over the past few years. However, this economic inflation has not generally translated to higher WC medical and indemnity benefit costs:

- Medical inflation has been more stable in the aggregate with the WC Weighted Medical Price Index showing an average increase of 2.6% for the past 3 years. Medical fee schedules have helped moderate price increases in workers compensation in states that have medical fee

schedules.

- Indemnity severity has largely been tracking wage inflation in recent years—a pattern which is not unusual considering indemnity costs are essentially wage replacement benefits for injured workers.

## **Conclusion**

The workers compensation system continues to be healthy. While consumer inflation has been elevated, the inflation for workers compensation medical costs remained stable. The increases observed in indemnity severity are largely driven by increased wages, which have risen significantly in recent years. Workers Compensation premiums are based on payroll, which is an inflation-sensitive exposure base. The combination of continued frequency declines and moderate benefit costs at or below the level of wage growth, have continued to put downward pressure on overall WC system costs relative to collected premiums.
