

Supplemental data

Quercetin improves epithelial regeneration from airway basal cells of COPD patients

Elizabeth S. McCluskey¹, Nathan Liu¹, Abhimaneu Pandey¹, Nathaniel Marchetti³, Steven G Kelsen³ and Umadevi S. Sajjan^{1,2,3}

Supplemental Figure Legends

Supplemental Figure 1. Optimization of quercetin dose and time of culture at ALI for TER measurements. Ninety % confluent BC from one COPD patient were treated with vehicle or 01, 1 and 5 μ M quercetin for 3 days. The cells were then cultured at ALI up to 10 days and TER was monitored on days 4, 6, 8 and 10. BC from one healthy non-smoker was cultured similarly without treatment with DMSO or quercetin. The experiment was repeated three times using P1 cells. For each experiment, cells at P0 were thawed grown to 80% confluence on 10 cm dish, dissociated from the plate and seeded in transwells. The data represent mean \pm SEM calculated from 3 independent experiments and the statistical significance was determined by ANOVA with Tukey post-hoc analysis (* $p\leq 0.05$, different from normal; # $p\leq 0.05$, different from COPD cells treated with 1 μ M quercetin).

Supplemental Figure 2. Detection of Ciliated, goblet and basal cells in mucociliary-differentiated normal and COPD cultures. Basal cells obtained 6 COPD patients were grown to 90% confluence and treated with DMSO or 1 μ M quercetin for three days. The cells were then cultured at ALI for 4 weeks to promote mucociliary differentiation. BC obtained from 6 healthy non-smokers cultured at ALI for 4 weeks were used as controls. The cells were dissociated from the transwells, stained with Zombie to detect dead cells, fixed/permeabilized, blocked with 5% BSA and incubated with antibodies to acetylated tubulin (ciliated cells), MUC5AC (goblet cells) or TP63 (basal cells) or normal mouse IgG (control to detect FITC positive cells). Cells were then washed to remove unbound antibodies and then incubated with antimouse IgG labeled with FITC and analyzed by flow cytometry. The cells were selected on the basis of forward and side scatter, dead cells were gated out based on Zombie staining and live cells were gated on the basis of FITC positivity. The data in Panel A shows gating strategy used for cells incubated with

normal mouse IgG (negative control). Panel B to D shows live cells gated on the basis of FITC positivity.

Supplemental Figure 3. Differential expression of genes by microarray in COPD BC treated with quercetin. COPD BC were treated with placebo or quercetin for 3 consecutive days, total RNA was isolated and subjected to microarray analysis using Human Gene 2.1 ST arrays. The data was analyzed by TAC software analysis to identify the number of altered genes at least by 2 fold with FDR p value <0.05.

Table 1. Study population

Subject	Age	Sex	Pack-years	FEV1% predicted
Normal (8)	50	4:4		
N4	59	F	-	-
N17	33	M	-	-

Gene Expression Summary

Total transcripts: 48,226

Filter Criteria:

FDR P-value: <0.05

Fold Change: >2 OR <-2

Transcripts passed filter criteria: 1,527 (3.17%)

Up-regulated: 673 (44.07%)

Down-regulated: 854 (55.93%)
