Contents

1 Preparations.....	1
1.1 Configuring MRS Cloud Service Authorization.....	1
1.2 Creating an IAM User and Granting MRS Permissions.....	2
1.3 Creating a Custom Policy for MRS.....	7
2 MRS Cluster Planning.....	13
2.1 Service Selection.....	13
2.1.1 MRS Cluster Types.....	13
2.1.2 MRS Cluster Node Types.....	14
2.1.3 MRS Cluster Node Specifications.....	16
2.2 MRS Cluster Deployment.....	17
2.2.1 Overview.....	17
2.2.2 Kerberos Authentication for MRS Clusters.....	25
2.2.3 ECS Specifications Supported by MRS Clusters.....	27
3 Buying MRS Clusters.....	30
3.1 Quickly Buying an MRS Cluster.....	30
3.2 Manually Buying an MRS Cluster.....	34
4 Installing an MRS Cluster Client.....	49
4.1 Installing a Client (MRS 3.x).....	49
4.2 Installing a Client (MRS 2.x or Earlier).....	59
5 Submitting an MRS Job.....	65
5.1 MRS Job Types.....	65
5.2 Uploading Application Data to an MRS Cluster.....	66
5.3 Running an MRS Job.....	69
5.3.1 Running a MapReduce Job.....	69
5.3.2 Running a SparkSubmit Job.....	73
5.3.3 Running a HiveSQL Job.....	80
5.3.4 Running a Spark SQL Job.....	84
5.3.5 Running a Flink Job.....	89
5.3.6 Running a HadoopStreaming Job.....	96
5.4 Viewing MRS Job Details and Logs.....	98
6 Managing Clusters.....	101

6.1 Overview.....	101
6.2 Introduction to MRS Manager.....	103
6.3 Accessing MRS Manager.....	108
6.4 Managing an MRS Cluster.....	115
6.4.1 Viewing Basic Information About an MRS Cluster.....	115
6.4.2 Checking the Running Status of an MRS Cluster.....	118
6.4.3 Starting and Stopping an MRS Cluster.....	121
6.4.4 Restarting an MRS Cluster.....	122
6.4.5 Exporting MRS Cluster Configuration Parameters.....	125
6.4.6 Synchronizing the MRS Cluster Configuration.....	126
6.4.7 Transforming a Pay-per-Use MRS Cluster to a Yearly/Monthly Cluster.....	128
6.4.8 Deleting an MRS Cluster.....	128
6.4.9 Changing the VPC Subnet of an MRS Cluster.....	129
6.4.10 Replacing the NTP Server for an MRS Cluster.....	132
6.4.11 Modifying the OMS Service Configuration.....	134
6.4.12 Modifying MRS Manager Routing Table.....	136
6.5 Managing MRS Cluster Components.....	139
6.5.1 Checking the Running Status of an MRS Cluster Component.....	139
6.5.2 Starting and Stopping an MRS Cluster Component.....	146
6.5.3 Restarting an MRS Cluster Component.....	147
6.5.4 Adding and Deleting an MRS Cluster Component.....	154
6.5.5 Modifying the Configuration Parameters of an MRS Cluster Component.....	155
6.5.6 Viewing the Modified Component Configuration Parameters of an MRS Cluster.....	160
6.5.7 Synchronizing MRS Component Configuration Parameters.....	162
6.5.8 Adding Custom MRS Component Parameters.....	166
6.5.9 Managing MRS Role Instances.....	170
6.5.10 Managing MRS Role Instance Groups.....	172
6.5.11 Modifying MRS Role Instance Parameters.....	174
6.5.12 Perform an Active/Standby Switchover for MRS Role Instances.....	176
6.5.13 Decommissioning and Recommissioning an MRS Role Instance.....	177
6.5.14 Enabling and Disabling Ranger Authentication for an MRS Component.....	179
6.5.15 Accessing Web Pages of Open Source Components Managed in MRS Clusters.....	181
6.6 Managing MRS Cluster Nodes.....	182
6.6.1 Checking the Running Status of an MRS Cluster Node.....	182
6.6.2 Starting and Stopping All Roles on an MRS Cluster Node.....	186
6.6.3 Isolating an MRS Cluster Node.....	187
6.6.4 Modifying the Rack Information of an MRS Cluster Node.....	189
6.6.5 Scaling Up Master Node Specifications in an MRS Cluster.....	192
6.6.6 Synchronizing Disk Information of an MRS Cluster Node.....	198
6.6.7 Adding a Tag to an MRS Cluster/Node.....	199
6.6.8 Configuring Bootstrap Actions for an MRS Cluster Node.....	203
6.6.8.1 MRS Bootstrap Action Overview.....	203

6.6.8.2 Preparing the Bootstrap Action Script for an MRS Node.....	203
6.6.8.3 Adding MRS Node Bootstrap Actions and Installing Third-Party Software.....	204
6.6.8.4 Viewing the Bootstrap Action Execution Records of an MRS Node.....	208
6.7 Managing the MRS Cluster Client.....	209
6.7.1 Updating the MRS Cluster Client After the Server Configuration Expires.....	209
6.7.2 Viewing the Installed MRS Cluster Client.....	213
6.7.3 Batch Upgrading MRS Cluster Clients.....	214
6.8 Managing MRS Cluster Jobs.....	216
6.8.1 Stopping and Deleting an MRS Cluster Job.....	216
6.8.2 Configuring Notification Rules for MRS Jobs.....	217
6.9 Managing MRS Cluster Tenants.....	218
6.9.1 Introduction to MRS Multi-Tenancy.....	218
6.9.2 Using MRS Multi-Tenancy.....	230
6.9.3 Configuring MRS Tenants.....	232
6.9.3.1 Creating an MRS Tenant.....	233
6.9.3.2 Creating an MRS Sub-Tenant.....	246
6.9.3.3 Binding Tenant to an MRS Cluster User.....	261
6.9.3.4 Adding an MRS Tenant Resource Pool.....	264
6.9.3.5 Configuring the Queue Capacity Policy of a Resource Pool.....	266
6.9.3.6 Configuring the MRS Tenant Queue.....	269
6.9.4 Managing MRS Tenant Resources.....	277
6.9.4.1 Managing the MRS Tenant Resource Directory.....	277
6.9.4.2 Managing MRS Tenant Resource Pools.....	279
6.9.4.3 Clearing the MRS Tenant Queue Configuration.....	281
6.9.4.4 Restoring MRS Tenant Data After YARN Is Reinstalled.....	282
6.9.4.5 Deleting an MRS Tenant.....	282
6.9.4.6 Managing Global User Policies When Using Superior Scheduler.....	284
6.9.4.7 Clearing Tenant's Non-Associated Queues Using Capacity Scheduler.....	286
6.9.5 Switching the MRS Tenant Resource Scheduler.....	287
6.10 Managing MRS Cluster Users.....	290
6.10.1 Cluster User Permissions.....	290
6.10.1.1 MRS Cluster User Permission Model.....	291
6.10.1.2 MRS Cluster User Identity Authentication Policy.....	293
6.10.1.3 MRS Cluster User Permission Authentication Policy.....	295
6.10.1.4 Default Permissions of the MRS Cluster.....	297
6.10.1.5 Synchronizing IAM Users to MRS.....	300
6.10.2 MRS Cluster User Accounts.....	305
6.10.3 Managing MRS Cluster Roles.....	359
6.10.4 Managing MRS Cluster User Groups.....	362
6.10.5 Managing MRS Cluster Users.....	364
6.10.5.1 Creating an MRS Cluster User.....	365
6.10.5.2 Modifying MRS Cluster User Information.....	367

6.10.5.3 Locking an MRS Cluster User.....	368
6.10.5.4 Deleting an MRS Cluster User.....	370
6.10.5.5 Initializing MRS Cluster User Passwords.....	372
6.10.5.6 Downloading MRS Cluster User Credentials.....	373
6.10.6 Unlocking an MRS Cluster User.....	374
6.10.6.1 Unlocking an LDAP User in the MRS Cluster.....	374
6.10.6.2 Unlocking the LDAP Management Account of the MRS Cluster.....	377
6.10.7 Configuring Password Policies for MRS Cluster Users.....	377
6.10.8 Configuring the Private Attribute of MRS Cluster Users.....	381
6.11 Managing MRS Cluster Metadata.....	382
6.11.1 MRS Cluster Metadata Overview.....	382
6.11.2 Storing Ranger Metadata to RDS.....	383
6.11.3 Storing Hive Metadata to RDS.....	393
6.11.4 Configuring a LakeFormation Data Connection.....	398
6.11.4.1 LakeFormation Overview.....	399
6.11.4.2 Preparing for a LakeFormation Data Connection.....	400
6.11.4.3 Configuring a LakeFormation Data Connection During Cluster Creation.....	409
6.11.5 Managing MRS Cluster Data Connections.....	415
6.12 Managing Static Service Resources in an MRS Cluster.....	416
6.12.1 Overview of Static Service Resources.....	416
6.12.2 Configuring Static Resources for an MRS Cluster.....	417
6.12.3 Checking the Static Resources of an MRS Cluster.....	423
7 MRS Cluster O&M.....	426
7.1 Cluster O&M.....	426
7.2 Logging In to an MRS Cluster.....	430
7.2.1 Checking MRS Active/Standby Management Nodes.....	430
7.2.2 Logging In to an MRS Cluster Node.....	431
7.3 Viewing MRS Cluster Monitoring Metrics.....	436
7.3.1 Viewing MRS Cluster Resource Monitoring Metrics.....	437
7.3.2 Viewing MRS Cluster Component Monitoring Metrics.....	440
7.3.3 Viewing MRS Node Resource Monitoring Metrics.....	446
7.3.4 Dumping MRS Cluster Monitoring Data.....	451
7.4 Checking MRS Cluster Health.....	454
7.4.1 Performing a Health Check for an MRS Cluster.....	455
7.4.2 Performing Health Checks on MRS Cluster Nodes.....	456
7.4.3 Viewing and Exporting a Health Check Report.....	457
7.5 Adjusting the Capacity of an MRS Cluster.....	459
7.5.1 Scaling Out an MRS Cluster.....	459
7.5.2 Expanding a Data Disk of an MRS Cluster Node.....	464
7.5.3 Scaling In an MRS Cluster.....	466
7.5.4 Scaling In ClickHouseServer Nodes.....	471
7.5.5 Unsubscribing from a Specified Node in a Yearly/Monthly MRS Cluster.....	478

7.5.6 MRS Task Node Auto Scaling.....	480
7.5.6.1 Automatic Scaling of Task Nodes in an MRS Cluster.....	480
7.5.6.2 Adding an Auto Scaling Policy for MRS Task Nodes.....	488
7.5.6.3 Managing MRS Cluster Auto Scaling Policies.....	494
7.6 MRS Cluster Data Backup and Restoration.....	496
7.6.1 Backing Up and Restoring MRS Cluster Data.....	497
7.6.2 Enabling MRS Inter-Cluster Replication.....	504
7.6.3 Creating an MRS Cluster Data Backup Task.....	506
7.6.4 Creating an MRS Cluster Data Restoration Task.....	508
7.6.5 Backing Up MRS Cluster Component Data.....	509
7.6.5.1 Backing Up Manager Data (MRS 2.x and Earlier).....	509
7.6.5.2 Backing Up Manager Data (MRS 3.x and Later Versions).....	510
7.6.5.3 Backing Up CDL Service Data.....	515
7.6.5.4 Backing Up ClickHouse Metadata.....	517
7.6.5.5 Backing Up ClickHouse Service Data.....	520
7.6.5.6 Backing Up DBService Data.....	525
7.6.5.7 Backing Up Flink Metadata.....	529
7.6.5.8 Backing Up HBase Metadata.....	532
7.6.5.9 Backing Up HBase Service Data.....	535
7.6.5.10 Backing Up HDFS NameNode Data.....	540
7.6.5.11 Backing Up HDFS Service Data.....	544
7.6.5.12 Backing Up Hive Service Data.....	549
7.6.5.13 Backing Up IoTDB Metadata.....	555
7.6.5.14 Backing Up IoTDB Service Data.....	558
7.6.5.15 Backing Up Kafka Metadata.....	560
7.6.6 Restoring MRS Cluster Component Data.....	564
7.6.6.1 Restoring Manager Data (MRS2.x and Earlier).....	564
7.6.6.2 Restoring Manager Data (MRS 3.x and Later Versions).....	567
7.6.6.3 Restoring CDL Service Data.....	572
7.6.6.4 Restoring ClickHouse Metadata.....	574
7.6.6.5 Restoring ClickHouse Service Data.....	576
7.6.6.6 Restoring DBService Metadata.....	579
7.6.6.7 Restoring Flink Metadata.....	583
7.6.6.8 Restoring HBase Metadata.....	585
7.6.6.9 Restoring HBase Service Data.....	589
7.6.6.10 Restoring HDFS NameNode Metadata.....	593
7.6.6.11 Restoring HDFS Service Data.....	597
7.6.6.12 Restoring Hive Service Data.....	601
7.6.6.13 Restoring IoTDB Metadata.....	606
7.6.6.14 Restoring IoTDB Service Data.....	609
7.6.6.15 Restoring Kafka Metadata.....	611
7.6.7 Managing MRS Cluster Backup and Restoration Tasks.....	615

7.6.8 Using HDFS Snapshots to Quickly Restore Component Service Data.....	618
7.7 MRS Cluster Patching.....	619
7.7.1 Viewing Patch Information for an MRS Cluster.....	619
7.7.2 Patching an MRS Cluster.....	620
7.7.3 Applying Rolling Patches for an MRS Cluster.....	621
7.7.4 Patching Hosts Isolated in an MRS Cluster.....	625
7.8 MRS Cluster Patch Description.....	626
7.8.1 MRS 3.0.5.1 Patch Description.....	626
7.8.2 MRS 2.1.0.11 Patch Description.....	628
7.8.3 MRS 2.1.0.10 Patch Description.....	634
7.8.4 MRS 2.1.0.9 Patch Description.....	639
7.8.5 MRS 2.1.0.8 Patch Description.....	643
7.8.6 MRS 2.1.0.7 Patch Description.....	647
7.8.7 MRS 2.1.0.6 Patch Description.....	650
7.8.8 MRS 2.1.0.3 Patch Description.....	653
7.8.9 MRS 2.1.0.2 Patch Description.....	654
7.8.10 MRS 2.1.0.1 Patch Description.....	656
7.8.11 MRS 2.0.6.1 Patch Description.....	657
7.8.12 MRS 2.0.1.3 Patch Description.....	658
7.8.13 MRS 2.0.1.2 Patch Description.....	659
7.8.14 MRS 2.0.1.1 Patch Description.....	660
7.8.15 MRS 1.9.3.3 Patch Description.....	660
7.8.16 MRS 1.9.3.1 Patch Description.....	662
7.8.17 MRS 1.9.2.2 Patch Description.....	663
7.8.18 MRS 1.9.0.8, 1.9.0.9, and 1.9.0.10 Patch Description.....	664
7.8.19 MRS 1.9.0.7 Patch Description.....	669
7.8.20 MRS 1.9.0.6 Patch Description.....	673
7.8.21 MRS 1.9.0.5 Patch Description.....	676
7.8.22 MRS 1.8.10.1 Patch Description.....	679
7.9 Viewing Logs of an MRS Cluster.....	679
7.9.1 Overview of MRS Cluster Logs.....	679
7.9.2 Viewing MRS Operation Logs.....	708
7.9.3 Viewing MRS Cluster History.....	709
7.9.4 Viewing MRS Cluster Audit Logs.....	711
7.9.5 Viewing Role Instance Logs of MRS Components.....	713
7.9.6 Searching for MRS Cluster Logs Online.....	714
7.9.7 Downloading MRS Cluster Logs.....	717
7.9.8 Collecting MRS Cluster Service Stack Information.....	718
7.9.9 Configuring Default Log Level and Archive File Size for MRS Components.....	721
7.9.10 Configuring the Number of Local Backups of MRS Cluster Audit Logs.....	722
7.9.11 Configuring Dumping for MRS Cluster Audit Logs.....	723
7.10 MRS Cluster Security Configuration.....	727

7.10.1 Cluster Mutual Trust Management.....	727
7.10.1.1 Overview of Mutual Trust Between MRS Clusters.....	727
7.10.1.2 Changing the System Domain Name of an MRS Cluster.....	728
7.10.1.3 Configuring Mutual Trust Between MRS Clusters.....	732
7.10.1.4 Configuring User Permissions for Mutually Trusted MRS Clusters.....	739
7.10.2 Replacing MRS Cluster Certificates.....	741
7.10.2.1 Replacing the CA Certificate.....	741
7.10.2.2 Replacing an HA Certificate.....	744
7.10.3 MRS Cluster Security Hardening.....	747
7.10.3.1 MRS Cluster Security Hardening Policies.....	747
7.10.3.2 Configuring Hadoop Data Encryption During Transmission.....	749
7.10.3.3 Configuring Kafka Data Encryption During Transmission.....	752
7.10.3.4 Configuring HDFS Data Encryption During Transmission.....	753
7.10.3.5 Configuring Spark Data Encryption During Transmission.....	756
7.10.3.6 Configuring ZooKeeper Data Encryption During Transmission.....	757
7.10.3.7 Encrypting Data Transmission Between the Controller and Agent.....	758
7.10.3.8 Configuring a Trusted IP Address to Access LDAP.....	760
7.10.3.9 HFile and WAL Encryption.....	762
7.10.3.10 Configuring the IP Address Whitelist for Modifying Data in an HBase Read-Only Cluster.....	769
7.10.3.11 Configuring LDAP Output Audit Logs.....	770
7.10.3.12 Updating Encryption Keys of an MRS Cluster.....	771
7.10.3.13 Updating the SSH Key of User omm on MRS Cluster Nodes.....	773
7.10.3.14 Enabling and Disabling Permission Verification on MRS Cluster Components.....	775
7.10.3.15 Allowing External Users to Access MRS Clusters in Normal Mode.....	777
7.10.3.16 Configuring Secure Communication Authorization for an MRS Cluster.....	779
7.10.4 Changing the Passwords for System Users of an MRS Cluster.....	784
7.10.4.1 Changing or Resetting the Password for User admin of an MRS Cluster.....	784
7.10.4.2 Changing the Passwords for OS Users of an MRS Cluster Node.....	787
7.10.4.3 Changing the Password for the Kerberos Administrator of an MRS Cluster.....	788
7.10.4.4 Changing the Passwords for Manager Users of an MRS Cluster.....	790
7.10.4.5 Changing the Password for a Regular LDAP User of an MRS Cluster.....	792
7.10.4.6 Changing the LDAP Administrator Password for an MRS Cluster.....	794
7.10.4.7 Changing the Passwords for MRS Cluster Component Running Users.....	795
7.10.5 Changing the Passwords for Database Users of an MRS Cluster.....	798
7.10.5.1 Changing the Password for the OMS Database Administrator.....	798
7.10.5.2 Changing the Password for an OMS Database Access User.....	799
7.10.5.3 Changing the Passwords for Database Users of MRS Cluster Components.....	800
7.10.5.4 Resetting the MRS Component Database User Password.....	802
7.10.5.5 Resetting the Password for User omm in DBService.....	803
7.10.5.6 Changing the Password for User compdbuser of the DBService Database.....	804
7.11 Viewing and Configuring MRS Alarm Events.....	804
7.11.1 Viewing MRS Cluster Events.....	805

7.11.2 Viewing Alarms of an MRS Cluster.....	808
7.11.3 Configuring Alarm Thresholds for an MRS Cluster.....	813
7.11.4 Configuring Alarm Masking for an MRS Cluster.....	832
7.11.5 Connecting an MRS Cluster to SNMP to Report Alarms.....	833
7.11.6 Connecting an MRS Cluster to the Syslog Server to Report Alarms.....	835
7.11.7 Periodically Backing Up Alarm and Audit Information.....	840
7.11.8 Enabling the MRS Cluster Maintenance Mode to Disable Alarm Reporting.....	841
7.11.9 Configuring Notifications for MRS Cluster Alarms and Events.....	844
7.12 MRS Cluster Alarm Handling Reference.....	847
7.12.1 ALM-12001 Audit Log Dumping Failure.....	847
7.12.2 ALM-12004 Oldap Resource Abnormal.....	850
7.12.3 ALM-12005 OKerberos Resource Abnormal.....	851
7.12.4 ALM-12006 Node Fault.....	853
7.12.5 ALM-12007 Process Fault.....	857
7.12.6 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes.....	861
7.12.7 ALM-12011 Manager Data Synchronization Exception Between the Active and Standby Nodes..	863
7.12.8 ALM-12012 NTP Service Is Abnormal.....	867
7.12.9 ALM-12014 Partition Lost.....	874
7.12.10 ALM-12015 Partition Filesystem Readonly.....	877
7.12.11 ALM-12016 CPU Usage Exceeds the Threshold.....	878
7.12.12 ALM-12017 Insufficient Disk Capacity.....	881
7.12.13 ALM-12018 Memory Usage Exceeds the Threshold.....	884
7.12.14 ALM-12027 Host PID Usage Exceeds the Threshold.....	886
7.12.15 ALM-12028 Number of Processes in the D State and Z State on a Host Exceeds the Threshold.	888
7.12.16 ALM-12033 Slow Disk Fault.....	890
7.12.17 ALM-12034 Periodical Backup Failure.....	897
7.12.18 ALM-12035 Unknown Data Status After Recovery Task Failure.....	900
7.12.19 ALM-12037 NTP Server Abnormal.....	902
7.12.20 ALM-12038 Monitoring Indicator Dumping Failure.....	905
7.12.21 ALM-12039 Active/Standby OMS Databases Not Synchronized.....	907
7.12.22 ALM-12040 Insufficient System Entropy.....	910
7.12.23 ALM-12041 Incorrect Permission on Key Files.....	913
7.12.24 ALM-12042 Incorrect Configuration of Key Files.....	915
7.12.25 ALM-12045 Read Packet Dropped Rate Exceeds the Threshold.....	917
7.12.26 ALM-12046 Write Packet Dropped Rate Exceeds the Threshold.....	921
7.12.27 ALM-12047 Read Packet Error Rate Exceeds the Threshold.....	924
7.12.28 ALM-12048 Write Packet Error Rate Exceeds the Threshold.....	926
7.12.29 ALM-12049 Network Read Throughput Rate Exceeds the Threshold.....	929
7.12.30 ALM-12050 Network Write Throughput Rate Exceeds the Threshold.....	932
7.12.31 ALM-12051 Disk Inode Usage Exceeds the Threshold.....	935
7.12.32 ALM-12052 TCP Temporary Port Usage Exceeds the Threshold.....	937
7.12.33 ALM-12053 Host File Handle Usage Exceeds the Threshold.....	940

7.12.34 ALM-12054 Invalid Certificate File.....	943
7.12.35 ALM-12055 Certificate File Is About to Expire.....	946
7.12.36 ALM-12057 Metadata Not Configured with the Task to Periodically Back Up Data to a Third-Party Server.....	949
7.12.37 ALM-12061 Process Usage Exceeds the Threshold.....	950
7.12.38 ALM-12062 OMS Parameter Configurations Mismatch with the Cluster Scale.....	954
7.12.39 ALM-12063 Unavailable Disk.....	956
7.12.40 ALM-12064 Host Random Port Range Conflicts with Cluster Used Port.....	958
7.12.41 ALM-12066 Trust Relationships Between Nodes Become Invalid.....	960
7.12.42 ALM-12067 Tomcat Resource Is Abnormal.....	964
7.12.43 ALM-12068 ACS Resource Exception.....	965
7.12.44 ALM-12069 AOS Resource Exception.....	967
7.12.45 ALM-12070 Controller Resource Is Abnormal.....	969
7.12.46 ALM-12071 Httpd Resource Is Abnormal.....	971
7.12.47 ALM-12072 FloatIP Resource Is Abnormal.....	973
7.12.48 ALM-12073 CEP Resource Is Abnormal.....	975
7.12.49 ALM-12074 FMS Resource Is Abnormal.....	977
7.12.50 ALM-12075 PMS Resource Is Abnormal.....	979
7.12.51 ALM-12076 GaussDB Resource Is Abnormal.....	981
7.12.52 ALM-12077 User omm Expired.....	983
7.12.53 ALM-12078 Password of User omm Expired.....	985
7.12.54 ALM-12079 User omm Is About to Expire.....	987
7.12.55 ALM-12080 Password of User omm Is About to Expire.....	988
7.12.56 ALM-12081 User ommdba Expired.....	990
7.12.57 ALM-12082 User ommdba Is About to Expire.....	992
7.12.58 ALM-12083 Password of User ommdba Is About to Expire.....	994
7.12.59 ALM-12084 Password of User ommdba Expired.....	995
7.12.60 ALM-12085 Service Audit Log Dump Failure.....	997
7.12.61 ALM-12087 System Is in the Upgrade Observation Period.....	1000

7.12.99 ALM-14013 Failed to Update the NameNode FsImage File.....	1093
7.12.100 ALM-14014 NameNode GC Time Exceeds the Threshold.....	1099
7.12.101 ALM-14015 DataNode GC Time Exceeds the Threshold.....	1102
7.12.102 ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold.....	1104
7.12.103 ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold.....	1107
7.12.104 ALM-14018 NameNode Non-heap Memory Usage Exceeds the Threshold.....	1109
7.12.105 ALM-14019 DataNode Non-heap Memory Usage Exceeds the Threshold.....	1112
7.12.106 ALM-14020 Number of Entries in the HDFS Directory Exceeds the Threshold.....	1115
7.12.107 ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold.....	1118
7.12.108 ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold.....	1123
7.12.109 ALM-14023 Percentage of Total Reserved Disk Space for Replicas Exceeds the Threshold.....	1128
7.12.110 ALM-14024 Tenant Space Usage Exceeds the Threshold.....	1130
7.12.111 ALM-14025 Tenant File Object Usage Exceeds the Threshold.....	1133
7.12.112 ALM-14026 Blocks on DataNode Exceed the Threshold.....	1135
7.12.113 ALM-14027 DataNode Disk Fault.....	1138
7.12.114 ALM-14028 Number of Blocks to Be Supplemented Exceeds the Threshold.....	1141
7.12.115 ALM-14029 Number of Blocks in a Replica Exceeds the Threshold.....	1143
7.12.116 ALM-14030 HDFS Allows Write of Single-Replica Data.....	1146
7.12.117 ALM-14031 DataNode Process Is Abnormal.....	1147

7.12.118 ALM-14032 JournalNode Process Is Abnormal.....	1149
7.12.119 ALM-14033 ZKFC Process Is Abnormal.....	1151
7.12.120 ALM-14034 Router Process Is Abnormal.....	1153
7.12.121 ALM-14035 HttpFS Process Is Abnormal.....	1155
7.12.122 ALM-16000 Percentage of Sessions Connected to the HiveServer to Maximum Number Allowed Exceeds the Threshold.....	1157
7.12.123 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold.....	1159
7.12.124 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold.....	1161
7.12.125 ALM-16003 Background Thread Usage Exceeds the Threshold.....	1164
7.12.126 ALM-16004 Hive Service Unavailable.....	1167
7.12.127 ALM-16005 The Heap Memory Usage of the Hive Process Exceeds the Threshold.....	1171
7.12.128 ALM-16006 The Direct Memory Usage of the Hive Process Exceeds the Threshold.....	1175
7.12.129 ALM-16007 Hive GC Time Exceeds the Threshold.....	1179
7.12.130 ALM-16008 Non-Heap Memory Usage of the Hive Process Exceeds the Threshold.....	1183
7.12.131 ALM-16009 Map Number Exceeds the Threshold.....	1187
7.12.132 ALM-16045 Hive Data Warehouse Is Deleted.....	1189
7.12.133 ALM-16046 Hive Data Warehouse Permission Is Modified.....	1190
7.12.134 ALM-16047 HiveServer Has Been Deregistered from ZooKeeper.....	1192
7.12.135 ALM-16048 Tez or Spark Library Path Does Not Exist.....	1195
7.12.136 ALM-17003 Oozie Service Unavailable.....	1196
7.12.137 ALM-17004 Oozie Heap Memory Usage Exceeds the Threshold.....	1200
7.12.138 ALM-17005 Oozie Non Heap Memory Usage Exceeds the Threshold.....	1203
7.12.139 ALM-17006 Oozie Direct Memory Usage Exceeds the Threshold.....	1206
7.12.140 ALM-17007 Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold.....	1208
7.12.141 ALM-17008 Abnormal Connection Between Oozie and ZooKeeper.....	1211
7.12.142 ALM-17009 Abnormal Connection Between Oozie and DBService.....	1213
7.12.143 ALM-17010 Abnormal Connection Between Oozie and HDFS.....	1215
7.12.144 ALM-17011 Abnormal Connection Between Oozie and Yarn.....	1217
7.12.145 ALM-18000 Yarn Service Unavailable.....	1219
7.12.146 ALM-18002 NodeManager Heartbeat Lost.....	1221
7.12.147 ALM-18003 NodeManager Unhealthy.....	1224
7.12.148 ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold.....	1227
7.12.149 ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold.....	1231
7.12.150 ALM-18010 ResourceManager GC Time Exceeds the Threshold.....	1233
7.12.151 ALM-18011 NodeManager GC Time Exceeds the Threshold.....	1237
7.12.152 ALM-18012 JobHistoryServer GC Time Exceeds the Threshold.....	1240
7.12.153 ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold.....	1242
7.12.154 ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold.....	1245
7.12.155 ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold.....	1247
7.12.156 ALM-18016 Non Heap Memory Usage of ResourceManager Exceeds the Threshold.....	1250
7.12.157 ALM-18017 Non Heap Memory Usage of NodeManager Exceeds the Threshold.....	1253
7.12.158 ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold.....	1256
7.12.159 ALM-18019 Non Heap Memory Usage of JobHistoryServer Exceeds the Threshold.....	1258

7.12.160 ALM-18020 Yarn Task Execution Timeout.....	1261
7.12.161 ALM-18021 Mapreduce Service Unavailable.....	1263
7.12.162 ALM-18022 Insufficient Yarn Queue Resources.....	1266
7.12.163 ALM-18023 Number of Pending Yarn Tasks Exceeds the Threshold.....	1269
7.12.164 ALM-18024 Pending Yarn Memory Usage Exceeds the Threshold.....	1271
7.12.165 ALM-18025 Number of Terminated Yarn Tasks Exceeds the Threshold.....	1273
7.12.166 ALM-18026 Number of Failed Yarn Tasks Exceeds the Threshold.....	1275
7.12.167 ALM-19000 HBase Service Unavailable.....	1277
7.12.168 ALM-19006 HBase Replication Sync Failed.....	1283
7.12.169 ALM-19007 HBase GC Time Exceeds the Threshold.....	1287
7.12.170 ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold.....	1291
7.12.171 ALM-19009 Direct Memory Usage of the HBase Process Exceeds the Threshold.....	1294
7.12.172 ALM-19011 RegionServer Region Number Exceeds the Threshold.....	1298
7.12.173 ALM-19012 HBase System Table Directory or File Lost.....	1302
7.12.174 ALM-19013 Duration of Regions in transaction State Exceeds the Threshold.....	1304
7.12.175 ALM-19014 Capacity Quota Usage on ZooKeeper Exceeds the Threshold Severely.....	1307
7.12.176 ALM-19015 Quantity Quota Usage on ZooKeeper Exceeds the Threshold.....	1309
7.12.177 ALM-19016 Quantity Quota Usage on ZooKeeper Exceeds the Threshold Severely.....	1312
7.12.178 ALM-19017 Capacity Quota Usage on ZooKeeper Exceeds the Threshold.....	1315
7.12.179 ALM-19018 HBase Compaction Queue Size Exceeds the Threshold.....	1317
7.12.180 ALM-19019 Number of HBase HFiles to Be Synchronized Exceeds the Threshold.....	1319
7.12.181 ALM-19020 Number of HBase WAL Files to Be Synchronized Exceeds the Threshold.....	1322
7.12.182 ALM-19021 Handler Usage of RegionServer Exceeds the Threshold.....	1325
7.12.183 ALM-19022 HBase Hotspot Detection Is Unavailable.....	1328
7.12.184 ALM-19023 Region Traffic Restriction for HBase.....	1331
7.12.185 ALM-19024 RPC Requests P99 Latency on RegionServer Exceeds the Threshold.....	1333
7.12.186 ALM-19025 Damaged StoreFile in HBase.....	1336
7.12.187 ALM-19026 Damaged WAL Files in HBase.....	1338

1 Preparations

1.1 Configuring MRS Cloud Service Authorization

You can interact with MRS clusters on the MRS console, monitor their status, and perform management operations. However, you need to obtain service authorization before using MRS for the first time.

After permission assignment, MRS creates an agency named **mrs_admin_agency** in Identity and Access Management (IAM). After the agency is created, do not modify or delete it. Deleting the agency or the Tenant Administrator role in the agency will automatically cancel the permission assignment. If permission assignment is canceled, functions such as cluster creation, cluster scale-in/out, Master node specification upgrade, auto scaling, cluster name modification, and IAM user synchronization will be affected, and the cluster running status cannot be monitored.

Registering with Huawei Cloud

If you have registered with Huawei Cloud, log in to the management console and access your MRS. If you do not have an account, register one with Huawei Cloud. After the registration, your account can be used to access all public cloud services, including your MRS.

Step 1 Visit [Huawei Cloud](#).

Step 2 Click **Register** and complete the registration as instructed.

After you have registered, the system automatically redirects you to your personal information page.

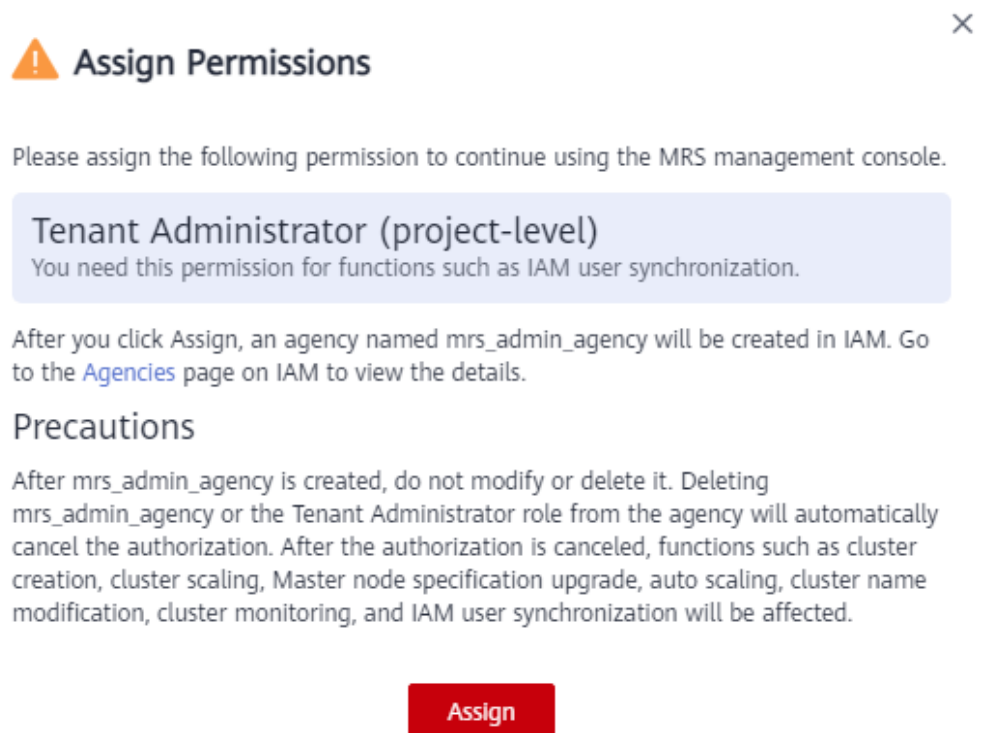

----End

Procedure

Step 1 Log in to the management console.

Step 2 Choose **Analytics > MapReduce Service** in the service list. The **Assign Permissions** page is displayed.

Figure 1-1 Assigning permissions

Step 3 Click **Assign**.

After assignment is agreed, an agency named **`mrs_admin_agency`** will be created in IAM. Do not modify or delete the agency after it is created. After the agency is created, you can use MRS.

 **NOTE**

After assignment, if the agency fails to be created, it is probably because the number of agencies already reaches the upper limit. In this case, log in to the IAM console and delete unnecessary agencies, or contact the administrator to increase the agency quota.

----End

1.2 Creating an IAM User and Granting MRS Permissions

Use **IAM** to implement fine-grained permission control over your MRS. With IAM, you can:

- Create IAM users under your Huawei Cloud account for employees based on your enterprise's organizational structure so that each employee is allowed to access MRS resources using their unique security credential (IAM user).
- Grant only the permissions required for users to perform a specific task.
- Entrust a Huawei Cloud account or cloud service to perform efficient O&M on your MRS resources.

If your Huawei Cloud account does not require IAM users, skip this section.

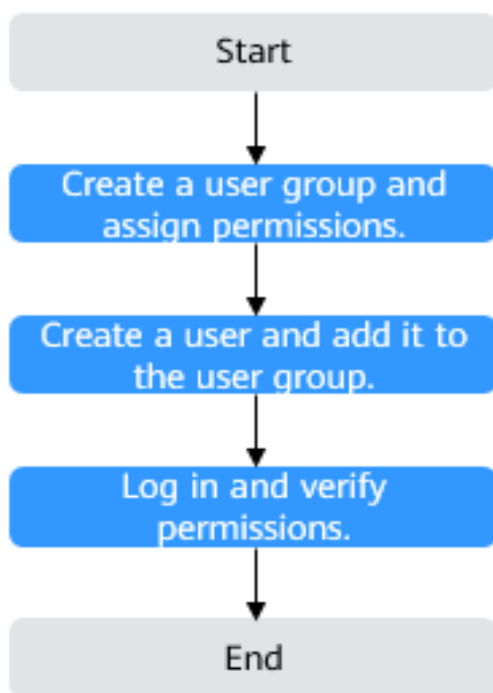

This section describes the procedure for granting permissions (see [Figure 1-2](#)).

Prerequisites

Learn about the permissions supported by MRS by referring to [Permission Management](#). For the permissions of other services, see [Permission Description](#).

Process Flow

Figure 1-2 Process for granting MRS permissions

1. [Creating a User Group and Assigning Permissions](#)

Create a user group on the IAM console, and assign MRS permissions to the group.

2. [Create a user and add it to a user group.](#)

Create a user on the IAM console and add the user to the group created in [1](#).

3. [Log in](#) and verify permissions.

Log in to the console by using the user created, and verify that the user has the granted permissions.

- Choose **Service List > Analytics > MapReduce Service**. Click **Buy Cluster** on the MRS console. If you fail to buy an MRS cluster (assume that you only have the **MRS ReadOnlyAccess** permission), the **MRS ReadOnlyAccess** policy has taken effect.

- Choose any other service in **Service List**. If a message appears indicating that you have insufficient permissions to access the service, the **MRS ReadOnlyAccess** policy has already taken effect.

IAM permissions of MRS

By default, new IAM users lack permissions assigned. Add a user to one or more groups, and attach permissions policies or roles to these groups. Users inherit permissions from the groups to which they are added and can perform specified operations on cloud services.

MRS is a project-level service deployed for specific regions. To assign permissions to a user group, specify **Scope** as **Region-specific projects** and select projects in the corresponding region for the permissions to take effect. If **All projects** is selected, the permissions will take effect for the user group in all region-specific projects. When accessing MRS, the users need to switch to the authorized region.

You can grant permissions by using roles and policies.

- **Roles:** A coarse-grained IAM authorization strategy to assign permissions based on user responsibilities. Only a limited number of service-level roles are available. Some roles depend on other roles to take effect. When you assign such roles to users, remember to assign the roles they depend on. Roles are not an ideal choice for fine-grained authorization and secure access control.
- **Policies:** A fine-grained authorization mechanism that defines permissions required to perform operations on specific cloud resources under certain conditions. This type of authorization is more flexible and is ideal for secure access control. For example, you can grant MRS users only the permissions for performing specified operations on MRS clusters, such as creating a cluster and querying a cluster list rather than deleting a cluster. Most policies define permissions based on APIs. For the API actions supported by MRS, see [Permissions Policies and Supported Actions](#).

Table 1-1 lists all the default system policies supported by MRS.

Table 1-1 MRS system policies

Policy	Description	Type
MRS FullAccess	Administrator permissions for MRS. Users with these permissions can perform all operations on MRS resources.	Fine-grained policy
MRS CommonOperations	Common user permissions for MRS. Users with these permissions can use MRS but cannot add or delete resources.	Fine-grained policy
MRS ReadOnlyAccess	Read-only permission for MRS. Users with these permissions can only view MRS resources.	Fine-grained policy

Policy	Description	Type
MRS Administrator	Operation permissions: <ul style="list-style-type: none"> • All operations on MRS • Permissions of the Tenant Guest and Server Administrator policies, which must also be granted to the users 	RBAC policy

Table 1-2 lists the common operations supported by each system-defined policy or role of MRS. Select the permissions as needed.

Table 1-2 Common operations supported by each system-defined policy

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Creating a cluster	√	x	x	√
Resizing a cluster	√	x	x	√
Upgrading node specifications	√	x	x	√
Deleting a cluster	√	x	x	√
Querying cluster details	√	√	√	√
Listing all clusters	√	√	√	√
Configuring an auto scaling rule	√	x	x	√
Querying a host list	√	√	√	√
Querying operation logs	√	√	√	√

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Creating and executing a job	√	√	x	√
Stopping a job	√	√	x	√
Deleting a single job	√	√	x	√
Deleting jobs in batches	√	√	x	√
Querying job details	√	√	√	√
Querying a job list	√	√	√	√
Creating a folder	√	√	x	√
Deleting a file	√	√	x	√
Querying a file list	√	√	√	√
Operating cluster tags in batches	√	√	x	√
Creating a single cluster tag	√	√	x	√
Deleting a single cluster tag	√	√	x	√
Querying a resource list by tag	√	√	√	√
Querying cluster tags	√	√	√	√
Accessing Manager	√	√	x	√

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Querying a patch list	√	√	√	√
Installing a patch	√	√	x	√
Uninstalling a patch	√	√	x	√
Authorizing O&M channels	√	√	x	√
Sharing O&M channel logs	√	√	x	√
Querying an alarm list	√	√	√	√
Subscribing to alarm notifications	√	√	x	√
Submitting a SQL statement	√	√	x	√
Querying SQL query results	√	√	x	√
Canceling a SQL execution task	√	√	x	√

1.3 Creating a Custom Policy for MRS

Custom policies can be created to supplement the system-defined policies of MRS. For the actions that can be added to custom policies, see [Permissions Policies and Supported Actions](#).

You can create custom policies in either of the following ways:

- Visual editor: Select cloud services, actions, resources, and request conditions. This does not require knowledge of policy syntax.

- JSON: Edit JSON policies from scratch or based on an existing policy.

For details, see [Creating a Custom Policy](#).

 **NOTE**

Custom policy modifications do not take effect immediately. You need to wait about 15 minutes.

The following section contains examples of common MRS custom policies.

Example Custom Policies

- Example 1: Allowing users to create MRS clusters only

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:create",
        "ecs:*:*",
        "bms:*:*",
        "evs:*:*",
        "vpc:*:*",
        "smn:*:*"
      ]
    }
  ]
}
```

- Example 2: Allowing users to modify MRS clusters.

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:resize"
      ]
    }
  ]
}
```

- Example 3: Allowing users to create a cluster, create and execute a job, and delete a single job, but denying cluster deletion

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:create",
        "mrs:job:submit",
        "mrs:job:delete"
      ]
    },
    {
      "Effect": "Deny",
      "Action": [
        "mrs:cluster:delete"
      ]
    }
  ]
}
```

- Example 4: Granting users the minimum permission to create an MRS cluster with ECS specifications

 NOTE

- If you need a key pair when creating a cluster, add the following permissions: **ecs:serverKeypairs:get** and **ecs:serverKeypairs:list**.
- Add the **kms:cmk:list** permission when encrypting data disks during cluster creation.
- Add the **mrs:alarm:subscribe** permission to enable the alarm function during cluster creation.
- Add the **rds:instance:list** permission to use external data sources during cluster creation.

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:create"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "ecs:cloudServers:updateMetadata",
        "ecs:cloudServerFlavors:get",
        "ecs:cloudServerQuotas:get",
        "ecs:servers:list",
        "ecs:servers:get",
        "ecs:cloudServers:delete",
        "ecs:cloudServers:list",
        "ecs:serverInterfaces:get",
        "ecs:serverGroups:manage",
        "ecs:servers:setMetadata",
        "ecs:cloudServers:get",
        "ecs:cloudServers:create"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "vpc:securityGroups:create",
        "vpc:securityGroupRules:delete",
        "vpc:vpcs:create",
        "vpc:ports:create",
        "vpc:securityGroups:get",
        "vpc:subnets:create",
        "vpc:privateIps:delete",
        "vpc:quotas:list",
        "vpc:networks:get",
        "vpc:publicIps:list",
        "vpc:securityGroups:delete",
        "vpc:securityGroupRules:create",
        "vpc:privateIps:create",
        "vpc:ports:get",
        "vpc:ports:delete",
        "vpc:publicIps:update",
        "vpc:subnets:get",
        "vpc:publicIps:get",
        "vpc:ports:update",
        "vpc:vpcs:list"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "evs:quotas:get",
        "evs:types:get"
      ]
    }
  ]
}
```

```
    },  
    {  
      "Effect": "Allow",  
      "Action": [  
        "bms:serverFlavors:get"  
      ]  
    }  
  ]  
}
```

- Example 5: Granting users the minimum permission to create an MRS cluster with BMS specifications

NOTE

- If you need a key pair when creating a cluster, add the following permissions: **ecs:serverKeypairs:get** and **ecs:serverKeypairs:list**.
- Add the **kms:cmk:list** permission when encrypting data disks during cluster creation.
- Add the **mrs:alarm:subscribe** permission to enable the alarm function during cluster creation.
- Add the **rds:instance:list** permission to use external data sources during cluster creation.

```
{  
  "Version": "1.1",  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": [  
        "mrs:cluster:create"  
      ]  
    },  
    {  
      "Effect": "Allow",  
      "Action": [  
        "ecs:servers:list",  
        "ecs:servers:get",  
        "ecs:cloudServers:delete",  
        "ecs:serverInterfaces:get",  
        "ecs:serverGroups:manage",  
        "ecs:servers:setMetadata",  
        "ecs:cloudServers:create",  
        "ecs:cloudServerFlavors:get",  
        "ecs:cloudServerQuotas:get"  
      ]  
    },  
    {  
      "Effect": "Allow",  
      "Action": [  
        "vpc:securityGroups:create",  
        "vpc:securityGroupRules:delete",  
        "vpc:vpcs:create",  
        "vpc:ports:create",  
        "vpc:securityGroups:get",  
        "vpc:subnets:create",  
        "vpc:privateIps:delete",  
        "vpc:quotas:list",  
        "vpc:networks:get",  
        "vpc:publicIps:list",  
        "vpc:securityGroups:delete",  
        "vpc:securityGroupRules:create",  
        "vpc:privateIps:create",  
        "vpc:ports:get",  
        "vpc:ports:delete",  
        "vpc:publicIps:update",  
        "vpc:subnets:get",  
        "vpc:publicIps:get",  
      ]  
    }  
  ]  
}
```

```
        "vpc:ports:update",
        "vpc:vpcs:list"
    ]
  },
  {
    "Effect": "Allow",
    "Action": [
      "evs:quotas:get",
      "evs:types:get"
    ]
  },
  {
    "Effect": "Allow",
    "Action": [
      "bms:servers:get",
      "bms:servers:list",
      "bms:serverQuotas:get",
      "bms:servers:updateMetadata",
      "bms:serverFlavors:get"
    ]
  }
]
}
```

- Example 6: Allowing users to create a hybrid ECS and BMS cluster with the minimum permission

NOTE

- If you need a key pair when creating a cluster, add the following permissions: **ecs:serverKeyPairs:get** and **ecs:serverKeyPairs:list**.
- Add the **kms:cmk:list** permission when encrypting data disks during cluster creation.
- Add the **mrs:alarm:subscribe** permission to enable the alarm function during cluster creation.
- Add the **rds:instance:list** permission to use external data sources during cluster creation.

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:create"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "ecs:cloudServers:updateMetadata",
        "ecs:cloudServerFlavors:get",
        "ecs:cloudServerQuotas:get",
        "ecs:servers:list",
        "ecs:servers:get",
        "ecs:cloudServers:delete",
        "ecs:cloudServers:list",
        "ecs:serverInterfaces:get",
        "ecs:serverGroups:manage",
        "ecs:servers:setMetadata",
        "ecs:cloudServers:get",
        "ecs:cloudServers:create"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "vpc:securityGroups:create",

```

```
        "vpc:securityGroupRules:delete",
        "vpc:vpcs:create",
        "vpc:ports:create",
        "vpc:securityGroups:get",
        "vpc:subnets:create",
        "vpc:privateIps:delete",
        "vpc:quotas:list",
        "vpc:networks:get",
        "vpc:publicIps:list",
        "vpc:securityGroups:delete",
        "vpc:securityGroupRules:create",
        "vpc:privateIps:create",
        "vpc:ports:get",
        "vpc:ports:delete",
        "vpc:publicIps:update",
        "vpc:subnets:get",
        "vpc:publicIps:get",
        "vpc:ports:update",
        "vpc:vpcs:list"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "evs:quotas:get",
        "evs:types:get"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "bms:servers:get",
        "bms:servers:list",
        "bms:serverQuotas:get",
        "bms:servers:updateMetadata",
        "bms:serverFlavors:get"
    ]
}
]
```

2 MRS Cluster Planning

2.1 Service Selection

2.1.1 MRS Cluster Types

MRS consists of multiple big data components, and you can select the cluster type that best fits your service requirements, data types, reliability expectations, and resource budget.

You can **quickly buy** a cluster using the preset cluster template or select the component list and advanced settings to **manually buy** a cluster.

Table 2-1 MRS cluster types

Type	Scenario	Core component
Hadoop analysis cluster	Hadoop cluster uses components in the open source Hadoop ecosystem to analyze and query vast amounts of data. For example, use YARN to manage cluster resources, Hive and Spark to provide offline storage and computing of large-scale distributed data, Spark Streaming and Flink to offer streaming data computing, and Tez to provide a distributed computing framework of directed acyclic graphs (DAGs).	Hadoop, Hive, Spark, Tez, Flink, ZooKeeper, and Ranger

Type	Scenario	Core component
HBase query cluster	An HBase cluster uses Hadoop and HBase components to provide a column-oriented distributed cloud storage system featuring enhanced reliability, great performance, and elastic scalability. It applies to the storage and distributed computing of massive amounts of data. You can use HBase to build a storage system capable of storing TB- or even PB-level data. With HBase, you can filter and analyze data with ease and get responses in milliseconds, rapidly mining data value.	Hadoop, HBase, ZooKeeper, and Ranger
Kafka streaming cluster	Kafka cluster uses Kafka and Storm to provide an open source message system with high throughput and scalability. It is widely used in scenarios such as log collection and monitoring data aggregation to implement efficient streaming data collection and real-time data processing and storage.	Kafka and Storm
ClickHouse cluster	ClickHouse is a columnar database management system for online analysis. It features ultimate compression ratio and fast query performance. It is widely used in Internet advertisement, app and web traffic analysis, telecom, finance, and IoT fields.	ClickHouse and ZooKeeper
Real-time analysis cluster	Real-time analysis clusters use Hadoop, Kafka, Flink, and ClickHouse components to provide a system for collection, real-time analysis, and query of data at scale.	Hadoop, Kafka, Flink, ClickHouse, ZooKeeper, and Ranger

2.1.2 MRS Cluster Node Types

An MRS cluster consists of multiple ECSs. The system manages nodes in node groups based on specifications. Nodes in the same node group use same ECS specifications.

Nodes in a cluster can be classified into Master nodes, Core nodes, and Task nodes based on the roles of components deployed on the nodes.

Table 2-2 Cluster node types

Node Type	Functions
Master node	<p>MRS cluster management node. OMS server is deployed on the node to manage and monitor the cluster.</p> <p>After creating the MRS cluster, the node containing master1 in its name functions as the Master1 node, and the one with master2 in its name functions as the Master2 node.</p> <p>You can log in to a Master node either using VNC on the ECS management console or using SSH. After logging in to the Master node, you can access other nodes without entering passwords.</p> <p>The system automatically deploys the Master nodes in active/standby mode and supports the high availability (HA) feature for MRS cluster management. If the active management node fails, the standby management node switches to the active state and takes over services.</p> <p>To determine whether the Master1 node is the active management node, see Checking MRS Active/Standby Management Nodes.</p>
Core node	<p>Work node of an MRS cluster. It processes and analyzes data and stores process data.</p> <p>In the Nodes tab of the cluster details page, the nodes in the node group whose Node Type includes Core are Core nodes.</p>
Task node	<p>Compute node. When the compute resources of a cluster are insufficient, you can configure elastic scaling policies to increase nodes automatically.</p> <p>In the Nodes tab of the cluster details page, the nodes in the node group whose Node Type is Task are Task nodes.</p> <p>If only the NodeManager (Yarn) or Supervisor (Storm) role is deployed in a node group in addition to basic mandatory roles, this node group is a Task node group.</p>

MRS cluster nodes support remote login. The following remote login methods are available:

- GUI login: Use the remote login function provided by the ECS console to log in to the Linux CLI of the cluster node.
- SSH login: Use a remote login tool like PuTTY to access Linux ECSs. You need to bind an EIP to the ECS first.

Apply for and bind an EIP to a cluster node. For details, see [Assigning an EIP](#).

You can log in to the ECS using a key or password. For details, see [Logging In to an MRS Cluster Node](#).

2.1.3 MRS Cluster Node Specifications

MRS Node Specifications

MRS supports host specifications determined by CPU, memory, and disk space.

Tenants share physical resources of ECSs, but can exclusively use resources of BMSs. BMSs can better meet your requirements for deploying key applications and services that require high performance (such as big data clusters and enterprise middleware systems) and a secure and reliable running environment. If BMS specifications are used, Master node specifications cannot be scaled up.

MRS supports BMS specifications only when the billing mode of a cluster is **Yearly/Monthly**.

MRS supports the following hybrid deployment of **ECSs** and **BMSs**:

- Master, Core, and Task nodes are deployed on ECSs.
- Master and Core nodes are deployed on BMSs, and Task nodes are deployed on ECSs.
- Master nodes are deployed on either ECSs or BMSs, Core nodes are deployed on either ECSs or BMSs, and Task nodes are deployed on ECSs.

Tenants share physical resources of ECSs, but can exclusively use resources of BMSs. BMSs can better meet your requirements for deploying key applications and services that require high performance (such as big data clusters and enterprise middleware systems) and a secure and reliable running environment.

If BMS specifications are used, Master node specifications cannot be scaled up.

NOTE

- More advanced instance specifications provide better data processing. However, they require higher cluster cost.
- Instance specifications may vary in different AZs. If no instance specifications in the current AZ can meet your requirements, switch to another AZ.
- If you select HDDs for Core nodes, there is no billing information for data disks. The fees are charged with ECSs.
- If you select non-HDD disks for Core nodes, the disk types of Master and Core nodes are determined by **Data Disk**.
- If **Sold out** appears next to an instance specification of a node, the node of this specification cannot be bought. You can only buy nodes of other specifications.
- The Master node specification (4 vCPUs 8 GB) is not within the SLA after-sales scope. It is applicable only to the test environment and is not recommended for the production environment.
- For MRS 3.x or later, the memory of the master node must be greater than 64 GB.

Disk Roles

Table 2-3 Disk types of MRS cluster nodes

Disk Role	Description
System disk	<p>Storage type and space of the system disk on a node.</p> <p>Storage type can be any of the following:</p> <ul style="list-style-type: none">• SAS: high I/O• SSD: ultra-high I/O• GPSSD: general-purpose SSD
Data disk	<p>Data disk storage space of a node. For more data storage, you can add disks when creating a cluster. A maximum of 10 disks can be added to each Core or Task node.</p> <ul style="list-style-type: none">• Data storage and computing are separated. Data is stored in OBS, which features low cost and unlimited storage capacity. The clusters can be deleted at any time in OBS. The computing performance is determined by OBS access performance and is lower than that of HDFS. This configuration is recommended if data computing is infrequent.• Data storage and computing are not separated. Data is stored in HDFS, which features high cost, high computing performance, and limited storage capacity. Before deleting clusters, you must export and store the data. This configuration is recommended if data computing is frequent. <p>The storage type can be any of the following:</p> <ul style="list-style-type: none">• SAS: high I/O• SSD: ultra-high I/O• GPSSD: general-purpose SSD <p>NOTE</p> <p>Adding nodes to an MRS cluster requires increasing the disk capacity of the management node (Master node). To ensure stable cluster running, set the disk capacity of the Master node to over 600 GB if the number of nodes is 300 and increase it to over 1 TB if the number of nodes reaches 500.</p>

2.2 MRS Cluster Deployment

2.2.1 Overview

The analysis cluster, streaming cluster, and hybrid cluster provided by MRS use fixed templates to deploy cluster processes. Therefore, you cannot customize service processes on management nodes and control nodes.

If you want to customize the cluster deployment, set **Cluster Type** to **Custom** when creating a cluster. In this way, you can customize the deployment mode of process instances on the management nodes and control nodes in the cluster.

 **NOTE**

Only MRS 3.x and later versions support the creation of clusters in a custom topology.

A custom cluster provides the following functions:

- Separated deployment of the management and control roles: The management role and control role are deployed on different Master nodes.
- Co-deployment of the management and control roles: The management and control roles are co-deployed on the Master node.
- Components are deployed separately to avoid resource contention.

MRS Cluster Deployment Types

Table 2-4 MRS cluster deployment types

Common Node	Description	Node Range
Compact	The management role and control role are deployed on the Master node, and data instances are deployed in the same node group. This deployment mode applies to scenarios where the number of control nodes is less than 100, reducing costs.	<ul style="list-style-type: none">• The number of Master nodes is greater than or equal to 3 and less than or equal to 11.• The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.
Co-deployment of the management role, control role, and data instances	This template is not recommended in the production environment or commercial environment. If management, control, and data nodes are deployed together, cluster performance and reliability may deteriorate. If there are enough nodes, deploy data nodes separately.	<ul style="list-style-type: none">• There must be at least 3 master nodes and 100 at most.• The total node groups are no more than 10.
OMS-separate	The management role and control role are deployed on different Master nodes, and data instances are deployed in the same node group. This deployment mode is applicable to a cluster with 100 to 500 nodes and delivers better performance in high-concurrency load scenarios.	<ul style="list-style-type: none">• The number of Master nodes is greater than or equal to 5 and less than or equal to 11.• The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.

Common Node	Description	Node Range
Full-size	The management role and control role are deployed on different Master nodes, and data instances are deployed in different node groups. This deployment mode is applicable to a cluster with more than 500 nodes. Components can be deployed separately, which can be used for a larger cluster scale.	<ul style="list-style-type: none"> The number of Master nodes is greater than or equal to 9 and less than or equal to 11. The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.

Role Deployment Rules for MRS Clusters

The MRS system consists of multiple services in logical architecture. Each service contains one or more roles. Each role can deploy one or more instances.

- **Service:** A service is a kind of service capabilities provided by a component in a cluster. Each component in the cluster provides a service and is named by the service.
- **Role:** Roles are components of a service. Each service consists of one or more roles. Services are deployed on nodes (servers) through roles to ensure normal service running.
- **Instance:** An instance is formed when a service role is installed on a node. A service has one or more role instances.

For details about the deployment principles of each service, see [Overview](#).

- **Service A depending on service B:** If service A is deployed in a cluster, service B must be deployed in advance. Service B provides basic capabilities for service A.
- **Service A associated with service B:** Service A exchanges data with service B during service running but does not depend on service B during deployment.
- **Role A and role B deployed on the same server:** If role A is deployed in a cluster, role B must also be deployed, and role A and role B must be deployed on the same node.

Table 2-5 MRS role deployment rules

Service	Dependency	Role	Role Deployment Suggestions
OMSServer	-	OMSServer	This role can be deployed it on the Master node and cannot be modified.

Service	Dependency	Role	Role Deployment Suggestions
ClickHouse	Depends on ZooKeeper.	CHS (ClickHouseServer)	This role can be deployed on all nodes. You can deploy 2 to 256 role instances, but the number must be even.
		CLB (ClickHouseBalancer)	This role can be deployed on all nodes. Number of role instances to be deployed: 2 to 256
Flink	<ul style="list-style-type: none"> • Depends on ZooKeeper. • Depends on KrbServer. • Depends on DBService. • Depends on Hadoop. 	FR(FlinkResource)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000
		FS(FlinkServer)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 2
Flume	-	MS(MonitorServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2
		F(Flume)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000
Hadoop	Depends on ZooKeeper.	NN(NameNode)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2
		HFS (HttpFS)	This role can be deployed on the Master node only. Number of role instances to be deployed: 0 to 10
		JN(JournalNode)	This role can be deployed on the Master node only. Number of role instances to be deployed: 3 to 60, with the step size of 2

Service	Dependency	Role	Role Deployment Suggestions
		DN(DataNode)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000
		RM(Resource Manager)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2
		NM(NodeManager)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000
		JHS(JobHistoryServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2
		TLS(Timeline Server)	This role can be deployed on the Master node only. Number of role instances to be deployed: 0 to 1
HBase	Depends on Hadoop.	HM(HMaster)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2
		TS(ThriftServer)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 10,000
		RT(RESTServer)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 10,000
		RS(RegionServer)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000

Service	Dependency	Role	Role Deployment Suggestions
		TS1(Thrift1Server)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 10,000 If the Hue service is installed in a cluster and HBase needs to be used on the Hue web UI, install this instance for HBase.
HetuEngine	<ul style="list-style-type: none"> • Depends on Hadoop. • Depends on DBService. • Depends on Hive. • Depends on ZooKeeper. • Depends on KrbServer. • Depends on Yarn. • Depends on HDFS. 	HSB(HSBroker)	This role can be deployed on all nodes. Number of role instances to be deployed: 2 to 50
		HSC(HSConsole)	This role can be deployed on all nodes. Number of role instances to be deployed: 2
		HSF(HSFabric)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 50
		QAS (available for MRS 3.2.0-LTS.1 and later versions only)	This role can be deployed on all nodes. Number of role instances to be deployed: 0 to 2
Hive	<ul style="list-style-type: none"> • Depends on Hadoop. • Depends on DBService. 	MS(MetaStore)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 10
		WH (WebHCat)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 10
		HS(HiveServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 80
Hue	Depends on DBService.	H(Hue)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2

Service	Dependency	Role	Role Deployment Suggestions
Impala	<ul style="list-style-type: none"> • Depends on Hadoop. • Depends on Hive. • Depends on DBService. • Depends on ZooKeeper. 	StateStore	This role can be deployed on the Master node only. Number of role instances to be deployed: 1
		Catalog	This role can be deployed on the Master node only. Number of role instances to be deployed: 1
		Impalad	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000
IoTDB	Depends on KrbServer.	ConfigNode (CN)	This role can be deployed on Master nodes only. Number of role instances to be deployed: 3 to 9, with the step size of 2
		IoTDBServer (IoTDBS)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 256
Kafka	Depends on ZooKeeper.	B(Broker)	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000
Kudu	-	KuduMaster	This role can be deployed on the Master node only. Number of role instances to be deployed: 3 or 5
		KuduTserver	This role can be deployed on all nodes. Number of role instances to be deployed: 3 to 10,000
Loader	<ul style="list-style-type: none"> • Depends on Hadoop. • Depends on DBService. 	LS(LoaderServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2

Service	Dependency	Role	Role Deployment Suggestions
Oozie	<ul style="list-style-type: none"> • Depends on Hadoop. • Depends on DBService. • Depends on ZooKeeper. 	O(oozie)	<p>This role can be deployed on the Master node only.</p> <p>Number of role instances to be deployed: 2</p>
Presto	Depends on Hive.	PCD(Coordinator)	<p>This role can be deployed on the Master node only.</p> <p>Number of role instances to be deployed: 2</p>
		PWK(Worker)	<p>This role can be deployed on all nodes.</p> <p>Number of role instances to be deployed: 1 to 10,000</p>
Ranger	Depends on DBService.	RA(RangerAdmin)	<p>This role can be deployed on the Master node only.</p> <p>Number of role instances to be deployed: 1 to 2</p>
		USC(UserSync)	<p>This role can be deployed on the Master node only.</p> <p>Number of role instances to be deployed: 1</p>
		TSC(TagSync)	<p>This role can be deployed on all nodes.</p> <p>Number of role instances to be deployed: 0 to 1</p>
Spark	<ul style="list-style-type: none"> • Depends on Hadoop. • Depends on Hive. • Depends on ZooKeeper. 	JS(JDBCServer)	<p>This role can be deployed on the Master node only.</p> <p>Number of role instances to be deployed: 1 to 2</p>
		JH(JobHistory)	<p>This role can be deployed on the Master node only.</p> <p>Number of role instances to be deployed: 1 to 2</p>
		SR(SparkResource)	<p>This role can be deployed on the Master node only.</p> <p>Number of role instances to be deployed: 1 to 2</p>

Service	Dependency	Role	Role Deployment Suggestions
Spark2x	<ul style="list-style-type: none"> • Depends on Hadoop. • Depends on Hive. • Depends on ZooKeeper. 	JS2X(JDBCServer2x)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 10
		JH2X(JobHistory2x)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2
		SR2X(SparkResource2x)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to 50
		IS2X(IndexServer2x)	(Optional) This role can be deployed on the Master node only. Number of role instances to be deployed: 0 to 2, with the step size of 2
Sqoop	Depends on Hadoop.	SC(SqoopClient)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to 10,000
Tez	<ul style="list-style-type: none"> • Depends on Hadoop. • Depends on DBService. • Depends on ZooKeeper. 	TUI(TezUI)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2
ZooKeeper	-	QP(quorumpeer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 3 to 9, with the step size of 2

2.2.2 Kerberos Authentication for MRS Clusters

The Hadoop community version has two authentication modes: Kerberos authentication for security and Simple authentication for regular use. During cluster setup, you can choose to enable or disable Kerberos authentication. Once the cluster is created, it cannot be modified.

Security Mode (Kerberos Authentication Enabled)

The MRS clusters in security mode use the Kerberos authentication protocol for security authentication. The Kerberos protocol supports mutual authentication between clients and servers. This eliminates the risks incurred by sending user credentials over the network for simulated authentication. In clusters, KrbServer provides the Kerberos authentication support.

Kerberos user object

In the Kerberos protocol, each user object is a principal. A complete principal consists of username and domain name. In O&M or application development scenarios, the user identity must be verified before a client connects to a server. Users for O&M and service operations are classified into human-machine and machine-machine users. The password of human-machine users is manually configured, while the password of machine-machine users is generated by the system randomly.

Kerberos authentication

Kerberos authentication supports two authentication modes: password authentication and keytab authentication. The default authentication validity period is 24 hours.

- Password authentication: User identity is verified by entering the correct password. This mode mainly used in O&M scenarios where human-machine users are used. The client command is **kinit Username**.
- Keytab authentication: Keytab files contain users' principal and encrypted credential information. When keytab files are used for authentication, the system automatically uses encrypted credential information to perform authentication and the user password does not need to be entered. This mode is mainly used in component application development scenarios where machine-machine users are used. Keytab authentication can also be configured using the **kinit** command.

Common mode (Kerberos Authentication Disabled)

In normal clusters, MRS components use a native open source authentication mechanism, which is typically Simple authentication. If Simple authentication is used, authentication is automatically performed by a client user (for example, user **root**) by default when a client connects to a server. The authentication is imperceptible to the administrator or service user. In addition, when being executed, the client may even pretend to be any user (including **superuser**) by injecting **UserGroupInformation**. Cluster resource management and data control APIs are not authenticated on the server and are easily exploited and attacked by hackers.

It is best to use this for single-user scenarios in normal clusters, but make sure to tightly control network access permissions to keep the cluster secure.

- Deploy service applications on ECSs in the same VPC and subnet to avoid accessing the MRS cluster through the external network.
- Configure security group rules to strictly control the access scope. Do not configure access rules that allow **Any** or **0.0.0.0** for the inbound direction of MRS cluster ports.

2.2.3 ECS Specifications Supported by MRS Clusters

MRS uses ECSs of the following types in different application scenarios.

- General computing-plus: C3, C3ne, C6, and C6s
- Memory-optimized: M3, and M6
- Ultra-high I/O: I3 and IR3
- Kunpeng general computing-plus: KC1

MRS uses the following BMS:

- Kunpeng V1 BMS

ECS Flavor Naming Rules

AB.C.D

Example: m2.8xlarge.8

In the preceding flavor:

- **A** specifies the ECS type. For example, **s** indicates a general-purpose ECS, **c** a computing ECS, and **m** a memory-optimized ECS.
- **B** specifies the type ID. For example, the **1** in **s1** indicates a general-purpose first-generation ECS, and the **2** in **s2** indicates a general-purpose second-generation ECS.
- **C** specifies a flavor size and can be any of the following options: medium, large, and xlarge.
- **D** specifies the ratio of memory to vCPUs expressed in a digit. For example, value **4** indicates that the ratio of memory to vCPUs is 4.

ECS Specifications

Table 2-6 General computing-plus (C) ECS specifications

Type	vCPU	Memory (GB)	Flavor	Virtualization Type
C3	32	64	c3.8xlarge.2	KVM
C3	16	64	c3.4xlarge.4	KVM
C3	32	128	c3.8xlarge.4	KVM
C3	60	256	c3ne.15xlarge.4	KVM
C3ne	32	64	c3ne.8xlarge.2	KVM
C3ne	16	64	c3ne.4xlarge.4	KVM
C3ne	32	128	c3ne.8xlarge.4	KVM
C3ne	60	256	c3ne.15xlarge.4	KVM

Type	vCPU	Memory (GB)	Flavor	Virtualization Type
C6	32	64	c6.8xlarge.2	KVM

3 Buying MRS Clusters

3.1 Quickly Buying an MRS Cluster

MRS consists of multiple big data components, and you can select the cluster type that best fits your service requirements, data types, reliability expectations, and resource budget.

This section uses an HBase query cluster as an example to describe how to quickly purchase an MRS cluster. An HBase cluster uses Hadoop and HBase components to provide a column-oriented distributed cloud storage system featuring enhanced reliability, great performance, and elastic scalability. It applies to the storage and distributed computing of massive amounts of data. You can use HBase to build a storage system capable of storing TB- or even PB-level data. With HBase, you can filter and analyze data with ease and get responses in milliseconds, rapidly mining data value.

Procedure

- Step 1** Go to the [Buy Cluster](#) page.
- Step 2** On the displayed page, click the **Quick Config** tab.
- Step 3** Configure basic cluster information by referring to the following table.

Table 3-1 MRS cluster parameters

Parameter	Description	Example Value
Billing Mode	Billing mode of a cluster. MRS provides two billing modes: yearly/monthly and pay-per-use. Pay-per-use: If you select this mode, a prepaid balance will be frozen. For details, see Billing Description .	Pay-per-use

Parameter	Description	Example Value
Region	Region where the resource to be created is located. Resources located in different regions cannot communicate with each other using an internal network. To improve access speed and reduce network latency, choose a region that is close to your own.	-
Cluster Name	MRS cluster name. You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing. After a cluster is created, you can change the cluster name in the cluster list.	mrs-test
Cluster Type	Select a proper MRS cluster type based on service requirements. <ul style="list-style-type: none"> • Analysis cluster: It is used for offline data analysis and comprises data analysis tools like Hadoop, Spark, HBase, Hive, Flink, Oozie, and Tez. • Streaming cluster: It processes streaming data to quickly analyze real-time data sources, and it mainly includes streaming data processing tools such as Kafka and Flume. • Hybrid cluster: It is utilized for both offline data analysis and stream processing. • Custom: You can select from a variety of components that are supported by the corresponding version of the MRS cluster. 	Custom

Parameter	Description	Example Value
Version Type	<p>MRS provides two types of clusters: LTS and Normal. Different versions provide different components. You can select a version as required.</p> <ul style="list-style-type: none"> • LTS: employs MRS's own components to provide highly reliable clusters with strong DR capabilities, making long-term support and evolution possible. • Normal: integrates MRS's mature and stable features and functions with open-source capabilities, offering high performance and stability. 	LTS
Cluster Version	Version of the MRS cluster. Different versions may contain different open source component versions and functions. You are advised to select the latest version.	MRS 3.2.0-LTS.1
Component	Cluster templates containing preset opensource components you will need for your business.	HBase Query Cluster
AZ	Resources are assigned to the AZ of the current region during creation. An AZ is a physical region that operates on independent power supplies and networks for resource usage.	AZ1
VPC	VPC to which the MRS cluster node belongs. If no VPC is available, click View VPC to access the network console and create a VPC.	-
Subnet	Subnet information in the VPC. If no subnet is available, click View Subnet to access the network console and create a subnet.	-
Cluster Node	<p>Specifications and quantity of nodes in an MRS cluster.</p> <p>For MRS 3.x or later, the memory of the master node must be greater than 64 GB.</p>	Select the number of cluster node specifications as required.

Parameter	Description	Example Value
Kerberos Authentication	Whether to enable Kerberos authentication for each component in the MRS cluster. If Kerberos authentication is enabled, users can access component resources only after being authenticated. This function cannot be changed after you buy a cluster.	Switch this function on.
Username	Default user for logging in to Manager and nodes in the MRS cluster. User admin is used to log in to Manager, while user root is used to log in to the OS of nodes in the cluster.	-
Password/Confirm Password	Set the passwords for the root and admin users. The passwords are user-defined and must be kept secure.	-
Enterprise Project	Enterprise project is a way to manage cloud resources. It allows you to manage resources and members within a project, and you can choose to use the system-defined enterprise project default or create your own.	default
Secure Communications	To allow the MRS console to access big data components in the user VPC, you need to activate the relevant security group rules. For details, see Configuring Secure Communication Authorization for an MRS Cluster .	Select this function.

Step 4 Click **Buy Now**.

If Kerberos authentication is enabled, check whether this function is required. If it is, click **Continue**. If not, click **Back** to disable it and then proceed with the subsequent step. This function cannot be changed after you buy a cluster.

NOTE

For any doubt about the pricing, click **Pricing details** in the lower left corner.

Step 5 Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in [Table 6-9](#).

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

3.2 Manually Buying an MRS Cluster

This section describes how to create an MRS cluster on the MRS console.

MRS consists of multiple big data components, and you can select the cluster type that best fits your service requirements, data types, reliability expectations, and resource budget.

You can **quickly buy** a cluster using the preset cluster template or select the component list and advanced settings to manually buy a cluster.

Manually Buying an MRS Cluster

Step 1 Go to the **Buy Cluster** page.

Step 2 Click the **Custom Config** tab.

NOTE

When creating a cluster, pay attention to quota notification. If a resource quota is insufficient, increase the resource quota as prompted and create a cluster.

Step 3 In the basic configuration area, set basic information about the MRS cluster.

- **Billing Mode:** MRS provides two billing modes: yearly/monthly and pay-per-use.
- **Region:** Resources in different regions cannot communicate through intranet. To enhance access speed and minimize network latency, it is recommended to choose the nearest region when selecting the location of your resources.

Step 4 Configure the MRS cluster information as prompted.

When creating a cluster, you need to configure the cluster version, network, node specifications and quantity, and other advanced settings.

- **MRS Cluster Version Configuration**
- **MRS Cluster Network Configuration**
- **MRS Cluster Node Configuration**
- **Other MRS Cluster Configuration Parameters**

Step 5 After the cluster information is configured, click **Buy Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster. This function cannot be changed after you buy a cluster.

NOTE

- For any doubt about the pricing, click **Pricing details** in the lower left corner.
- If you select the pay-per-use billing mode, the order may fail to be placed because the account may be in risk. In this case, contact technical support.

Step 6 Click **Back to Cluster List** to view the cluster status.

Wait for the cluster creation to complete. The initial status of the cluster is **Starting**. After the cluster is created, the cluster status becomes **Running**.

On the MRS console, a maximum of 10 clusters can be created concurrently, and a maximum of 100 clusters can be managed.

For details about cluster status during creation, see the description of the status parameters in [Table 6-9](#).

----End

MRS Cluster Version Configuration

Table 3-2 MRS cluster parameters

Parameter	Description	Example Value
Cluster Type	<p>Select a proper MRS cluster type based on service requirements.</p> <ul style="list-style-type: none"> • Analysis cluster: It is used for offline data analysis and comprises data analysis tools like Hadoop, Spark, HBase, Hive, Flink, Oozie, and Tez. • Streaming cluster: It processes streaming data to quickly analyze real-time data sources, and it mainly includes streaming data processing tools such as Kafka and Flume. • Hybrid cluster: It is utilized for both offline data analysis and stream processing. • Custom: You can select from a variety of components that are supported by the corresponding version of the MRS cluster. 	Custom
Version Type	<p>MRS provides two types of clusters: LTS and Normal. Different versions provide different components. You can select a version as required.</p> <ul style="list-style-type: none"> • LTS: employs MRS's own components to provide highly reliable clusters with strong DR capabilities, making long-term support and evolution possible. • Normal: integrates MRS's mature and stable features and functions with open-source capabilities, offering high performance and stability. 	LTS

Parameter	Description	Example Value
Component	<p>Select the components to be deployed in the MRS cluster.</p> <p>You can change components based on your needs. For some clusters, components cannot be added after creation.</p>	-
Metadata	<p>Whether to use external data sources to store Hive and Ranger metadata of the cluster.</p> <ul style="list-style-type: none"> • Local: Metadata is stored in the local cluster. • External data connection: Metadata of external data sources is used. If the cluster is abnormal or deleted, metadata is not affected. This mode applies to scenarios where storage and compute are decoupled. When creating an MRS cluster, you can connect to LakeFormation instances to store metadata of components such as Hive and Spark. For details, see Configuring a LakeFormation Data Connection. <p>After a cluster is created, you can manually store the component metadata to external data sources. For details, see Managing MRS Cluster Metadata.</p>	Local
Component Port	<p>Default communication port policy of each component in the MRS cluster. The LTS cluster supports the configuration.</p> <ul style="list-style-type: none"> • Open source: Use the port provided by the open source component. • Custom: Customize a port for the component. <p>For details about the differences between default open source port and default custom port, see Common Ports for MRS Cluster Services.</p>	Open source

MRS Cluster Network Configuration

Table 3-3 Network configuration parameters

Parameter	Description	Example Value
AZ	<p>Resources are assigned to the AZ of the current region during creation. An AZ is a physical region that operates on independent power supplies and networks for resource usage.</p>	AZ1

Parameter	Description	Example Value
VPC	VPC to which the MRS cluster node belongs. If no VPC is available, click View VPC to access the network console and create a VPC.	-
Subnet	<p>Subnet information in the VPC. If no subnet is available, click View Subnet to access the network console and create a subnet.</p> <p>A subnet provides dedicated network resources that are logically isolated from other networks for network security. For details about how to configure network ACL outbound rules, see How Do I Configure a Network ACL Outbound Rule?</p> <p>NOTE</p> <ul style="list-style-type: none">The number of IP addresses required by creating an MRS cluster depends on the number of cluster nodes and selected components, but not the cluster type.In MRS, IP addresses are automatically assigned to clusters during cluster creation basically based on the following formula: Quantity of IP addresses = Number of cluster nodes + 2 (one for Manager; one for the DB). In addition, if the Hadoop, Hue, Sqoop, and Presto or Loader and Presto components are selected during cluster deployment, one IP address is added for each component. To buy a ClickHouse cluster independently, the number of IP addresses required is calculated as follows: Number of IP addresses = Number of cluster nodes + 1 (for Manager).	-
Security Group	<p>A security group is a set of ECS access rules. It provides access policies for ECSs that have the same security protection requirements and are mutually trusted in a VPC.</p> <p>When you create an MRS cluster, a security group is automatically created by default. You can also select an existing security group from the drop-down list.</p> <p>NOTE</p> <p>When you select a security group created by yourself, ensure that the inbound rule contains a rule in which Protocol is set to All, Port is set to All, and Source is set to a trusted accessible IP address range. Do not use 0.0.0.0/0 as a source address. Otherwise, security risks may occur. If you do not know the trusted accessible IP address range, select Auto create.</p>	Auto create

Parameter	Description	Example Value
EIP	<p>After binding an EIP to an MRS cluster, you can use the EIP to access the Manager web UI of the cluster.</p> <p>When creating a cluster, you can select an available EIP from the drop-down list and bind it. If no EIP is available in the drop-down list, click Create EIPs to buy an EIP.</p> <p>NOTE The EIP must be in the same region as the cluster.</p>	Bind later

MRS Cluster Node Configuration

Table 3-4 Cluster node information

Parameter	Description	Example Value
CPU Architecture	CPU architecture type of an MRS cluster node. The value can be x86 or Kunpeng . This parameter is not available for MRS 3.1.0 and 3.1.5.	x86
Common Node Configurations	This parameter is available only when Cluster Type is set to Custom . Value options include Compact , Full-size , and OMS-separate . For details, see MRS Cluster Deployment Types .	Compact
Node Group	<p>Name of the node group in the cluster.</p> <ul style="list-style-type: none">The name of the Master node group is fixed to master_node_default_group.The system automatically creates a Core node group based on the components contained in the cluster. For example, if you select the ClickHouse component, the system adds the ClickHouse node group and deploys the ClickHouseServer role in the node group by default.If Cluster Type is set to Custom, you can customize the names of other node groups.If the data volume does not change much but the service processing capability changes greatly, manually add a Task node group. For details, see Manually Adding a Task Node Group During MRS Cluster Creation.	node_group_1

Parameter	Description	Example Value
Node Type	<p>If Cluster Type is set to Custom, you can select the node type of a non-Master node group. If the node group type is set to Task, only the NodeManager role (except the mandatory roles of nodes) can be deployed in the node group.</p>	Core
Payment Type	<p>Billing mode of nodes in a cluster.</p> <ul style="list-style-type: none"> • The billing mode of the Master and Core node groups is the same as that of the cluster. • The billing mode of the Task node group is fixed to pay-per-use. 	Pay-per-use
Node Count	<p>Configure node quantity in each node group.</p> <ul style="list-style-type: none"> • The number of nodes in a master node group ranges from 3 to 9. • There must be at least one Core node and the total number of Core and Task nodes must not exceed 10,000. • If Cluster Type is set to Custom, you can click Add Node Group to add node groups. <p>NOTE A small number of nodes may cause clusters to run slowly while a large number of nodes may be unnecessarily costly. Set an appropriate value based on data to be processed.</p>	-

Parameter	Description	Example Value
Instance Specifications	<p>Select the instance specifications of the MRS cluster node. You can click  to adjust the specifications.</p> <p>For details about the MRS cluster node specifications, see MRS Cluster Node Specifications.</p> <p>NOTE</p> <ul style="list-style-type: none"> • More advanced instance specifications provide better data processing. However, they require higher cluster cost. • Instance specifications may vary in different AZs. If no instance specifications in the current AZ can meet your requirements, switch to another AZ. • If you select HDDs for Core nodes, there is no billing information for data disks. The fees are charged with ECSs. • If you select non-HDD disks for Core nodes, the disk types of Master and Core nodes are determined by Data Disk. • If Sold out appears next to an instance specification of a node, the node of this specification cannot be bought. You can only buy nodes of other specifications. • The Master node specification (4 vCPUs 8 GB) is not within the SLA after-sales scope. It is applicable only to the test environment and is not recommended for the production environment. • For MRS 3.x or later, the memory of the master node must be greater than 64 GB. 	-
System Disk	<p>You can adjust the storage type and space of the system disk on a node as required. For details about the MRS cluster storage, see Disk Roles.</p>	-
Data Disk	<p>Storage type and space of data disks on a node. To increase the data storage capacity, you can add disks during cluster creation. A maximum of 10 disks can be added to each Core or Task node. For more information about MRS cluster storage, see Disk Roles.</p>	-
LVM	<p>This parameter is valid when a streaming Core node is created only. Click this parameter to enable or disable the disk LVM management function. This parameter is not available in MRS 3.x and later versions.</p> <p>If LVM is enabled, all disks on a node are mounted as logical volumes. This delivers more proper disk planning to avoid data skew, thereby improving system stability.</p>	Disable this function.

Parameter	Description	Example Value
Topology Adjustment	<p>If Cluster Type is set to Custom, you can adjust the deployment of each component in the cluster in the node group.</p> <p>Set Topology Adjustment to Enable and adjust the instance deployment mode based on service requirements. For details, see Role Deployment Rules for MRS Clusters.</p>	Disable this function.

Other MRS Cluster Configuration Parameters

Table 3-5 Other configuration parameters

Parameter	Description	Example Value
Kerberos Authentication	<p>Whether to enable Kerberos authentication for each component in the MRS cluster. If Kerberos authentication is enabled, users can access component resources only after being authenticated.</p> <p>This function cannot be changed after you buy a cluster.</p>	Switch this function on.
Username	Name of the administrator of Manager. admin is used by default.	admin
Password/Confirm Password	<p>Password of the Manager administrator admin. Keep the password secure.</p> <ul style="list-style-type: none"> • Must contain 8 to 26 characters. • Must contain at least four of the following: <ul style="list-style-type: none"> - Lowercase letters - Uppercase letters - Digits - At least one of the following special characters: `~!@#\$\$%^&*()-_+= [{]}:;','<.>/? • Cannot be the same as the username or the username spelled backwards. 	-

Parameter	Description	Example Value
Login Mode	<p>Method for logging in to a node in the MRS cluster.</p> <ul style="list-style-type: none"> • Password You can log in to the node as user root using a password. You need to customize the password of user root. • Key Pair Select a key pair from the drop-down list. Select "I acknowledge that I have obtained private key file <i>SSHkey-xxx</i> and that without this file I will not be able to log in to my ECS." Click View Key Pair to create or import a key pair, and then obtain the private key file. 	Password
Kerberos Encryption Type	<p>Encryption algorithm and method used by Kerberos. (This parameter is supported in MRS 3.3.1-LTS and later versions. In earlier versions, the default Kerberos encryption type is aes256-sha1,aes128-sha1.)</p> <ul style="list-style-type: none"> • aes256-sha1,aes128-sha1: indicates that the encryption algorithm and mode are AES256-CTS-HMAC-SHA1-96 AES128-CTS-HMAC-SHA1-96. • aes256-sha2,aes128-sha2: indicates that the encryption algorithm and mode are AES256-CTS-HMAC-SHA384-192 AES128-CTS-HMAC-SHA256-128. <p>NOTE If the encryption types of the two clusters are different, mutual trust cannot be set up across the Managers of clusters.</p>	aes256-sha2,aes128-sha2
Set Advanced Options	<p>Advanced function parameters of the MRS cluster. For details, see Table 3-6.</p>	-
Enterprise Project	<p>Select the enterprise project to which the cluster belongs. To use an enterprise project, create one on the Enterprise > Project Management page.</p> <p>The Enterprise Management console is designed for resource management. It helps you manage cloud-based personnel, resources, permissions, and finance in a hierarchical manner, such as management of companies, departments, and projects.</p>	default

Parameter	Description	Example Value
Required Duration	This parameter is valid in Yearly/Monthly billing mode and indicates a cluster subscription duration. The minimum cluster duration is 1 month and the maximum available cluster duration is 1 year. If Auto-renew is selected, monthly subscriptions are automatically renewed every month and yearly subscriptions are automatically renewed every year.	-
Secure Communications	To allow the MRS console to access big data components in the user VPC, you need to activate the relevant security group rules. For details, see Configuring Secure Communication Authorization for an MRS Cluster .	Select this function.

Table 3-6 MRS cluster advanced configuration

Parameter	Description	Example Value
Hostname Prefix	Enter the prefix for the computer hostname of an ECS or BMS in the cluster.	-
Cryptographic Algorithm	Algorithm used for encrypting and decrypting passwords in the cluster system. <ul style="list-style-type: none"> • International: general encryption algorithm • Chinese: SM series cryptographic algorithms are compatible with general cryptographic algorithms. 	International
Tag	It is recommended that you use the tag function of TMS to add the same tag to different cloud resources.	-
Auto Scaling	Configure an auto scaling policy for the Task node group after the cluster is created. For details, see MRS Task Node Auto Scaling .	-
Bootstrap Action	Bootstrap actions run scripts on specified nodes in a cluster to install third-party software and modify the cluster's running environment. For details, see Adding MRS Node Bootstrap Actions and Installing Third-Party Software .	-

Parameter	Description	Example Value
Agency	<p>When an agency is bound to an ECS or BMS, it can manage designated resources in the cluster. It is essential to consider service requirements before deciding to configure an agency.</p> <p>For example, you can configure an ECS agency to automatically obtain the AK/SK to access OBS. For details, see Interconnecting an MRS Cluster with OBS Using an IAM Agency.</p> <p>To bind an agency to an MRS cluster, you need to create an IAM agency with required permissions in advance. By default, the system generates an MRS_ECS_DEFAULT_AGENCY agency. This agency has the OBSOperateAccess permission and the CESFullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.</p>	Bind later
Metric Sharing	Monitoring metrics of big data components are collected. If a fault occurs when you use a cluster, share the monitoring metrics with Huawei Cloud technical support for troubleshooting.	Disable

Parameter	Description	Example Value
System Disk Encryption	<p>Whether to encrypt data in the system disk mounted to the MRS cluster node. This function is disabled by default.</p> <p>Keys used by encrypted system disks are provided by Key Management Service (KMS) in Data Encryption Workshop (DEW). You do not need to build and maintain the key management infrastructure. To enable this function, you must have the Security Administrator and KMS Administrator permissions.</p> <p>For more information about disk encryption, see Managing Encrypted EVS Disks.</p> <p>Configure the following parameters to enable this function:</p> <ul style="list-style-type: none">• Data Disk Key ID: key ID of the selected key name.• Data Disk Key Name: Select the name of the key used to encrypt the data disk. By default, the default master key named evs/default is selected. You can select another master key from the drop-down list. <p>If cloud disks are encrypted using a master key and it is then disabled or scheduled for deletion, the cloud disks can no longer be read from or written to, and data on these disks may never be restored. Exercise caution when performing this operation.</p> <p>Click View the Key List to enter a page where you can create and manage keys.</p>	Disable

Parameter	Description	Example Value
Data Disk Encryption	<p>Whether to encrypt data in the data disk mounted to the MRS cluster node. This function is disabled by default. MRS 3.1.0 and MRS 3.1.2-LTS.3 do not support this function.</p> <p>For more information about disk encryption, see Managing Encrypted EVS Disks.</p> <p>Keys used by encrypted system disks are provided by Key Management Service (KMS) in Data Encryption Workshop (DEW). You do not need to build and maintain the key management infrastructure. To enable this function, you must have the Security Administrator and KMS Administrator permissions.</p> <p>Configure the following parameters to enable this function:</p> <ul style="list-style-type: none"> • Data Disk Key ID: key ID of the selected key name. • Data Disk Key Name: Select the name of the key used to encrypt the data disk. By default, the default master key named evs/default is selected. You can select another master key from the drop-down list. <p>If cloud disks are encrypted using a master key and it is then disabled or scheduled for deletion, the cloud disks can no longer be read from or written to, and data on these disks may never be restored. Exercise caution when performing this operation.</p> <p>Click View the Key List to enter a page where you can create and manage keys.</p>	Disable
Alarm	<p>If the alarm function is enabled, the cluster maintenance personnel can be notified in a timely manner to locate faults when the cluster runs abnormally or the system is faulty. To send alarm messages, you need to enable the Simple Message Notification (SMN) service, set a notification rule, and bind the rule to an SMN topic.</p> <ul style="list-style-type: none"> • Rule Name: Name of the rule for sending alarm messages. The value can contain only digits, letters, hyphens (-), and underscores (_). • Topic Name: Select an existing SMN topic or click Create Topic to create a topic. To deliver messages published to a topic, you need to add a subscriber to the topic. For details, see Adding Subscriptions to a Topic. 	Enable

Parameter	Description	Example Value
Install UniAgent	Install UniAgent on MRS cluster nodes to simplify plug-in management, provide AOM instructions, and enable script delivery and execution.	No
Logging	Whether to collect logs when cluster creation fails. After the logging function is enabled, system logs and component run logs are automatically collected and saved to the OBS file system in scenarios such as cluster creation failures and scale-out or scale-in failures for O&M personnel to quickly locate faults. The log information is retained for a maximum of seven days.	Disable

Manually Adding a Task Node Group During MRS Cluster Creation

To add a Task node group in the current MRS cluster for auto scaling, do as follows:

Add an analysis Task node group.

- For a cluster whose **Cluster Type** is **Analysis cluster** or **Hybrid cluster**:
The system automatically adds the analysis Task node group **task_node_analysis_group**. Set the number of nodes, instance specifications, and node disk configurations as needed.
If the analysis Task node group is not required, you can delete it.
- For a cluster whose **Cluster Type** is **Custom**:
 - a. In the cluster node configuration area, click **Add Node Group** to manually add a node group.
 - b. Set **Topology Adjustment** to **Enable**.
 - c. Select the role topology so that the node group contains only the NodeManager (NM) role.

Add a Task node group after the cluster is created. For details, see [Adding a Task Node](#).

Adding streaming Task node group

For a streaming or hybrid cluster that contains the Storm component:

The system automatically adds the streaming Task node group **task_node_streaming_group**. Set the number of nodes, instance specifications, and node disk configurations as needed.

If the streaming Task node group is not required, you can manually delete it.

Viewing Failed MRS Cluster Creation Tasks

If a cluster fails to be created, the failed task will be managed on the **Manage Failed Tasks** page.

On the cluster list page, click  to switch to the **Manage Failed Tasks** page. In the **Task Status** column, hover the cursor over the task status to view the failure cause.

Table 3-7 lists the error codes of MRS cluster creation failures.

Table 3-7 Error codes

Error Code	Description
MRS.101	Insufficient quota to meet your request. Contact customer service to increase the quota.
MRS.102	The token cannot be null or invalid. Try again later or contact customer service.
MRS.103	Invalid request. Try again later or contact customer service.
MRS.104	Insufficient resources. Try again later or contact customer service.
MRS.105	Insufficient IP addresses in the existing subnet. Try again later or contact customer service.
MRS.201	Failed due to an ECS error. Try again later or contact customer service.
MRS.202	Failed due to an IAM error. Try again later or contact customer service.
MRS.203	Failed due to a VPC error. Try again later or contact customer service.
MRS.400	MRS system error. Try again later or contact customer service.

4 Installing an MRS Cluster Client

4.1 Installing a Client (MRS 3.x)

You need to install a cluster client to connect to the component server in the cluster and perform tasks such as component connection and job submission. You can install the cluster client on a node within the cluster or on a node outside of it.

To ensure that certain features function properly, it is important to reinstall the client after modifying the server configuration of a component in the cluster. This ensures that the client version matches the server version.

This section describes how to install the MRS 3.x cluster client. For MRS 2.x and earlier versions, see [Installing a Client \(MRS 2.x or Earlier\)](#). If the cluster contains the Flume component, install the Flume client separately. For details, see [Installing the Flume Client](#).

Prerequisites

- If the node where the client is to be installed is outside the cluster, the node must be able to communicate with the nodes in the MRS cluster. Otherwise, client installation will fail.
- The node where the client is to be installed must have the NTP service enabled and synchronized time with the MRS cluster server. Otherwise, client installation will fail.
- You can install the client on the node as a **root** or any OS user. The user must have the operation permission on the client file storage directory and installation directory.
- When you install the client as a user other than **omm** or **root**, and the **/var/tmp/patch** directory already exists, you have changed the permission for the directory to **777** and changed the permission for the logs in the directory to **666**.

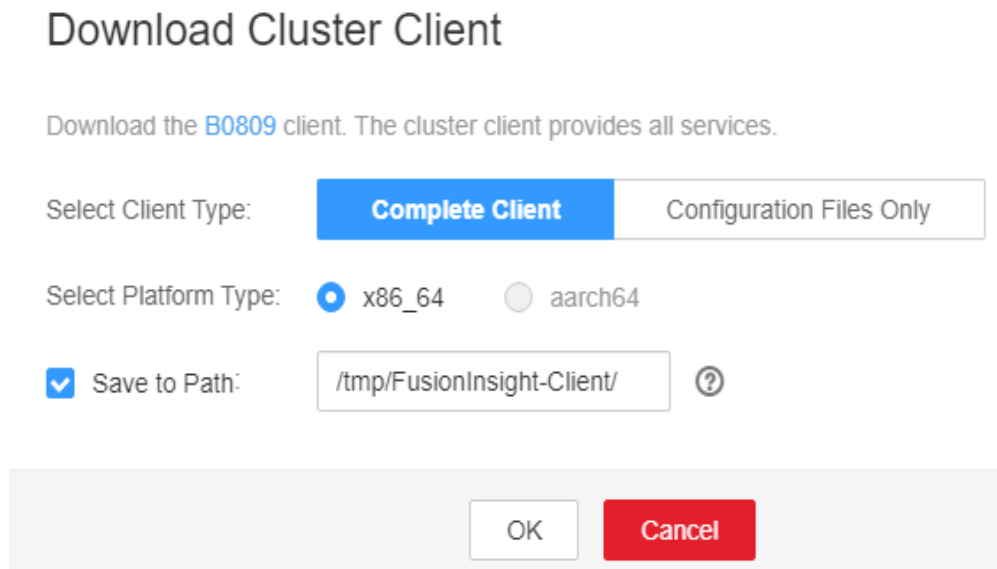

Installing a Client on a Node in a Cluster

Step 1 Obtain the client software package.

Log in to Manager by referring to [Accessing MRS Manager](#). Click **Cluster**. On the **Dashboard** page, click the more sign (...) and select **Download Client**. In the

displayed **Download Cluster Client** dialog box, configure parameters and click **OK**.

Figure 4-1 Downloading a client

NOTE

- The client software package downloaded from the FusionInsight Manager homepage contains the clients of all services (excluding Flume) in the cluster. To download the client of a single service, choose **Cluster > Services > Service name**, click **More**, and select **Download Client**.
- For MRS 3.3.0 or later, click **Download Client** on the Manager homepage.

Table 4-1 Client download parameters

Parameter	Description	Example Value
Select Client Type	<ul style="list-style-type: none"> • Complete Client: contains the complete client software package and configuration files. Generally, this option is selected. • Configuration Files Only: downloads only client configuration files in the scenario where the administrator modifies the component server configuration on FusionInsight Manager after the complete client is downloaded and installed in an application development task, and developers need to update client configuration files. 	Complete Client

Parameter	Description	Example Value
Select Platform Type	<p>The client type must match the architecture of the node where the client is to be installed. Otherwise, the installation fails.</p> <p>For clusters of the LTS version, only the client software package whose type is the same as that of FusionInsight Manager can be downloaded.</p> <ul style="list-style-type: none">• x86_64: indicates the client software package that can be deployed on a x86 platform.• aarch64: indicates the client software package that can be deployed on a Kunpeng server.	x86_64
Save to Path	<p>The path for storing the client software package on the active OMS node</p> <ul style="list-style-type: none">• Select Save to Path: Customize the path for storing the client software package on the active OMS node. User omm must have the read, write, and execute permissions on the path. If the path is not changed, the client file generated is saved in the /tmp/FusionInsight-Client directory on the active OMS node in the cluster by default.• Not to select Save to Path: The generated client file is automatically downloaded and saved to the local host. Before installing the client, you need to upload the file to a specified directory on the target node.	Select Save to Path

Step 2 Copy the client software package to a specified directory on the node where the client is to be installed.

By default, the client software package is stored on the active OMS node in the cluster. To install the client on other nodes in the cluster, log in to the active OMS node as user **omm** and run the following command to copy the software package to the specified node. Otherwise, skip this step.

For example, copy the software package to the **/tmp/clienttemp** directory.

```
scp -p /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_Client.tar IP  
address of the node where the client is to be installed:/tmp/clienttemp
```

Step 3 Log in to the node where the client is to be installed as the client installation user.

 **NOTE**

You can install the client on the node as user **root**, **omm**, or any other OS user. The user needs to have the operation permission on the directory for storing the client file and the installation directory. The permission on the two directories is **755**.

Step 4 Decompress the client software package.

1. Go to the directory where the package is stored, for example, `/tmp/clienttemp`.
cd /tmp/clienttemp
2. Decompress the installation package.
tar -xvf FusionInsight_Cluster_1_Services_Client.tar
3. Run the **sha256sum** command to verify the decompressed file and check whether the command output is consistent with the content in the **sha256** file.
sha256sum -c FusionInsight_Cluster_1_Services_ClientConfig.tar.sha256
FusionInsight_Cluster_1_Services_ClientConfig.tar: OK
4. Decompress the installation package.
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig.tar

Step 5 Go to the directory where the client software package is decompressed and run the following command to install the client to the specified directory:**cd FusionInsight_Cluster_1_Services_ClientConfig****./install.sh** *Client installation directory*

Example:

./install.sh /opt/hadoopclient

Wait until the client installation is complete.

...
The component client is installed successfully**NOTE**

- **When installing the client, you can choose the installation directory. If you opt to use an existing directory, it must be empty. Also, the installation directory cannot have spaces and should only contain uppercase and lowercase letters, digits, and underscores (_).**
- Delete the client installation directory when uninstalling a client.
- To ensure that the client can be used only by the current user, add the **-o** parameter during the installation. For example, run the **./install.sh /opt/hadoopclient -o** command to install the client.

Step 6 Check whether the client is installed.

1. Go to the client installation directory and load environment variables.
cd /opt/hadoopclient
source bigdata_env
2. Run related commands based on the cluster mode.
 - If Kerberos authentication is not enabled for the cluster, you can directly run commands related to the component client.
View files in the HDFS root directory:
hdfs dfs -ls /
 - If Kerberos authentication is enabled for the cluster, run the **kinit** command to perform user authentication.

Example:

kinit admin

Password for xxx@HADOOP.COM: #Enter the password of user **admin**.

Run the **klist** command to query and confirm authentication details.

Ticket cache: FILE:/tmp/krb5cc_0
Default principal: xxx@HADOOP.COM

Valid starting	Expires	Service principal
...		

----End

Installing a Client on a Node Outside a Cluster

Step 1 Prepare a Linux ECS for installing the MRS cluster client.

- The recommended ECS OSs and versions are as follows:

Table 4-2 OS reference list

CPU Architecture	OS	Supported Version
x86 computing	EulerOS	EulerOS 2.5
	SUSE	SUSE Linux Enterprise Server 12 SP4 (SUSE 12.4)
	Red Hat	Red Hat-7.5-x86_64 (Red Hat 7.5)
	CentOS	CentOS 7.6
Kunpeng computing	EulerOS	EulerOS 2.8
	CentOS	CentOS 7.6

- Sufficient disk space (at least 40 GB) must be allocated to the ECS client installation directory.
- The ECS must be in the same VPC and security group as the MRS cluster.
- All ports in the inbound direction of the MRS cluster security group are open to the client node. For details, see [Adding a Security Group Rule](#).
- The NTP service has been installed on the ECS OS and is running properly. If the NTP service is not installed, run the **yum install ntp -y** command to install it when the **yum** source is configured.
- The ECS must allow users to log in to it using a password (SSH).

Step 2 Configure NTP time synchronization for the node where the client is to be installed to synchronize time with the MRS cluster.

- Log in to the MRS console and click the MRS cluster name from the cluster list.
- Click **Nodes** to expand the Master node group list and view the IP addresses of the **Master1** and **Master2** nodes in the cluster.

Figure 4-2 Viewing the IP address of the Master node

The screenshot shows a web interface for a cluster named 'master_node_default_group'. It displays a table with columns for 'Node Name/Resource ID', 'IP', and 'Operating Status'. Two nodes are listed: 'node-master1BBSg' with IP '192.168.12.136' and 'node-master2gUSI' with IP '192.168.12.61'. Both nodes are in a 'Running' state.

Node Name/Resource ID	IP	Operating Status
★ node-master1BBSg	192.168.12.136	Running
☆ node-master2gUSI	192.168.12.61	Running

3. Log in to the node where the client is to be installed as user **root** and run the following command to edit the NTP configuration file. Add the IP addresses of the **Master1** and **Master2** nodes in the MRS cluster and comment out other **server** addresses.

```
vi /etc/ntp.conf
```

```
server master1_ip prefer
server master2_ip
```

Figure 4-3 Modifying the NTP configuration file

The screenshot shows the contents of the /etc/ntp.conf file. The configuration includes comments and settings for driftfile, restrict, and server. The following lines are highlighted with a red box:

```
#server 0.centos.pool.ntp.org iburst
#server 1.centos.pool.ntp.org iburst
#server 2.centos.pool.ntp.org iburst
#server 3.centos.pool.ntp.org iburst
server 10.9.2.38 prefer
server 10.9.2.39
```

4. Save the configuration file and run the following command to disable the NTP service:

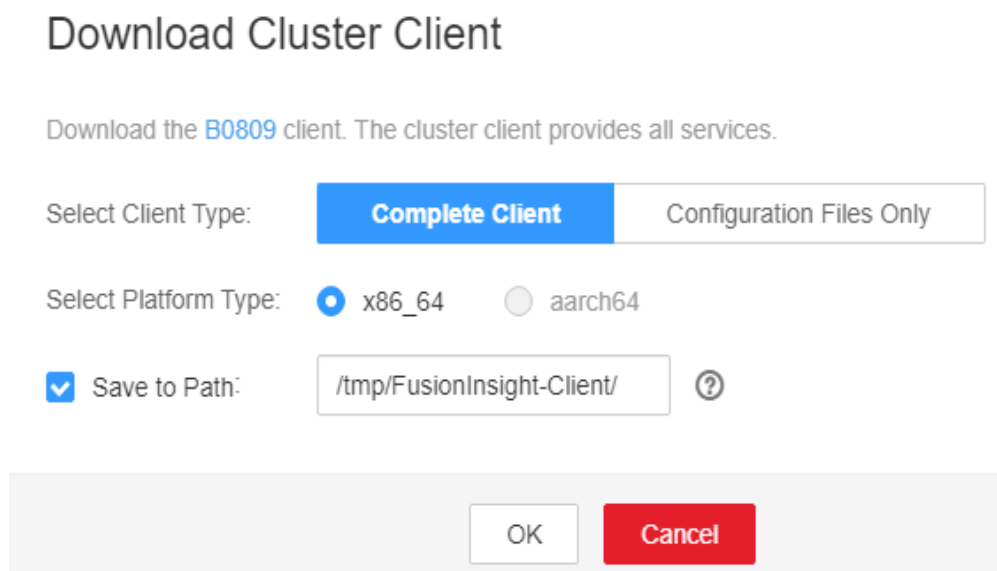

```
service ntpd stop
```

5. Manually synchronize the time.
`/usr/sbin/ntpdate IP address of the active Master node`
6. Start the NTP service.
`service ntpd start`
Or
`systemctl restart ntpd`
7. Run the `ntpstat` command to check the time synchronization result.
synchronised to NTP server (xxx) at stratum 2
time correct to within 12 ms
polling server every 16 s

Step 3 Obtain the client software package.

Log in to Manager by referring to [Accessing MRS Manager](#). Click **Cluster**. On the **Dashboard** page, click the more sign (...) and select **Download Client**. In the displayed **Download Cluster Client** dialog box, configure parameters and click **OK**.

Figure 4-4 Downloading a client

NOTE

- The client software package downloaded from the FusionInsight Manager homepage contains the clients of all services (excluding Flume) in the cluster. To download the client of a single service, choose **Cluster > Services > Service name**, click **More**, and select **Download Client**.
- For MRS 3.3.0 or later, click **Download Client** on the Manager homepage.

Table 4-3 Client download parameters

Parameter	Description	Example Value
Select Client Type	<ul style="list-style-type: none">• Complete Client: contains the complete client software package and configuration files. Generally, this option is selected.• Configuration Files Only: downloads only client configuration files in the scenario where the administrator modifies the component server configuration on FusionInsight Manager after the complete client is downloaded and installed in an application development task, and developers need to update client configuration files.	Complete Client
Select Platform Type	<p>The client type must match the architecture of the node where the client is to be installed. Otherwise, the installation fails.</p> <p>For clusters of the LTS version, only the client software package whose type is the same as that of FusionInsight Manager can be downloaded.</p> <ul style="list-style-type: none">• x86_64: indicates the client software package that can be deployed on a x86 platform.• aarch64: indicates the client software package that can be deployed on a Kunpeng server.	x86_64
Save to Path	<p>The path for storing the client software package on the active OMS node</p> <ul style="list-style-type: none">• Select Save to Path: Customize the path for storing the client software package on the active OMS node. User omm must have the read, write, and execute permissions on the path. If the path is not changed, the client file generated is saved in the /tmp/FusionInsight-Client directory on the active OMS node in the cluster by default.• Not to select Save to Path: The generated client file is automatically downloaded and saved to the local host. Before installing the client, you need to upload the file to a specified directory on the target node.	Select Save to Path

Step 4 Copy the client software package to a specified directory on the node where the client is to be installed.

By default, the client software package is stored on the active OMS node in the cluster. To install the client on other nodes in the cluster, log in to the active OMS node as user **omm** and run the following command to copy the software package to the specified node. Otherwise, skip this step.

For example, copy the software package to the **/tmp/clienttemp** directory.

```
scp -p /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_Client.tar IP  
address of the node where the client is to be installed:/tmp/clienttemp
```

Step 5 Log in to the node where the client is to be installed as the client installation user.

 **NOTE**

You can install the client on the node as user **root**, **omm**, or any other OS user. The user needs to have the operation permission on the directory for storing the client file and the installation directory. The permission on the two directories is **755**.

Step 6 Decompress the client software package.

1. Go to the directory where the package is stored, for example, **/tmp/clienttemp**.

```
cd /tmp/clienttemp
```

2. Decompress the installation package.

```
tar -xvf FusionInsight_Cluster_1_Services_Client.tar
```

3. Run the **sha256sum** command to verify the decompressed file and check whether the command output is consistent with the content in the **sha256** file.

```
sha256sum -c FusionInsight_Cluster_1_Services_ClientConfig.tar.sha256
```

```
FusionInsight_Cluster_1_Services_ClientConfig.tar: OK
```

4. Decompress the installation package.

```
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig.tar
```

Step 7 Check the network connection of the client.

1. To install the client on a node, map the host names and IP addresses of all nodes in the cluster in the **/etc/hosts** file. Here are the steps to import the domain name mapping of the cluster to the **hosts** file:

- a. Switch to user **root** or a user who has the permission to modify the **hosts** file.

```
su - root
```

- b. Go to the directory where the client package is decompressed.

```
cd /tmp/clienttemp/FusionInsight_Cluster_1_Services_ClientConfig
```

- c. Import the domain name mapping to the **hosts** file.

```
cat realm.ini >> /etc/hosts
```

 NOTE

- If the host where the client is installed is not a node in the cluster, configure network connections for the client to prevent errors when you run commands on the client.
- If Spark tasks are executed in yarn-client mode, add the **spark.driver.host** parameter to the file *Client installation directory/Spark/spark/conf/spark-defaults.conf* and set the parameter to the client IP address.
- If the yarn-client mode is used, you need to configure the mapping between the IP address and host name of the client in the **hosts** file on the active and standby YARN nodes (ResourceManager nodes in the cluster) to make sure that the Spark web UI is properly displayed.

Step 8 Go to the directory where the client software package is decompressed and run the following command to install the client to the specified directory:

```
cd FusionInsight_Cluster_1_Services_ClientConfig
```

```
./install.sh Client installation directory
```

Example:

```
./install.sh /opt/hadoopclient
```

Wait until the client installation is complete.

...

```
The component client is installed successfully
```

 NOTE

- **When installing the client, you can choose the installation directory. If you opt to use an existing directory, it must be empty. Also, the installation directory cannot have spaces and should only contain uppercase and lowercase letters, digits, and underscores (_).**
- Delete the client installation directory when uninstalling a client.
- To ensure that the client can be used only by the current user, add the **-o** parameter during the installation. For example, run the **./install.sh /opt/hadoopclient -o** command to install the client.

Step 9 Check whether the client is installed.

1. Go to the client installation directory and load environment variables.

```
cd /opt/hadoopclient
```

```
source bigdata_env
```

2. Run related commands based on the cluster mode.
 - If Kerberos authentication is not enabled for the cluster, you can directly run commands related to the component client.

View files in the HDFS root directory:

```
hdfs dfs -ls /
```

- If Kerberos authentication is enabled for the cluster, run the **kinit** command to perform user authentication.

Example:

```
kinit admin
```

```
Password for xxx@HADOOP.COM: #Enter the password of user admin.
```

Run the **klist** command to query and confirm authentication details.

```
Ticket cache: FILE:/tmp/krb5cc_0
Default principal: xxx@HADOOP.COM

Valid starting    Expires          Service principal
...

```

----End

4.2 Installing a Client (MRS 2.x or Earlier)

You need to install a cluster client to connect to the component server in the cluster and perform tasks such as component connection and job submission. You can install the cluster client on a node within the cluster or on a node outside of it.

To ensure that certain features function properly, it is important to reinstall the client after modifying the server configuration of a component in the cluster. This ensures that the client version matches the server version.

This section describes how to install the cluster client of MRS 2.x or earlier. For details about MRS 3.x, see [Installing a Client \(MRS 3.x\)](#).

After an MRS cluster earlier than 3.x is created, the client is installed on the active Master node by default. The installation directory is `/opt/client`.

Installing a Client on a Node in a Cluster

Step 1 Log in to Manager by referring to [Accessing MRS Manager](#), choose **Services** > **Download Client**, and download the client installation package to the active OMS node.

Step 2 On the MRS console, view the IP address on the **Nodes** page of the specified cluster.

Record the IP address of the node where the client is to be installed and the IP address of the active Master node (active OMS node).

Step 3 Log in to the active OMS node as user **root** and run the following command to switch to user **omm**.

```
sudo su - omm
```

Step 4 Copy the client installation package to the specified node.

```
scp -p /tmp/MRS-client/MRS_Services_Client.tar IP address of the node where
the client is to be installed:/opt/client_tmp
```

Step 5 Log in to the node where the client is to be installed as the **root** user.

Step 6 Install the client.

```
cd /opt/client_tmp
tar -xvf MRS_Services_Client.tar
tar -xvf MRS_Services_ClientConfig.tar
cd MRS_Services_ClientConfig
./install.sh Client installation directory
```

Example:

./install.sh /opt/hadoopclient

Wait until the client is installed.

 **NOTE**

- **When installing the client, you can choose the installation directory. If you opt to use an existing directory, it must be empty. Also, the installation directory cannot have spaces and should only contain uppercase and lowercase letters, digits, and underscores (_).**
- Delete the client installation directory when uninstalling a client.

Step 7 Check whether the client is installed.

1. Go to the client installation directory and load environment variables.

cd /opt/hadoopclient

source bigdata_env

2. Run related commands based on the cluster mode.
 - If Kerberos authentication is not enabled for the cluster, you can directly run commands related to the component client.

View files in the HDFS root directory:

hdfs dfs -ls /

- If Kerberos authentication is enabled for the cluster, run the **kinit** command to perform user authentication.

Example:

kinit admin

Password for xxx@HADOOP.COM: #Enter the password of user **admin**.

Run the **klist** command to query and confirm authentication details.

Ticket cache: FILE:/tmp/krb5cc_0
Default principal: xxx@HADOOP.COM

Valid starting	Expires	Service principal
...		

----End

Installing a Client on a Node Outside the Cluster

Step 1 Prepare a Linux ECS for installing the MRS cluster client.

- The recommended ECS OSs and versions are as follows:

Table 4-4 OS reference list

CPU Architecture	OS	Supported Version
x86 computing	EulerOS	<ul style="list-style-type: none"> - Available: EulerOS 2.2 - Available: EulerOS 2.3 - Available: EulerOS 2.5

CPU Architecture	OS	Supported Version
Kunpeng computing (Arm)	EulerOS	Available: EulerOS 2.8

- The CPU architecture of the ECS must be the same as that of the MRS cluster node.
- Sufficient disk space (at least 40 GB) must be allocated to the ECS client installation directory.
- The ECS must be in the same VPC and security group as the MRS cluster.
- All ports in the inbound direction of the MRS cluster security group are open to the client node. For details, see [Adding a Security Group Rule](#).
- The NTP service has been installed on the ECS OS and is running properly. If the NTP service is not installed, run the **yum install ntp -y** command to install it when the **yum** source is configured.
- The ECS must allow users to log in to it using a password (SSH).

Step 2 Log in to Manager of the cluster by referring to [Accessing MRS Manager](#) and choose **Services > Download Client**.

- In **Client Type**, select **All client files**.
- In **Download to**, select **Remote host**.
- Set **Host IP Address** to the IP address of the node where the client is to be installed, **Host Port** to **22**, and **Save Path** to **/tmp**.
If the default SSH login port of the node has been changed, set **Host Port** to the new port.
- Set **Login User** to **root**.
If other users are used, ensure that the users have read, write, and execute permission on the save path.
- Select **Password** or **SSH Private Key** for **Login Mode**.
 - **Password**: Enter the password of user **root** set during cluster creation.
 - **SSH Private Key**: Select and upload the key file used for creating the cluster.

Step 3 Click **OK** to generate a client file.

After the file download is confirmed, obtain the client software package from the specified path on the node where the client will be installed.

If the client download fails, check the username, password, and security group configuration of the remote host. Ensure that the username and password are accurate and that the inbound rule for the SSH port has been added to the remote host's security group. Once confirmed, retry the client download.

 NOTE

Generating a client will occupy a large number of disk I/Os. You are advised not to download a client when the cluster is being installed, started, and patched, or in other unstable states.

- Step 4** Configure NTP time synchronization for the node where the client is to be installed to synchronize time with the MRS cluster.
1. Log in to the MRS console and click the MRS cluster name from the cluster list.
 2. Click **Nodes** to expand the Master node group list and view the IP addresses of the **Master1** and **Master2** nodes in the cluster.
 3. Log in to the node where the client is to be installed as user **root** and run the following command to edit the NTP configuration file. Add the IP addresses of the **Master1** and **Master2** nodes in the MRS cluster and comment out other **server** addresses.

```
vi /etc/ntp.conf
```

```
server master1_ip prefer
server master2_ip
```

Figure 4-5 Modifying the NTP configuration file

```
# For more information about this file, see the man pages
# ntp.conf(5), ntp_acc(5), ntp_auth(5), ntp_clock(5), ntp_misc(5), ntp_mon(5).

driftfile /var/lib/ntp/drift

# Permit time synchronization with our time source, but do not
# permit the source to query or modify the service on this system.
restrict default nomodify notrap nopeer noquery

# Permit all access over the loopback interface. This could
# be tightened as well, but to do so would effect some of
# the administrative functions.
restrict 127.0.0.1
restrict ::1

# Hosts on local network are less restricted.
#restrict 192.168.1.0 mask 255.255.255.0 nomodify notrap

# Use public servers from the pool.ntp.org project.
# Please consider joining the pool (http://www.pool.ntp.org/join.html).
#server 0.centos.pool.ntp.org iburst
#server 1.centos.pool.ntp.org iburst
#server 2.centos.pool.ntp.org iburst
#server 3.centos.pool.ntp.org iburst
#server 4.centos.pool.ntp.org iburst
server 10.9.2.38 prefer
server 10.9.2.39
#broadcast 192.168.1.255 autokey           # broadcast server
#broadcastclient                          # broadcast client
#broadcast [redacted] autokey             # multicast server
#multicastclient [redacted]              # multicast client
#manycastserver [redacted]               # manycast server
#manycastclient [redacted] autokey       # manycast client

# Enable public key cryptography.
#crypto
```

4. Save the configuration file and run the following command to disable the NTP service:
service ntpd stop
5. Manually synchronize the time.
/usr/sbin/ntpdate IP address of the active Master node

6. Start the NTP service.
service ntpd start
Or
systemctl restart ntpd
7. Run the **ntpstat** command to check the time synchronization result.
synchronised to NTP server (xxx) at stratum 2
time correct to within 12 ms
polling server every 16 s

Step 5 Copy the downloaded client software package to the **/opt** directory.

```
cp /tmp/MRS_Services_Client.tar /opt
```

Step 6 Decompress the software package.

```
cd /opt  
tar -xvf MRS_Services_Client.tar
```

Step 7 Verify the file.

```
sha256sum -c MRS_Services_ClientConfig.tar.sha256
```

The command output is as follows:

```
MRS_Services_ClientConfig.tar: OK
```

Step 8 Decompress the software package.

```
tar -xvf MRS_Services_ClientConfig.tar
```

Step 9 Install the cluster client.

```
sh /opt/MRS_Services_ClientConfig/install.sh Client installation directory
```

Example:

```
sh /opt/MRS_Services_ClientConfig/install.sh /opt/hadoopclient
```

If the following information is displayed, the client has been successfully installed:

```
Components client installation is complete.
```

 **NOTE**

- When installing the client, you can choose the installation directory. If you opt to use an existing directory, it must be empty. Also, the installation directory cannot have spaces and should only contain uppercase and lowercase letters, digits, and underscores (_).
- Delete the client installation directory when uninstalling a client.

Step 10 Check whether the client is installed.

1. Go to the client installation directory and load environment variables.

```
cd /opt/hadoopclient  
source bigdata_env
```

2. Run related commands based on the cluster mode.

- If Kerberos authentication is not enabled for the cluster, you can directly run commands related to the component client.

View files in the HDFS root directory:

hdfs dfs -ls /

- If Kerberos authentication is enabled for the cluster, run the **kinit** command to perform user authentication.

Example:

kinit admin

Password for xxx@HADOOP.COM: #Enter the password of user **admin**.

Run the **klist** command to query and confirm authentication details.

Ticket cache: FILE:/tmp/krb5cc_0

Default principal: xxx@HADOOP.COM

Valid starting	Expires	Service principal
...		

...

----End

5 Submitting an MRS Job

5.1 MRS Job Types

Category

An MRS job is the program execution platform of MRS. It is used to process and analyze user data. You can create jobs online using the MRS console or submit jobs in the background through the cluster client.

MRS jobs typically process data from OBS or HDFS. To create a job, you must first upload the data to be analyzed to OBS. MRS utilizes the data stored in OBS for computing and analysis.

MRS allows exporting data from OBS to HDFS for computing and analyzing. After data analysis and computing is complete, you can store the data in the HDFS or export it to OBS. HDFS and OBS can store compressed data in **bz2** and **gz** formats.

You can create the following types of jobs online in an MRS cluster:

- MapReduce can quickly process large-scale data in parallel. It is a distributed data processing model and execution environment. MRS supports the submission of MapReduce JAR programs.
- Spark is a distributed in-memory computing framework. MRS supports SparkSubmit, Spark Script, and Spark SQL jobs.
 - SparkSubmit: You can submit Spark JAR and Spark Python programs, execute the Spark Application, and compute and process user data.
 - SparkScript: You can submit SparkScript scripts and batch execute Spark SQL statements.
 - Spark SQL: You can use Spark SQL statements (similar to SQL statements) to query and analyze user data in real time.
- Hive is an open-source data warehouse based on Hadoop. MRS allows you to submit HiveScript scripts and directly execute Hive SQL statements.
- Flink is a distributed big data processing engine that can perform stateful computations over both unbounded and bounded data streams.
- HadoopStreaming works similarly to a standard Hadoop job, where you can define the input and output HDFS paths, as well as the mapper and reducer executable programs.

Job Execution Permission Description

For a security cluster with Kerberos authentication enabled, a user needs to synchronize an IAM user before submitting a job on the MRS web UI. After the synchronization is completed, the MRS system generates a user with the same IAM username. Whether a user has the permission to submit jobs depends on the IAM policy bound to the user during IAM synchronization. For details about the job submission policy, see [Table 6-58](#) in [Synchronizing IAM Users to MRS](#).

When a user submits a job that involves the resource usage of a specific component, such as accessing HDFS directories and Hive tables, user **admin** (Manager administrator) must grant the relevant permission to the user.

- Step 1** Log in to Manager of the cluster as user **admin**.
- Step 2** Add the role of the component whose permission is required by the user. For details, see [Managing MRS Cluster Roles](#).
- Step 3** Change the user group to which the user who submits the job belongs and add the new component role to the user group. For details, see [Managing MRS Cluster User Groups](#).

NOTE

After the component role bound to the user group to which the user belongs is modified, it takes some time for the role permissions to take effect.

----End

5.2 Uploading Application Data to an MRS Cluster

MRS clusters generally process data from the OBS file system or the HDFS file system in the cluster. OBS provides you with the data storage capabilities that are massive, secure, reliable, and cost-effective.

You can access, manage, and use OBS data on the MRS console and OBS client. You can also import OBS data to the HDFS system of a cluster for processing. Note that the file upload rate may decrease as the file size increases and this method more suitable for scenarios with smaller amounts of data.

Importing OBS Data to HDFS

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.

Complete IAM user synchronization first for MRS clusters with Kerberos authentication enabled. (On the **Dashboard** page of the cluster details page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

- Step 3** Click **Files** to go to the file management page.
- Step 4** Select **HDFS File List**.

Figure 5-1 HDFS file list

[HDFS File List](#)

You can view HDFS audit logs on the tenant plane.

/

File Name	File Size
app-logs	--
apps	--
datasets	--
datastore	--
flume	--

Step 5 Go to the directory where the data to be imported is stored.

Click **Create** to create a folder directory or select an existing folder in HDFS.

Step 6 Click **Import Data** and configure the HDFS and OBS paths correctly.

When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **OK**.

Figure 5-2 Importing data

Import Data from OBS to HDFS

OBS Path

HDFS Path

- OBS path description:
 - The path must start with **obs://**.
 - Files or programs encrypted by KMS cannot be imported.
 - An empty folder cannot be imported.
 - The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain special characters ;|&>,<'\$*?\
 - The directory and file name cannot start or end with a space, but can contain spaces between them.
 - The OBS full path contains a maximum of 255 characters.
- HDFS path description:

- The directory and file name can contain letters, digits, hyphens (-), and underscores (_), but cannot contain the following special characters: ; | & > , < ' \$ * ? \ :
- The directory and file name cannot start or end with a space, but can contain spaces between them.
- The HDFS full path contains a maximum of 255 characters.

Step 7 Click **OK**.

You can view the file upload progress on the **File Operation Records** page. The system generates a DistCp job for processing the data import operation. You can also view the job execution status on the **Job Management** page.

----End

Exporting HDFS Data to OBS

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.

Step 3 Click the **Files** tab to go to the file management page.

Step 4 Select **HDFS File List**.

Step 5 Go to the data storage directory.

Step 6 Click **Export Data** and configure the OBS and HDFS paths. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **OK**.

Figure 5-3 Exporting data

Export Data from HDFS to OBS

The screenshot shows a dialog box titled "Export Data from HDFS to OBS". It contains two rows of input fields. The first row is labeled "HDFS Path" and has a text input field with a small icon on the left and a "Browse" button on the right. The second row is labeled "OBS Path" and has a text input field with a question mark icon on the left and a "Browse" button on the right. At the bottom of the dialog, there are two buttons: a red "OK" button and a grey "Cancel" button.

NOTE

When a folder is exported to OBS, a label file named **folder name_ \$folder\$** is added to the OBS path. Ensure that the exported folder is not empty. If the exported folder is empty, OBS cannot display the folder and only generates a file named **folder name_ \$folder\$**.

Step 7 Click **OK**.

You can view the file upload progress on the **File Operation Records** page. The system generates a DistCp job for processing the data import operation. You can also view the job execution status on the **Job Management** page.

----End

5.3 Running an MRS Job

5.3.1 Running a MapReduce Job

MRS allows you to submit and run your own programs, and get the results. This section will show you how to submit a MapReduce job in an MRS cluster.

MapReduce jobs are used to submit Hadoop JAR programs to quickly process a large amount of data in parallel. MapReduce is a distributed data processing mode.

You can create a job online and submit it for running on the MRS console, or submit a job in CLI mode on the MRS cluster client.

Prerequisites

- You have uploaded the program packages and data files required by jobs to OBS or HDFS.
- If the job program needs to read and analyze data in the OBS file system, you need to configure storage-compute decoupling for the MRS cluster. For details, see [Configuring Storage-Compute Decoupling for an MRS Cluster](#).

Submitting a Job on the Console

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 In the **Basic Information** area of the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.

Perform this step only when Kerberos authentication is enabled for the cluster.

NOTE

- After the IAM user synchronization is complete, wait for 5 minutes before submitting a job. For details about IAM user synchronization, see [Synchronizing IAM Users to MRS..](#)
- When the policy of the user group an IAM user belongs to changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, or vice versa, it takes time for the cluster node's System Security Services Daemon (SSSD) cache to refresh. To prevent job submission failure, wait for five minutes after user synchronization is complete before submitting the job with the new policy.
- If the IAM username contains spaces (for example, **admin 01**), jobs cannot be added.

Step 4 Click **Job Management**. On the displayed job list page, click **Create**.

Step 5 In **Type**, select **MapReduce**. Configure other job information.

Figure 5-4 Adding a MapReduce job

Create Job

* Type

* Name

* Program Path

Parameters

Service Parameter

Command Reference

Table 5-1 Job configuration information

Parameter	Description	Example
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.	mapreduce_job
Program Path	<p>Path of the program package to be executed. You can enter the path or click HDFS or OBS to select a file.</p> <ul style="list-style-type: none"> The value contains a maximum of 1,023 characters. It cannot contain special characters (; &>,<'\$) and cannot be left blank or all spaces. The OBS program path should start with obs://, for example, obs://wordcount/program/XXX.jar. The HDFS program path should start with hdfs://, for example, hdfs://hacluster/user/XXX.jar. The MapReduce job execution program must end with .jar. 	obs://wordcount/program/test.jar

Parameter	Description	Example
Parameters	<p>(Optional) Key parameters for program execution. Use spaces to separate multiple parameters.</p> <p>Configuration format: <i>Program class name Data input path Data output path</i></p> <ul style="list-style-type: none"> • Program class name: It is specified by a function in your program. MRS is responsible for transferring parameters only. • Data input path: Click HDFS or OBS to select a path or manually enter a correct path. • Data output path: output path of the data processing result. Enter a directory that does not exist. The parameter contains a maximum of 150,000 characters. It cannot contain special characters ; &><'\$, but can be left blank. <p>CAUTION When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext.</p> <p>When you view job information on the MRS console, the sensitive information is displayed as *.</p> <p>Example: <code>username=testuser @password=User password</code></p>	-
Service Parameter	<p>(Optional) Service parameters for the job.</p> <p>To modify the current job, change this parameter. For permanent changes to the entire cluster, refer to Modifying the Configuration Parameters of an MRS Cluster Component and modify the cluster component parameters accordingly.</p> <p>Click  on the right to add more parameters.</p> <p>If a job needs to access OBS using AK/SK, add the following service configuration parameters:</p> <ul style="list-style-type: none"> • fs.obs.access.key: key ID for accessing OBS. • fs.obs.secret.key: key corresponding to the key ID for accessing OBS. 	-
Command Reference	Command submitted to the background for execution when a job is submitted.	<code>yarn jar hdfs://hacluster/user/test.jar</code>

Step 6 Confirm job configuration information and click **OK**.

Step 7 After the job is submitted, you can view the job running status and execution result in the job list. After the job status changes to **Completed**, you can view the analysis result of related programs.

----End

Submitting a Job Using the Cluster Client

Step 1 Install the MRS cluster client. For details, see [Installing an MRS Cluster Client](#).

The MRS cluster comes with a client installed for job submission by default, which can also be used directly. For MRS 3.x and later versions, the default client installation path is **/opt/Bigdata/client** on the Master node. For versions earlier than MRS 3.x, the default client installation path is **/opt/client** on the Master node.

Step 2 Log in to the node where the client is located as the MRS cluster client installation user.

Step 3 Initialize environment variables.

```
cd /opt/Bigdata/client
```

```
source bigdata_env
```

Step 4 Perform authentication if Kerberos authentication has been enabled for the current cluster.

Skip this step for normal clusters.

```
kinit MRScluster service user
```

The MRS cluster service user needs to create a service user with the job submission permission on Manager. For details, see [Creating an MRS Cluster User](#).

Example:

```
kinit testuser
```

Step 5 Copy the program in the OBS file system to the node where the cluster client is located.

```
hadoop fs -Dfs.obs.access.key=AK for accessing OBS -Dfs.obs.secret.key=SK for  
accessing OBS -copyToLocal Source path of the application Destination path of  
the application
```

Example:

```
hadoop fs -Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX -copyToLocal  
"obs://mrs-word/program/hadoop-mapreduce-examples-XXX.jar" "/  
home/omm/hadoop-mapreduce-examples-XXX.jar"
```

NOTE

- Commands carrying authentication passwords pose security risks. Disable historical command recording before running such commands to prevent information leakage.
- To obtain the AK and SK, log in to the OBS console and choose **My Credentials > Access Keys** from the username drop-down list in the upper right corner of the page.

- Step 6** Submit a wordcount job. If data needs to be read from OBS or outputted to OBS, the AK/SK parameters need to be added.

```
hadoop jar Application wordcount Input file path Output file path
```

Example:

```
hadoop jar /home/omm/hadoop-mapreduce-examples-XXX.jar wordcount -  
Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX "obs://mrs-word/input/*"  
"obs://mrs-word/output/"
```

- *Input file path* is the path for storing job input files on OBS.
- *Output file path* is the path for storing the job output file on OBS. Set it to a directory that does not exist.

----End

5.3.2 Running a SparkSubmit Job

MRS allows you to submit and run your own programs, and get the results. This section will show you how to submit a SparkSubmit job in an MRS cluster.

Spark is an open source parallel data processing framework. It helps users easily develop unified big data applications and perform offline processing, stream processing, and interactive analysis on data.

You can create a job online and submit it for running on the MRS console, or submit a job in CLI mode on the MRS cluster client.

Prerequisites

- You have uploaded the program packages and data files required for running jobs to OBS or HDFS.
- If the job program needs to read and analyze data in the OBS file system, you need to configure storage-compute decoupling for the MRS cluster. For details, see [Configuring Storage-Compute Decoupling for an MRS Cluster](#).

Submitting a Job on the Console

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** In the **Basic Information** area of the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.

Perform this step only when Kerberos authentication is enabled for the cluster.

 **NOTE**

- After the IAM user synchronization is complete, wait for 5 minutes before submitting a job. For details about IAM user synchronization, see [Synchronizing IAM Users to MRS..](#)
- When the policy of the user group an IAM user belongs to changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, or vice versa, it takes time for the cluster node's System Security Services Daemon (SSSD) cache to refresh. To prevent job submission failure, wait for five minutes after user synchronization is complete before submitting the job with the new policy.
- If the IAM username contains spaces (for example, **admin 01**), jobs cannot be added.

Step 4 Click **Job Management**. On the displayed job list page, click **Create**.

Step 5 In **Type**, select **SparkSubmit**. Configure other job information.

Figure 5-5 Adding a Spark job

The screenshot shows a web form for adding a Spark job. The 'Type' dropdown is set to 'SparkSubmit'. The 'Name' field contains the placeholder 'Enter a job name.'. The 'Program Path' field contains 'obs://bucket/program/xx.jar or xx.py'. There are two sections for optional parameters: '(Optional) Tuning Parameters' and '(Optional) Runtime Parameters'. Each section has a 'Parameter' and 'Value' input field, a 'Create' button, and 'HDFS' and 'OBS' radio buttons. Below the runtime parameters section, there is a note: 'Use spaces to separate parameters and the '@key=value' format to prevent values being saved in plaintext.'. The '(Optional) Service Parameter' section also has 'Parameter', 'Value', and 'Create' fields. At the bottom, the 'Command Reference' is 'spark-submit --master yarn --deploy-mode cluster'.

Table 5-2 Job configuration information

Parameter	Description	Example
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.	spark_job

Parameter	Description	Example
Program Path	<p>Path of the program package to be executed. You can enter the path or click HDFS or OBS to select a file.</p> <ul style="list-style-type: none"> • The value contains a maximum of 1,023 characters. It cannot contain special characters (; &>,<'\$) and cannot be left blank or all spaces. • The OBS program path should start with obs://, for example, obs://wordcount/program/XXX.jar. The HDFS program path should start with hdfs://, for example, hdfs://hacluster/user/XXX.jar. • The SparkSubmit job execution program must end with .jar or .py. 	obs://wordcount/program/test.jar
Program Parameter	<p>(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance.</p> <p>Table 5-3 lists the common program parameters of Spark jobs. You can configure the parameters based on the execution program and cluster resources.</p>	-
Parameters	<p>(Optional) Key parameter for program execution. The parameter is specified by the function of the custom program. MRS is only responsible for loading the parameters.</p> <p>Multiple parameters are separated by spaces. The value can contain a maximum of 150,000 characters and can be left blank. The value cannot contain special characters such as ; &><'\$</p> <p>CAUTION</p> <p>When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext.</p> <p>When you view job information on the MRS console, the sensitive information is displayed as *.</p> <p>Example: username=testuser @password=User password</p>	-

Parameter	Description	Example
Service Parameter	<p>(Optional) Service parameters for the job.</p> <p>To modify the current job, change this parameter. For permanent changes to the entire cluster, refer to Modifying the Configuration Parameters of an MRS Cluster Component and modify the cluster component parameters accordingly.</p> <p>Click to the add icon on the right to add more parameters.</p> <p>If a job needs to access OBS using AK/SK, add the following service configuration parameters:</p> <ul style="list-style-type: none"> • fs.obs.access.key: key ID for accessing OBS. • fs.obs.secret.key: key corresponding to the key ID for accessing OBS. 	-
Command Reference	Command submitted to the background for execution when a job is submitted.	spark-submit --master yarn--deploy- mode cluster

Table 5-3 Spark job running program parameters

Parameter	Description	Example
--conf	Configuration item for adding tasks.	spark.executor.memory=2G
--driver-memory	Set the running memory of driver.	2G
--num-executors	Set the number of executors to be started.	5
--executor-cores	Set the number of executor cores.	2
--class	Set the main class name of a task, which is specified by a function in the user program.	org.apache.spark.examples.SparkPi
--files	Upload files to a job. The files can be user-defined configuration files or some data files from OBS or HDFS.	-
--jars	Additional dependency JAR packages of a task, which is used to add the external dependency packages to the task.	-
--executor-memory	Executor memory.	2G

Parameter	Description	Example
<code>--conf spark-yarn.maxAppAttempts</code>	Control the number of AM retries. If this parameter is set to 0 , retry is not allowed. If this parameter is set to 1 , one retry is allowed.	0

Table 5-4 Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. NOTE You are advised to set different names for different jobs.
Program Path	Path of the program package to be executed. The following requirements must be met: <ul style="list-style-type: none"> The value contains a maximum of 1,023 characters. It cannot contain special characters (; &><'\$) and cannot be left blank or all spaces. The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> OBS: The path must start with s3a://. Example: s3a://wordcount/program/xxx.jar HDFS: The path must start with /user. For details about how to import data to HDFS, see Uploading Application Data to an MRS Cluster. For SparkScript, the path must end with .sql. For MapReduce and Spark, the path must end with .jar. The .sql and .jar are case-insensitive.
Parameters	Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter. Multiple parameters are separated by space. Configuration method: <i>Package name.Class name</i> The parameter contains a maximum of 150,000 characters. It cannot contain special characters ; &><'\$, but can be left blank. CAUTION When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext. When you view job information on the MRS console, the sensitive information is displayed as *. Example: username=testuser @password=User password

Parameter	Description
Import From	<p>Path for inputting data</p> <p>Data can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none"> • OBS: The path must start with s3a://. • HDFS: The path must start with /user. For details about how to import data to HDFS, see Uploading Application Data to an MRS Cluster. <p>The value contains a maximum of 1,023 characters and cannot contain special characters (; &>,<'\$). This parameter can be left blank.</p>
Export To	<p>Path for outputting data</p> <p>NOTE</p> <ul style="list-style-type: none"> • When setting this parameter, select OBS or HDFS. Select a file directory or manually enter a file directory, and click OK. • If you add the hadoop-mapreduce-examples-x.x.x.jar sample program or a program similar to hadoop-mapreduce-examples-x.x.x.jar, enter a directory that does not exist. <p>Data can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none"> • OBS: The path must start with s3a://. • HDFS: The path must start with /user. <p>The value contains a maximum of 1,023 characters and cannot contain special characters (; &>,<'\$). This parameter can be left blank.</p>
Log Path	<p>Path for storing job logs that record job running status.</p> <p>Data can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none"> • OBS: The path must start with s3a://. • HDFS: The path must start with /user. <p>The value contains a maximum of 1,023 characters and cannot contain special characters (; &>,<'\$). This parameter can be left blank.</p>

Step 6 Confirm job configuration information and click **OK**.

Step 7 After the job is submitted, you can view the job running status and execution result in the job list. After the job status changes to **Completed**, you can view the analysis result of related programs.

----End

Submitting a Job Using the Cluster Client

Step 1 Install the MRS cluster client. For details, see [Installing an MRS Cluster Client](#).

The MRS cluster comes with a client installed for job submission by default, which can also be used directly. For MRS 3.x and later versions, the default client installation path is `/opt/Bigdata/client` on the Master node. For versions earlier than MRS 3.x, the default client installation path is `/opt/client` on the Master node.

Step 2 Upload the application to be run to the node where the cluster client is located.

 **NOTE**

- The JAR sample program used in this section is `{Cluster client installation directory}/Spark2x/spark/examples/jars/spark-examples_*.jar`. (In some versions, the name of the `Spark2x` folder in the cluster is `Spark`. Replace it with the actual name.)
- You can log in to the client node and run the following command to upload the sample JAR package to be executed to the HDFS.

For example, upload the file to the `/tmp` directory of HDFS.

```
hdfs dfs -put {Client installation directory}/Spark2x/spark/examples/jars/spark-examples_*.jar /tmp
```

Step 3 If Kerberos authentication has been enabled for the current cluster, create a user for submitting jobs by referring to [Creating an MRS Cluster User](#).

Skip this step for normal clusters.

In this example, a machine-machine user has been created, and user groups (`hadoop` and `supergroup`), the primary group (`supergroup`), and role permissions (`System_administrator` and `default`) have been correctly assigned to the user.

After the user is created, download the authentication credential file.

- For clusters of MRS 3.x or later, log in to FusionInsight Manager and choose **System > Permission > User**. In the **Operation** column of the newly created user, choose **More > Download Authentication Credential**.
- For MRS 2.x or earlier, log in to MRS Manager and choose **System > Manage User**. In the **Operation** column of the newly created user, choose **More > Download Authentication Credential**.

Upload the user authentication credential to the `/opt` directory on the cluster client node.

Step 4 Log in to the node where the client is located as the MRS cluster client installation user.

Step 5 Decompress the user authentication credential file to obtain the `user.keytab` and `krb5.conf` files.

```
cd /opt
tar -xvf XXX_keytab.tar
```

Step 6 Initialize environment variables.

```
cd /opt/Bigdata/client
source bigdata_env
cd $SPARK_HOME
```

Step 7 Run the following command to submit a Spark job:

```
./bin/spark-submit --master yarn --deploy-mode client --conf  
spark.yarn.principal=MRSTest --conf spark.yarn.keytab=/opt/user.keytab --class  
org.apache.spark.examples.SparkPi examples/jars/spark-examples_*.jar 10
```

```
...  
Pi is roughly 3.1402231402231404
```

Parameter description:

- **deploy-mode**: running mode of the Spark driver. The value can be **client** or **cluster**. In this example, the client mode is used to submit the job.
- **conf**: additional configuration attribute. For example, if the **keytab** file is used for user authentication in this example, configure the following parameters:
 - **spark.yarn.principal**: name of the user who submits the job.
 - **spark.yarn.keytab**: **keytab** file for user authentication.
- **class**: main class name of the application, which is specified by the running application.
- **XXX.jar**: program run by the job

----End

5.3.3 Running a HiveSQL Job

MRS allows you to submit and run your own programs, and get the results. This section will show you how to submit a HiveSQL job in an MRS cluster.

HiveSQL jobs enable the submission of SQL statements and script files for data analysis and querying. Both SQL statements and scripts are supported, and script files can be used to submit sensitive information.

You can create a job online and submit it for running on the MRS console, or submit a job in CLI mode on the MRS cluster client.

Prerequisites

- You have uploaded the program packages and data files required by jobs to OBS or HDFS.
- If the job program needs to read and analyze data in the OBS file system, you need to configure storage-compute decoupling for the MRS cluster. For details, see [Configuring Storage-Compute Decoupling for an MRS Cluster](#).

Submitting a Job on the Console

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 In the **Basic Information** area of the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.

Perform this step only when Kerberos authentication is enabled for the cluster.

NOTE

- After the IAM user synchronization is complete, wait for 5 minutes before submitting a job. For details about IAM user synchronization, see [Synchronizing IAM Users to MRS..](#)
- When the policy of the user group an IAM user belongs to changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, or vice versa, it takes time for the cluster node's System Security Services Daemon (SSSD) cache to refresh. To prevent job submission failure, wait for five minutes after user synchronization is complete before submitting the job with the new policy.
- If the IAM username contains spaces (for example, **admin 01**), jobs cannot be added.

Step 4 Click **Job Management**. On the displayed job list page, click **Create**.

Step 5 Set **Type** to **HiveSql** and configure HiveSQL job information by referring to [Table 5-5](#).

Figure 5-6 Adding a HiveSQL job

Table 5-5 Job configuration information

Parameter	Description	Example
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.	hivesql

Parameter	Description	Example
SQL Type	<p>Submission type of the SQL statement.</p> <ul style="list-style-type: none"> SQL: Run the entered SQL statement. Script: Load SQL scripts from HDFS or OBS to run SQL statements. 	SQL
SQL Statement	<p>This parameter is valid only when SQL Type is set to SQL. Enter the SQL statement to be executed, and then click Check to check whether the SQL statement is correct.</p> <p>If you want to submit and execute multiple statements at the same time, use semicolons (;) to separate them.</p>	-
SQL File	<p>This parameter is valid only when SQL Type is set to Script. The path of the SQL file to be executed must meet the following requirements:</p> <p>Path of the SQL script file to be executed. You can enter the path or click HDFS or OBS to select a file.</p> <ul style="list-style-type: none"> The value contains a maximum of 1,023 characters. It cannot contain special characters (; &><'\$) and cannot be left blank or all spaces. The OBS program path should start with obs://, for example, obs://wordcount/program/XXX.jar. The HDFS program path should start with hdfs://, for example, hdfs://hacluster/user/XXX.jar. The HiveScript file must end with .sql. 	obs://wordcount/program/test.sql
Program Parameter	<p>(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance.</p> <p>Table 5-6 lists the common program parameters of HiveSQL jobs. You can configure the parameters based on the execution program and cluster resources.</p>	-

Parameter	Description	Example
Service Parameter	<p>(Optional) Service parameters for the job.</p> <p>To modify the current job, change this parameter. For permanent changes to the entire cluster, refer to Modifying the Configuration Parameters of an MRS Cluster Component and modify the cluster component parameters accordingly.</p> <p>Click  on the right to add more parameters.</p> <p>For example, add the following service configuration parameters:</p> <ul style="list-style-type: none"> • fs.obs.access.key: key ID used to access OBS in AK/SK mode. • fs.obs.secret.key: key used to access OBS in AK/SK mode. • hive.execution.engine: engine for executing the job. The value can be mr or tez. 	-
Command Reference	Command submitted to the background for execution when a job is submitted.	beeline- e"SELECT * for TABLE test;"

Table 5-6 HiveSQL job running program parameters

Parameter	Description	Example Value
--hiveconf	Configure the Hive service.	<p>For example, set the execution engine to MapReduce.</p> <ul style="list-style-type: none"> • Parameter: --hiveconf • Value: hive.execution.engine=mr
--hivevar	Set user-defined variables.	<p>Set the variable ID as follows:</p> <ul style="list-style-type: none"> • Parameter: --hivevar id • Value: "123" select * from test where id = \$ {hivevar:id};

Step 6 Confirm job configuration information and click **OK**.

Step 7 After the job is submitted, you can view the job running status and execution result in the job list. After the job status changes to **Completed**, you can view the analysis result of related programs.

----End

Submitting a Job Using the Cluster Client

Step 1 Install the MRS cluster client. For details, see [Installing an MRS Cluster Client](#).

The MRS cluster comes with a client installed for job submission by default, which can also be used directly. For MRS 3.x and later versions, the default client installation path is `/opt/Bigdata/client` on the Master node. For versions earlier than MRS 3.x, the default client installation path is `/opt/client` on the Master node.

Step 2 Log in to the node where the client is located as the MRS cluster client installation user.

Step 3 Initialize environment variables.

```
cd /opt/Bigdata/client
```

```
source bigdata_env
```

Step 4 Perform authentication if Kerberos authentication has been enabled for the current cluster.

Skip this step for normal clusters.

```
kinit MRScluster service user
```

The MRS cluster service user needs to create a service user who has the permission to submit jobs on Manager. The user needs to be added to the hive user group. For details, see [Creating an MRS Cluster User](#).

Example:

```
kinit testuser
```

Step 5 Run the **beeline** command to connect to Hive in the cluster and run related tasks.

```
beeline -f SQL file (SQL statements in the execution files.)
```

To specify a component service user for normal clusters, use the command below. If no service user is specified, HiveServer will connect using the current OS user.

```
beeline -nMRS cluster service user
```

----End

5.3.4 Running a Spark SQL Job

MRS allows you to submit and run your own programs, and get the results. This section will show you how to submit a Spark SQL job in an MRS cluster.

Spark SQL jobs are used to query and analyze data, including SQL statements and scripts. If SQL statements contain sensitive information, you can also use script files to submit them.

You can create a job online and submit it for running on the MRS console, or submit a job in CLI mode on the MRS cluster client.

Prerequisites

- You have uploaded the program packages and data files required by jobs to OBS or HDFS.
- If the job program needs to read and analyze data in the OBS file system, you need to configure storage-compute decoupling for the MRS cluster. For details, see [Configuring Storage-Compute Decoupling for an MRS Cluster](#).

Submitting a Job on the Console

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 In the **Basic Information** area of the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.

Perform this step only when Kerberos authentication is enabled for the cluster.

NOTE

- After the IAM user synchronization is complete, wait for 5 minutes before submitting a job. For details about IAM user synchronization, see [Synchronizing IAM Users to MRS](#).
- When the policy of the user group an IAM user belongs to changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, or vice versa, it takes time for the cluster node's System Security Services Daemon (SSSD) cache to refresh. To prevent job submission failure, wait for five minutes after user synchronization is complete before submitting the job with the new policy.
- If the IAM username contains spaces (for example, **admin 01**), jobs cannot be added.

Step 4 Click **Job Management**. On the displayed job list page, click **Create**.

Step 5 Set **Type** to **SparkSql** and configure Spark SQL information by referring to [Table 5-7](#).

Figure 5-7 Adding a Spark SQL job

The screenshot shows the configuration page for adding a Spark SQL job. It includes the following elements:

- Type:** A dropdown menu set to "SparkSql".
- Name:** A text input field with the placeholder "Enter a job name."
- SQL Type:** Two buttons, "SQL" (highlighted in blue) and "Script".
- SQL Statement:** A large text area for entering the SQL statement, with a "Check" button to the right.
- (Optional) Tuning Parameters:** A table with columns "Parameter" and "Value", and a "Create" button.
- (Optional) Service Parameter:** A table with columns "Parameter" and "Value", and a "Create" button.
- Command Reference:** A text box containing the command `mrs-spark-sql-wrapper -e`.

Table 5-7 Job configuration information

Parameter	Description	Example
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.	sparksql
SQL Type	Submission type of the SQL statement <ul style="list-style-type: none"> SQL: Run the entered SQL statement. Script: Load SQL scripts from HDFS or OBS to run SQL statements. 	SQL
SQL Statement	This parameter is valid only when SQL Type is set to SQL . Enter the SQL statement to be executed, and then click Check to check whether the SQL statement is correct. If you want to submit and execute multiple statements at the same time, use semicolons (;) to separate them.	-

Parameter	Description	Example
SQL File	<p>This parameter is valid only when SQL Type is set to Script. The path of the SQL file to be executed must meet the following requirements:</p> <p>Path of the SQL script file to be executed. You can enter the path or click HDFS or OBS to select a file.</p> <ul style="list-style-type: none"> • The value contains a maximum of 1,023 characters. It cannot contain special characters (; &>,<'\$) and cannot be left blank or all spaces. • The OBS program path should start with obs://, for example, obs://wordcount/program/XXX.jar. The HDFS program path should start with hdfs://, for example, hdfs://hacluster/user/XXX.jar. • The script file must end with .sql. 	obs://wordcount/program/test.sql
Program Parameter	<p>(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance.</p> <p>Table 5-8 lists the common program parameters of SparkSql jobs. You can configure the parameters based on the execution program and cluster resources.</p>	-
Service Parameter	<p>(Optional) Service parameters for the job.</p> <p>To modify the current job, change this parameter. For permanent changes to the entire cluster, refer to Modifying the Configuration Parameters of an MRS Cluster Component and modify the cluster component parameters accordingly.</p> <p>Click to the add icon on the right to add more parameters.</p> <p>For example, add the following service configuration parameters:</p> <ul style="list-style-type: none"> • fs.obs.access.key: key ID used to access OBS in AK/SK mode. • fs.obs.secret.key: key used to access OBS in AK/SK mode. 	-
Command Reference	Command submitted to the background for execution when a job is submitted.	mrs-spark-sql-wrapper -e

Table 5-8 Program parameters

Parameter	Description	Example
--conf	Configuration item for adding tasks.	spark.executor.memory=2G
--driver-memory	Running memory of a driver.	2G
--num-executors	Number of executors to be started.	5
--executor-cores	Number of executor cores.	2
--jars	Additional dependency packages of a task, which is used to add the external dependency packages to the task.	-
--executor-memory	Executor memory.	2G

Step 6 Confirm job configuration information and click **OK**.

Step 7 After the job is submitted, you can view the job running status and execution result in the job list. After the job status changes to **Completed**, you can view the analysis result of related programs.

----End

Submitting a Job Using the Cluster Client

Step 1 Install the MRS cluster client. For details, see [Installing an MRS Cluster Client](#).

The MRS cluster comes with a client installed for job submission by default, which can also be used directly. For MRS 3.x and later versions, the default client installation path is `/opt/Bigdata/client` on the Master node. For versions earlier than MRS 3.x, the default client installation path is `/opt/client` on the Master node.

Step 2 If Kerberos authentication has been enabled for the current cluster, create a user for submitting jobs by referring to [Creating an MRS Cluster User](#).

Skip this step for normal clusters.

In this example, a machine-machine user has been created, and user groups (**hadoop** and **supergroup**), the primary group (**supergroup**), and role permissions (**System_administrator** and **default**) have been correctly assigned to the user.

After the user is created, download the authentication credential file.

- For clusters of MRS 3.x or later, log in to FusionInsight Manager and choose **System > Permission > User**. In the **Operation** column of the newly created user, choose **More > Download Authentication Credential**.
- For MRS 2.x or earlier, log in to MRS Manager and choose **System > Manage User**. In the **Operation** column of the newly created user, choose **More > Download Authentication Credential**.

Upload the user authentication credential to the `/opt` directory on the cluster client node.

Step 3 Log in to the node where the client is located as the MRS cluster client installation user.

Step 4 Decompress the user authentication credential file to obtain the **user.keytab** and **krb5.conf** files.

```
cd /opt
tar -xvf XXX_keytab.tar
```

Step 5 Initialize environment variables.

```
cd /opt/Bigdata/client
source bigdata_env
cd $SPARK_HOME
```

Step 6 Enter the spark-sql CLI and run the SQL statement.

```
./bin/spark-sql --conf spark.yarn.principal=MRSTest --conf
spark.yarn.keytab=/opt/user.keytab
```

To execute the SQL file, upload the SQL file to the node where the client is located (for example, the **/opt/** directory) in advance and run the following command:

```
./bin/spark-sql --conf spark.yarn.principal=MRSTest --conf
spark.yarn.keytab=/opt/user.keytab -f /opt/script.sql
```

- **spark.yarn.principal**: name of the user who submits the job.
- **spark.yarn.keytab**: **keytab** file for user authentication.

----End

5.3.5 Running a Flink Job

MRS allows you to submit and run your own programs, and get the results. This section will show you how to submit a Flink job in an MRS cluster.

Flink jobs are used to submit JAR programs to process streaming data.

You can create a job online and submit it for running on the MRS console, or submit a job in CLI mode on the MRS cluster client.

Prerequisites

- You have uploaded the program packages and data files required by jobs to OBS or HDFS.
- If the job program needs to read and analyze data in the OBS file system, you need to configure storage-compute decoupling for the MRS cluster. For details, see [Configuring Storage-Compute Decoupling for an MRS Cluster](#).

Submitting a Job on the Console

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 In the **Basic Information** area of the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.

Perform this step only when Kerberos authentication is enabled for the cluster.

NOTE

- After the IAM user synchronization is complete, wait for 5 minutes before submitting a job. For details about IAM user synchronization, see [Synchronizing IAM Users to MRS..](#)
- When the policy of the user group an IAM user belongs to changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, or vice versa, it takes time for the cluster node's System Security Services Daemon (SSSD) cache to refresh. To prevent job submission failure, wait for five minutes after user synchronization is complete before submitting the job with the new policy.
- If the IAM username contains spaces (for example, **admin 01**), jobs cannot be added.

Step 4 Click **Job Management**. On the displayed job list page, click **Create**.

Step 5 Set **Type** to **Flink** and configure Flink job information by referring to [Table 5-9](#).

Figure 5-8 Creating a Flink job

The screenshot shows a 'Create Job' form with the following fields and options:

- Type:** A dropdown menu with 'Flink' selected.
- Name:** A text input field with the placeholder 'Enter a job name.'
- Program Path:** A text input field with the placeholder 'obs://bucket/program/xx.jar'. To its right are two buttons: 'HDFS' and 'OBS'.
- (Optional) Tuning Parameters:** A section with a help icon. It contains two input fields: 'Parameter' and 'Value', followed by a 'Create' button.
- (Optional) Runtime Parameters:** A section with a help icon. It contains a large empty text area for parameters. To its right are two buttons: 'HDFS' and 'OBS'.
- (Optional) Service Parameter:** A section with a help icon. It contains two input fields: 'Parameter' and 'Value', followed by a 'Create' button.
- Command Reference:** A text field containing the command 'flink run -d -m yarn-cluster'.

Table 5-9 Job configuration information

Parameter	Description	Example
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.	flink_job

Parameter	Description	Example
Program Path	<p>Path of the program package to be executed. You can enter the path or click HDFS or OBS to select a file.</p> <ul style="list-style-type: none"> The value contains a maximum of 1,023 characters. It cannot contain special characters (; &>,<'\$) and cannot be left blank or all spaces. The OBS program path should start with obs://, for example, obs://wordcount/program/XXX.jar. The HDFS program path should start with hdfs://, for example, hdfs://hacluster/user/XXX.jar. The Flink job execution program must end with .jar. 	-
Program Parameter	<p>(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance.</p> <p>Table 5-10 lists the common program parameters of Flink jobs. You can configure the parameters based on the execution program and cluster resources.</p>	-
Parameters	<p>(Optional) Key parameter for program execution. The parameter is specified by the function of the custom program. MRS is only responsible for loading the parameters.</p> <p>Multiple parameters are separated by spaces. The value can contain a maximum of 150,000 characters and can be left blank. The value cannot contain special characters such as ; &><'\$</p> <p>CAUTION</p> <p>When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext.</p> <p>When you view job information on the MRS console, the sensitive information is displayed as *.</p> <p>Example: username=testuser @password=User password</p>	-

Parameter	Description	Example
Service Parameter	<p>(Optional) Service parameters for the job.</p> <p>To modify the current job, change this parameter. For permanent changes to the entire cluster, refer to Modifying the Configuration Parameters of an MRS Cluster Component and modify the cluster component parameters accordingly.</p> <p>Click  on the right to add more parameters.</p> <p>If a job needs to access OBS using AK/SK, add the following service configuration parameters:</p> <ul style="list-style-type: none"> • fs.obs.access.key: key ID for accessing OBS. • fs.obs.secret.key: key corresponding to the key ID for accessing OBS. 	-
Command Reference	Command submitted to the background for execution when a job is submitted.	-

Table 5-10 Flink job running program parameters

Parameter	Description	Example
-ytm	Memory size of each TaskManager container. (Optional unit. The unit is MB by default.)	1024
-yjm	Memory size of JobManager container. (Optional unit. The unit is MB by default.)	1024
-ys	Number of TaskManager cores.	2
-ynm	Custom name of an application on YARN.	test
-c	Class of the program entry method (for example, the main or getPlan() method). This parameter is required only when the JAR program does not specify the class of its manifest.	com.bigdata.mrs.test

Step 6 Confirm job configuration information and click **OK**.

Step 7 After the job is submitted, you can view the job running status and execution result in the job list. After the job status changes to **Completed**, you can view the analysis result of related programs.

----End

Submitting a Job Using the Cluster Client

Step 1 Install the MRS cluster client. For details, see [Installing an MRS Cluster Client](#).

The MRS cluster comes with a client installed for job submission by default, which can also be used directly. For MRS 3.x and later versions, the default client installation path is `/opt/Bigdata/client` on the Master node. For versions earlier than MRS 3.x, the default client installation path is `/opt/client` on the Master node.

Step 2 Log in to the node where the client is located as the MRS cluster client installation user.

Step 3 Run the following command to initialize environment variables:

```
cd /opt/Bigdata/client
source bigdata_env
```

Step 4 Perform the following steps to create a user for submitting jobs and modify the security configuration of the cluster client only for clusters with Kerberos authentication enabled.

1. Prepare a user for submitting Flink jobs.
 - MRS 3.x or earlier: For details, see [Preparing a Development User](#).
 - MRS 3.x or later: For details, see [Preparing a Development User](#).
2. Log in to Manager as the newly created user.
 - For MRS 3.x earlier: Log in to Manager of the cluster. Choose **System > Manage User**. In the **Operation** column of the row that contains the added user, choose **More > Download authentication credential** to locate the row that contains the user.
 - For MRS 3.x or later: Log in to Manager of the cluster. Choose **System > Permission > Manage User**. On the displayed page, locate the row that contains the added user, click **More** in the **Operation** column, and select **Download authentication credential**.
3. Decompress the downloaded authentication credential package and copy the obtained file to a directory on the client node, for example, `/opt/Bigdata/client/Flink/flink/conf`. If the client is installed on a node outside the cluster, copy the obtained files to the `/etc/` directory on the node.
4. For MRS 3.x or later: In security mode, add the service IP address of the node where the client is installed and floating IP address of Manager to the `jobmanager.web.allow-access-address` configuration item in the `/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml` file.
5. Run the following commands to configure security authentication by adding the `keytab` path and username to the `/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml` configuration file.

```
security.kerberos.login.keytab: <user.keytab file path>
security.kerberos.login.principal: <Username>
```

Example:

```
security.kerberos.login.keytab: /opt/Bigdata/client/Flink/flink/conf/user.keytab
security.kerberos.login.principal: test
```
6. In the `bin` directory of the Flink client, run the following command to perform security hardening. Then, set a password for submitting jobs.

sh generate_keystore.sh

This script automatically replaces the SSL value in the `/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml` file. For MRS 3.x or earlier, external SSL is disabled by default in security clusters. To enable external SSL, run this script again after configuration. The configuration parameters do not exist in the default Flink configuration of MRS, if you enable SSL for external connections, you need to add the parameters listed in [Table 5-11](#).

Table 5-11 Parameter description

Parameter	Description	Example Value
security.ssl.rest.enabled	Switch to enable external SSL.	true
security.ssl.rest.keystore	Path for storing keystore .	<code>\${path}/flink.keystore</code>
security.ssl.rest.keystore-password	Password of the keystore . 123456 indicates a user-defined password is required.	123456
security.ssl.rest.key-password	Password of the SSL key. 123456 indicates a user-defined password is required.	123456
security.ssl.rest.truststore	Path for storing the truststore .	<code>\${path}/flink.truststore</code>
security.ssl.rest.truststore-password	Password of the truststore . 123456 indicates a user-defined password is required.	123456

NOTE

- For MRS 3.x or earlier: The **generate_keystore.sh** script is automatically generated.
- The generated **flink.keystore**, **flink.truststore**, and **security.cookie** items are automatically filled in the corresponding configuration items in **flink-conf.yaml**.
- For MRS 3.x or later: You can obtain the values of **security.ssl.key-password**, **security.ssl.keystore-password**, and **security.ssl.truststore-password** using the Manager plaintext encryption API by running the following command:

```
curl -k -i -u <user name>:<password> -X POST -HContent-type:application/json -d '{"plainText":"<password>"}' 'https://x.x.x.x:28443/web/api/v2/tools/encrypt';
```

In the preceding command, `<password>` must be the same as the password used for issuing the certificate, and `x.x.x.x` indicates the floating IP address of Manager in the cluster.

Commands carrying authentication passwords pose security risks. Disable historical command recording before running such commands to prevent information leakage.

7. Configure paths for the client to access the **flink.keystore** and **flink.truststore** files.
 - Absolute path: After the script is executed, the file path of **flink.keystore** and **flink.truststore** is automatically set to the absolute path **opt/**

- Bigdata/client/Flink/flink/conf/** in the **flink-conf.yaml** file. In this case, you need to move the **flink.keystore** and **flink.truststore** files from the **conf** directory to this absolute path on the Flink client and YARN nodes.
- Relative path: Perform the following steps to set the file path of **flink.keystore** and **flink.truststore** to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.
 - i. In the **/opt/Bigdata/client/Flink/flink/conf/** directory, create a new directory, for example, **ssl**.
 - ii. Move the **flink.keystore** and **flink.truststore** file to the **/opt/Bigdata/client/Flink/flink/conf/ssl/** directory.
 - iii. For MRS 3.x or later: Change the values of the following parameters in the **flink-conf.yaml** file to relative paths:

```
security.ssl.keystore: ssl/flink.keystore
security.ssl.truststore: ssl/flink.truststore
```
 - iv. For MRS 3.x or earlier: Change the values of the following parameters in the **flink-conf.yaml** file to relative paths:

```
security.ssl.internal.keystore: ssl/flink.keystore
security.ssl.internal.truststore: ssl/flink.truststore
```
8. If the client is installed on a node outside the cluster, add the following configuration to the configuration file (for example, **/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml**). Replace **xx.xx.xxx.xxx** with the IP address of the node where the client resides.
- ```
web.access-control-allow-origin: xx.xx.xxx.xxx
jobmanager.web.allow-access-address: xx.xx.xxx.xxx
```

### Step 5 Run the Flink job.

This section uses the WordCount sample program provided by the client as an example.

- Normal cluster (Kerberos authentication disabled)
  - Run the following commands to start a session and submit a job in the session:

```
yarn-session.sh -nm "session-name" -d
flink run /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
  - Run the following command to submit a single job on YARN:

```
flink run -m yarn-cluster /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
- Security cluster (Kerberos authentication enabled)
  - If the **flink.keystore** and **flink.truststore** file are stored in the absolute path:
    - Run the following commands to start a session and submit a job in the session:

```
yarn-session.sh -nm "session-name" -d
flink run /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
    - Run the following command to submit a single job on YARN:

```
flink run -m yarn-cluster /opt/Bigdata/client/Flink/flink/
examples/streaming/WordCount.jar
```

- If the **flink.keystore** and **flink.truststore** file are stored in the relative path:
  - In the same directory of SSL, run the following command to start a session and submit jobs in the session. The SSL directory is a relative path. For example, if the SSL directory is **opt/Bigdata/client/Flink/flink/conf/**, then run the following command in this directory:

```
yarn-session.sh -t ssl/ -nm "session-name" -d
flink run /opt/Bigdata/client/Flink/flink/examples/streaming/
WordCount.jar
```
  - Run the following command to submit a single job on YARN:

```
flink run -m yarn-cluster -yt ssl/ /opt/Bigdata/client/Flink/flink/
examples/streaming/WordCount.jar
```

----End

### 5.3.6 Running a HadoopStreaming Job

MRS allows you to submit and run your own programs, and get the results. This section will show you how to submit a Hadoop Streaming job in an MRS cluster.

#### Prerequisites

- You have uploaded the program packages and data files required by jobs to OBS or HDFS.
- If the job program needs to read and analyze data in the OBS file system, you need to configure storage-compute decoupling for the MRS cluster. For details, see [Configuring Storage-Compute Decoupling for an MRS Cluster](#).

#### Submitting a Hadoop Streaming job

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** In the **Basic Information** area of the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.

Perform this step only when Kerberos authentication is enabled for the cluster.

#### NOTE

- After the IAM user synchronization is complete, wait for 5 minutes before submitting a job. For details about IAM user synchronization, see [Synchronizing IAM Users to MRS..](#)
- When the policy of the user group an IAM user belongs to changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, or vice versa, it takes time for the cluster node's System Security Services Daemon (SSSD) cache to refresh. To prevent job submission failure, wait for five minutes after user synchronization is complete before submitting the job with the new policy.
- If the IAM username contains spaces (for example, **admin 01**), jobs cannot be added.

**Step 4** Click **Job Management**. On the displayed job list page, click **Create**.

**Step 5** Set **Type** to **HadoopStreaming**. Configure job information by referring to [Table 5-12](#).

**Table 5-12** Job parameters

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Example    |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|
| Name              | Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | hadoop_job |
| Program Parameter | (Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance.<br><a href="#">Table 5-13</a> describes the common parameters of a running program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | -          |
| Parameters        | (Optional) Key parameter for program execution. The parameter is specified by the function of the custom program. MRS is only responsible for loading the parameters.<br><br>Multiple parameters are separated by spaces. The value can contain a maximum of 150,000 characters and can be left blank. The value cannot contain special characters such as ; &><'\$<br><b>CAUTION</b><br>When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext.<br><br>When you view job information on the MRS console, the sensitive information is displayed as *.<br><br>Example: <code>username=testuser @password=User password</code> | -          |

For permanent changes to the entire cluster, refer to <a href="#">Modifying the Configuration Parameters of an MRS Cluster Component</a> and modify the cluster component parameters accordingly.<br><br>Click  on the right to add more parameters.<br>If a job needs to access OBS using AK/SK, add the following service configuration parameters: <ul style="list-style-type: none"> <li><b>fs.obs.access.key</b>: key ID for accessing OBS.</li> <li><b>fs.obs.secret.key</b>: key corresponding to the key ID for accessing OBS.</li> </ul>                                                                                            | -          |

| Parameter         | Description                                                     | Example |
|-------------------|-----------------------------------------------------------------|---------|
| Command Reference | Commands submitted to the background when the job is submitted. | -       |

**Table 5-13** Program parameters

| Parameter | Description                                                                                                                                                                                | Example Value        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| -ytm      | Memory size of each TaskManager container. (Optional unit. The unit is MB by default.)                                                                                                     | 1024                 |
| -yjm      | Memory size of JobManager container. (Optional unit. The unit is MB by default.)                                                                                                           | 1024                 |
| -yn       | Number of Yarn containers allocated to applications. The value is the same as the number of TaskManagers.<br>For MRS 3.x or later, the <b>-yn</b> parameter is not supported.              | 2                    |
| -ys       | Number of TaskManager cores                                                                                                                                                                | 2                    |
| -ynm      | Custom name of an application on Yarn                                                                                                                                                      | test                 |
| -c        | Class of the program entry method (for example, the <b>main</b> or <b>getPlan()</b> method). This parameter is required only when the JAR file does not specify the class of its manifest. | com.bigdata.mrs.test |

**Step 6** Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

## 5.4 Viewing MRS Job Details and Logs

You can check the status, configuration, and run logs of all jobs in an MRS cluster on the console.

Spark SQL and DistCp jobs do not generate background logs, which means that you cannot access the running logs of these jobs online.

## Viewing the Job Status

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** Click **Job Management** to view the list and status of jobs created in an MRS cluster.

By default, jobs in the job list are sorted by submission time. For details about the parameters in the job list, see [Table 5-14](#). You can quickly filter jobs by job type and job status.

**Table 5-14** Job list parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name/ID    | Job name, which is set when a job is created.<br>ID is the unique identifier of a job. After a job is added, the system automatically assigns a value to ID.                                                                                                                                                                                                                                                                                                                                                           |
| Username   | Name of the user who submits a job.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Job Type   | Job type.<br><b>NOTE</b><br>After importing and exporting files on the <b>Files</b> tab page, you can view the DistCp job on the <b>Jobs</b> page.                                                                                                                                                                                                                                                                                                                                                                     |
| Status     | Job status. <ul style="list-style-type: none"><li>• <b>Submitted</b>: The job has been submitted.</li><li>• <b>Accepted</b>: Initial status of a job after it is successfully submitted.</li><li>• <b>Running</b>: The job is running.</li><li>• <b>Completed</b>: The job is executed.</li><li>• <b>Terminated</b>: The job execution is stopped.</li><li>• <b>Abnormal</b>: An error is reported during job execution, or the job execution is complete but fails.</li></ul>                                         |
| Result     | Execution result of a job. <ul style="list-style-type: none"><li>• <b>Undefined</b>: indicates that the job is being executed.</li><li>• <b>Successful</b>: indicates that the job has been executed.</li><li>• <b>Killed</b>: indicates that the job is manually terminated during execution.</li><li>• <b>Failed</b>: indicates that the job fails to be executed.</li></ul> <b>NOTE</b><br>After a job is successfully executed or fails to be executed, it cannot be executed again. You can only add a job again. |
| Queue Name | Name of the resource queue bound to the user who submits the job.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Submitted  | Time when a job is submitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter | Description                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------|
| Ended     | Time when a job is completed or manually stopped.                                                    |
| Operation | Operations can be performed on the job. For details, see <a href="#">Managing MRS Cluster Jobs</a> . |

----End

## Viewing MRS Job Logs

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Active Clusters** in the navigation pane, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** Click **Jobs**.

**Step 4** In the **Operation** column of the job to be viewed, choose **More > View Details**.

In the **View Details** window that is displayed, configuration of the selected job is displayed.

**Step 5** Select a running job, and click **View Log** in the **Operation** column.

In the new page that is displayed, real-time log information of the job is displayed.

### NOTE

- Each tenant can submit and view 10 jobs concurrently.
- After a job is executed, the system will compress and save the logs to the corresponding path if you choose to save job logs to OBS or HDFS. Therefore, after a job execution of this type is completed, the job status is still **Running**. After the log is successfully stored, the job status changes to **Completed**. The log storage duration depends on the log size and takes several minutes.

----End

# 6 Managing Clusters

## 6.1 Overview

### MRS Console

After creating a cluster, you can use the MRS console or MRS Manager to manage and maintain it, as well as view basic information.

- The MRS console's cluster management page allows you to monitor and manage nodes, components, alarms, files, and jobs related to the cluster.
- MRS Manager is the O&M management system of MRS and provides unified cluster management capabilities for services deployed in clusters.

For further information on the capabilities of the MRS console and Manager, refer to [Table 6-1](#).

**Table 6-1** MRS console and Manager capability comparison

| Operation                                                                                                                  | Console | Manager |
|----------------------------------------------------------------------------------------------------------------------------|---------|---------|
| Changing subnets, adding security group rules, controlling OBS permissions, managing agencies, and synchronizing IAM users | Yes     | No      |
| Adding node groups, scaling out, scaling in, and upgrading specifications                                                  | Yes     | No      |
| Isolating hosts, starting all roles, and stopping all roles                                                                | Yes     | Yes     |
| Downloading the client, starting services, stopping services, and perform rolling restart of services                      | Yes     | Yes     |

| Operation                                                                                         | Console | Manager |
|---------------------------------------------------------------------------------------------------|---------|---------|
| Viewing the instance status of services, configuring parameters, and synchronizing configurations | Yes     | Yes     |
| Viewing cleared alarms and events                                                                 | Yes     | Yes     |
| Viewing the alarm help                                                                            | Yes     | Yes     |
| Setting thresholds for threshold alarms                                                           | No      | Yes     |
| Adding message subscription specifications                                                        | Yes     | No      |
| Managing files                                                                                    | Yes     | No      |
| Managing jobs                                                                                     | Yes     | No      |
| Managing tenants                                                                                  | Yes     | Yes     |
| Managing tags                                                                                     | Yes     | No      |
| Setting permissions (adding and deleting users, user groups, and roles)                           | No      | Yes     |
| Backing up component data and restoring data                                                      | No      | Yes     |
| Logging metadata operation audit                                                                  | No      | Yes     |
| Monitoring resources                                                                              | Yes     | Yes     |

## MRS Cluster Management Objects

There are various fundamental objects in MRS, which are listed in [Table 6-2](#).

**Table 6-2** MRS basic objects

| Object    | Description                                                                     | Example                                                                  |
|-----------|---------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| Component | Function set that can complete specific business.                               | KrbServer and LdapServer                                                 |
| Instance  | Specific instance of a component, which can also be referred to as a component. | KrbServer                                                                |
| Role      | Function entity that forms a complete component, usually called role.           | KrbServer is composed of the KerberosAdmin role and KerberosServer role. |

| Object        | Description                                                                   | Example                                                                                                                       |
|---------------|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Role instance | Specific instance of a service role running on a host.                        | KerberosAdmin that is running on Host2 and KerberosServer that is running on Host3                                            |
| Host          | An ECS running Linux OS.                                                      | Host1 to Host5                                                                                                                |
| Rack          | Physical entity that contains multiple hosts connecting to the same switch.   | Rack1 contains Host1 to Host5.                                                                                                |
| Cluster       | Logical entity that consists of multiple hosts and provides various services. | Cluster names <b>Cluster1</b> consists of five hosts (Host1 to Host5) and provides services such as KrbServer and LdapServer. |

## 6.2 Introduction to MRS Manager

### Manager Overview

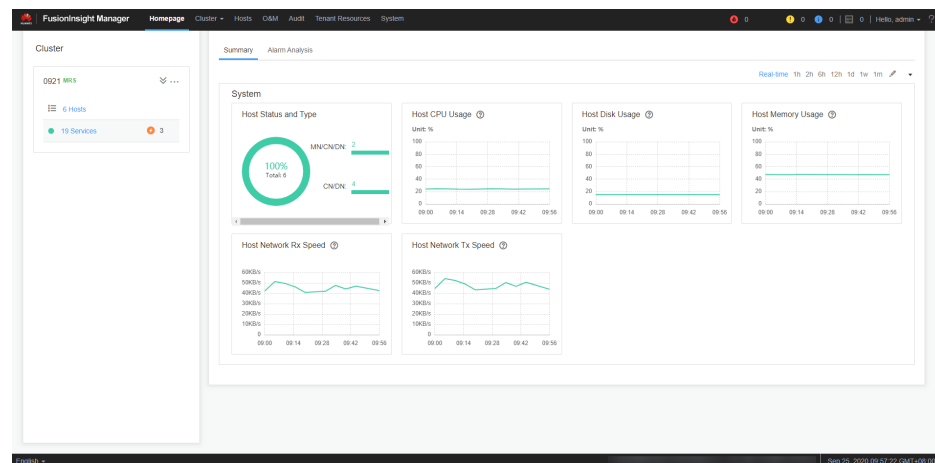

MRS manages and analyzes massive amounts of data and quickly mines valuable data from structured and unstructured data. Open source components have complex structures and therefore they are difficult to install, configure, and manage. MRS Manager is a unified enterprise-level cluster management platform that provides:

- Cluster monitoring: enables you to quickly learn the running status of hosts and services.
- Graphical metric monitoring and customization: enable you to obtain key system information in a timely manner.
- Service property configurations can meet service performance requirements.
- Cluster, service, and role instance operations: allow you to start or stop services and clusters with just a few clicks.
- Rights management and audit: allow you to configure the access control and manage operation logs.

### Manager GUI

MRS Manager provides a unified cluster management platform, facilitating rapid and easy O&M for clusters.

**Figure 6-1** Manager GUI of MRS 3.x

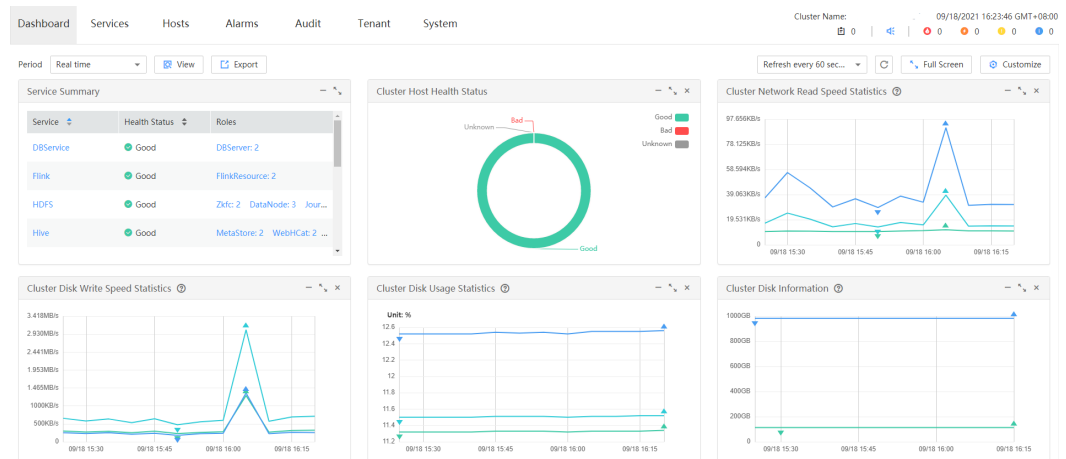

The Manager GUI contains three parts: the operation bar at the top, the display area in the middle, and the taskbar at the bottom. The operation bar has multiple entries, each with its unique function, which are explained in the table provided.

**Table 6-3** Functions of different entries (MRS 3.x)

| Entry            | Function                                                                                                                                                                                                                                                             |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Homepage         | Displays key monitoring metrics of clusters and host statuses in column charts, line charts, and tables. You can customize a dashboard for key monitoring metrics and drag them onto any positions on the GUI. Data on the dashboard can be automatically refreshed. |
| Cluster          | Provides guidance on how to monitor, operate, and configure services in a cluster, helping you manage services in a unified manner.                                                                                                                                  |
| Hosts            | Provides guidance on how to monitor and operate hosts, helping you manage hosts in a unified manner.                                                                                                                                                                 |
| O&M              | Provides guidance on how to query and handle alarms, helping you identify and rectify product faults and potential risks in a timely manner to ensure normal system operations.                                                                                      |
| Audit            | Allows you to query and export audit logs, and view all user activities and operations.                                                                                                                                                                              |
| Tenant Resources | Provides a unified tenant management platform.                                                                                                                                                                                                                       |
| System           | Provides system management settings of FusionInsight Manager, such as user permission settings.                                                                                                                                                                      |

**Figure 6-2** Manager GUI of MRS 2.x

**Table 6-4** Functions of different entries (MRS 2.x)

| Parameter | Function                                                                                                                                                                                                                                                                                                                         |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dashboard | Displays the status of all services, main monitoring indicators of each service, and host status in charts, such as bar charts, line charts, and tables. You can customize a dashboard for the key monitoring indicators and drag it to any position on the interface. The system dashboard page supports automatic data update. |
| Services  | Provides the service monitoring, operation, and configuration guidance, which helps you manage services in a unified manner.                                                                                                                                                                                                     |
| Hosts     | Provides guidance on how to monitor, operate, and configure hosts, helping you manage hosts in a unified manner.                                                                                                                                                                                                                 |
| Alarms    | Supports alarm query and provides guidance on alarm handling, helping you identify and rectify product faults and potential risks in a timely manner to ensure normal system operation.                                                                                                                                          |
| Audit     | Allows authorized users to query and export audit logs, helping you to view all user activities and operations.                                                                                                                                                                                                                  |
| Tenant    | Provides a unified tenant management platform.                                                                                                                                                                                                                                                                                   |
| System    | Provides monitoring, alarm configuration management, and backup management.                                                                                                                                                                                                                                                      |

## Manager Homepage (MRS 3.x)

On the FusionInsight Manager homepage, you can view the cluster service status, monitoring reports, and alarm statistics and analysis information in the preview area.

- On the right of the homepage, you can view the number of alarms of different severities, number of running tasks, current user, and help information.

**Figure 6-3** Cluster status information

Click  to view the task name, status, progress, start time, and end time of the last 100 operation tasks in **Task Management Center**.

 **NOTE**

For a start, stop, restart, or rolling restart task, you can abort it by clicking the task name in the task list, clicking **Abort**, and then entering the system administrator password in the dialog box that is displayed. An aborted task is no longer executed.

- The taskbar at the bottom of the homepage displays the language options of FusionInsight Manager and the current cluster time and time zone information. You can switch the system language as needed.

**Figure 6-4** Taskbar at the bottom of the homepage

- **Service status preview area**

The list of installed service components in the cluster is displayed on the left of the homepage. You can view the status and alarms of each service.

The  icon on the left of each service name indicates that the service is running properly; the  icon indicates that the current service fails to start; and the  icon indicates that the current service is not started.

You can also check whether alarms have been generated for the service on the right of the service name. If alarms have been generated, the alarm severities and the number of alarms are displayed.

The  icon displayed on the right of the service name indicates that the service configuration has expired.
- **Monitoring status report area**

The chart area is on the right of the homepage, which displays key monitoring metric reports, such as the status of all hosts in the cluster, host CPU usage, and host memory usage. You can customize the monitoring reports displayed in the chart area. For details, see [Viewing MRS Cluster Resource Monitoring Metrics](#).

You can view the data source of a monitoring chart in the lower left corner of the chart. You can zoom in on a monitoring report to view chart values more clearly or close the monitoring report.

Figure 6-5 Monitoring status report

- Alarm analysis  
On the **Alarm Analysis** page, you can view the **Top 20 Alarms** table and **Analysis on Top 3 Alarms** chart. You can click an alarm name in the **Top 20 Alarms** table to view analysis information of this alarm only. Alarm analysis allows you to view top alarms and their occurrence time so you can handle alarms accordingly, improving system stability.

Figure 6-6 Alarm analysis

## Manager Security Functions

You can query and set user rights data through the following Manager modules:

- Role management: Roles can be added, deleted, modified, queried, and assigned with the resource access rights of one or multiple components. For details, see [Managing MRS Cluster Roles](#).
- User group management: User groups can be added, deleted, modified, queried, and bound to roles. For details, see [Managing MRS Cluster User Groups](#).
- User management: Users can be added, deleted, modified, queried, bound to user groups, and assigned with roles. For details, see [Managing MRS Cluster Users](#).
- Tenant management: Tenants can be added, deleted, modified, queried, and bound to component resources. MRS generates a role for each tenant to

facilitate management. If a tenant is assigned with the rights of some resources, its corresponding role also has these rights.

For details, see [Managing MRS Cluster Tenants](#).

## Checking the Manager Version

By checking the Manager version, you can get ready for system upgrades and regular maintenance. This section uses MRS clusters of 3.x or later as an example.

- Using the GUI:

Log in to MRS Manager. On the homepage, click  in the upper right corner and choose **About** from the drop-down list. In the dialog box that is displayed, check the Manager version.

**Figure 6-7** Checking the version number

- Using the CLI:
  - a. Log in to the Manager active OMS node as user **root**.  
To obtain the IP address of the active OMS node, view the host information marked with ★ on the **Hosts** page of Manager.
  - b. Check the version and platform information of Manager.

**su - omm**

**cd \${BIGDATA\_HOME}/om-server/om/sbin/pack**

**./queryManager.sh**

The following information is displayed:

| Version | Package                   | Cputype |
|---------|---------------------------|---------|
| ***     | FusionInsight_Manager_*** | x86_64  |

 **NOTE**

\*\*\* indicates the version number. Replace it with the actual version number.

## 6.3 Accessing MRS Manager

### Scenario

MRS allows you to oversee, adjust, and handle clusters on Manager. Once the cluster is set up, you can access Manager as user **admin**.

Currently, you can access Manager using the following methods:

- **Accessing MRS Manager Using an EIP:** You can bind an EIP to the cluster to access the MRS Manager GUI and open source components managed in the cluster. This method is suggested as it is more user-friendly.
- **Accessing MRS Cluster Manager Using Direct Connect:** Direct Connect is a high-speed, low-latency, stable, and secure dedicated network connection that connects your local data center to an online cloud VPC. It extends online cloud services and existing IT facilities to build a flexible, scalable hybrid computing environment.

You need to ensure that Direct Connect is available, and the connection between the local data center and the online VPC has been established. For details, see [What Is Direct Connect?](#)

You can switch between EIP access and Direct Connect access on the MRS console as follows: Log in to the MRS console, click  next to **MRS Manager** on the **Dashboard** page of the target MRS cluster, and switch between the two access methods on the displayed page.

- **Accessing MRS Manager Through an ECS:** Access Manager through an ECS that is in the same VPC as the MRS cluster. This method is complex and is recommended when the EIP function is not supported.
- **Configuring an SSH Tunnel to Access MRS Manager:** Users and an MRS cluster are in different networks. As a result, an SSH tunnel needs to be created to send users' requests for accessing websites to the MRS cluster and dynamically forward them to the target websites.

## Prerequisites

Make sure the cluster is not in the starting, stopping, stopped, deleting, deleted, or frozen state before accessing MRS Manager.

## Accessing MRS Manager Using an EIP

**Step 1** Log in to the MRS management console.

**Step 2** In the navigation pane, choose **Active Clusters**. Click the target cluster name to access the cluster details page.

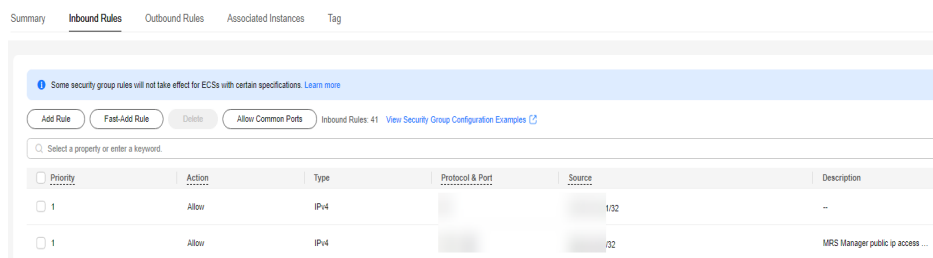

**Step 3** Click **Access Manager** next to **MRS Manager**. In the displayed dialog box, select **EIP** and configure the EIP information.

1. If no EIP is bound when the MRS cluster is created, select an available EIP from the EIP drop-down list. Otherwise, perform the operations in [Step 3.2](#).
  - If no available EIPs are displayed, click **Manage EIP** to create one. An EIP can be bound to only one MRS cluster.
  - To unbind or release an EIP, log in to the **EIPs** page, locate the row containing the target EIP, and click **Unbind** or choose **More > Release** in the **Operation** column.
2. In **Security Group**, select the security group to which the current cluster belongs. The security group is configured during cluster creation or is automatically created by the cluster.

If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

- "MRS Manager public ip access control rule" is automatically added to the **Description** column of the added security group. To view this description, choose **Manage Security Group Rule**, click **Security Group**, and click **Inbound Rules**.

**Figure 6-8** Adding a security group rule to the MRS cluster

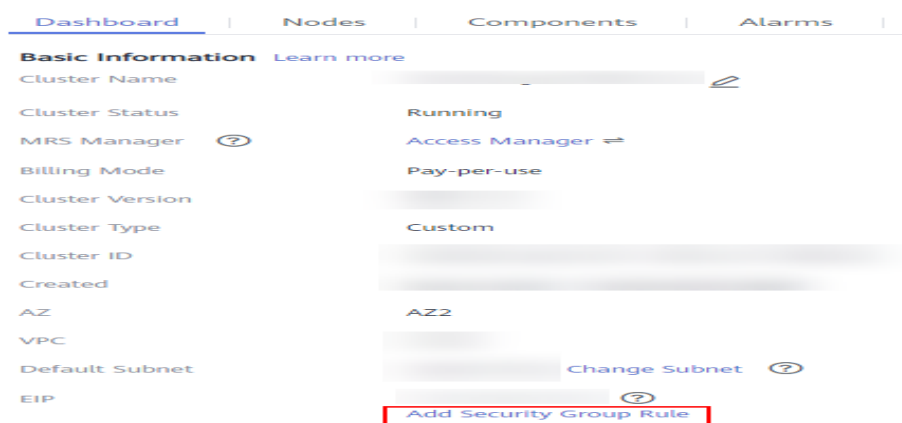

- It is normal that the automatically generated public IP address is different from your local IP address and no action is required.
  - Port **9022** is the Knox port of the MRS cluster. Therefore, you need to enable the permission to access the port to access Manager.
3. Select the information to be confirmed and click **OK**. The Manager login page is displayed.

**Step 4** Enter the default username **admin** and the password set during cluster creation, and click **Log In**. The Manager page is displayed.

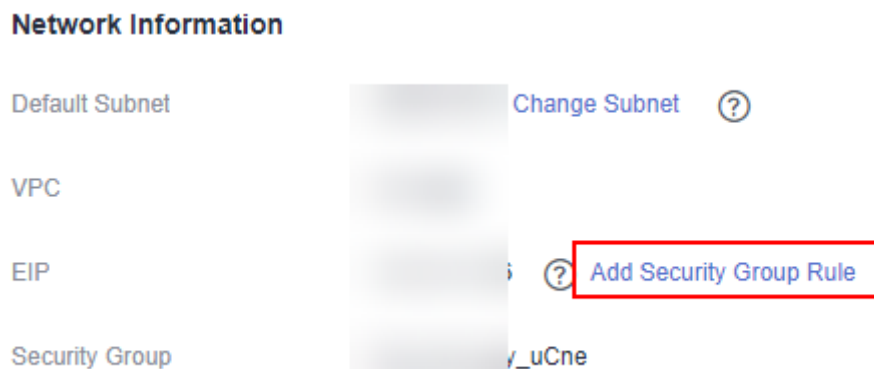

**Step 5** To grant users in other network segments the permission to access Manager, you can modify the security group and add the IP address range for the users to access the public network.

1. Click **Add Security Group Rule** next to **EIP**.

**Figure 6-9** Cluster details

2. On the **Add Security Group Rule** page, add the IP address segment for users to access the public network and select **I confirm that *public network IP/ port* is a trusted public IP address. I understand that using 0.0.0.0/0. poses security risks.** See [Figure 6-10](#).

**Figure 6-10** Adding a security group rule

By default, the IP address segment used for accessing the public network is filled. You can change the IP address segment as required. To view, modify, or delete security group rules, click **Manage Security Group Rule**.

3. Click **OK**.

----End

## Accessing MRS Cluster Manager Using Direct Connect

**Step 1** Log in to the MRS console.

**Step 2** Click the name of the cluster to enter its details page.

**Step 3** On the **Dashboard** page of the cluster details page, click **Access Manager** next to **MRS Manager**.

**Step 4** Set **Access Mode** to **Direct Connect** and confirm that you understand the impact of the operation.

The floating IP address is automatically allocated by MRS to access MRS Manager. Before using Direct Connect to access MRS Manager, ensure that the connection between the local data center and the online VPC has been established.

**Step 5** Click **OK**. The MRS Manager login page is displayed. Enter the username **admin** and the password set during cluster creation.

----End

## Accessing MRS Manager Through an ECS

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, click the name of the specified cluster.

Record the **AZ**, **VPC**, and **Security Group** of the cluster.

**Step 3** On the homepage of the management console, choose **Service List > Elastic Cloud Server** to switch to the ECS management console and create an ECS.

- The **AZ**, **VPC**, and **Security Group** of the ECS must be the same as those of the cluster to be accessed.

- Select a Windows public image. For example, a standard image **Windows Server 2012 R2 Standard 64bit(40GB)**.
- For details about other configuration parameters, see [Purchasing an ECS with Customized Configurations](#).

**NOTE**

If the security group of the ECS is different from **Default Security Group** of the Master node, you can modify the configuration using either of the following methods:

- Change the security group of the ECS to the default security group of the Master node. For details, see [Changing a Security Group](#).
- Add two security group rules to the security groups of the Master and Core nodes to enable the ECS to access the cluster. Set **Protocol** to **TCP**, **Ports** of the two security group rules to **28443** and **20009**, respectively. For details, see [Creating a Security Group](#).

If "Failed to add security group rules." is displayed, check whether the security group quota is sufficient. If more quotas are needed, increase the quotas or delete security group rules that are no longer used.

**Step 4** On the EIP console, apply for an EIP and bind it to the ECS.

For details, see [Assigning an EIP and Binding It to an ECS](#).

**Step 5** Log in to the ECS.

The Windows system account, password, EIP, and security group rules are required for logging in to the ECS. For details, see [Logging In to a Windows ECS](#).

**Step 6** On the Windows remote desktop, use your browser to access Manager.

The Manager access address is in the **https://OMS floating IP address:28443/web** format. Enter the name and password of the cluster user, for example, user **admin**.

**NOTE**

- To obtain the floating IP address of OMS, log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of OMS. Record the value of **inet**. If the floating IP address of OMS cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.
- If you access Manager with other cluster usernames, change the password upon your first access. The new password must meet the requirements of the current password complexity policies. For details, contact the administrator.
- By default, a user is locked after inputting an incorrect password five consecutive times. The user is automatically unlocked after 5 minutes.

**Step 7** Log out of FusionInsight Manager. To log out of Manager, move the cursor to  in the upper right corner and click **Log Out**.

----End

## Configuring an SSH Tunnel to Access MRS Manager

Users and an MRS cluster are in different networks. As a result, an SSH tunnel needs to be created to send users' requests for accessing websites to the MRS cluster and dynamically forward them to the target websites.

The MAC system does not support this function. For details about how to access MRS, see [Accessing MRS Manager Using an EIP](#).

Make sure the following prerequisites are met before proceeding with the operation:

- You have prepared an SSH client for creating the SSH tunnel, for example, the Git open source SSH client. You have downloaded and installed the client.
- You have created a cluster and prepared a key file in PEM format or obtained the password used during cluster creation.
- Users can access the Internet on the local PC.

**Step 1** Log in to the MRS console and click **Active Clusters**.

**Step 2** Click the specified MRS cluster name.

Record the security group of the cluster.

**Step 3** Add an inbound rule to the security group of the master node to allow data access to the IP address of the MRS cluster through port 22.

For details, see [Adding a Security Group Rule](#).

**Step 4** Query the primary management node of the cluster by referring to [Checking MRS Active/Standby Management Nodes](#).

**Step 5** Bind an elastic IP address to the primary management node of the cluster.

For details, see [Assigning an EIP and Binding It to an ECS](#).

**Step 6** Start Git Bash locally and run the following command to log in to the active management node of the cluster:

```
ssh root@EIP address
```

Alternatively, run the following command:

```
ssh -i Key file path root@EIP address
```

**Step 7** View data forwarding configurations.

```
cat /etc/sysctl.conf | grep net.ipv4.ip_forward
```

- If **net.ipv4.ip\_forward=1** is displayed, the forwarding function has been configured. Go to [Step 9](#).
- If **net.ipv4.ip\_forward=0** is displayed, the forwarding function has not been configured. Go to [Step 8](#).
- If **net.ipv4.ip\_forward** fails to be queried, this parameter has not been configured. Run the following command and then go to [Step 9](#):  
echo "net.ipv4.ip\_forward = 1" >> /etc/sysctl.conf

**Step 8** Modify forwarding configurations on the node.

1. Switch to user **root**.

```
sudo su - root
```

2. Modify forwarding configurations.

```
echo 1 > /proc/sys/net/ipv4/ip_forward
```

```
sed -i "s/net.ipv4.ip_forward=0/net.ipv4.ip_forward = 1/g" /etc/sysctl.conf
```

```
sysctl -w net.ipv4.ip_forward=1
```

3. Modify the `sshd` configuration file.

```
vi /etc/ssh/sshd_config
```

Press **I** to enter the edit mode. Locate **AllowTcpForwarding** and **GatewayPorts** and delete comment tags. Modify them as follows. Save the changes and exit.

```
AllowTcpForwarding yes
GatewayPorts yes
```

4. Restart the `sshd` service.

```
service sshd restart
```

- Step 9** View the floating IP address.

```
ifconfig
```

In the command output, **eth0:FI\_HUE** indicates the floating IP address of Hue, and **eth0:wsom** indicates the floating IP address of Manager. Record the value of **inet**.

Run the **exit** command to exit.

- Step 10** Run the following command on the local host to create an SSH tunnel that supports dynamic port forwarding:

```
ssh -i Path of the key file -v -ND Local port root@EIP address
```

Alternatively, run the following command:

```
ssh -v -ND Local port root@EIP address
```

Enter the password for creating the cluster as prompted.

In the command, set **Local port** to the user's local port that is not occupied. Port **8157** is recommended.

After the SSH tunnel is created, use **-D** to enable the dynamic port forwarding function. By default, the dynamic port forwarding function enables a SOCKS proxy process and monitors the user's local port. Port data will be forwarded to the primary management node using the SSH tunnel.

- Step 11** Configure the browser proxy.

1. Go to the Google Chrome client installation directory on the local PC.
2. Press **Shift** and right-click the blank area, choose **Open Command Window Here** and enter the following command:

```
chrome --proxy-server="socks5://localhost:8157" --host-resolver-rules="MAP * 0.0.0.0 , EXCLUDE localhost" --user-data-dir=c:/tmp/path --proxy-bypass-list="*google*.com,*gstatic.com,*gvt*.com,*:80"
```

 **NOTE**

- In the preceding command, **8157** is the local proxy port configured in [Step 10](#).
- If the local OS is Windows 10, start the Windows OS, click **Start** and enter **cmd**. In the displayed CLI, run the command in [Step 11.2](#). If this method fails, click **Start**, enter the command in the search box, and run the command in [Step 11.2](#).

- Step 12** In the address box of the browser, enter the address for accessing Manager.

The Manager access address is in the **https://Manager floating IP address:28443/web** format.

The username and password of the MRS cluster need to be entered for accessing clusters with Kerberos authentication enabled, for example, user **admin**. They are not required for accessing normal clusters with Kerberos authentication disabled.

For the first access, add the site to the trusted site list as prompted to continue to open the page.

**Step 13** When logging out of Manager, terminate and close the SSH tunnel.

----End

## 6.4 Managing an MRS Cluster

### 6.4.1 Viewing Basic Information About an MRS Cluster

You can monitor and manage the clusters you have created. On the **Active Clusters** page. Click the name of a cluster to go to the cluster details page. On the displayed page, view the basic configuration, network, and node information of the cluster.

#### NOTE

On the MRS console, operations performed on an ECS cluster are basically the same as those performed on a BMS cluster. This document describes operations on an ECS cluster. If operations on the two clusters differ, the operations will be described separately.

### Viewing Basic Information About an MRS Cluster

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the cluster details page, click **Dashboard** to view the basic information of the cluster.

**Table 6-5** MRS cluster basic information

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cluster Name    | The name of a cluster. Configure this parameter when creating a cluster. Click  to change the cluster name. Only the cluster name displayed on the MRS management console is changed, while the cluster name on MRS Manager is not changed synchronously. |
| Cluster Status  | The cluster status. For details, see <a href="#">Table 6-10</a> .                                                                                                                                                                                                                                                                            |
| Cluster Version | MRS version information.                                                                                                                                                                                                                                                                                                                     |

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cluster Type            | There are three types of clusters: <ul style="list-style-type: none"><li>● <b>Analysis Cluster</b>: is used for offline data analysis and provides Hadoop components.</li><li>● <b>Streaming Cluster</b>: is used for streaming tasks and provides stream processing components.</li><li>● <b>Hybrid Cluster</b>: is used for both offline data analysis and streaming processing and provides Hadoop components and streaming processing components.</li><li>● <b>Custom</b>: An MRS cluster with all custom components. MRS 3.x or later supports this type.</li></ul> |
| Cluster ID              | Unique identifier of a cluster, which is automatically assigned when a cluster is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Created                 | Time when a cluster is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| AZ                      | Availability zone (AZ) in the region of a cluster, which is set when a cluster is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Kerberos Authentication | Whether to enable Kerberos authentication when logging in to Manager.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Enterprise Project      | The enterprise project to which a cluster belongs. Only on the <b>Active Clusters</b> page, you can click the name of an enterprise project to go to its <b>Enterprise Project Management</b> page.                                                                                                                                                                                                                                                                                                                                                                      |

**Table 6-6** MRS cluster network information

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Subnet | The subnet selected during cluster creation.<br>If the subnet IP addresses are insufficient, click <b>Change Subnet</b> to switch to another subnet in the same VPC of the current cluster to obtain more available subnet IP addresses. Changing a subnet does not affect the IP addresses and subnets of existing nodes.<br>A subnet provides dedicated network resources that are isolated from other networks, improving network security. |
| VPC            | VPC selected during cluster creation.<br>A VPC is a secure, isolated, and logical network environment.                                                                                                                                                                                                                                                                                                                                         |

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EIP            | <p>After binding an EIP to an MRS cluster, you can use the EIP to access the Manager web UI of the cluster. If you do not need the EIP, click <b>Unbind</b> to unbind the EIP from the cluster. The Manager will not be accessible through the unbound EIP.</p> <p><b>NOTE</b><br/>If you unbind the EIP from a cluster, other users may fail to access the Manager of that cluster.</p> |
| Security Group | The security group name of the cluster.                                                                                                                                                                                                                                                                                                                                                  |

**Table 6-7** MRS cluster O&M management

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MRS Manager            | Manager entry. For details, see <a href="#">Accessing MRS Manager</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| IAM User Sync          | <p>IAM user information (including federated users) can be synchronized to an MRS cluster for cluster management. For details, see <a href="#">Synchronizing IAM Users to MRS</a>.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>The <b>Components</b>, <b>Tenants</b>, and <b>Backups &amp; Restorations</b> pages on the cluster details page can be used only after users are synchronized. After an MRS 3.x cluster is synchronized, you can use the <b>Components</b> function.</li> <li>For a federated user, only information about the user that logged in the system can be synchronized.</li> </ul> |
| Data Connection        | Click <b>Manage</b> to view the data connection type associated with the cluster. For details, see <a href="#">Creating a Data Connection</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Agency                 | <p>Click <b>Manage Agency</b> to bind or modify an agency for the cluster.</p> <p>An agency allows ECS or BMS to manage MRS resources. You can configure an agency of the ECS type to automatically obtain the AK/SK to access OBS. For details, see <a href="#">Interconnecting an MRS Cluster with OBS Using an IAM Agency</a>.</p> <p>The <b>MRS_ECS_DEFAULT_AGENCY</b> agency has the OBSOperateAccess permission of OBS and the CESFullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.</p>                   |
| OBS Permission Control | Click <b>Manage</b> and modify the mapping between MRS users and OBS permissions. For details, see <a href="#">Configuring Fine-Grained OBS Access Permissions for MRS Cluster Users</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter             | Description                                                                                                                                                                                                                                                                                                    |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Logging               | Used to collect logs about cluster creation and scaling failures.                                                                                                                                                                                                                                              |
| Secure Communications | Used to display the security authorization status. You can enable or disable security authorization. Disabling security authorization brings high risks. Exercise caution when performing this operation. For details, see <a href="#">Configuring Secure Communication Authorization for an MRS Cluster</a> . |

**Table 6-8** MRS cluster billing information

| Parameter              | Description                                                                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Billing Mode           | Billing mode of a cluster. Currently, <b>Pay-per-use</b> and <b>Yearly/Monthly</b> are supported.                                                    |
| Last Transaction Order | Order number for purchasing a cluster. This parameter is available only when <b>Billing Mode</b> is set to <b>Yearly/Monthly</b> .                   |
| Created                | Time when the cluster is created. This parameter is available only when <b>Billing Mode</b> is set to <b>Yearly/Monthly</b> .                        |
| Expired                | Cluster expiration time. This parameter is available only when <b>Billing Mode</b> is set to <b>Yearly/Monthly</b> .                                 |
| Upon Expiration        | The cluster will enter the grace period upon expiration. This parameter is available only when <b>Billing Mode</b> is set to <b>Yearly/Monthly</b> . |

----End

## 6.4.2 Checking the Running Status of an MRS Cluster

MRS allows you to buy multiple clusters. The cluster quantity is subject to that of ECSs. You can view the running status of all MRS clusters on the console.

### Checking the Running Status of an MRS Cluster

**Step 1** Log in to the MRS console.

**Step 2** Click **Active Clusters**.

By default, clusters in the cluster list are sorted by creation time. For details about the cluster list parameters, see [Table 6-9](#).

- **Active Clusters**: contain all clusters except the clusters in the **Failed** and **Deleted** states.
- **Cluster History**: contains the clusters in the **Deleted** states. Only clusters deleted within the last six months are displayed. If you want to view clusters deleted six months ago, contact Huawei Cloud technical support.

- **Failed Tasks:** Click  to view the failed cluster creation tasks.

**Table 6-9** Parameters in the active cluster list

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name/ID         | <p>Cluster name, which is set when a cluster is created. Unique identifier of a cluster, which is automatically assigned when a cluster is created.</p> <ul style="list-style-type: none"> <li>•  : Change the cluster name.</li> <li>•  : Copy the cluster ID.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Cluster Version | Cluster version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Cluster Type    | The type of a cluster you want to create.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Nodes           | Number of nodes that can be deployed in a cluster. This parameter is set when a cluster is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Status          | <p>Cluster running state and state change information. For details, see <a href="#">Table 6-10</a>.</p> <p>The cluster creation progress includes:</p> <ul style="list-style-type: none"> <li>• Verifying cluster parameters</li> <li>• Applying for cluster resources</li> <li>• Creating VMs</li> <li>• Initializing VMs</li> <li>• Installing MRS Manager</li> <li>• Deploying the cluster</li> <li>• Cluster installation failed</li> </ul> <p>The cluster scale-out progress includes:</p> <ul style="list-style-type: none"> <li>• Preparing for scale-out</li> <li>• Creating VMs</li> <li>• Initializing VMs</li> <li>• Adding nodes to the cluster</li> <li>• Scale-out failed</li> </ul> <p>The cluster scale-in progress includes:</p> <ul style="list-style-type: none"> <li>• Preparing for scale-in</li> <li>• Decommissioning instance</li> <li>• Deleting VMs</li> <li>• Deleting nodes from the cluster</li> <li>• Scale-in failed</li> </ul> <p>The system will display causes of cluster installation, scale-out, and scale-in failures. | Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Billing Mode       | <p>Currently, the commercial version of MRS is charged based on ECSs in a cluster.</p> <ul style="list-style-type: none"><li>• <b>Yearly/Monthly:</b> The duration ranges from one month to one year. The minimum cluster duration is 1 month and the maximum available cluster duration is 1 year.</li><li>• <b>Pay-per-use:</b> Nodes are charged by actual duration of use, with a billing cycle of one hour.</li></ul> <p>The billing start time, that is, the time when the cluster node is successfully created is displayed under <b>Billing Mode</b>.</p> |
| Created            | The time when a cluster node is successfully created. This parameter is displayed only on the <b>Cluster History</b> page.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Deleted            | Time when a cluster node billing stops and the cluster node begins to be deleted. This parameter is valid only for historical clusters displayed on the <b>Cluster History</b> page.                                                                                                                                                                                                                                                                                                                                                                              |
| AZ                 | Availability zone (AZ) in the region of a cluster, which is set when a cluster is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enterprise Project | Enterprise project to which a cluster belongs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 6-10** MRS cluster running state

| Status      | Description                                                                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Starting    | When a cluster is being created, it is in the <b>Starting</b> state.                                                                                                                                                                                    |
| Running     | If a cluster is created successfully and functioning properly, it is in the <b>Running</b> state.                                                                                                                                                       |
| Scaling out | If the Master, Core, or Task node in a cluster is being added, the cluster is in the <b>Scaling out</b> state.                                                                                                                                          |
| Scaling in  | If a cluster node is being deleted, the cluster node is in the <b>Scaling in</b> state. This state shows when you scale in or elastically scale in a cluster node, decommission a node in a yearly/monthly cluster, change the OS, or reinstall the OS. |
| Abnormal    | If some components in a cluster are abnormal, the cluster is in the <b>Abnormal</b> state.                                                                                                                                                              |
| Deleting    | When you delete a pay-per-use cluster node, the cluster state changes to <b>Deleting</b> . This state is shown after you click <b>Delete</b> and confirm the deletion.                                                                                  |

| Status            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Frozen            | If the grace period of a yearly/monthly resource expires but the resource is not renewed, or if the fee of a pay-per-use resource fails to be deducted and you have not topped up your account before the grace period expires, the system freezes the resource in the <b>Frozen</b> state.<br><b>NOTE</b><br>A frozen cluster is unavailable and its all ECSs are shut down. After being unfrozen, the cluster returns to the <b>Running</b> state. If no renewal fee is paid, the cluster will be deleted after a specified period (called freeze period) and the cluster status will be changed to <b>Deleted</b> . |
| Restoring node... | If a faulty node in the cluster is being recovered, its state is <b>Restoring node....</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

----End

### 6.4.3 Starting and Stopping an MRS Cluster

You can stop an MRS cluster using the MRS console or Manager when it is no longer needed or has been fixed due to a fault. Once stopped, the cluster's components will no longer serve external systems.

You can also restart a stopped cluster.

#### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

#### Starting and Stopping a Cluster on the Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the cluster details page, choose **Management Operations** > **Start All Components** or **Stop All Components** in the upper right corner to perform the required operation.

----End

#### Starting and Stopping a Cluster Using Manager

- MRS 3.x and later versions:
  - a. Log in to Manager.

- b. Click  next to the target cluster and select **Stop**. Enter the password of the cluster administrator. In the **Stop Cluster** dialog box that is displayed, click **OK**. Wait until the cluster is stopped.
- MRS 2.x and earlier versions:
  - a. Log in to Manager and click **Services**.
  - b. In the upper part of the service list, choose **More > Start Cluster** or **Stop Cluster** accordingly.

## 6.4.4 Restarting an MRS Cluster

To apply configuration changes to a big data component, you must restart it. However, using the common restart mode will restart all services or instances at once, which can cause service interruption.

To ensure that services are not affected during service restart, you can restart services or instances in batches by rolling restart. For instances in active/standby mode, a standby instance is restarted first and then an active instance is restarted.

A rolling restart takes a longer time and may affect service throughput and performance.

### NOTE

- Performing a rolling restart during off-peak hours is recommended.
- Not all components support rolling restart. When performing a rolling restart of the cluster, components that do not support it will be restarted in common restart mode, which may cause service interruptions. For details, see [Component Restart Reference Information](#).
- Configurations that must take effect immediately, for example, server port configurations, should be restarted in normal mode.

## Restarting a Cluster on the Console

**Step 1** Log in to the MRS console.

**Step 2** Choose **Active Clusters** and click a cluster name to go to the cluster details page.

**Step 3** In the upper right corner of the page, choose **Management Operations > Perform Rolling Cluster Restart**.

**Figure 6-11** Performing a rolling restart of a cluster (use MRS 1.9.2 as an example)

**Step 4** The **Rolling-restart Cluster** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the target cluster.

**Step 5** After the rolling restart task is complete, click **Finish**.

----End

## Restarting a Cluster on Manager

- MRS 3.x or later:
  - a. Log in to FusionInsight Manager.
  - b. Choose **Cluster > Dashboard**. In the upper right corner, click **More > Restart**.

### NOTE

- For MRS 3.3.0 or later, the **Cluster > Dashboard** page has been removed from Manager. You can choose **More** in the upper right corner of the **Homepage** to access cluster maintenance and management functions.
  - When restarting a cluster, you can choose between restart or rolling restart. Rolling restart takes more time but has less impact on services.
- c. In the displayed dialog box, enter the password of the current login user and click **OK**.
  - d. If you select rolling restart, adjust related parameters based on the site requirements.

Figure 6-12 Rolling restart

### Rolling-restart Cluster

**Are you sure you want to perform a rolling restart of the MRS Cluster?**

 A rolling restart can minimize the impact on services, but takes a longer time than a standard restart.

The following services do not support the rolling restart and can be restarted only in common mode:

- Tez
- Oozie
- Loader
- Hue
- Flink

| Restart only instances with expired configurations in the cluster | Whether to restart only the modified instances in a cluster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable rack strategy                                              | Whether to enable the concurrent rack rolling restart strategy. This parameter takes effect only for roles that meet the rack rolling restart strategy. (The roles support rack awareness, and instances of the roles belong to two or more racks.)<br><b>NOTE</b><br>This parameter can be set only when a rolling restart is performed on HDFS or YARN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Data Nodes to Be Batch Restarted                                  | Number of instances that are restarted in each batch when the batch rolling restart strategy is used. The default value is <b>1</b> .<br><b>NOTE</b> <ul style="list-style-type: none"> <li>This parameter is valid only when the batch rolling restart strategy is used and the instance type is DataNode.</li> <li>This parameter is invalid when the rack strategy is enabled. In this case, the cluster uses the maximum number of instances (<b>20</b> by default) configured in the rack strategy as the maximum number of instances that are concurrently restarted in a rack.</li> <li>This parameter is configurable only when a rolling restart is performed on HDFS, HBase, YARN, Kafka, Storm, or Flume.</li> <li>This parameter for the RegionServer of HBase cannot be manually configured. Instead, it is automatically adjusted based on the number of RegionServer nodes. Specifically, if the number of RegionServer nodes is less than 30, the parameter value is <b>1</b>. If the number is greater than or equal to 30 and less than 300, the parameter value is <b>2</b>. If the number is greater than or equal to 300, the parameter value is 1% of the number (rounded-down).</li> </ul> |
| Batch Interval                                                    | Interval between two batches of instances to be roll-restarted. The default value is <b>0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Decommissioning Timeout Interval | <p>Decommissioning interval for role instances during a rolling restart. The default value is <b>1800s</b>.</p> <p>Some roles (such as HiveServer and JDBCServer) stop providing services before the rolling restart. Stopped instances cannot be connected to new clients. Existing connections will be completed after a period of time. An appropriate timeout interval can ensure service continuity.</p> <p><b>NOTE</b><br/>This parameter is configurable only when a rolling restart is performed on Hive or Spark2x.</p> |
| Batch Fault Tolerance Threshold  | <p>Tolerance times when the rolling restart of instances fails to be batch executed. The default value is <b>0</b>, which indicates that the rolling restart task ends after any batch of instances fails to restart.</p>                                                                                                                                                                                                                                                                                                        |

 **NOTE**

Advanced parameters, such as **Data Nodes to Be Batch Restarted**, **Batch Interval**, and **Batch Fault Tolerance Threshold**, should be properly configured based on site requirements. Otherwise, services may be interrupted or cluster performance may be severely affected.

Examples:

- If **Data Nodes to Be Batch Restarted** is set to an unnecessarily large value, a large number of instances are restarted concurrently. As a result, services are interrupted or cluster performance is severely affected due to too few working instances.
  - If **Batch Fault Tolerance Threshold** is too large, services will be interrupted because a next batch of instances will be restarted after a batch of instances fails to restart.
- e. Click **OK**.
- MRS 2.x and earlier versions:
    - a. On MRS Manager, click **Services**.
    - b. Choose **More > Perform Rolling Service Restart**.
    - c. After you enter the administrator password, the **Perform Rolling Cluster Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the cluster.
    - d. After the rolling restart task is complete, click **Finish**.

## 6.4.5 Exporting MRS Cluster Configuration Parameters

Administrators can export key server configuration parameters of MRS cluster components for quick check or backup.

## Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

## Exporting Cluster Configurations on the Console

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** Choose **Configuration > Export Cluster Configuration** in the upper right corner of the page to export cluster configurations to the local PC.

### NOTE

This operation applies to MRS 2.x and earlier versions.

**Figure 6-13** Exporting cluster configurations

----End

## Exporting Cluster Configurations Using Manager

- Step 1** Log in to MRS Manager.
- Step 2** Choose **Cluster > Dashboard**.
- Step 3** Choose **More > Export Configurations** to export the configurations of all services in the cluster in batches.

----End

### 6.4.6 Synchronizing the MRS Cluster Configuration

If a new configuration needs to be delivered to all services in the cluster, or **Configuration Status** of multiple services changes to **Expired** or **Failed** after a configuration is modified, the configuration parameters of these services are not synchronized and do not take effect. In this case, synchronize the configurations and restart related service instances for the cluster so that the new parameters take effect for all services.

## Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

## Impact on the System

- After the cluster configurations are synchronized, you need to restart the services whose configurations have expired. During the restart, the corresponding services are unavailable.
- The instances whose configuration has expired are unavailable during restart.

## Synchronizing Cluster Configurations on the Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** choose **Configure** > **Synchronize Configuration** in the upper right corner.

### NOTE

This operation applies to MRS 2.x and earlier versions.

**Figure 6-14** Synchronizing configurations (using MRS 1.9.2 as an example)

**Step 4** In the displayed dialog box, select "Restart services and instances whose configuration have expired" and click **OK** to restart the service whose configurations have expired.

When **Operation successful** is displayed, click **Finish**. The cluster is started.

----End

## Synchronizing Cluster Configurations Using Manager

**Step 1** Log in to MRS Manager.

**Step 2** Choose **Cluster** > **Dashboard**.

**Step 3** On this page, choose **More** > **Synchronize Configuration**.

**Step 4** In the dialog box that is displayed, click **OK**.

**Step 5** On the cluster dashboard page, choose **More** > **Restart Configuration-Expired Instances**.

**Step 6** In the dialog box that is displayed, enter the password of the current login user and click **OK**.

**Step 7** In the displayed dialog box, click **OK**.

You can click **View Instance** to open the list of all expired instances and confirm that the instances have been restarted.

----End

## 6.4.7 Transforming a Pay-per-Use MRS Cluster to a Yearly/Monthly Cluster

This section describes how to change the billing mode of a cluster from **Pay-per-use** to **Yearly/Monthly**.

This operation can be performed only when the cluster status is **Running** or **Stopping**.

### Procedure

**Step 1** Log in to the MRS console.

**Step 2** In the navigation pane on the left, choose **Active Clusters**.

**Step 3** In the **Operation** column corresponding to the cluster for which you want to change the billing mode, click **Change to Yearly/Monthly**.

**Step 4** If you are sure you want to change the billing mode, click **Yes**.

**Step 5** On the **Change Subscription** page that is displayed, choose how often you would like to renew and click **Pay**.

After the order is submitted, the cluster status changes from **Running** to **Changing to Yearly/Monthly**.

After the order is paid successfully, the cluster billing mode starts changing to **Yearly/Monthly**. After the billing mode is successfully changed, the cluster status is **Running**.

#### NOTE

After the billing mode is changed to yearly/monthly, Task nodes in a cluster are still billed in pay-per-use mode. During the change, the configured AS rules do not trigger scaling actions. Change the billing mode at an appropriate time to avoid any adverse impact on your services.

----End

## 6.4.8 Deleting an MRS Cluster

To delete or unsubscribe from a cluster, wait until data analysis and storage are finished, or if the cluster is not functioning properly and cannot provide services. If an MRS cluster fails to be deployed, the cluster is automatically deleted or unsubscribed.

- You can delete a pay-per-use cluster if you no longer need it after completing a job. The deleted or unsubscribed cluster is no longer billed.
- You cannot delete a cluster that is billed yearly/monthly if you no longer need it after completing a job. You can unsubscribe from this cluster.

After a cluster is unsubscribed, resources and data will be deleted and cannot be restored. Ensure that the data is backed up before unsubscribing from the cluster. For details about the unsubscription rules, see [Conditional Unsubscription](#).

 **NOTE**

After deleting a component or cluster connected to OBS (including scenarios with storage and compute decoupled or where hot and cold datasets are stored separately), you must manually delete the service data on OBS.

## Deleting an MRS Pay-per-Use Cluster

- Step 1** Log in to the MRS management console.
- Step 2** In the navigation pane on the left, choose **Active Clusters**.
- Step 3** In the cluster list, locate the row containing the cluster to be deleted, and click **Delete** in the **Operation** column. In the **Delete Cluster** dialog box, enter **DELETE** in the confirmation text box and click **OK**.

The cluster status changes from **Running** to **Deleting**, and finally to **Deleted**. You can view the deleted cluster in **Cluster History**. The deleted cluster is no longer billed.

----End

## Unsubscribing from a Yearly/Monthly MRS Cluster

- Step 1** Log in to the MRS management console.
- Step 2** In the navigation pane on the left, choose **Active Clusters**.
- Step 3** In the **Operation** column of the cluster from which you want to unsubscribe, click **Unsubscribe**.
- Step 4** On the **Unsubscribe** page, confirm the cluster information, select reasons for unsubscription, and confirm the unsubscription amount and related fees.
- Step 5** Click **Confirm**.
- Step 6** Confirm the unsubscription information and click **Yes** to submit the unsubscription application.

After the unsubscription application is submitted, the cluster status changes from **Running** to **Deleting**. After the cluster is deleted, the cluster status changes to **Deleted** and is displayed in **Cluster History**.

----End

### 6.4.9 Changing the VPC Subnet of an MRS Cluster

If the current subnet does not have sufficient IP addresses, you can change to another subnet in the same VPC of the current cluster to obtain more available subnet IP addresses. Changing a subnet does not affect the IP addresses or subnets of existing nodes.

For details about how to configure network ACL outbound rules, see [How Do I Configure a Network ACL Outbound Rule?](#)

## Changing a Subnet When No Network ACL Is Associated

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** In the **Network Information** area, click **Change Subnet** on the right of **Default Subnet**.
- Step 4** Select the target subnet and click **OK**.

If no subnet is available, click **Create Subnet** to create a subnet first.

----End

## Changing a Subnet When a Network ACL Is Associated

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** In the **Network Information** area, view **VPC**.
- Step 4** Log in to the VPC console. In the navigation pane on the left, choose **Virtual Private Cloud** and obtain the IPv4 CIDR block corresponding to the VPC obtained in [Step 3](#).

**Figure 6-15** Obtaining the IPv4 CIDR block

- Step 5** Choose **Access Control > Network ACLs** and click the name of the network ACL that is associated with the default and new subnets.

**NOTE**

If both the default and new subnets are associated with a network ACL, add inbound rules to the network ACL by referring to [Step 6](#) to [Step 8](#).

- Step 6** On the **Inbound Rules** page, choose **More > Insert Rule Above** in the **Operation** column.
- Step 7** Add a network ACL rule. Set **Action** to **Allow**, **Source** to the VPC IPv4 CIDR block obtained in [Step 4](#), and retain the default values for other parameters.
- Step 8** Click **OK**.

**NOTE**

If you do not want to allow access from all IPv4 CIDR blocks of the VPC, add the IPv4 CIDR blocks of the default and new subnets by performing [Step 9](#) to [Step 13](#). If you have added rules for the IPv4 CIDR block of the VPC, skip these steps.

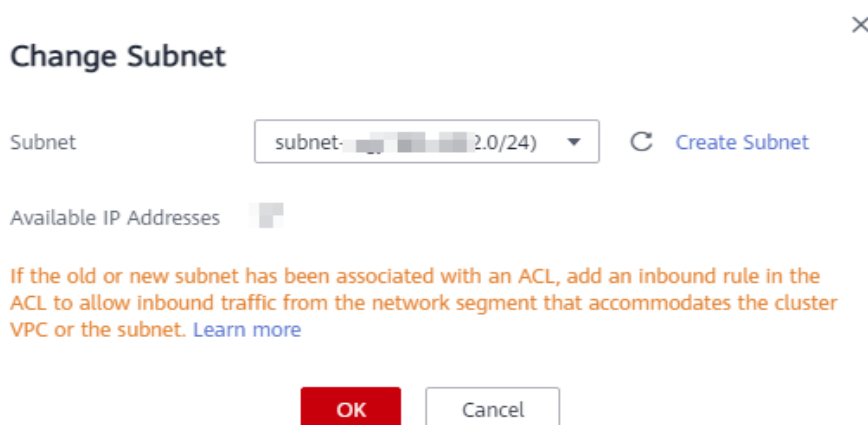

- Step 9** Log in to the MRS console.
- Step 10** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 11** In the **Network Information** area, click **Change Subnet** on the right of **Default Subnet**.
- Step 12** Obtain the IPv4 CIDR blocks of the default and new subnets.

**NOTICE**

In this case, you do not need to click **OK** displayed in the **Change Subnet** dialog box. Otherwise, the default subnet will be updated to the new subnet, thereby making it difficult to query the IPv4 CIDR block of the default subnet. Exercise caution when performing this operation.

- Step 13** Add the default subnet and the new subnet to the inbound rules of the network ACL by referring to [Step 5](#) to [Step 8](#).
- Step 14** Log in to the MRS console.
- Step 15** Click the cluster name to go to its details page.
- Step 16** In the **Network Information** area, click **Change Subnet** on the right of **Default Subnet**.
- Step 17** Select the target subnet and click **OK**.

**Figure 6-16** Selecting the target subnet

----End

## How Do I Configure a Network ACL Outbound Rule?

- Method 1  
Allow all outbound traffic. This method ensures that clusters can be created and used properly.

**Figure 6-17** Allowing all outbound traffic

| Status  | Type | Action | Protocol | Source    | Source Port Range | Destination | Destination Port Range |
|---------|------|--------|----------|-----------|-------------------|-------------|------------------------|
| Enabled | IPv4 | Allow  | All      | 0.0.0.0/0 | All               | 0.0.0.0/0   | All                    |

- Method 2  
Allow the mandatory outbound rules that can ensure the successful creation of clusters. You are not advised to use this method because created clusters may not run properly due to absent outbound rules. If the preceding problem occurs, contact O&M personnel.  
Similar to the example provided in method 1, set **Action** to **Allow** and add the outbound rules whose destinations are the address with **Secure Communications** enabled, NTP server address, OBS server address, OpenStack address, and DNS server address, respectively.

### 6.4.10 Replacing the NTP Server for an MRS Cluster

If no NTP server is configured or the configured NTP server is no longer used, you can specify a new NTP server for the MRS cluster or replace the NTP server with a new one to enable the cluster to synchronize time with the new NTP clock source.

 **NOTE**

This section applies only to MRS 3.x or later.

#### Prerequisites

- You have prepared a new NTP server and obtained its IP address, and have configured the network between the cluster and the new NTP server.
- Ensure that the NTP service status of the server is normal. Otherwise, the operations in this section will fail.

#### Impact on the System

- Replacing the NTP server is a high-risk operation and may result in time change in the cluster.
- If the time difference between the NTP server and the cluster is greater than 150s before the NTP server replacement, you need to stop the cluster first to prevent data loss. Services are unavailable when the cluster is stopped.
- If the time difference between the NTP server and the cluster exceeds 15 minutes, the cluster will be unable to access OBS.
- If your clusters use Kerberos authentication and the time difference between the NTP server and the cluster exceeds 5 minutes, authentication will not work.

## Modifying the NTP Server of an MRS Cluster

**Step 1** Log in to FusionInsight Manager and check whether there are uncleared alarms.

- If yes, clear the alarm. After the alarm is cleared, go to [Step 2](#).
- If no, go to [Step 2](#).

**Step 2** Log in to the active and standby management nodes as user **omm**.

**Step 3** Run the following command on the active management node to check the management plane gateway:

```
cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/oms-config.ini | grep om_gateway
```

**Step 4** Run the **ping Management plane gateway** command on the active and standby management nodes and check whether the nodes are connected to the management plane gateway.

- If yes, go to [Step 5](#).
- If no, contact the network administrator to rectify the network fault. After the fault is rectified, go to [Step 5](#).

**Step 5** Run the following command on the active management node to obtain the domain name of the NTP server in the current environment:

This section uses **ntp.myhuaweicloud.com** as an example.

```
cat /opt/Bigdata_func/cloudinit/cloudinit_params | grep ntpserver
```

**Step 6** On the active management node, check the time difference between the new NTP server and the cluster. The unit is second.

For example, to check the time different with the NTP server at **ntp.myhuaweicloud.com**, run the **ntpdate -d ntp.myhuaweicloud.com** command. The following information is displayed:

```
6 Dec 15:16:10 ntpdate[2861453]: step time server 10.79.3.251 offset +2.118107 sec
```

In the preceding information, **+2.118107 sec** indicates the time offset. A positive value indicates that the NTP server time is earlier than the current cluster time. A negative value indicates the opposite.

•  **NOTE**

You can run the **ntpq -v** or **ntpq --version** command to query the NTP version. The command output may vary with the actual service environment.

– Output of the **ntpq -v** command:

```
10.1.1.112: ~# ntpq -v
ntpq - standard NTP query program - Ver. 4.2.4p8
```

– Output of the **ntpq --version** command:

```
10.1.1.112: ~# ntpq --version
ntpq 4.2.8p10@1.3728-o Mon Jun 6 08:01:59 UTC 2016 (1)
```

**Step 7** Check whether the absolute value of the time difference exceeds **150**.

- If yes, go to [Step 8](#).
- If no, perform [Step 10](#) as user **omm**.

**Step 8** Check whether the cluster can be stopped.

- If yes, stop upper-layer services and the cluster, and go to [Step 9](#).
- If no, no further action is required.

**Step 9** Check whether the time of the NTP server is slower than the time of the cluster.

- If yes, wait a period of the time difference obtained in [Step 6](#) after message **Operation successful** is displayed on the UI, perform [Step 11](#) as user **omm**.
- If no, after message **Operation successful** is displayed on the UI, perform [Step 11](#) as user **omm**.

**Step 10** Run the following command on the active management node to replace the NTP server:

```
sh ${BIGDATA_HOME}/om-server/om/bin/tools/modifyntp.sh --ntp_server_ip ntp.myhuaweicloud.com
```

 **NOTE**

The IP address of the NTP server cannot be set to the IP address of a node in the cluster. Otherwise, the service network between the node and the active/standby OMS node may be disconnected.

**Step 11** Run the following command on the active management node to forcibly synchronize time from the NTP server at **ntp.myhuaweicloud.com** immediately and replace the NTP server:

```
sh ${BIGDATA_HOME}/om-server/om/bin/tools/modifyntp.sh --ntp_server_ip ntp.myhuaweicloud.com --force_sync_time
```

 **NOTE**

- If the cluster is stopped, start the cluster after the NTP server is replaced.
- After the command for forcible time synchronization is executed, it takes about five minutes for time synchronization on cluster nodes.

----End

## 6.4.11 Modifying the OMS Service Configuration

Based on the security requirements of the user environment, you can modify the Kerberos and LDAP configurations in the OMS on FusionInsight Manager.

 **NOTE**

This section applies only to MRS 3.x or later.

### Impact on the System

After the OMS service configuration parameters are modified, the corresponding OMS module needs to be restarted. In this case, FusionInsight Manager cannot be used.

### Modifying the OMS Service Configuration

#### Modifying the okerberos configuration

**Step 1** Log in to FusionInsight Manager and choose **System > OMS**.

**Step 2** Locate the row that contains okerberos and click **Modify Configuration**.

**Step 3** Modify the parameters according to [Table 6-12](#).

**Table 6-12** okerberos parameters

| Parameter                   | Description                                                                                                                                                                                                                                                                                                            |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KDC Timeout (ms)            | Timeout duration for an application to connect to Kerberos, in milliseconds. The value must be an integer.                                                                                                                                                                                                             |
| Max Retries                 | Maximum number of retries for an application to connect to Kerberos, in seconds. The value must be an integer.                                                                                                                                                                                                         |
| LDAP Timeout (ms)           | Timeout duration for Kerberos to connect to LDAP, in milliseconds.                                                                                                                                                                                                                                                     |
| LDAP Search Timeout (ms)    | Timeout duration for Kerberos to query user information in LDAP, in milliseconds.                                                                                                                                                                                                                                      |
| Kadmin Listening Port       | Port number of the Kadmin service.                                                                                                                                                                                                                                                                                     |
| KDC Listening Port          | Port number of the kinit service.                                                                                                                                                                                                                                                                                      |
| Kpasswd Listening Port      | Port number of the Kpasswd service.                                                                                                                                                                                                                                                                                    |
| Reset LDAP Account Password | Machine-machine users ( <b>cn=krbadmin,ou=Users,dc=hadoop,dc=com</b> and <b>cn=krbkdc,ou=Users,dc=hadoop,dc=com</b> ) used by Kerberos to access LDAP.<br>If this parameter is selected, the passwords will be replaced by random passwords.<br><b>NOTE</b><br>This parameter is available only in MRS 3.1.2 or later. |

**Step 4** Click **OK**.

In the displayed dialog box, enter the password of the current login user and click **OK**. In the displayed confirmation dialog box, click **OK**.

#### Modifying the oldap configuration

**Step 5** Locate the row that contains the oldap and click **Modify Configuration**.

**Step 6** Modify the parameters according to [Table 6-13](#).

**Table 6-13** OLDAP parameters

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LDAP Listening Port         | Port number of the LDAP service.                                                                                                                                                                                                                                                                                                                    |
| Reset LDAP Account Password | Machine-machine users ( <b>cn=root,dc=hadoop,dc=com</b> and <b>cn=pg_search_dn,ou=Users,dc=hadoop,dc=com</b> ) used by LDAP for data management, synchronization, and status check.<br>If this parameter is selected, the passwords will be replaced by random passwords.<br><b>NOTE</b><br>This parameter is available only in MRS 3.1.2 or later. |

**Step 7** Click **OK**.

In the displayed dialog box, enter the password of the current login user and click **OK**. In the displayed confirmation dialog box, click **OK**.

 **NOTE**

To reset the password of the LDAP account, you need to restart ACS. The procedure is as follows:

1. Log in to the active management node as user **omm** using PuTTY, and run the following command to update the domain configuration:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/restart-RealmConfig.sh
```

The command is run successfully if the following information is displayed:

```
Modify realm successfully. Use the new password to log into FusionInsight again.
```

2. Run the **sh \$CONTROLLER\_HOME/sbin/acs\_cmd.sh stop** command to stop ACS.
3. Run the **sh \$CONTROLLER\_HOME/sbin/acs\_cmd.sh start** command to start ACS.

**Restarting the cluster****Step 8** Log in to FusionInsight Manager and restart the cluster by referring to [Restarting an MRS Cluster](#).

----End

## 6.4.12 Modifying MRS Manager Routing Table

When FusionInsight Manager is installed, two pieces of routing information are automatically created on the active management node. You can run the **ip rule list** command to view the routing information.

```
0:from all lookup local
32764:from all to 10.10.100.100 lookup ntp_rt #NTP routing information created by FusionInsight
Manager (this information is unavailable if no external NTP clock source is configured).
32765:from 192.168.0.117 lookup om_rt #OM routing information created by the FusionInsight Manager.
32766:from all lookup main
32767:from all lookup default
```

 NOTE

- If no external NTP server has been configured, only OM routing information **om\_rt** will be created.
- This section applies only to MRS 3.x or later.

If the routing information created by FusionInsight Manager conflicts with the routing information configured in the enterprise network planning, the cluster administrator can use **autoroute.sh** to disable or enable the routing information created by FusionInsight Manager.

## Impact on the System

After the routing information created by FusionInsight Manager is disabled and before the new routing information is set, FusionInsight Manager cannot be accessed but the clusters are running properly.

## Prerequisites

You have obtained the information about the route to be created.

## Disable the Routing Information Created by the System

- Step 1** Log in to the active management node of the cluster as the **omm** user. Run the following commands to disable the routing information created by the system:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
./autoroute.sh disable
```

```
Deactivating Route.
Route operation (disable) successful.
```

- Step 2** View the execution result.

```
ip rule list
```

```
0:from all lookup local
32766:from all lookup main
32767:from all lookup default
```

- Step 3** Run the following command and enter the password of user **root** to switch to user **root**:

```
su - root
```

- Step 4** Run the following commands to manually create the routing information about the WS floating IP address:

```
ip route add Network segment of the WS floating IP address/Subnet mask of the WS floating IP address scope link src WS floating IP address dev NIC of the WS floating IP address table om_rt
```

```
ip route add default via Gateway of the WS floating IP address dev NIC of the WS floating IP address table om_rt
```

```
ip rule add from WS floating IP address table om_rt
```

Example:

```
ip route add 192.168.0.0/255.255.255.0 scope link src 192.168.0.117 dev eth0:ws table om_rt
```

```
ip route add default via 192.168.0.254 dev eth0:ws table om_rt
```

```
ip rule add from 192.168.0.117 table om_rt
```

#### NOTE

If IPv6 addresses are used, run the `ip -6 route add` command.

- Step 5** Run the following commands to manually create the NTP service routing information. Skip this step when no external NTP clock source is configured.

```
ip route add default via IP gateway of the NTP service dev NIC of the local IP address table ntp_rt
```

```
ip rule add to ntpIP table ntp_rt
```

*NIC of the local IP address* indicates the NIC that can communicate with the network segment where the NTP server is located.

Example:

```
ip route add default via 10.10.100.254 dev eth0 table ntp_rt
```

```
ip rule add to 10.10.100.100 table ntp_rt
```

- Step 6** View the execution result.

In the following example, if the command output contains `om_rt` and `ntp_rt`, the operation is successful.

#### ip rule list

```
0:from all lookup local
32764:from all to 10.10.100.100 lookup ntp_rt #This information is not displayed if no external NTP clock source is configured.
32765:from 192.168.0.117 lookup om_rt
32766:from all lookup main
32767:from all lookup default
```

----End

## Enable the Routing Information Created by the System

- Step 1** Log in to the active management node as user `omm`.

- Step 2** Run the following commands to enable the routing information created by the system:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

```
./autoroute.sh enable
```

```
Activating Route.
Route operation (enable) successful.
```

- Step 3** View the execution result.

In the following example, if the command output contains `om_rt` and `ntp_rt`, the operation is successful.

### ip rule list

```
0:from all lookup local
32764:from all to 10.10.100.100 lookup ntp_rt #This information is not displayed if no external NTP clock
source is configured.
32765:from 192.168.0.117 lookup om_rt
32766:from all lookup main
32767:from all lookup default
```

----End

## 6.5 Managing MRS Cluster Components

### 6.5.1 Checking the Running Status of an MRS Cluster Component

After creating an MRS cluster, you can check the status of each service component and its role instance on the console or Manager. This will assist you in detecting any performance issues with the component.

#### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

#### Viewing Component Status on the Console

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** On the MRS cluster details page, click **Components** to view the service operation status, health status, and configuration status.

**Figure 6-18** Checking component status

| Name      | Version | Operating Status | Health Status | Configuration Status | Roles                                                   | Operation                 |
|-----------|---------|------------------|---------------|----------------------|---------------------------------------------------------|---------------------------|
| ▼ Hadoop  | 3.3.1   |                  |               |                      |                                                         |                           |
| Spark     | 3.3.1   | Started          | Good          | Synchronized         | JobHistory 2 JDBCServer 2 SparkResource 3 IndexServer 2 | Start Stop Restart Delete |
| Flink     | 1.17.1  | Started          | Good          | Synchronized         | FlinkResource 2 FlinkServer 2                           | Start Stop Restart Delete |
| ZooKeeper | 3.6.1   | Started          | Good          | Synchronized         | quorumpeer 3                                            | Start Stop Restart Delete |

**Table 6-14** Component status description

| Status Type      | Status  | Description             |
|------------------|---------|-------------------------|
| Operating Status | Started | The service is started. |
|                  | Stopped | The service is stopped. |

| Status Type          | Status                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      | Failed to start       | Failed to start the role instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                      | Failed to stop        | Failed to stop the role instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                      | Unknown               | Initial service status after the background system restarts.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Health Status        | Good                  | Indicates that all role instances in the service are running properly.                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                      | Faulty                | The running status of at least one role instance is <b>Faulty</b> or the status of the service on which the current service depends is abnormal.<br><br>If the running status of a service is <b>Faulty</b> , an alarm is generated. Rectify the fault based on the alarm information.                                                                                                                                                                                                            |

|                      | Partially Healthy     | The status of the service on which the service depends is abnormal, and APIs related to the abnormal service cannot be called by external systems.<br><br>HBase, Hive, Spark, and Loader may be in the <b>Partially Healthy</b> state. <ul style="list-style-type: none"> <li>If YARN is installed but is abnormal, HBase is in the <b>Partially Healthy</b> state.</li> <li>If HBase is installed but is abnormal, Hive, Spark, and Loader are in the <b>Partially Healthy</b> state.</li> </ul> |
| Configuration Status | Synchronized          | Indicates that the latest configuration takes effect.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                      | Configuration expired | The latest configuration does not take effect after the parameter modification. You need to restart related services.                                                                                                                                                                                                                                                                                                                                                                             |
|                      | Configuration failed  | If a communication or read/write exception occurs during parameter configuration, you can use the synchronization configuration function to rectify the fault.                                                                                                                                                                                                                                                                                                                                    |
|                      | Configuring           | Parameters are being configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Status Type | Status  | Description                                      |
|-------------|---------|--------------------------------------------------|
|             | Unknown | Current configuration status cannot be obtained. |

**Step 4** Click a component name to go to the component details page and view the detailed running information about the component.

**Figure 6-19** Viewing cluster component details

**Step 5** Click **Instances** to view the detailed running information about each role instance in the service.

- The list of role instances shows all the instances for each role in the cluster, including their running and configuration status, hosts, and IP addresses.
- You can click an instance name to go to the instance details page and view the basic information, configuration file, instance logs, and monitoring metric graphs of the instance.

**Figure 6-20** Checking the status of cluster component instances

| Role     | Host Name            | OM IP Address | Business IP Address | Rack | Running status | Configuration Status |
|----------|----------------------|---------------|---------------------|------|----------------|----------------------|
| DataNode | node-group-10h4r0001 |               |                     |      | Good           | Synchronized         |
| DataNode | node-group-10h4r0002 |               |                     |      | Good           | Synchronized         |
| DataNode | node-group-1S4ha     |               |                     |      | Good           | Synchronized         |
| DataNode | node-group-10h4r0003 |               |                     |      | Good           | Synchronized         |
| HDFS     | node-master3a7q      |               |                     |      | Good           | Synchronized         |
| HDFS     | node-master1Bvy      |               |                     |      | Good           | Synchronized         |

**Table 6-15** Instance status

| Status Type    | Status         | Description                                            |
|----------------|----------------|--------------------------------------------------------|
| Running Status | Good           | The instance is running properly.                      |
|                | Bad            | The instance cannot run properly.                      |
|                | Decommissioned | The instance is out of service.                        |
|                | Not started    | The instance is stopped.                               |
|                | Unknown        | The initial status of the instance cannot be detected. |
|                | Starting       | The instance is being started.                         |
|                | Stopping       | The instance is being stopped.                         |

| Status Type          | Status                | Description                                                                                                                                                    |
|----------------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      | Restoring             | An exception may occur in the instance and the instance is being automatically rectified.                                                                      |
|                      | Decommissioning       | The instance is being decommissioned.                                                                                                                          |
|                      | Recommissioning       | The instance is being recommissioned.                                                                                                                          |
|                      | Failed to start       | The instance fails to be started.                                                                                                                              |
|                      | Failed to stop        | The instance fails to be stopped.                                                                                                                              |
| Configuration Status | Synchronized          | The latest configuration takes effect.                                                                                                                         |
|                      | Configuration expired | The latest configuration does not take effect after the parameter modification. You need to restart related services.                                          |
|                      | Configuration failed  | If a communication or read/write exception occurs during parameter configuration, you can use the synchronization configuration function to rectify the fault. |
|                      | Configuring           | Parameters are being configured.                                                                                                                               |
|                      | Unknown               | Current configuration status cannot be obtained.                                                                                                               |

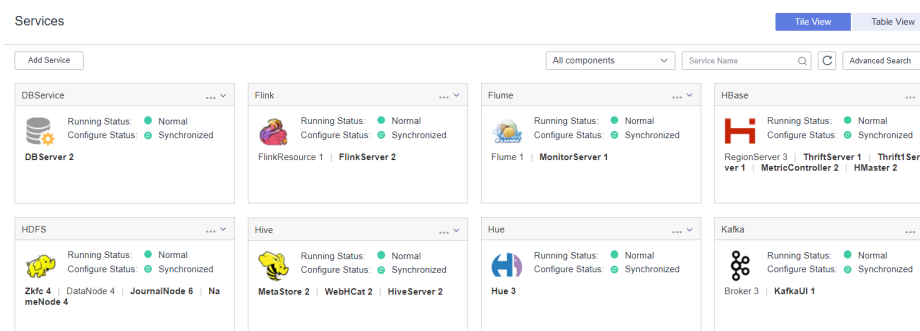

----End

## Checking the Component Status on Manager

**Step 1** Log in to Manager and choose **Cluster > Services** to access the component management page.

The service list displays the running status, configuration status, role type, and number of instances of each component.

**Figure 6-21** Checking the status of cluster components

 **NOTE**

On the Manager of MRS 2.x or earlier, click **Services** to open the component management page.

**Table 6-16** Manager component status description

| Status Type          | Status                                                                                                                                | Description                                                                                                                                                    |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Running Status       | Normal                                                                                                                                | The component is running properly.                                                                                                                             |
|                      | Faulty                                                                                                                                | The component cannot work properly.                                                                                                                            |
|                      | Partially Healthy                                                                                                                     | Some enhanced functions of the component cannot work properly.                                                                                                 |
|                      | Not started                                                                                                                           | The component is stopped.                                                                                                                                      |
|                      | Unknown                                                                                                                               | The initial status of the component cannot be detected.                                                                                                        |
|                      | Starting                                                                                                                              | The component is being started.                                                                                                                                |
|                      | Stopping                                                                                                                              | The component is being stopped.                                                                                                                                |

|                      | Unknown                                                                                                                               | Current configuration status cannot be obtained.                                                                                                               |

**Step 2** Click a component name to view its details.

**Step 3** Click **Instances** to view the detailed running information about each role instance in the service.

**Figure 6-22** Checking the status of cluster component instances

- The list of role instances shows all the instances for each role in the cluster, including their running and configuration status, hosts, and IP addresses.
- You can click an instance name to go to the instance details page and view the basic information, configuration file, instance logs, and monitoring metric graphs of the instance.

**Table 6-17** Manager instance status description (3.x and later versions)

| Status Type          | Status                            | Description                                                                                                                                                    |
|----------------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Running Status       | Normal                            | The instance is running properly.                                                                                                                              |
|                      | Faulty                            | The instance cannot run properly.                                                                                                                              |
|                      | Decommissioned                    | The instance is out of service.                                                                                                                                |
|                      | Not started                       | The instance is stopped.                                                                                                                                       |
|                      | Unknown                           | The initial status of the instance cannot be detected.                                                                                                         |
|                      | Starting                          | The instance is being started.                                                                                                                                 |
|                      | Stopping                          | The instance is being stopped.                                                                                                                                 |
|                      | Restoring                         | An exception may occur in the instance and the instance is being automatically rectified.                                                                      |
|                      | Decommissioning                   | The instance is being decommissioned.                                                                                                                          |
|                      | Recommissioning                   | The instance is being recommissioned.                                                                                                                          |
|                      | Failed to start                   | The instance fails to be started.                                                                                                                              |
| Failed to stop       | The instance fails to be stopped. |                                                                                                                                                                |
| Configuration Status | Synchronized                      | The latest configuration takes effect.                                                                                                                         |
|                      | Expired                           | The latest configuration does not take effect after the parameter modification. You need to restart related services.                                          |
|                      | Failed                            | If a communication or read/write exception occurs during parameter configuration, you can use the synchronization configuration function to rectify the fault. |

| Status Type | Status        | Description                                      |
|-------------|---------------|--------------------------------------------------|
|             | Synchronizing | Parameters are being configured.                 |
|             | Unknown       | Current configuration status cannot be obtained. |

**Table 6-18** Manager instance status description (2.x and earlier versions)

| Status Type          | Status            | Description                                                                                                                                                       |
|----------------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Operating Status     | Started           | The role instance has been started.                                                                                                                               |
|                      | Stopped           | The role instance has been stopped.                                                                                                                               |
|                      | Failed to start   | Failed to start the role instance.                                                                                                                                |
|                      | Failed to stop    | Failed to stop the role instance.                                                                                                                                 |
|                      | Decommissioning   | The role instance is being decommissioned.                                                                                                                        |
|                      | Decommissioned    | The role instance has been decommissioned.                                                                                                                        |
|                      | Recommissioning   | The role instance is being recommissioned.                                                                                                                        |
|                      | Unknown           | Initial role instance status after the background system restarts.                                                                                                |
| Health Status        | Good              | The role instance is running properly.                                                                                                                            |
|                      | Restoring         | The background system is restarting a role instance.                                                                                                              |
|                      | Bad               | The instance role is experiencing an abnormality, such as the inability to access a port due to a non-existent PID.                                               |
|                      | Unknown           | The host where a role instance resides does not connect to the background system.                                                                                 |
|                      | Partially Healthy | The role instance is partially running properly.                                                                                                                  |
| Configuration Status | Synchronized      | The latest configuration takes effect.                                                                                                                            |
|                      | Expired           | The latest configuration does not take effect after the parameter modification. Related services need to be restarted.                                            |
|                      | Failed            | The communication is incorrect or data cannot be read or written during the parameter configuration. Click <b>Synchronize Configuration</b> to rectify the fault. |

| Status Type | Status      | Description                                      |
|-------------|-------------|--------------------------------------------------|

|             | Unknown     | Current configuration status cannot be obtained. |

----End

## 6.5.2 Starting and Stopping an MRS Cluster Component

You can stop a service component in the MRS cluster as required. After the component is stopped, it will no longer offer any services.

- Stop the services or abnormal services.
- Start the service in the **Stopped**, **Stop Failed**, or **Failed to Start** state to use the service again.
- Restart abnormal services or configure expired services to restore or enable the services.

### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

### Impact on the System

Services within the system rely on one another. Therefore, when you initiate, halt, or reboot a service, any services that depend on it will be impacted.

- If a service is to be started, the lower-layer services dependent on it must be started first.
- If a service is stopped, the upper-layer services dependent on it are unavailable.
- If a service is restarted, the running upper-layer services dependent on it must be restarted.

### Starting or Stopping a Component on the Console

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** On the MRS cluster details page, click **Components**.
- Step 4** Locate the row that contains the target service and click **Stop**.

Click **Start** to start the service if needed.

----End

## Starting or Stopping a Component on Manager

For MRS 3.x or later:

**Step 1** Log in to Manager and choose **Cluster > Services** to access the service management page.

The displayed service list contains all installed services in the cluster. If the tile view is selected, the services will be displayed in pane style. If you select the list view, the services will be displayed in a table.

In this section, the **Tile View** is used by default.

**Step 2** In the upper right corner of the specified service pane, choose  > **Stop Service**, enter the password, and click **OK**.

You can also click the name of the service to be operated, click **Stop Service** in the upper right corner of the **Dashboard** page, enter the password, confirm the operation impact, and click **OK**.

----End

For MRS 2.x or earlier:

**Step 1** Log in to Manager and click **Services**.

**Step 2** Locate the row that contains the target service and click **Stop**.

Click **Start** to start the service if needed.

----End

## 6.5.3 Restarting an MRS Cluster Component

To apply configuration changes to a big data component, you must restart it. However, using the common restart mode will restart all services or instances at once, which can cause service interruption.

To ensure that services are not affected during service restart, you can restart services or instances in batches by rolling restart. For instances in active/standby mode, a standby instance is restarted first and then an active instance is restarted.

A rolling restart takes a longer time and may affect service throughput and performance.

For details about whether services and instances in the current MRS cluster support rolling restart and the rolling restart parameters, see [Component Restart Reference Information](#).

### Restrictions

- Perform a rolling restart during off-peak hours.
  - If the service throughput of the Kafka service is high (over 100 MB/s) during a rolling restart, the restart will fail.

- To avoid RegionServer restart failures caused by heavy loads during an HBase rolling restart, increase the number of handles if the requests per second of each RegionServer on the native interface exceed 10,000.
- Before restarting, check the current number of requests in HBase. If the number of requests on the native interface for each RegionServer is over 10,000, increase the number of handles to prevent overloading.
- If the number of Core nodes in a cluster is less than six, services may be affected for a short period of time.
- Preferentially perform a rolling instance or service restart and select **Only restart instances whose configurations have expired**.

## Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

## Restarting Cluster Components

**Step 1** Access the MRS cluster component management page.

- Log in to the MRS console and click the cluster name to go to the cluster details page. Click **Components**.
- If you are using the Manager of MRS 3.x and later versions, log in to Manager and choose **Cluster > Services**.
- If you are using the Manager of MRS 2.x and earlier versions, log in to Manager and click **Services**.

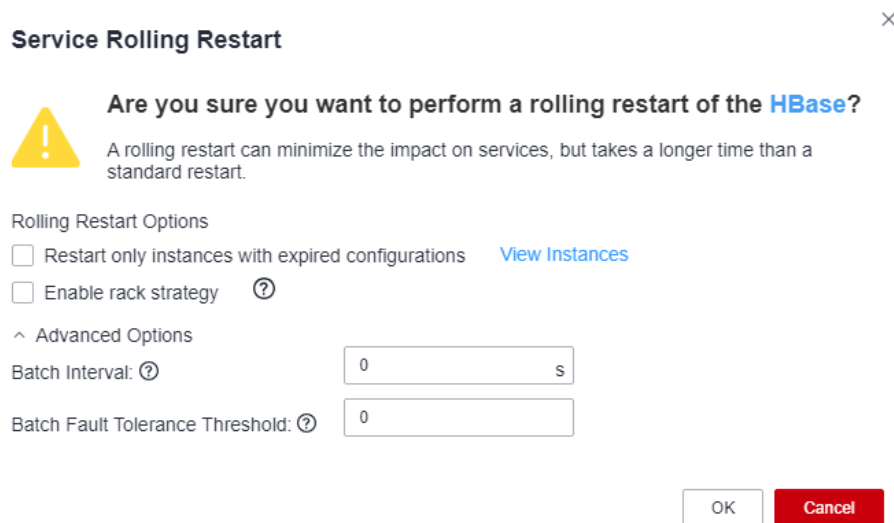

**Step 2** Click the name of the target component to go to the details page.

**Step 3** On the service details page, expand the **More** drop-down list and select **Restart Service** or **Service Rolling Restart**.

**Step 4** Enter the user password (required when you perform operations on Manager), confirm the operation impact, and click **OK** to restart the system.

If you select rolling restart, set parameters listed in [Table 6-19](#). (Required parameters may vary by version, set parameters based on the actual GUI.)

**Figure 6-23** Performing a rolling restart on Manager

**Table 6-19** Rolling restart configuration parameters

| Parameter                                          | Description                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Restart only instances with expired configurations | Whether to restart only the modified instances in a cluster. The name of this parameter may be different in other versions.                                                                                                                                                                                                                    |
| Enable rack strategy                               | Whether to enable the concurrent rack rolling restart strategy. This parameter takes effect only for roles that meet the rack rolling restart strategy. (The roles support rack awareness, and instances of the roles belong to two or more racks.)<br><br>This parameter can be set only when a rolling restart is performed on HDFS or YARN. |

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Data Nodes to Be Batch Restarted | <p>Number of instances that are restarted in each batch when the batch rolling restart strategy is used. The default value is <b>1</b>.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>This parameter is valid only when the batch rolling restart strategy is used and the instance type is DataNode.</li> <li>This parameter is invalid when the rack strategy is enabled. In this case, the cluster uses the maximum number of instances (<b>20</b> by default) configured in the rack strategy as the maximum number of instances that are concurrently restarted in a rack.</li> <li>This parameter can be set only when a rolling restart is performed on some components, such as HDFS, HBase, YARN, Kafka, Storm, and Flume. The actual value displayed on the GUI prevails.</li> <li>The number of concurrent RegionServer rolling restarts of HBase cannot be manually configured. It is automatically adjusted based on the number of RegionServer nodes. The adjustment rules are as follows: If the number of nodes is less than 30, one node will be added in each batch. For node counts less than 300, two nodes will be added in each batch. If the node count exceeds 300 (including 300 nodes), each batch will add 1% (rounded down) of the total nodes.</li> </ul> |
| Batch Interval                   | <p>Interval between two batches of instances to be roll-restarted. The default value is <b>0</b>.</p> <p>Setting the batch interval parameter can increase the stability of the big data component process during the rolling restart.</p> <p>You are advised to set this parameter to a non-default value, for example, <b>10</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Decommissioning Timeout Interval | <p>Decommissioning waiting time of a role instance during a rolling restart. This parameter can be set only when a rolling restart is performed on Hive or Spark.</p> <p>Some roles (such as HiveServer and JDBCServer) stop providing services before the rolling restart. Stopped instances cannot be connected to new clients. Existing connections will be completed after a period of time. An appropriate timeout interval can ensure service continuity.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Batch Fault Tolerance Threshold  | <p>Tolerance times when the rolling restart of instances fails to be batch executed. The default value is <b>0</b>, which indicates that the rolling restart task ends after any batch of instances fails to restart.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Component Restart Reference Information

**Table 6-20** provides services and instances that support or do not support rolling restart in the MRS cluster.

**Table 6-20** Services and instances that support or do not support rolling restart

| Service    | Instance           | Rolling Restart |
|------------|--------------------|-----------------|
| Alluxio    | AlluxioJobMaster   | Yes             |
|            | AlluxioMaster      |                 |
| ClickHouse | ClickHouseServer   | Yes             |
|            | ClickHouseBalancer |                 |
| CDL        | CDLConnector       | Yes             |
|            | CDLService         |                 |
| Flink      | FlinkResource      | No              |
|            | FlinkServer        |                 |
| Flume      | Flume              | Yes             |
|            | MonitorServer      |                 |
| Guardian   | TokenServer        | Yes             |
| HBase      | HMaster            | Yes             |
|            | RegionServer       |                 |
|            | ThriftServer       |                 |
|            | RETServert         |                 |
| HetuEngine | HSBroker           | Yes             |
|            | HSConsole          |                 |
|            | HSFabric           |                 |
|            | QAS                |                 |
| HDFS       | NameNode           | Yes             |
|            | Zkfc               |                 |
|            | JournalNode        |                 |
|            | HttpFS             |                 |
|            | DataNode           |                 |
| Hive       | MetaStore          | Yes             |
|            | WebHCat            |                 |
|            | HiveServer         |                 |
| Hue        | Hue                | No              |
| Impala     | Impalad            | No              |

| Service   | Instance         | Rolling Restart |
|-----------|------------------|-----------------|
|           | StateStore       |                 |
|           | Catalog          |                 |
| IoTDB     | IoTDBServer      | Yes             |
| Kafka     | Broker           | Yes             |
|           | KafkaUI          | No              |
| Kudu      | KuduTserver      | Yes             |
|           | KuduMaster       |                 |
| Loader    | Sqoop            | No              |
| MapReduce | JobHistoryServer | Yes             |
| Oozie     | oozie            | No              |
| Presto    | Coordinator      | Yes             |
|           | Worker           |                 |
| Ranger    | RangerAdmin      | Yes             |
|           | UserSync         |                 |
|           | TagSync          |                 |
| Spark     | JobHistory       | Yes             |
|           | JDBCServer       |                 |
|           | SparkResource    |                 |
| Storm     | Nimbus           | Yes             |
|           | UI               |                 |
|           | Supervisor       |                 |
|           | Logviewer        |                 |
| Tez       | TezUI            | No              |
| Yarn      | ResourceManager  | Yes             |
|           | NodeManager      |                 |
| ZooKeeper | Quorumpeer       | Yes             |

**Table 6-21** lists the instance startup duration.

**Table 6-21** Restart duration for reference

| Service    | Restart Duration | Startup Duration                                                                                                                                       | Remarks                                                                                                                                                                                                                                         |
|------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IoTDB      | 3min             | IoTDBServer: 3 min                                                                                                                                     | -                                                                                                                                                                                                                                               |

| Flink   | 4min             | <ul style="list-style-type: none"><li>● FlinkResource: 1 min</li><li>● FlinkServer: 3 min</li></ul>                                        | -                                                                                                                     |
| Kafka   | 2min+x           | <ul style="list-style-type: none"><li>● Broker: 1 min + x</li><li>● Kafka UI: 5 min</li></ul>                                              | x indicates the data restoration duration. It takes about 2 minutes to start 20,000 partitions for a single instance. |
| Storm   | 6min             | <ul style="list-style-type: none"><li>● Nimbus: 3 min</li><li>● UI: 1 min</li><li>● Supervisor: 1 min</li><li>● Logviewer: 1 min</li></ul> | -                                                                                                                     |
| Flume   | 3min             | <ul style="list-style-type: none"><li>● Flume: 2 min</li><li>● MonitorServer: 1 min</li></ul>                                              | -                                                                                                                     |
| Doris   | 2 min            | <ul style="list-style-type: none"><li>● FE: 1min</li><li>● BE: 1min</li><li>● DBroker: 1min</li></ul>                                      | -                                                                                                                     |

## 6.5.4 Adding and Deleting an MRS Cluster Component

When creating an MRS cluster, you can select service components to be included in the cluster. After the cluster is created, administrators can manually add or delete components for MRS on the console.

### NOTE

MRS 3.1.2-LTS.3 and later versions allow you to add and delete components.

### Prerequisites

- You have configured permissions for the user group to which the IAM users belong.

Adding or deleting a service in a cluster is a high-risk operation. Bind the MRS FullAccess, MRS Administrator, Server Administrator, Tenant Guest, MRS

Administrator, or Tenant Administrator policy to the user group before you perform this operation.

For details about the permissions, see [Synchronizing IAM Users to MRS](#).

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.

## Adding or Deleting a Cluster Component

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the cluster details page, choose **Components** and click **Add Service**.

**Step 4** In the service list, select the services to be added and click **Next**.

### NOTE

- When you add a service, the underlying services on which the service depends are automatically selected. You can add multiple services at the same time.
- You can add services only on nodes or node groups that are in normal state.
- Components (MapReduce, YARN, and HDFS) in the Hadoop service cannot be added separately.
- If Hadoop is not installed in a cluster, after Hadoop is added, you need to refresh the console and synchronize IAM users again to submit jobs on the job management page.
- After the Spark2x/Spark component is added, if you need to perform operations on Spark SQL on the Hue web UI, restart the Hue service first.

**Step 5** On the **Topology Adjustment** page, select the nodes where the service is to be deployed. For details about the deployment scheme, see [Table 2-5](#).

**Step 6** Confirm the operation impact and click **OK**. After the service is added, you can view the added service on the **Components** page.

**Step 7** Locate the row that contains the service and click **Delete** to delete a service.

Enter **DELETE** in the displayed **Delete Service** dialog box and click **OK** to confirm the deletion.

### NOTE

- If the service to be deleted has upper-layer dependencies, the service cannot be deleted. Only one service can be deleted at a time.
- You can delete installed services except Hadoop (HDFS, YARN, and MapReduce), Ranger, DBService, KrbServer, LdapServer, and meta services.
- Before deleting a service, back up the service data to prevent data loss.

----End

## 6.5.5 Modifying the Configuration Parameters of an MRS Cluster Component

To meet actual service requirements, quickly view and modify default service configurations in MRS.

## Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

## Impact on the System

- After configuring the HBase, HDFS, Hive, Spark, YARN and MapReduce service attributes, you need to download and update the client configuration file again.
- The parameters of DBService cannot be modified when only one DBService role instance exists in the cluster.
- After configuring properties of a service, restart the service if the service status is **Expired**. The service is unavailable during the restart.
- After the service configuration parameters are modified and then take effect after restart, you need to download and install the client again or download the configuration file to update the client.

## Modifying Parameters on the Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS cluster details page, click **Components**.

Figure 6-24 Components tab page

| Name      | Version    | Operating Status | Health Status |
|-----------|------------|------------------|---------------|
| Hadoop    | 3.1.1      |                  |               |
| Spark2x   | 2.4.5      | Started          | Faulty        |
| HBase     | 2.2.3      | Started          | Good          |
| Hive      | 3.1.0      | Started          | Faulty        |
| Hue       | 4.7.0      | Started          | Good          |
| Kafka     | 2.11-2.4.0 | Started          | Good          |
| Flume     | 1.9.0      | Started          | Good          |
| Flink     | 1.12.0     | Started          | Good          |
| Oozie     | 5.1.0      | Started          | Faulty        |
| ZooKeeper | 3.5.6      | Started          | Good          |

**Step 4** Select the target service from the service list.

**Step 5** Click **Service Configuration**. Switch **Basic** to **All**. All configuration parameters of the service are displayed in the navigation tree. The service name and role names are displayed from upper to lower in the navigation tree.

**NOTE**

The parameters under the service node are service-level configuration parameters, and the parameters under the role node are role-level configuration parameters. For details, see [Modifying MRS Role Instance Parameters](#).

**Step 6** In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

Figure 6-25 Modifying component configuration parameters

If you want to cancel the modification of a parameter value, click to restore it.

**NOTE**

- Select a port parameter value from the value range on the right. Ensure that all parameter values in the same service are within the value range and are unique. Otherwise, the service fails to be started.
- Configure parameters based on the information provided in the configuration description.

**Step 7** Click **Save Configuration**, save the parameters as prompted, and restart the service.

**NOTE**

In versions earlier than MRS 3.x, to update the queue configuration of YARN without restarting the service, choose **More > Refresh Queue** on the **Service Status** tab page.

----End

## Modifying Component Parameters on Manager

For clusters of MRS 3.x or later:

**Step 1** Log in to Manager and choose **Cluster > Services**.

**Step 2** Click the name of the service to be operated and click **Configurations**.

The **Basic Configurations** page is displayed by default. To modify more parameters, click **All Configurations**. The navigation tree displays all configuration parameters of the service. The level-1 nodes in the navigation tree are service names or role names. The parameter category is displayed after the level-1 node is expanded.

As shown in the following figure, **LdapServer** indicates the service name, indicating that the configuration applies to the entire service; **SlapdServer** indicates the role name, indicating that the configuration applies to all instances in the role.

**Figure 6-26** Configuration parameter navigation tree

**NOTE**

The parameters under the service node are service-level configuration parameters, and the parameters under the role node are role-level configuration parameters. For details, see [Modifying MRS Role Instance Parameters](#).

**Step 3** In the navigation tree, select the specified parameter category and change the parameter values on the right.

If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The Manager searches for the parameter in real time and displays the result.

 **NOTE**

- Select a port parameter value from the value range on the right. Ensure that all parameter values in the same service are within the value range and are unique. Otherwise, the service fails to be started.
- Configure parameters based on the information provided in the configuration description.

**Step 4** Click **Save**. In the confirmation dialog box, click **OK**.

Wait until the message "Operation succeeded" is displayed. Click **Finish**. The configuration is modified.

 **NOTE**

- To update the queue configuration of the YARN service without restarting service, choose **More > Refresh Queue** to update the queue for the configuration to take effect.
- You can both download and upload configuration files. To configure Flume parameters, edit the **flume.config.file** file and upload it to apply the changes. After a configuration file is uploaded, the old file will be overwritten. If the configuration is not saved and the service is restarted, the configuration does not take effect. Save the configuration in time.
- If you need to restart the service for the configuration to take effect after modifying service configuration parameters, choose **More > Restart Service** in the upper right corner of the service page.
- If  is displayed before a parameter, this parameter takes effect dynamically. After the configuration is saved, the parameter value is automatically updated to the configuration file.  is supported only in MRS 3.2.0 or later.

----End

For clusters of MRS 2.x or earlier:

**Step 1** Log in to Manager and click **Services**.

**Step 2** Select the target service from the service list.

**Step 3** Click **Service Configuration**.

**Step 4** Set **Type** to **All**. All configuration parameters of the service are displayed in the navigation tree. The root nodes from top down in the navigation tree represent the service names and role names.

**Step 5** In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

To cancel the change to a parameter value, click .

**Step 6** Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the service.

After the system displays "Operation succeeded", click **Finish**. The service is started.

 NOTE

To update the queue configuration of the YARN service without restarting service, choose **More > Refresh Queue** to update the queue for the configuration to take effect.

----End

## 6.5.6 Viewing the Modified Component Configuration Parameters of an MRS Cluster

MRS allows you to view the changes of service configuration parameters in a cluster with one click, helping you quickly locate faults and improve configuration management efficiency.

On the Manager page of the MRS 3.x cluster, you can easily see the non-initial default values for each service, non-unified values for the same role instance, historical records of cluster configuration changes, and expired configuration parameters in the cluster.

In MRS 3.x, O&M personnel can view environment variables and role configurations on Manager to quickly verify the accuracy of configuration items or access hidden configuration items.

### Viewing the Modified Component Configuration Parameters

**Step 1** Log in to the Manager page of the cluster.

**Step 2** Choose **Cluster > Configurations**.

**Step 3** Select an operation page based on the scenario.

- View all non-default values.
  - a. Click **All Non-default Values**. The system displays the parameters whose values are different from the default values configured for each service, role, or instance in the current cluster.

You can click  next to a parameter value to quickly restore the value to the default one. You can click  to view the historical modification records of the parameter.

If there are a large number of parameters to configure, you can filter the parameters in the filter box in the upper right corner of the page or enter keywords in the search box.

- b. To change the values of the parameters, change the values according to the parameter description and click **Save**. In the dialog box that is displayed, click **OK**.
- View all non-uniform values.
    - a. Click **All Non-uniform Values**. The system displays parameters with different role, service, instance group, or instance configurations in the current cluster.

You can click  next to a parameter value and view the differences in the dialog box that is displayed.

- b. To change the value of a parameter, click  to cancel the configuration difference or manually adjust the parameter value, click **OK**, and then click **Save**. In the dialog box that is displayed, click **OK**.
- View the expired configuration items.
  - a. Click **Expired Configurations**. Expired configuration items in the current cluster are displayed.
  - b. You can filter services using the service filter box in the upper part of the page to view expired configurations of different services. Alternatively, you can enter keywords in the search box.
  - c. Expired configuration items do not take effect completely. Restart the services or instances whose configurations have expired in a timely manner.
- View historical configuration records.
  - a. Click **Historical Configurations**. The historical configuration change records of the current cluster are displayed. You can view details about parameter value changes, including the service to which the parameter belongs, parameter values before and after the modification, and parameter files.
  - b. To restore a configuration change, click **Restore Configuration** in the **Operation** column of the target record. In the dialog box that is displayed, click **OK**.

If **the same configuration of the same service instance** is modified for multiple times, the configuration can only be restored to the latest modification.

 **NOTE**

Some configuration items take effect only after the corresponding services are restarted. After the configurations are saved, restart the services or instances whose configurations have expired in a timely manner.

----End

## Viewing the Role Instance Configuration File

- Step 1** Log in to the cluster Manager.
- Step 2** Choose **Cluster > Services**.
- Step 3** On the page that is displayed, click **Instances**.
- Step 4** Click the name of the target instance. In the **Configuration File** area on the **Instance Status** page, the configuration file list of the instance is displayed.

**Figure 6-27** Viewing the instance configuration file

**Step 5** Click the name of the configuration file to be viewed to view the parameter values in the configuration file.

To obtain the configuration file, download the configuration file to the local PC.

 **NOTE**

If a node in the cluster is faulty, the configuration file cannot be viewed. Rectify the fault before viewing the configuration file again.

----End

## 6.5.7 Synchronizing MRS Component Configuration Parameters

If you find that the **status of some components or instances expires or fails**, you can synchronize the configuration to restore the configuration state. If all services in the cluster are in the **Failed** state, synchronize the cluster configuration with the background configuration.

- If all services in the cluster are in the **Configuration failed** state, synchronize the cluster configuration with the background configuration.
- If all services in the cluster are in the **Configuration failed** state, synchronize the service configuration with the background configuration.

### Impact on the System

- After synchronizing cluster or service configurations, restart the services whose configurations have expired. These services are unavailable during the restart.
- After synchronizing the role instance configuration, restart the role instance whose configuration has expired. The role instance is unavailable during the restart.

## Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

## Synchronizing Configurations on the Console

### Synchronizing cluster configurations

**Step 1** Log in to the MRS console and click the name of the target cluster.

**Step 2** On the cluster details page, choose **Configuration > Synchronize Configuration** in the upper right corner.

This operation applies only to MRS 2.x and earlier versions.

**Figure 6-28** Synchronizing configurations (using MRS 1.9.2 as an example)

**Step 3** In the displayed dialog box, select "Restart services and instances whose configuration have expired" and click **OK** to restart the service whose configurations have expired.

When **Operation successful** is displayed, click **Finish**. The cluster is started.

----End

### Synchronizing component configurations

**Step 1** Log in to the MRS console and click the name of the target cluster.

**Step 2** On the MRS cluster details page, click **Components**.

**Step 3** Select the target service from the service list.

**Step 4** On the **Service Status** page, choose **More > Synchronize Configuration** and operate as prompted.

----End

### Synchronizing role instance configurations

**Step 1** Log in to the MRS console and click the name of the target cluster.

**Step 2** On the MRS cluster details page, click **Components**.

**Step 3** Select the target service from the service list.

**Step 4** On the service details page, click **Instances**.

**Step 5** Click the target role instance from the role instance list.

**Step 6** In the upper part of the role instance status and metric information, choose **More > Synchronize Configuration** and synchronize the configuration as prompted.

**Figure 6-29** Configuration synchronization

----End

## Synchronizing Configurations Using Manager

### Synchronizing cluster configurations

**Step 1** Log in to Manager.

- MRS 3.x: Choose **Cluster > Dashboard**.  
For MRS 3.3.0 or later, the **Cluster > Dashboard** page has been removed from Manager. You can choose **More** in the upper right corner of the **Homepage** to access cluster maintenance and management functions.
- For MRS 2.x and earlier versions, click **Services**.

**Step 2** On this page, choose **More > Synchronize Configuration**.

**Step 3** Perform operations based on the cluster version.

- MRS 2.x and earlier versions: Perform identity authentication, select "Restart services and instances whose configuration have expired", and click **OK**. No further action is required.
- MRS 3.x and later versions: Click **OK**. After the synchronization is complete, perform the operations in [Step 4](#) to restart the instance whose configurations have expired.

**Step 4** Restart the instance whose configurations have expired. (Perform this operation only for MRS 3.x and later versions.)

1. On Manager, choose **Cluster > Dashboard**.
2. Choose **More > Restart Configuration-Expired Instances**.
3. In the dialog box that is displayed, enter the password of the current login user and click **OK**.
4. In the displayed dialog box, click **OK**.

Click **View Instance** to open the list of all expired instances and confirm that the instances have been restarted.

----End

### Synchronizing component configurations

**Step 1** Log in to Manager.

- MRS 3.x: Choose **Cluster > Services**.
- For MRS 2.x and earlier versions, click **Services**.

**Step 2** Click the specified service name and choose **More > Synchronize Configuration**.

**Step 3** Perform operations based on the cluster version.

- MRS 2.x and earlier versions: Perform identity authentication, select "Restart services and instances whose configuration have expired", and click **OK**. No further action is required.
- MRS 3.x and later versions: Click **OK**. After the synchronization is complete, perform the operations in [Step 4](#) to restart the instance whose configurations have expired.

**Step 4** Restart the instance whose configurations have expired. (Perform this operation only for MRS 3.x and later versions.)

1. On Manager, choose **Cluster > Dashboard**.
2. Choose **More > Restart Configuration-Expired Instances**.
3. In the dialog box that is displayed, enter the password of the current login user and click **OK**.
4. In the displayed dialog box, click **OK**.

Click **View Instance** to open the list of all expired instances and confirm that the instances have been restarted.

----End

### Synchronizing role instance configurations

**Step 1** Log in to Manager.

- MRS 3.x: Choose **Cluster > Services**.
- For MRS 2.x and earlier versions, click **Services**.

**Step 2** Click the specified service name and click **Instances**.

**Step 3** Click the target role instance from the role instance list.

**Step 4** On the role instance information page, choose **More > Synchronize Configuration**.

**Step 5** Perform operations based on the cluster version.

- MRS 2.x and earlier versions: In the displayed dialog box, select "Restart services and instances whose configuration have expired" and click **OK**.
- MRS 3.x and later versions: Click **OK**. After the synchronization is complete, perform the operations in [Step 4](#) to restart the instance whose configurations have expired.

**Step 6** Restart the instance whose configurations have expired. (Perform this operation only for MRS 3.x and later versions.)

1. Click **Instances**.
2. Select the instance to be restarted and choose **More > Restart Instance**.
3. In the dialog box that is displayed, enter the password of the current login user and click **OK**.
4. In the displayed dialog box, confirm the impact and click **OK**.

Click **View Instance** to open the list of all expired instances and confirm that the instances have been restarted.

----End

## 6.5.8 Adding Custom MRS Component Parameters

The big data components in the cluster fully support all parameters from the open source community. You can modify configuration parameters on the MRS console or MRS Manager for common scenarios, but some client components may not support all open source parameters.

To modify or add configuration parameters not displayed on the page, use the configuration item customization function. The new parameters will be saved in the component's configuration file and take effect after the component is restarted.

### Prerequisites

- You have understood the meanings of parameters to be added, configuration files that have taken effect, and the impact on components.
- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

### Impact on the System

- After configuring properties of a service, restart the service if the service status is **Expired**. During the restart, the service cannot be accessed.
- After configuring the HBase, HDFS, Hive, Spark, YARN and MapReduce service properties, download and install the client again or download the configuration file to update the client.

## Adding Custom Parameters on the Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS cluster details page, click **Components**.

**Step 4** Select the target service from the service list.

**Step 5** Click **Service Configuration**.

**Step 6** In the configuration type drop-down box on the right side, switch **Basic** to **All**.

**Figure 6-30** All configurations

**Step 7** In the navigation tree on the left, locate a level-1 node and select **Customization**. The system displays the customized parameters of the current component.

- You can customize parameters for services and roles as required.
- Adding custom parameters for a single role instance is not supported.
- The configuration files that save the newly added customized parameters are displayed in the **Parameter File** column. Each configuration file may support open source parameters with the same name. The effective result is determined by the order in which the component loads the configuration files.

**Step 8** Based on the configuration files and parameter functions, locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Parameter** column and enter the parameter value in the **Value** column.

- You can click  or  to add or delete a custom parameter. You can delete a customized parameter only after you click  for the first time.
- If you want to cancel the modification of a parameter value, click  to restore it.

**Step 9** Click **Save Configuration** and operate as prompted.

----End

## Adding Custom Parameters on Manager

**For MRS 3.x and later versions:**

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** Choose **Configurations > All Configurations**.

**Step 5** In the navigation tree on the left, locate a level-1 node and select **Customization**. The system displays the customized parameters of the current component.

- You can customize parameters for services and roles as required.
- Adding custom parameters for a single role instance is not supported.
- The configuration files that save the newly added customized parameters are displayed in the **Parameter File** column. Each configuration file may support open source parameters with the same name. The effective result is determined by the order in which the component loads the configuration files.

**Step 6** Locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Name** column and enter the parameter value in the **Value** column.

You can click + or - to add or delete a customized parameter.

**Step 7** Click **Save**. In the displayed **Save Configuration** dialog box, confirm the modification and click **OK**. After the system displays "Operation succeeded", click **Finish**. The configuration is saved.

Restart the expired service or instance for the configuration to take effect.

 **NOTE**

If  is displayed before a parameter, this parameter takes effect dynamically. After the configuration is saved, the parameter value is automatically updated to the configuration file.  is supported only in MRS 3.2.0 or later.

----End

**For MRS 2.x and earlier:**

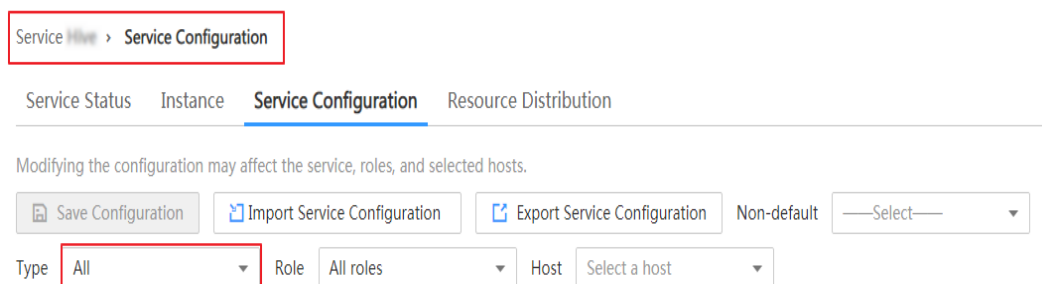

**Step 1** On MRS Manager, click **Services**.

**Step 2** Select the target service from the service list.

**Step 3** Click **Service Configuration**.

**Step 4** Set **Type** to **All**.

**Figure 6-31** Service configurations

**Step 5** In the navigation tree, select **Customization**. The custom parameters of the current component are displayed on Manager.

- You can customize parameters for services and roles as required.
- Adding custom parameters for a single role instance is not supported.
- The configuration files that save the newly added customized parameters are displayed in the **Parameter File** column. Each configuration file may support open source parameters with the same name. The effective result is determined by the order in which the component loads the configuration files.

**Figure 6-32** Custom service configurations

**Step 6** Based on the configuration files and parameter functions, locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Name** column and enter the parameter value in the **Value** column.

- You can click  or  to add or delete a user-defined parameter. You can delete a custom parameter only after you click  for the first time.
- Click  to cancel the change to a parameter value.

**Step 7** Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

After the system displays "Operation succeeded", click **Finish**. The service is started.

----End

## Task Example: Adding Custom Hive Parameters

Hive depends on HDFS. By default, Hive accesses the HDFS client. The configuration parameters to take effect are controlled by HDFS in a unified manner.

For example, the HDFS parameter **ipc.client.rpc.timeout** affects the RPC timeout period for all clients to connect to the HDFS server. If you need to modify the timeout period for Hive to connect to HDFS, you can use the configuration customization function. After this parameter is added to the **core-site.xml** file of Hive, this parameter can be identified by the Hive service and its configuration overwrites the parameter configuration in HDFS.

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS cluster details page, click **Components**.

**Step 4** Choose **Hive > Service Configuration**.

**Step 5** In the configuration type drop-down box on the right side, switch **Basic** to **All**.

**Step 6** In the navigation tree on the left, select **Customization** for the Hive service. The system displays the customized service parameters supported by Hive.

**Step 7** In **core-site.xml**, locate the row that contains the **core.site.customized.configs** parameter, enter **ipc.client.rpc.timeout** in the **Parameter** column, and enter a new value in the **Value** column, for example, **150000**. The unit is millisecond.

**Figure 6-33** Configuring custom Hive parameters

**Step 8** Click **Save Configuration** and operate as prompted.

**Figure 6-34** Saving custom configurations

----End

## 6.5.9 Managing MRS Role Instances

You can start a role instance that is in the **Stopped**, **Failed to stop** or **Failed to start** status, stop an unused or abnormal role instance or restart an abnormal role instance to recover its functions.

### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

### Managing Role Instances on the Console

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** On the MRS cluster details page, click **Components**.

**Figure 6-35** Components page

Dashboard Monitor Nodes **Components** Alarms Files Jobs Tenants

You can manage all services installed in the cluster. [Learn more](#)

| Name      | Version    | Operating Status | Health Status |
|-----------|------------|------------------|---------------|
| ▼ Hadoop  | 3.1.1      |                  |               |
| Spark2x   | 2.4.5      | ✔ Started        | ✘ Faulty      |
| HBase     | 2.2.3      | ✔ Started        | ✔ Good        |
| Hive      | 3.1.0      | ✔ Started        | ✘ Faulty      |
| Hue       | 4.7.0      | ✔ Started        | ✔ Good        |
| Kafka     | 2.11-2.4.0 | ✔ Started        | ✔ Good        |
| Flume     | 1.9.0      | ✔ Started        | ✔ Good        |
| Flink     | 1.12.0     | ✔ Started        | ✔ Good        |
| Oozie     | 5.1.0      | ✔ Started        | ✘ Faulty      |
| ZooKeeper | 3.5.6      | ✔ Started        | ✔ Good        |

- Step 4** Select the target service from the service list.
- Step 5** Click the **Instances** tab.
- Step 6** Select the check box on the left of the target role instance.
- Step 7** Click **More**, select operations such as **Start Instance**, **Stop Instance**, **Restart Instance**, **Rolling-restart Instance**, or **Delete Instance** based on site requirements.

[Component Restart Reference Information](#) outlines which instances support or not support rolling restart.

----End

## Managing Role Instances on Manager

- Step 1** Log in to Manager.
- Step 2** Go to the service instance page.
  - MRS 3.x and later versions: Choose **Cluster** > Services, click the name of the target service, and click **Instances**.
  - MRS 2.x and earlier versions: Click **Services** and click **Instances**.
- Step 3** Select the check box on the left of the target role instance.
- Step 4** Choose **More** > **Start Instance**, **Stop Instance**, or **Restart Instance** as prompted.

[Component Restart Reference Information](#) outlines which instances support or not support rolling restart.

----End

## Exporting and Importing Role Instance Configurations

**For clusters of MRS 3.x and later**

**Step 1** Log in to Manager.

**Step 2** Choose **Cluster > Services** and click the name of the service to be operated in the service view.

**Step 3** Click **Instances** and click the instance to be operated.

**Step 4** Click **Instance Configuration** and click **Export** to export the configuration parameter file to the local PC.

**Step 5** On the **Instance Configurations** page, click **Import**, select the configuration parameter file of the instance, and import the file.

----End

**For MRS clusters of 2.x and earlier:**

**Step 1** Log in to MRS Manager.

**Step 2** Click **Services**.

**Step 3** Select a service.

**Step 4** Select a role instance or click **Instances**.

**Step 5** Select a role instance on a specified host.

**Step 6** Click **Instance Configuration**.

**Step 7** Click **Export Instance Configuration** to export the configuration data of a specified role instance, and choose a path for saving the configuration file.

**Step 8** Click **Import Instance Configuration** to import the configuration data of the specified role instance.

Click **Save Configuration** and select **Restart the role instance**. Click **OK**.

After the system displays "Operation succeeded", click **Finish**. The role instance is started.

----End

### 6.5.10 Managing MRS Role Instance Groups

With MRS, you can easily manage instance groups by grouping multiple instances based on a specified principle, such as nodes with the same hardware configuration.

Any changes made to the configuration parameters of an instance group will apply to all instances within that group.

**NOTE**

This section applies to MRS 3.x or later.

### Prerequisites

You have logged in to MRS Manager. For details, see [Accessing MRS Manager](#).

### Managing MRS Role Instance Groups

**Step 1** On Manager, choose **Cluster > Services**.

**Step 2** Click the specified service name on the service management page.

**Step 3** On the displayed page, click **Instance Groups**.

Click  and configure parameters as prompted.

**Figure 6-36** Creating an instance group

**Table 6-22** Instance group configuration parameters

| Parameter   | Description                                                                                                                                                                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group Name  | Instance group name. The value can contain only letters, digits, underscores (_), hyphens (-), and spaces. It must start with a letter, digit, underscore (_), or hyphen (-) and cannot ends with a space. It can contain a maximum of 99 characters. |
| Role        | Role to which an instance group belongs.                                                                                                                                                                                                              |
| Copy From   | Instance group where the configuration parameter values are copied from. If the value is null, default values are used.                                                                                                                               |
| Description | Instance group description. It can contain only letters, digits, commas (,), periods (.), underscores (_), spaces, and line breaks, and can contain a maximum of 200 characters.                                                                      |

 **NOTE**

Each instance must belong to only one instance group. When an instance is installed for the first time, it belongs to the instance group *Role name-DEFAULT* by default.

**Step 4** Click **OK**.

**Step 5** You can perform the following operations on an instance group as needed.

- **Modifying an instance group:** On the **Instance Group** page, locate the target instance group, click , and modify parameters as prompted. The default instance group cannot be modified.
- **Deleting an instance group:** Click **Instance Groups**. On the **Instance Groups** page, locate the row that contains the target instance group. Click . In the displayed dialog box, click **OK**. The default instance group cannot be deleted. You can delete unnecessary or unused instance groups. Before deleting an instance group, migrate all instances in the group to other instance groups. The default instance group cannot be deleted.
- **Viewing instance group information:** On the **Instance Groups** page, select a role. On the **Basic** page, view all instances of the instance group.

 **NOTE**

To move an instance from an instance group to another, perform the following operations:

1. Select the instance to be moved and click **Move**.
2. In the displayed dialog box, select an instance group to which the instance to be moved.

During the migration, the configuration of the new instance group is automatically inherited. If the instance configuration is modified before the migration, the configuration of the instance will be used.

3. Click **OK**.

Restart the expired service or instance for the configuration to take effect.

- **Configuring instance group parameters:** On the **Instance Groups** page, select a role in the navigation pane, click **Configuration**, adjust the configuration parameters, and click **Save**. The configuration will take effect on all instances in the instance group.

----End

## 6.5.11 Modifying MRS Role Instance Parameters

Configuration parameters of each role instance can be modified. In the scenario where instances are migrated to a new cluster or the service is redeployed, the cluster administrator can import or export all configuration data of a service to quickly copy configuration results.

Making changes to configuration parameters, exporting instance configurations, or importing instance configurations will not impact other instances.

### Impact on the System

- After modifying the configuration of a role instance, you need to restart the instance if the instance status is **Expired**. The role instance is unavailable during restart.

- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, YARN, and MapReduce service properties.

## Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

## Modifying Instance Parameters on the Console

**Step 1** Log in to the MRS console and click the name of the target cluster.

**Step 2** On the MRS cluster details page, click **Components**.

**Step 3** Select the target service from the service list.

**Step 4** Click the **Instances** tab.

**Step 5** Click the target role instance from the role instance list.

**Step 6** Click the **Instance Configuration** tab.

**Step 7** Switch **Basic** to **All** from the drop-down list on the right of the page. All configuration parameters of the role instance are displayed in the navigation tree.

**Step 8** In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

If you want to cancel the modification of a parameter value, click  to restore it.

**Step 9** Click **Save Configuration** and operate as prompted.

----End

## Modifying Instance Parameters on Manager

**Step 1** Log in to Manager and choose **Cluster > Services**.

For MRS 2.x and earlier versions, click **Services**.

**Step 2** Click the specified service name and click **Instances**.

**Step 3** Click the specified instance and select **Instance Configuration**.

By default, **Basic Configuration** is displayed. To modify more parameters, click **All Configurations**. All parameter categories supported by the instance are displayed on the **All Configurations** page.

**Step 4** In the navigation tree, select the specified parameter category and change the parameter values on the right.

Enter the name of a parameter in the upper right corner to search for it. Search results are displayed on Manager in real-time.

**Step 5** Click **Save**. In the confirmation dialog box, click **OK**.

For MRS 2.x and earlier versions, click **Save Configuration**, select **Restart the role instance**, and click **OK** to restart the role instance.

Wait until the message "Operation succeeded" is displayed. Click **Finish**. The configuration is modified.

 **NOTE**

- After the configuration parameters of a role instance are modified, you need to restart the instance if the instance status is **Expired**. You can select the expired instance on the **Instances** page and choose **More > Restart Instance**.
- If  is displayed before a parameter, this parameter takes effect dynamically. After the configuration is saved, the parameter value is automatically updated to the configuration file.  is supported only in MRS 3.2.0 or later.

----End

## 6.5.12 Perform an Active/Standby Switchover for MRS Role Instances

Some service roles are deployed in active/standby mode. If the active instance needs to be maintained and cannot provide services, or other maintenance is required, you can manually trigger an active/standby switchover.

### Prerequisites

You have logged in to MRS Manager. For details, see [Accessing MRS Manager](#).

### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Services**.

For MRS 2.x and earlier versions, click **Services**. The parameters vary depending on the version.

**Step 3** Click the specified service name (such as **HDFS**).

**Step 4** On the service details page, expand the **More** drop-down list and select **Perform Role Instance Switchover**.

For example, click **Perform NameNode Switchover**.

**Step 5** In the displayed dialog box, enter the password of the current login user and click **OK**.

**Step 6** In the dialog box that is displayed, confirm the operation impact and click **OK** to perform an active/standby switchover for role instances.

 NOTE

- The following components support active/standby switchover of role instances: DBService, HDFS, YARN, Storm, HBase, MapReduce, and Loader. This function cannot be used for other role instances.
- When an active/standby switchover is performed for a NameNode on HDFS, a NameService must be set.

----End

## 6.5.13 Decommissioning and Recommissioning an MRS Role Instance

Data in an MRS cluster can be spread out over multiple Core nodes. If one of these nodes fails, it can destabilize the entire cluster. To prevent this, you can decommission a specific role instance on MRS, which will halt its service provision.

After fault rectification, you can recommission the role instance.

The following role instances can be decommissioned or recommissioned:

- DataNode role instance on HDFS
- NodeManager role instance on YARN
- RegionServer role instance on HBase
- ClickHouseServer role instance of ClickHouse (supported in MRS 3.1.2 or later)
- IoTDBServer role instance of IoTDB
- Broker role instance on Kafka

### Constraints

- If a role instance is out of service, you must recommission the instance to start it before using it again.
- For details about ClickHouseServer instance decommissioning restrictions, see [Constraints on ClickHouseServer Scale-in](#).
- By default, if the number of the DataNodes is less than or equal to that of HDFS replicas, decommissioning cannot be performed. If there are only three HDFS replicas and less than four DataNodes in the system, decommissioning cannot be carried out. In such a scenario, an error will be reported, and Manager will exit the decommissioning process 30 minutes after attempting to perform it.
- During MapReduce task execution, files with 10 replicas are generated. Therefore, if the number of DataNode instances is less than 10, decommissioning cannot be performed.
- If the number of DataNode racks (the number of racks is determined by the number of racks configured for each DataNode) is greater than 1 before the decommissioning, and after some DataNodes are decommissioned, that of the remaining DataNodes changes to 1, the decommissioning will fail. Therefore, before decommissioning DataNode instances, you need to evaluate the impact of decommissioning on the number of racks to adjust the DataNodes to be decommissioned.

- If multiple DataNodes are decommissioned at the same time, and each of them stores a large volume of data, the DataNodes may fail to be decommissioned due to timeout. To avoid this problem, it is recommended that one DataNode be decommissioned each time and multiple decommissioning operations be performed.
- If the number of IoTDBServers is less than or equal to the number of region copies configured for the cluster (3 by default), decommissioning cannot be performed.

## Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).
- If the DataNode is to be decommissioned, perform the following steps to perform a health check before decommissioning:
  - a. Log in to the client installation node as a client user and switch to the client installation directory.
  - b. For a security cluster, use user **hdfs** for permission authentication.

```
source bigdata_env #Configure client environment variables.
kinit hdfs #Configure kinit authentication.
Password for hdfs@HADOOP.COM: #Enter the login password of user hdfs.
```
  - c. Run the **hdfs fsck / -list-corruptfileblocks** command, and check the returned result.
    - If "has 0 CORRUPT files" is displayed, the health check is successful.
    - If the command output does not contain "has 0 CORRUPT files" and the name of the damaged file is returned, perform the following operations to delete the damaged file:

**hdfs dfs -rm** *Name of the damaged file*

### NOTE

Deleting a file is a high-risk operation. Ensure that the files are no longer needed before performing this operation.

## Decommissioning or Recommissioning an Instance on the Console

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** On the MRS cluster details page, click **Components**.
- Step 4** Click a service in the service list.
- Step 5** Click the **Instances** tab.
- Step 6** Select an instance.
- Step 7** Choose **More > Decommission** or **Recommission** to perform the corresponding operation.

Figure 6-37 Decommissioning an instance

| Host Name        | OM IP Address | Business IP Address | Rack              | Operating Status | Health Status | Configuration Status |
|------------------|---------------|---------------------|-------------------|------------------|---------------|----------------------|
| node-master1m0FW | 192.168.0.187 | 192.168.0.187       | /default/rack1485 | Started          | Good          | Synchronized         |
| node-master2m0QR | 192.168.0.82  | 192.168.0.82        | /default/rack1485 | Started          | Good          | Synchronized         |

**NOTE**

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, MRS displays a message indicating that the instance decommissioning is stopped, but the **Operating Status** of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

## Decommissioning or Recommissioning Instances on Manager

**Step 1** Log in to Manager and go to the page of the component instance to be operated.

- MRS 3.x and later versions: Choose **Cluster** > **Services**, click the specified service name on the **Services** page, and click **Instances**.
- MRS 2.x and earlier versions: Click **Services**, click the specified service name in the service list, and click **Instances**.

**Step 2** Select the specified role instance to be decommissioned.

**Step 3** Select **Decommission** or **Recommission** from the **More** drop-down list.

In the displayed dialog box, enter the password of the current login user and click **OK**.

Select the operation impact and click **OK** to perform the corresponding operation.

**NOTE**

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, MRS displays a message indicating that the instance decommissioning is stopped, but the **Operating Status** of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

### 6.5.14 Enabling and Disabling Ranger Authentication for an MRS Component

By default, the Ranger service is installed and Ranger authentication is enabled for a newly installed cluster with Kerberos authentication enabled. You can use the permission plug-in of the component to establish fine-grained security access policies for accessing component resources. If Ranger authentication is not required, the cluster administrator can manually disable Ranger authentication on the service page. After Ranger authentication is disabled, the system continues to perform permission control based on the role model of Manager when accessing component resources.

In a cluster upgraded from an earlier version, Ranger authentication is not used by default when users access component resources. The cluster administrator can manually enable Ranger authentication after installing the Ranger service.

#### NOTE

- This section applies only to MRS 3.x or later.
- In a cluster in security mode, the following components support Ranger authentication: HDFS, YARN, Kafka, Hive, HBase, Storm, Impala, HetuEngine, CDL, and Spark/Spark2x.
- In a cluster in non-security mode, Ranger supports permission control on component resources based on OS users. The following components support Ranger authentication: HBase, HDFS, Hive, Spark/Spark2x, and YARN.
- After Ranger authentication is enabled, all authentication of the component will be managed by Ranger. The permissions set by the original authentication plug-in will become invalid (The ACL rules of HDFS and YARN components still take effect). Exercise caution when performing this operation. You are advised to deploy permissions on Ranger in advance.
- After Ranger authentication is disabled, all authentication of the component will be managed by the permission plug-in of the component. The permission set on Ranger will become invalid. Exercise caution when performing this operation. You are advised to deploy permissions on Manager in advance.

## Enabling Ranger Authentication

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** On the service details page, expand the **More** drop-down list and select **Enable Ranger**.

**Step 5** In the displayed dialog box, enter the password of the current login user and click **OK**.

**Step 6** In the service list, restart the service whose configuration has expired.

----End

## Disabling Ranger Authentication

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** On the service details page, expand the **More** drop-down list and select **Disable Ranger**.

**Step 5** Enter the password of the current login user and click **OK**. In the displayed dialog box, click **OK**.

**Step 6** In the service list, restart the service whose configuration has expired.

----End

## 6.5.15 Accessing Web Pages of Open Source Components Managed in MRS Clusters

If the component has an open source web UI, you can access it by clicking the web UI link in the component's basic information area.

### NOTE

For clusters with Kerberos authentication enabled, user **admin** does not have the management permission on each component. To access the web UI of each component, create a user who has the management permission on the corresponding component by referring to [Creating an MRS Cluster User](#).

### Accessing the Web UI of an Open Source Component

**Step 1** Log in to MRS Manager.

For details, see [Accessing MRS Manager](#).

**Step 2** [Table 6-23](#) displays the steps to locate the entry for each component.

**Table 6-23** Web UI addresses of open-source components

| Web UI Type                | Address (Earlier than MRS 3.x)                                                                                                                    | Address (MRS 3.x and Later)                                                                                                                                            |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HDFS Name Node             | Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; HDFS &gt; NameNode Web UI &gt; NameNode (Active)</b> .               | MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; HDFS &gt; NameNode Web UI &gt; NameNode (Host name, Active)</b> .                      |
| HBase HMaster              | Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; HBase &gt; HMaster Web UI &gt; HMaster (Active)</b> .                | MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; HBase &gt; HMaster Web UI &gt; HMaster (Host name, Active)</b> .                       |
| MapReduce JobHistoryServer | Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; MapReduce &gt; JobHistoryServer Web UI &gt; JobHistoryServer</b> .   | MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; MapReduce &gt; JobHistoryServer Web UI &gt; JobHistoryServer (Host name, Active)</b> . |
| YARN ResourceManager       | Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Yarn &gt; ResourceManager Web UI &gt; ResourceManager (Active)</b> . | MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Yarn &gt; ResourceManager Web UI &gt; ResourceManager (Host name, Active)</b> .        |

| Web UI Type      | Address (Earlier than MRS 3.x)                                                                                                                                                                                                                                         | Address (MRS 3.x and Later)                                                                                                                                                                                                                                                          |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Spark JobHistory | Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Spark &gt; Spark Web UI &gt; JobHistory</b> .                                                                                                                                             | MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Spark2x &gt; Spark2x Web UI &gt; JobHistory2x (Host name, Active)</b> .                                                                                                                              |
| Hue              | Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Hue &gt; Hue Web UI &gt; Hue (Active)</b> .<br>Loader is a graphical data migration management tool based on the open-source Sqoop web UI, and its interface is hosted on the Hue web UI. | MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Hue &gt; Hue Web UI &gt; Hue (Host name, Active)</b> .<br>Loader is a graphical data migration management tool based on the open-source Sqoop web UI, and its interface is hosted on the Hue web UI. |
| Tez              | Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Tez &gt; Tez Web UI &gt; TezUI</b> .                                                                                                                                                      | MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Tez &gt; Tez Web UI &gt; TezUI (Host name)</b> .                                                                                                                                                     |
| Presto           | Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Presto &gt; Presto Web UI &gt; Coordinator (Active)</b> .                                                                                                                                 | MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Presto &gt; Coordinator Web UI &gt; Coordinator(Coordinator)</b> .                                                                                                                                   |
| Ranger           | Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Ranger &gt; Ranger Web UI &gt; RangerAdmin (Active)</b> .                                                                                                                                 | MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Ranger &gt; Ranger Web UI &gt; RangerAdmin</b> .                                                                                                                                                     |
| Storm            | Earlier than MRS 3.x: On the cluster details page, choose <b>Components &gt; Storm &gt; Storm Web UI &gt; UI</b> .                                                                                                                                                     | MRS 3.x or later: On the Manager homepage, choose <b>Cluster &gt; Services &gt; Storm &gt; Storm Web UI &gt; UI (Host name)</b> .                                                                                                                                                    |

## 6.6 Managing MRS Cluster Nodes

### 6.6.1 Checking the Running Status of an MRS Cluster Node

You can keep track of the status of each node in a running MRS cluster in real-time on the console or Manager. This helps you promptly detect any potential resource problems.

## Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

## Checking the Node Status on the Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the cluster details page, click **Nodes**.

**Step 4** Expand the node group name to view basic information about the nodes in a node group, such as their status, CPU usage, memory usage, and disk usage.

In the host list, click a host name to view detailed node information.

**Table 6-24** MRS cluster node information

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Node Group   | Node group name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Node Type    | Node type corresponding to the node group. For details, see <a href="#">MRS Cluster Node Types</a> .<br><br>On the <b>Nodes</b> page, click  next to a node group name to unfold the nodes contained in the node group. Click a node name to remotely log in to the ECS using the password or key pair configured during cluster creation. For details about the parameters, see <a href="#">Viewing MRS Cluster Component Monitoring Metrics</a> . |
| Node Count   | Number of nodes in a node group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Billing Mode | Billing mode of the cluster you purchased, including <b>Pay-Per-Use</b> and <b>Yearly/Monthly</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                    |

----End

## Checking the Node Status on Manager (MRS 3.x or Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Hosts** to view the host list.

The host list shows all the hosts in the cluster along with their basic information. You can use this list to perform O&M operations on hosts, apply filters, and search for specific hosts. Additionally, you can click **Export All**, set **Save As** to **TXT** or **CSV**, and click **OK** to export information about all hosts. **Host View** is displayed by

default. You can click **Role View** to switch the view type. You can also click the edit button to customize the content displayed in each view.

**Table 6-25** View type description

| View Type | Description                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Host View | Displays the IP address, rack planning, running status, and hardware resource usage of each host.                                          |
| Role view | Displays the roles that have been deployed on each host. If the role supports the active/standby mode, the role name is displayed in bold. |

**Table 6-26** Host running status description

| Status    | Description                                                       |
|-----------|-------------------------------------------------------------------|
| Normal    | Indicates that the host is in the normal state.                   |
| Faulty    | Indicates that the host is abnormal.                              |
| Unknown   | Indicates that the initial status of the host cannot be detected. |
| Isolated  | Indicates that the host is isolated.                              |
| Suspended | Indicates that the host is stopped.                               |

**Step 3** In the host list, click the specified host name to view the host overview information.

The host details page contains the basic information area, disk status area, instance list area, and monitoring graphs.

**Table 6-27** Host details

| Item                   | Description                                                                                                                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Basic Information      | The basic information area contains the key information about the host, such as the management IP address, service IP address, host type, rack, firewall, number of CPU cores, and OS.                                 |
| Disk                   | The disk status area contains all disk partitions configured for the cluster on the host and the usage of each disk partition.                                                                                         |
| Instances              | The instance list displays all role instances installed on the host and the status of each role instance. You can click the log file next to a role instance name to view the log file content of the instance online. |
| Alarm and Event Record | The alarm and event history area displays the key alarms and events reported by the current host. The system can display a maximum of 20 historical records.                                                           |

| Item  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chart | <p>The monitoring chart area is displayed on the right of the host details page, and contains the key monitoring metrics of the host.</p> <p>You can choose ▾ &gt; <b>Customize</b> in the upper right corner to customize the monitoring reports to be displayed in the chart area. Select a time range and choose ▾ &gt; <b>Export</b> to export detailed monitoring metric data within the specified time range.</p> <p>You can click ⓘ next to the title of a monitoring indicator to open the description of the monitoring metric.</p> |

**Step 4** View the host chart, process, and resource information.

Click the **Chart**, **Process**, and **Resource** to view the full monitoring chart information about the host.

- The **Chart** page displays all monitoring graphs of the host.
- The **Process** page shows information about the role processes of the deployed service instances on the current host, including their status, PID, and running time. You can easily access the log files of each process online.
- The **Resource** page displays the resource usage details of the deployed service instances on the current host, such as CPU, memory, disk, and port usage.

----End

## Checking the Node Status on Manager (MRS 2.x or Earlier)

**Step 1** Log in to MRS Manager.

**Step 2** Click **Hosts** to view the status of all hosts.

The following table lists the operating status and health status of the host.

**Table 6-28** Host operating status

| Status   | Description                                                           |
|----------|-----------------------------------------------------------------------|
| Normal   | The host and service roles on the host are running properly.          |
| Isolated | The host is isolated, and the service roles on the host stop running. |

**Table 6-29** Host health status

| Status | Description                                       |
|--------|---------------------------------------------------|
| Good   | The host can properly send heartbeats.            |
| Bad    | The host fails to send heartbeats due to timeout. |

| Status  | Description                                        |
|---------|----------------------------------------------------|
| Unknown | Initial status of the host when the host is added. |

**Step 3** Click the target host in the host list to view its status and metric information.

**Step 4** Customize and export monitoring charts.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

## 6.6.2 Starting and Stopping All Roles on an MRS Cluster Node

When a host or node is faulty, you may need to stop all roles on the host on MRS to check the host. After the fault is rectified, start all roles on the host to recover host services.

### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

### Starting or Stopping a Node Role on the Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS details page, click **Nodes**.

**Step 4** Unfold the node group information and select the check box of the target node.

**Step 5** Choose **Node Operation** > **Start All Roles** or **Stop All Roles** to perform the required operation.

----End

### Starting or Stopping Node Roles on Manager

**Step 1** Log in to the cluster Manager.

**Step 2** Click **Hosts** to go to the host list page.

For clusters of MRS 2.x or earlier, click **Hosts**.

**Step 3** Select the check box of the target hosts.

**Step 4** Select **Start All Instances** or **Stop All Instances** from the **More** drop-down list to start or stop all role instances.

----End

### 6.6.3 Isolating an MRS Cluster Node

If a host is found to be abnormal or faulty, affecting cluster performance or preventing services from being provided, you can temporarily exclude that host from the available nodes in the cluster. In this way, the client can access other available nodes. In scenarios where patches are to be installed in a cluster, you can also exclude a specified node from patch installation.

Only non-management nodes can be isolated.

You can isolate a host manually on MRS based on the actual service requirements or O&M plan.

#### Impact on the System

- After a host is isolated, all role instances on the host will be stopped. You cannot start, stop, or configure the host and any instances on the host.
- After a host is isolated, statistics of the monitoring status and indicator data of the host hardware and instances cannot be collected or displayed.
- For some services, after a host is isolated, some instances on other nodes do not work, and the service configuration status may expire.
- Retain the default SSH port (22) of the target node. Otherwise, the task described in this section will fail.

#### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

#### Isolating a Host on the Console

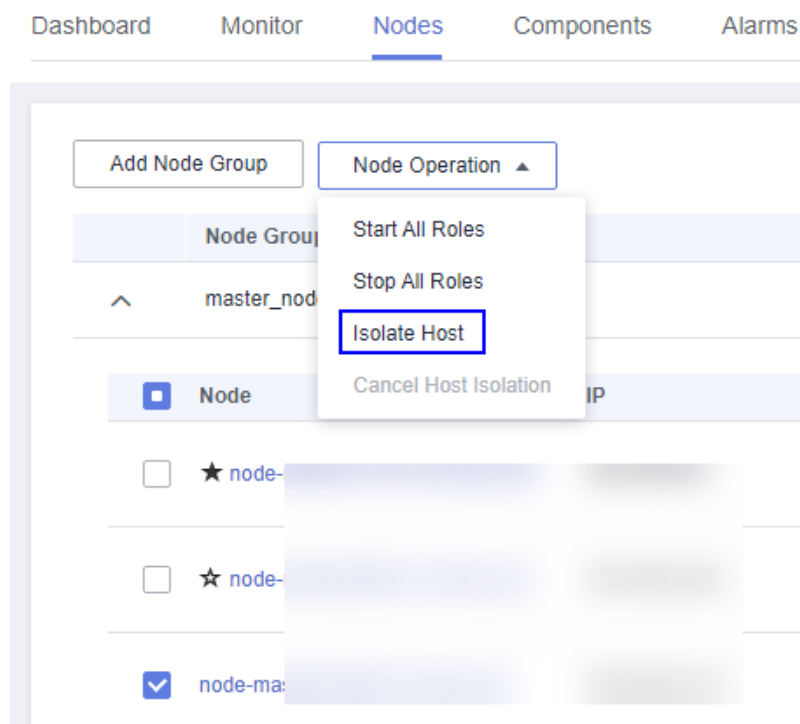

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS details page, click **Nodes**.

**Step 4** Unfold the node group information and select the check box of the target host.

**Step 5** Choose **Node Operation** > **Isolate Host**.

**Figure 6-38** Isolating a host

**Step 6** Confirm the information about the host to be isolated and click **OK**.

When **Operation successful** is displayed, click **Finish**. The host is isolated successfully, and the value of **Operating Status** becomes **Isolated**.

**NOTE**

The isolation of a host can be canceled and the host can be added to the cluster again. After the exception or fault of a host is handled, you must cancel the isolation of the host for proper usage.

**Step 7** Cancel the isolation status of the host before using the host if you have rectified the host exception or fault.

1. On the **Nodes** page, expand the node group information.
2. Select the check box of the host to be de-isolated and choose **Node Operation > Cancel Host Isolation**.
3. Confirm the information about the host for which the isolation is to be cancelled and click **OK**.

When **Operation successful** is displayed, click **Finish**. The host is de-isolated, and the value of **Operating Status** becomes **Normal**.

----End

## Isolating a Host on Manager

For MRS 3.x or later:

**Step 1** Log in to FusionInsight Manager and click **Hosts**.

**Step 2** Select the check box of the host to be isolated, choose **More > Isolate Host**, enter the password for identity authentication, and click **OK**.

**Step 3** Confirm the information about the host to be isolated and click **OK**.

After the system displays a message indicating that the operation is successful, click **Finish**. If the host is isolated, its **Running Status** is displayed as **Isolated**.

**Step 4** Log in to the isolated host as user **root** and run the **ps -ef | grep 'container' | grep '\${BIGDATA\_HOME}' | awk '{print \$2}' | xargs -l '{}' kill -9 '{}'** command to find and stop the container process.

**Step 5** Cancel the isolation status of the host before using the host if you have rectified the host exception or fault.

On the **Hosts** page, select the isolated host and choose **More > Cancel Isolation**.

 **NOTE**

After the isolation is canceled, all role instances on the host are not started by default. To start role instances on the host, select the target host on the **Hosts** page and choose **More > Start All Instances**.

----End

For MRS 2.x or earlier:

**Step 1** Log in to MRS Manager, and choose **Hosts**.

**Step 2** Select the check box of the host to be isolated, choose **More > Isolate Host**, enter the password for identity authentication, and click **OK**.

**Step 3** Confirm the information about the host to be isolated and click **OK**.

After the system displays a message indicating that the operation is successful, click **Finish**. If the host is isolated, its **Operating Status** is displayed as **Isolated**.

**Step 4** Cancel the isolation status of the host before using the host if you have rectified the host exception or fault.

1. On MRS Manager, click **Hosts**.
2. Select the check box of the host to be de-isolated and choose **More > Cancel Host Isolation**.
3. Click **OK** in the displayed dialog box.  
When **Operation successful** is displayed, click **Finish**. The host is de-isolated successfully, and the value of **Operating Status** becomes **Normal**.
4. Click the name of the de-isolated host to show its status, and click **Start All Roles**.

----End

## 6.6.4 Modifying the Rack Information of an MRS Cluster Node

All hosts in a large cluster are usually deployed on multiple racks. Hosts on different racks communicate with each other through switches. The network bandwidth between different hosts on the same rack is much greater than that on

different racks. In this case, plan the network topology based on the following requirements:

- To improve the communication speed, it is recommended that data be exchanged between hosts on the same rack.
- To improve the fault tolerance capability, distribute processes or data of distributed services on different hosts of multiple racks as dispersedly as possible.

Hadoop uses a file directory structure to represent hosts.

The HDFS cannot automatically determine the network topology of each DataNode in the cluster. You need to set the rack name to identify the rack where the host is located so that the NameNode can draw the network topology of the required DataNodes and back up data of the DataNodes to different racks. Similarly, YARN needs to obtain rack information and allocate tasks to different NodeManagers as required.

If the cluster network topology changes, you need to reallocate racks for hosts on FusionInsight Manager so that related services can be automatically adjusted.

#### NOTE

This section applies only to MRS 3.x or later.

## Impact on the System

- If the name of the host rack is changed, storage policy for HDFS replicas, YARN task assignment, and storage location of Kafka partitions will be affected. After the modification, you need to restart the HDFS, YARN, and Kafka for the configuration to take effect.
- Improper rack configuration will unbalance loads (including CPU, memory, disk, and network) among nodes in the cluster, which decreases the cluster reliability and stability. Therefore, before allocating racks, take all aspects into consideration and properly set racks.

## Rack Allocation Policies

#### NOTE

Physical rack: indicates the real rack where the host resides.

Logical rack: indicates the rack name of the host on FusionInsight Manager.

Policy 1: Each logical rack has nearly the same number of hosts.

Policy 2: The name of the logical rack of the host must comply with that of the physical rack to which the host belongs.

Policy 3: If there are only few hosts on a physical rack, combine this physical rack and other physical racks with few hosts into a logical rack, which complies with policy 1. Hosts in two equipment rooms cannot be placed in one logical rack. Otherwise, performance problems may be caused.

Policy 4: If there are lots of hosts on a physical rack, divide these hosts into multiple logical racks, which complies with policy 1. Hosts with great differences should not be placed in the same logical rack. Otherwise, the cluster reliability will be decreased.

Policy 5: You are advised to set **default** or other values for logical racks on the first layer, and the values in the same cluster must be consistent.

Policy 6: The number of hosts in each rack cannot be less than 3.

Policy 7: A cluster can contain at most 50 logical racks. If there are too many logical racks in a cluster, the maintenance is difficult.

## Best Practices

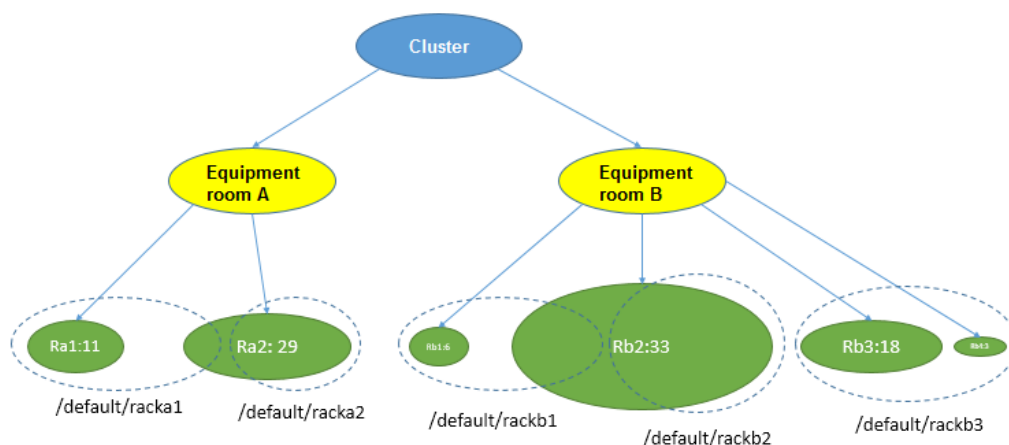

For example, in a cluster, 100 hosts are located in two equipment rooms A and B. A has 40 hosts and B has 60 hosts. In room A, there are 11 hosts on physical rack Ra1 and 29 hosts on physical rack Ra2. In room B, there are six hosts on physical rack Rb1, 33 hosts on physical rack Rb2, 18 hosts on physical rack Rb3, and three hosts on physical rack Rb4.

According to the rack allocation policy, each logical rack contains nearly the same number (for example, 20) of hosts. The allocation details are as follows:

- Logical rack /default/racka1: 11 hosts on physical rack Ra1 and nine hosts on physical rack Ra2
- Logical rack /default/racka2: the remaining 20 hosts (except the nine hosts of logical rack /default/racka1) on physical rack Ra2
- Logical rack /default/rackb1: six hosts on physical rack Rb1 and 13 hosts on physical rack Rb2
- Logical rack /default/rackb2: the remaining 20 hosts on physical rack Rb2
- Logical rack /default/rackb3: 18 hosts on physical rack Rb3 and three hosts on physical rack Rb4

Rack allocation example:

**Figure 6-39** Rack division

## Configuring the Cluster Node Rack

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Hosts**.

**Step 3** Select the check box of the target host.

**Step 4** Select **Set Rack** from the **More** drop-down list.

- Set rack names in hierarchy based on the actual network topology. Separate racks from different layers using slashes (/).
- Rack naming rules are as follows: */level1/level2/...*. The number of levels must be at least 1, and the name cannot be empty. A rack can contain letters, digits, and underscores (\_) and cannot exceed 200 characters.  
For example, */default/rack0*.
- If the hosts in the rack to be modified contain DataNode instances, ensure that the rack name levels of the hosts where all DataNode instances reside are the same. Otherwise, the configuration fails to be delivered.

**Step 5** Click **OK**.

----End

## 6.6.5 Scaling Up Master Node Specifications in an MRS Cluster

As users' increasing services lead to Core node scale-out and high CPU usage, Master node specifications cannot meet user requirements and need to be scaled up. This section describes how to scale up Master node specifications.

### Prerequisites

- You have checked whether the Host Security Service (HSS) is enabled. If HSS is enabled, disable the HSS monitoring on the MRS cluster before you scale up master node specifications.
- Ensure that sufficient specification resources are available throughout the steps in [Scaling Up Master Node Specifications \(Step-by-Step Upgrade\)](#).

### Use Restrictions

- Master nodes can be scaled up for clusters with two or more master nodes.
- The specifications of the Master node in a BMS cluster cannot be upgraded.
- For MRS 1.8.2 or later to a version earlier than MRS 3.x or MRS 3.1.0 or later, see [Scaling Up Master Node Specifications \(One-Click Upgrade\)](#).
- For MRS 3.0.5 and a version earlier than MRS 1.8.2, see [Scaling Up Master Node Specifications \(Step-by-Step Upgrade\)](#).
- Do not perform other operations on the cluster during the scale-up.
- It is best to scale up the Master node specifications during off-peak hours to prevent any service interruptions.

## Scaling Up Master Node Specifications (One-Click Upgrade)

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the **Nodes** tab page, select **Scale Up Specifications** in the **Operation** column of the Master node group. The **Scale Up Master Node Specifications** page is displayed.

**Step 4** Select the target specifications and click **Submit Order**. The order has been submitted successfully.

The node specification scale-up takes some time. After the scale-up is successful, the cluster status changes to **Running**.

 **NOTE**

- The VM to be scaled up is automatically stopped during the scale-up and started after the scale-up is complete.
- The scale-up does not automatically upgrade the memory of components due to different component usage requirements. You can adjust the memory of components as needed.

----End

## Scaling Up Master Node Specifications (Step-by-Step Upgrade)

### Preparing for Scaling Up Master Node Specifications

**Step 1** Log in to the MRS console.

**Step 2** In the navigation pane on the left, choose **Active Clusters**, select the cluster for which you want to scale up Master node specifications, and click its name to switch to the cluster details page.

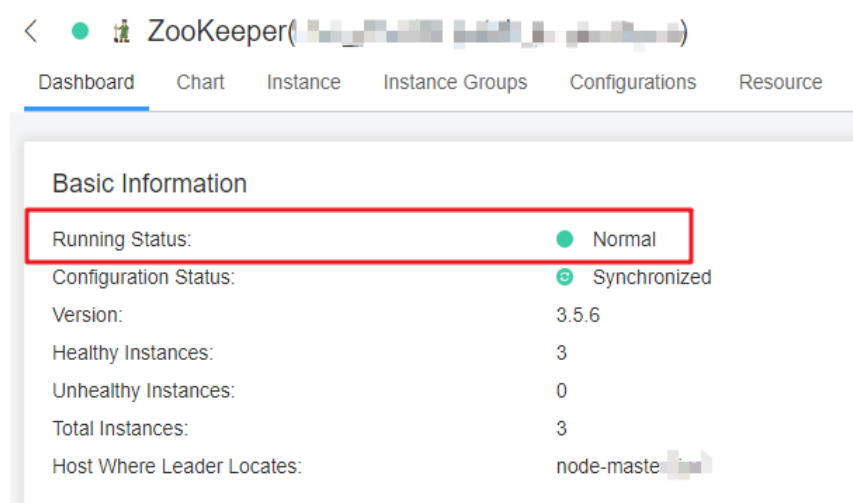

**Step 3** Ensure that the cluster status is **Running**.

**Step 4** On the **Nodes** tab page, ensure that all nodes in the cluster are in the **Running** state.

**Step 5** Log in to Manager and go to the cluster management page. For details, see [Accessing MRS Manager](#).

**Step 6** Choose **Cluster > Services > ZooKeeper > Dashboard** and ensure that **Running Status** of the ZooKeeper service is **Normal**.

**Figure 6-40** ZooKeeper service status

**Step 7** Update service parameter settings as required. For details, see [Modifying the Configuration Parameters of an MRS Cluster Component](#).

 **NOTE**

You need to perform this step only once before scaling up the standby Master node.

**Step 8** Choose **Cluster > Services > HDFS > Instance**.

**Step 9** Record the business IP address of **NameNode (Standby)**. When upgrading the specifications of the active Master node, record the business IP address of **NameNode (Active)**. **Figure 6-41** shows the location of the business IP address.

**Figure 6-41** Business IP address of the NameNode

| Role                        | Running Status | Configuration Status | Host Name       | Management IP Address | Service IP Address | Rack              | Instance Group   |
|-----------------------------|----------------|----------------------|-----------------|-----------------------|--------------------|-------------------|------------------|
| Zkfc                        | Normal         | Synchronized         | node-master2e0f | 192.168.1.100         | 192.168.1.100      | /default rack5501 | Zkfc-DEFAULT     |
| Zkfc                        | Normal         | Synchronized         | node-master0y4  | 192.168.1.101         | 192.168.1.101      | /default rack5501 | Zkfc-DEFAULT     |
| NameNode (hacuster Standby) | Normal         | Synchronized         | node-master2e0f | 192.168.1.100         | 192.168.1.100      | /default rack5501 | NameNode-DEFAULT |
| NameNode (hacuster Active)  | Normal         | Synchronized         | node-master0y4  | 192.168.1.101         | 192.168.1.101      | /default rack5501 | NameNode-DEFAULT |

 **NOTE**

Only when the cluster is an analysis cluster, you can perform **Step 8** to **Step 9** to record the IP addresses of the active and standby nodes.

**Step 10** On the upper right of the Manager page, check the number next to the  icon. If the number is 0, there is no running tasks in the cluster.

**Step 11** Click **Hosts**. If the cluster is an analysis cluster, select the checkbox of the host corresponding to the business IP address of the **NameNode** recorded in **Step 9**. If the cluster is a streaming cluster, you do not need to distinguish the active and standby nodes. You only need to choose hosts for the scale-up.

**Step 12** Choose **More > Stop All Instances** and wait until all instances are stopped.

 NOTE

- When the node where Manager resides is scaled up, Manager may not be accessed due to an active/standby switchover. It is a normal phenomenon. Try to log in to Manager later. If the login fails for a long time, contact O&M personnel.
- After all roles are stopped, the following alarms may be generated. After the scale-up of Master node specifications is complete and all roles are started, the alarms are automatically cleared.
  - [ALM-12006 Node Fault](#)
  - [ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes](#)
  - [ALM-12039 Active/Standby OMS Databases Not Synchronized](#)
  - [ALM-14000 HDFS Service Unavailable](#)
  - [ALM-14010 NameService Service Is Abnormal](#)
  - [ALM-14012 JournalNode Is Out of Synchronization](#)
  - [ALM-16004 Hive Service Unavailable](#)
  - [ALM-18000 Yarn Service Unavailable](#)
  - [ALM-19000 HBase Service Unavailable](#)
  - [ALM-20002 Hue Service Unavailable](#)
  - [ALM-27001 DBService Service Unavailable](#)
  - [ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes](#)
  - [ALM-27004 Data Inconsistency Between Active and Standby DBServices](#)
  - [ALM-43001 Spark2x Service Unavailable](#)

----End

### Scaling Up Master Node Specifications

**Step 1** Log in to the MRS console.

**Step 2** In the navigation pane on the left, choose **Active Clusters**, select the cluster for which you want to scale up Master node specifications, and click its name to switch to the cluster details page.

**Step 3** On the **Nodes** tab page, select **Scale Up Specifications** in the **Operation** column of the Master node group.

**Step 4** Select the target specifications and click **Next**.

 NOTE

Ensure that target specification resources are sufficient. Otherwise, the active node cannot be scaled up.

**Step 5** On the **Confirm** page that is displayed, confirm the target node specifications and fees and click **OK**.

**Step 6** Ensure that all services on the standby Master node have been stopped. For operation details, refer to [Step 1](#) to [Step 12](#) in the **Preparing for Scaling Up Master Node Specifications** part. On the **Scale Up Master Node Specifications** page, select **Are you sure you have stopped all services on the standby Master node?** and **If not all services are stopped before the scale-up, data saving failure or data damage may occur.** and click **Submit Order**.

Figure 6-43 NameNode

The screenshot shows the Hadoop Manager interface with a green navigation bar containing 'Hadoop', 'Overview', 'Datanodes', 'Datanode Volume Failures', 'Snapshot', 'Startup Progress', and 'Utilities'. The main content area is titled 'Overview' and shows details for a NameNode in a 'standby' state. A table lists the following information:

|                |                                                        |
|----------------|--------------------------------------------------------|
| Namespace:     | hacluster                                              |
| Namenode ID:   | 30                                                     |
| Started:       | 2024-09-23 10:00:00 +0800 (UTC+8)                      |
| Version:       | 3.6.7-cdh360-UB6 (rhel7)                               |
| Compiled:      | Thu Oct 28 11:00:00 +0800 2021 by jenkins from/centos7 |
| Cluster ID:    | hacluster                                              |
| Block Pool ID: | BP-12345678-123456789-123456789                        |

- Step 10** Stop all services on the active Master node by referring to [Step 1](#) to [Step 12](#) in the **Preparing for Scaling Up Master Node Specifications** part.
- Step 11** On the **Scale Up Master Node Specifications** page, select **I confirm that all services on the standby Master node have been started.** and **I confirm that all services on the active Master node have been stopped,** and click **Submit**.
- Step 12** On the **Confirm** page that is displayed, confirm again that all services on the active Master node are stopped and click **OK** to start scaling up the specifications of the active Master node.
- The node specification scale-up takes some time. Please wait. After the scale-up is successful, the cluster status changes to **Scaled-up-success**. Otherwise, contact O&M personnel.
- Step 13** Start all services and set parameters on the active Master node by referring to [Step 1](#) to [Step 11](#) in the **Operations After the Master Node Specifications Scale-up** part.
- Step 14** On the **Scale Up Master Node Specifications** page, select **Are you sure you have started all services on the active Master node?** and click **OK** to complete the scale-up.

----End

#### Operations After the Master Node Specifications Scale-up

- Step 1** Log in to Manager and go to the cluster management page. For details, see [Accessing MRS Manager](#).
- Step 2** Click **Hosts**. Check basic information about the host corresponding to the business IP address of the NameNode recorded in [Step 9](#) in the **Preparing for Scaling Up Master Node Specifications** part. If the **Running Status** is **Good** and **Disk**, **Memory**, and **CPU** have values, perform [Step 9](#). If any of the preceding conditions is not met, go to the next step.
- Step 3** Log in to the standby Master node remotely. For details, see [Logging In to an MRS Cluster Node](#).
- Step 4** Run the following command to switch to user **omm**:

```
su - omm
```

**Step 5** Run the following command to start the Agent:

```
sh /opt/Bigdata/nodeagent/bin/start-agent.sh
```

**Step 6** Run the following command to check whether the Agent is started successfully:

```
jps | grep NodeAgent
```

**Step 7** Log in to Manager and go to the cluster management page. For details, see [Accessing MRS Manager](#).

**Step 8** Click **Hosts**. Check basic information about the host corresponding to the business IP address of the NameNode recorded in [Step 9](#) in the **Preparing for Scaling Up Master Node Specifications** part to ensure that **Running Status** is **Good** and **Disk, Memory**, and **CPU** have values.

 **NOTE**

It may take 3 minutes until the host status is normal after the Agent is started successfully. Please wait. If the host status is abnormal for a long time, contact O&M personnel.

**Step 9** On the Manager page, click **Hosts** and select the checkbox of the host corresponding to the business IP address of the NameNode recorded in [Step 9](#) in the **Preparing for Scaling Up Master Node Specifications** part.

**Step 10** Choose **More > Start All Instances** and wait until all instances are started.

**Step 11** Access the NameNode web UI and check the NameNode startup status.

1. On FusionInsight Manager, choose **Cluster > Services > HDFS > Dashboard**.
2. In the **HDFS Summary** column, click **NameNode** of the active or standby node that has been scaled up on the right of **NameNode Web UI**.
3. Go to the **NameNode Web UI** page, choose **Startup Progress** in the navigation bar. After ensuring that **Percent Complete** is displayed as 100%, go to the next step, as shown in [Figure 6-44](#).

**Figure 6-44** NameNode startup status

 **NOTE**

Perform [Step 11](#) for an analysis cluster and skip this step for a streaming cluster.

----End

## 6.6.6 Synchronizing Disk Information of an MRS Cluster Node

If the information displayed on the console is not the actual disk information or "Data disk: -- (Synchronize disk information)" is displayed in the node list, you can use this function to update disk information.

To obtain the latest EVS disk status, you need to synchronize disk information on the MRS console. This function updates the disk information in the cluster.

## Constraints

- Only cloud disk information can be synchronized.
- If disk information is being synchronized, the cluster cannot be scaled or upgraded.

## Synchronizing Disk Information

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS details page, click **Nodes**.

**Step 4** Click **Synchronize Disk Info**.

Wait until "Disk information synchronization request issued successfully." is displayed in the upper right corner of the page.

----End

## 6.6.7 Adding a Tag to an MRS Cluster/Node

Tags are used to identify clusters/nodes. Adding tags to clusters/nodes can help you identify and manage your resources.

- **Cluster tags:** You can add up to 20 tags to a cluster during cluster creation or add them on the details page of a created cluster. Updating a cluster tag will synchronize the tag to all nodes in the cluster.
- **Node tags:** You can use the default tag or add tags to nodes in an MRS cluster when you configure an auto scaling policy. Node tags take the tag quotas. You can view the tags of a node in the **Nodes** tab on MRS console.
- **Default tags:** An MRS cluster contains multiple nodes, and each node is an ECS and contains EVS disks. After the default tag is enabled, the system automatically creates a cluster tag and a tag for each node. The default tag is automatically synchronized to the corresponding ECS or EVS instances.

To view node tags, go to the **Nodes** tab on the MRS console, and move the cursor to the tag icon of a node in the node list.

### NOTE

- MRS tag updates are synchronized to the ECSs or EVS disks in the cluster. However, if you modify MRS cluster tags on the ECS or EVS console, the modification will not be synchronized to MRS. To ensure tag consistency, do not modify MRS cluster tags on the ECS or EVS console.
- You can add a maximum of 20 tags to a cluster. If the number of tags of a node in the cluster reaches the upper limit, no more tags can be added to the cluster.
- If default tags are enabled, a default tag is added to the cluster and each node, which takes two quotas. That is, a maximum of 20 tags can be added by default. In this case, a maximum of 18 more tags can still be added.

If your organization has configured tag strategies for MRS, add tags to clusters/nodes based on the strategies. If a tag does not comply with the tag strategies, the cluster/node may be failed to be created. Contact the organization administrator to learn more about the tag strategies.

A tag consists of a tag key and a tag value. [Table 6-30](#) provides tag key and value requirements.

**Table 6-30** Tag key and value requirements

| Parameter | Requirement                                                                                                                                                                                                                                       | Example      |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| Key       | <p>A tag key cannot be left blank.</p> <p>A tag key must be unique in a cluster.</p> <p>A tag key can contain a maximum of 128 characters.</p> <p>A tag value cannot contain special characters (=*&lt;&gt;\, /) or start or end with spaces.</p> | Organization |
| Value     | <p>A tag value can contain a maximum of 255 characters.</p> <p>A tag value cannot contain special characters (=*&lt;&gt;\, /) or start or end with spaces. This parameter can be left blank.</p>                                                  | Apache       |

## Adding Tags to a Cluster

- Adding cluster tags during cluster creation
  - a. Log in to the MRS console.
  - b. Click **Buy Cluster**. The page for buying a cluster is displayed.
  - c. Click the **Custom Config** tab.
  - d. Configure the cluster software and hardware by referring to [Manually Buying an MRS Cluster](#).
  - e. Select **Configure** on the right of **Set Advanced Options** and enter the key and value of a new tag.

**Figure 6-45** Adding a tag to a cluster

- Adding tags to an existing cluster
  - a. Log in to the MRS console.
  - b. On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
  - c. Click the **Tags** tab.
  - d. Click **Add/Edit Tag**. If this is your first time adding a tag, click **Add Tag**. In the displayed dialog box, enter the key and value of a tag, and click **Add**.

**Figure 6-46** Adding/Editing a Tag

**Add/Edit Tag** ×

It is recommended that you use TMS's predefined tag function to add the same tag to different cloud resources. [View predefined tags](#) 

To add a tag, enter a tag key and a tag value below.

10 tags available for addition.

 **NOTE**

You can also add cluster tags by enabling default tags. All nodes will be tagged with the cluster ID and node IDs, which takes two quotas.

- e. Click **OK**.

## Adding Tags to a Node

- Node tags are automatically added when a default tag is added to a cluster. For details, see [Adding tags to an existing cluster](#).
- Adding node tags for auto scaling

If you add a tag when configuring an auto scaling policy, MRS automatically adds the tag to the new nodes and synchronizes the tag to the ECSs and EVS disks.

  - a. Log in to the MRS console.
  - b. On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
  - c. On the page that is displayed, click the **Auto Scaling** tab.

- d. Click **Edit** on the right of an existing auto scaling policy. In the displayed dialog box, enter the key and value of the tag you want to add, and click **Add**.

 **NOTE**

- You need to enable the auto scaling policy and configure scale-out rules. Otherwise, the node tags will not take effect.
  - If tag quotas are insufficient, delete the cluster tag or modify existing a tag of the auto scaling policy, and then enable the policy.
  - Tags cannot be added to auto scaling policies of resource pools.
- e. Click **OK**.

## Searching for Target Clusters by Tags

On the **Active Clusters** page, search for the target cluster by tag key or tag value.

1. Log in to the MRS console.
2. In the upper right corner of the **Active Clusters** page, click **Search by Tag** to access the search page.
3. Enter the tag of the cluster to be searched.

You can select a tag key or tag value from their drop-down lists. When the tag key or tag value is exactly matched, the system can automatically locate the target cluster. If you enter multiple tags, their intersections are used to search for the cluster.

4. Click **Search**.

The system searches for the target cluster by tag key or value.

## Managing Tags

You can view, add, and delete tags on the **Tags** tab page of the cluster.

1. Log in to the MRS console.
2. On the **Active Clusters** page, click the name of a cluster for which you want to manage tags.

The cluster details page is displayed.

3. Click the **Tags** tab and view, add, and delete tags on the tab page.

- View

On the **Tags** tab page, you can view details about tags of the cluster, including the number of tags and the key and value of each tag.

- Add

Click **Add/Edit Tag**. If this is your first time adding a tag, click **Add Tag**. In the displayed dialog box, enter the key and value of a tag, and click **OK**.

- Delete

Locate the row that contains the tag you want to delete and click **Delete** in the **Operation** column. In the displayed **Delete Tag** dialog box, enter **DELETE**, and click **Yes**.

## 6.6.8 Configuring Bootstrap Actions for an MRS Cluster Node

### 6.6.8.1 MRS Bootstrap Action Overview

You can run bootstrap actions to install additional third-party software, modify the cluster running environment, and perform other customizations.

Bootstrap actions can execute scripts on specified nodes before or after the first startup of cluster components. You can only manually run the third-party component installation script on the node to install a running cluster component.

If you choose to run bootstrap actions when scaling out a cluster, the bootstrap actions will be run on the newly added nodes in the same way. If auto scaling is enabled in a cluster, you can add an automation script in addition to configuring a resource plan. Then the automation script executes the corresponding script on the nodes that are scaled out or in to implement custom operations.

#### NOTE

- MRS 2.x and earlier versions: Bootstrap action scripts must be executed as user **root**. Otherwise, your cluster may become unavailable. You can run the **su - xxx** command to switch users in the script.
- MRS 3.x or later: Bootstrap action scripts must be executed as user **omm**. Otherwise, your cluster may become unavailable. You can run the **su - xxx** command to switch users in the script.

MRS determines the result based on the return code after the execution of the bootstrap action script. If the return code is **0**, the script is executed. If the return code is not **0**, the execution fails. If a bootstrap action script fails to be executed on a node, the corresponding boot script will fail to be executed. In this case, you can set **Action upon Failure** to choose whether to continue to execute the subsequent scripts.

- Example 1: If you set **Action upon Failure** to **Continue** for all scripts during cluster creation, all the scripts will be executed regardless of whether they are successfully executed, and the startup process will be complete.
- Example 2: If a script fails to be executed and **Action upon Failure** is set to **Stop**, subsequent scripts will not be executed and cluster creation or scale-out will fail.

You can add a maximum of 18 bootstrap actions, which will be executed before or after the cluster component is started in the order you specified. The bootstrap actions performed before or after the component startup must be completed within 60 minutes. Otherwise, the cluster creation or scale-out will fail.

### 6.6.8.2 Preparing the Bootstrap Action Script for an MRS Node

Currently, bootstrap actions support Linux shell scripts only. Script files must end with **.sh**.

Follow these steps to prepare the bootstrap action script for the MRS node:

- Step 1** Upload the required installation packages to the OBS file system.

Before compiling a script, you need to upload all required installation packages, configuration packages, and relevant files to the OBS file system in the same region.

Different regions are isolated from each other. Therefore, MRS VMs cannot download OBS files from other regions.

**Step 2** Use a script for downloading files from the OBS file system.

You can specify the file to be downloaded from OBS in the script. To upload a file to a private file system, you need to use **hadoop fs** to download the file.

To download the **myfile.tar.gz** file from the **obs://yourbucket/** directory to your local host and decompress it to the **/your-dir** directory, run the following commands:

```
source /opt/Bigdata/client/bigdata_env;hadoop fs -D fs.obs.endpoint=<obs-
endpoint> -D fs.obs.access.key=<your-ak> -D fs.obs.secret.key=<your-sk> -
copyToLocal obs://yourbucket/myfile.tar.gz ./
```

```
mkdir -p /<your-dir>
```

```
tar -zxvf myfile.tar.gz -C /<your-dir>
```

#### NOTE

- **/opt/Bigdata/client** indicates the client path. Change it based on the site requirements.
- The Hadoop client has been preinstalled on the MRS node. You can run the **hadoop fs** command to download or upload data from or to OBS.
- Obtain the obs-endpoint of each region. For details, see [Regions and Endpoints](#).
- Commands carrying authentication passwords pose security risks. Disable historical command recording before running such commands to prevent information leakage.

**Step 3** Upload the script to the OBS file system.

After script compilation, upload the script to the OBS file system in the same region. At the time you specify, each node in the cluster downloads the script from OBS and executes it as user **root**.

----End

### 6.6.8.3 Adding MRS Node Bootstrap Actions and Installing Third-Party Software

#### Prerequisites

You have prepared the bootstrap action script by referring to [Preparing the Bootstrap Action Script for an MRS Node](#).

#### Adding a Bootstrap Action When Creating a Cluster

**Step 1** Go to the [Buy Cluster](#) page.

**Step 2** Click **Custom Config**.

**Step 3** Configure the cluster software and hardware by referring to [Manually Buying an MRS Cluster](#).

**Step 4** In the **Set Advanced Options** area, select **Configure** and click **Add** in the **Bootstrap Action** area.

**Table 6-31** Parameter description

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                | Name of a bootstrap action script<br>The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space.<br>The value can contain 1 to 64 characters.<br><b>NOTE</b><br>A name must be unique in the same cluster. You can set the same name for different clusters.                                                                                                                        |
| Script Path         | Script path. The value can be an OBS file system path or a local VM path. <ul style="list-style-type: none"><li>• An OBS file system path must start with <b>obs://</b> and end with <b>.sh</b>, for example, <b>obs://mrs-samples/xxx.sh</b>.</li><li>• A local VM path must start with a slash (/) and end with <b>.sh</b>.</li></ul> <b>NOTE</b><br>A path must be unique in the same cluster, but can be the same for different clusters. |
| Parameter           | Bootstrap action script parameters                                                                                                                                                                                                                                                                                                                                                                                                            |
| Execution Node      | Select a type of the node where the bootstrap action script is executed.                                                                                                                                                                                                                                                                                                                                                                      |
| Executed            | Select the time when the bootstrap action script is executed. <ul style="list-style-type: none"><li>• Before initial component start</li><li>• After initial component start</li></ul> <b>NOTE</b><br>You can only manually run the third-party component installation script on the node to install a running cluster component.                                                                                                             |
| Action upon Failure | Whether to continue to execute subsequent scripts and create a cluster after the script fails to be executed.<br><b>NOTE</b><br>You are advised to set this parameter to <b>Continue</b> in the debugging phase so that the cluster can continue to be installed and started no matter whether the bootstrap action is successful.                                                                                                            |
| Run as root         | Whether to escalate the permission to user <b>root</b><br>If the bootstrap action requires root user operations, enable this function, or the bootstrap action may fail to execute.<br><b>NOTE</b><br>This parameter applies only to clusters of MRS 3.1.5, MRS 3.3.0, and later versions.                                                                                                                                                    |

**Step 5** Click **OK**.

After the bootstrap action is added, you can edit, clone, or delete it in the **Operation** column.

----End

## Adding a Bootstrap Action to an Existing Cluster

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the page that is displayed, click the **Bootstrap Actions** tab.

**Step 4** Click **Add** and set parameters as prompted.

**Figure 6-47** Add Bootstrap Action

| Parameter           | Bootstrap action script parameters                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Execution Node      | Select a type of the node where the bootstrap action script is executed.                                                                                                                                                                                                                                                                                                                                                                                        |
| Executed            | <p>Select the time when the bootstrap action script is executed.</p> <ul style="list-style-type: none"> <li>• Before initial component start</li> <li>• After initial component start</li> </ul> <p><b>NOTE</b><br/>You can only manually run the third-party component installation script on the node to install a running cluster component.</p>                                                                                                             |
| Action upon Failure | <p>Whether to continue to execute subsequent scripts and create a cluster after the script fails to be executed.</p> <p><b>NOTE</b><br/>You are advised to set this parameter to <b>Continue</b> in the debugging phase so that the cluster can continue to be installed and started no matter whether the bootstrap action is successful.</p>                                                                                                                  |
| Run as root         | <p>Whether to escalate the permission to user <b>root</b></p> <p>If the bootstrap action requires root user operations, enable this function, or the bootstrap action may fail to execute.</p> <p><b>NOTE</b><br/>This parameter applies only to clusters of MRS 3.1.5, MRS 3.3.0, and later versions.</p>                                                                                                                                                      |

**Step 5** Click **OK** to save the configuration.

**Step 6** Click **Yes**. After a bootstrap action is added, you can modify or delete it in the bootstrap action list.

----End

## Adding an Automatic Script for Auto Scaling Nodes

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** Click **Auto Scaling**.

**Step 4** Click **Configure Automation Script**.

**Step 5** Click **Add**. Set parameters by referring to [Table 6-32](#).

**Step 6** Click **OK** to save the automation script configurations.

----End

### 6.6.8.4 Viewing the Bootstrap Action Execution Records of an MRS Node

You can view the execution result of the bootstrap operation on the **Bootstrap Action** page.

## Viewing the Execution Result

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the cluster details page, click **Bootstrap Action**. Information about the bootstrap actions added during cluster creation is displayed.

**Figure 6-48** Bootstrap action information

| Name                                 | Script Path                | Execution Node               | Parameter | Execution Time                | Action upon Fail. | Executed | Status  |
|--------------------------------------|----------------------------|------------------------------|-----------|-------------------------------|-------------------|----------|---------|
| <input type="checkbox"/> bootstrap_0 | s3a://bucket/program/vx.sh | Active Master/Standby Master | --        | After initial component start | Continue          | --       | PENDING |
| <input type="checkbox"/> 232-2-w2    | s3a://bucket/program/vx.sh | Active Master/Standby Master | --        | After initial component start | Continue          | --       | PENDING |

### NOTE

- You select **Before initial component start** or **After initial component start** in the upper right corner to query information about the related bootstrap actions.
- The last execution result is listed here. For a newly created cluster, the records of bootstrap actions executed during cluster creation are listed. If a cluster is expanded, the records of bootstrap actions executed on the newly added nodes are listed.

----End

## Viewing Execution Logs

If you want to view the run logs of a bootstrap action, set **Action upon Failure** to **Continue** when adding the bootstrap action. And then, log in to each node to view the run logs in the `/var/log/Bootstrap` directory.

If you add bootstrap actions before and after component start, you can distinguish bootstrap action logs of the two phases based on the timestamps.

You are advised to print logs in detail in the script so that you can view the detailed run result. MRS redirects the standard output and error output of the script to the log directory of the bootstrap action.

## 6.7 Managing the MRS Cluster Client

### 6.7.1 Updating the MRS Cluster Client After the Server Configuration Expires

An MRS cluster provides a client for you to connect to a server, view task results, or manage data. If you modify service configuration parameters on Manager and restart the service, you need to download and install the client again or use the configuration file to update the client.

For clusters of MRS 2.x or earlier, the original client is stored in the `/opt/client` directory of all nodes in the cluster by default when you create a cluster. After the cluster is created, only the client of a Master node can be directly used. To use the client of a Core node, you need to update the client configuration file first.

### Updating Client Configurations (Version 3.x or Later)

#### Method 1

**Step 1** Log in to MRS Manager by referring to [Accessing MRS Manager](#). Choose **Cluster > Overview > More > Download Client**.

**Step 2** Choose **More > Download Client > Configuration Files Only**.

The generated compressed file contains the configuration files of all services.

**Figure 6-49** Downloading the client configuration file

## Download Cluster Client

Download the **MRS Cluster** client. The cluster client provides all services.

Select Client Type:  Complete Client  Configuration Files Only

Select Platform Type:  x86\_64  aarch64

Save to Path :  ?

- Step 3** Determine whether to generate a configuration file on the cluster node.
- If yes, select **Save to Path**, and click **OK** to generate the client file. By default, the client file is generated in **/tmp/FusionInsight-Client** on the active management node. You can also store the client file in other directories, and user **omm** has the read, write, and execute permissions on the directories. Then go to **Step 4**.
  - If no, click **OK**, specify a local save path, and download the complete client. Wait until the download is complete and go to **Step 4**.
- Step 4** Use WinSCP to save the compressed file to the client installation directory, for example, **/opt/hadoopclient**, as the client installation user.
- Step 5** Decompress the software package.
- Run the following commands to go to the directory where the client is installed, and decompress the file to a local directory. For example, the downloaded client file is **FusionInsight\_Cluster\_1\_Services\_Client.tar**.
- ```
cd /opt/hadoopclient
tar -xvf FusionInsight_Cluster_1_Services_Client.tar
```
- Step 6** Verify the software package.
- Run the following command to verify the decompressed file and check whether the command output is consistent with the information in the **sha256** file.
- ```
sha256sum -c
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar.sha256
```
- FusionInsight\_Cluster\_1\_Services\_ClientConfig\_ConfigFiles.tar: OK
- Step 7** Decompress the package to obtain the configuration file.
- ```
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar
```
- Step 8** Run the following command in the client installation directory to update the client using the configuration file:
- ```
sh refreshConfig.sh Client installation directory Directory where the configuration file is located
```

For example, run the following command:

```
sh refreshConfig.sh /opt/hadoopclient /opt/hadoopclient/
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles
```

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

----End

#### Method 2:

- Step 1** Log in to the client installation node as user **root**.
- Step 2** Go to the client installation directory, for example, **/opt/hadoopclient** and run the following commands to update the configuration file:

```
cd /opt/hadoopclient
sh autoRefreshConfig.sh
```

- Step 3** Enter the username and password of the FusionInsight Manager administrator and the floating IP address of OMS.

#### NOTE

To obtain the floating IP address of OMS, log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of OMS. Record the value of **inet**. If the floating IP address of OMS cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the IP address on the Master node.

- Step 4** Enter the names of the components whose configuration needs to be updated. Use commas (,) to separate the component names. Press **Enter** to update the configurations of all components if necessary.

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

----End

## Updating Client Configurations (Version 2.x or Earlier)

### Method 1 (applicable to all versions)

- Step 1** Log in to MRS Manager and choose **Services**.
- Step 2** Click **Download Client**.

Set **Client Type** to **Only configuration files**, **Download To** to **Server**, and click **OK** to generate the client configuration file. The generated file is saved in the **/tmp/MRS-client** directory on the active management node by default. You can customize the file path.

**Figure 6-50** Downloading the client configuration file

## Download Client

Warning: Generating a client will occupy a large number of disk I/Os. You are advised not to download a client when the cluster is being installed, started, and patched, or in other unstable states.

\* Client Type  All client files  Only configuration files

\* Download To  Server  Remote host

Files will only be saved to the following path on the server. Existing client files in the path will be overwritten.

\* Client Path

OK

Cancel

**Step 3** Query and log in to the active Master node.

**Step 4** If you use the client in the cluster, run the following command to switch to user **omm**. If you use the client outside the cluster, switch to user **root**.

```
sudo su - omm
```

**Step 5** Go to the client directory.

```
cd Client installation directory
```

**Step 6** Update client configurations.

```
sh refreshConfig.sh Client installation directoryFull path of the client configuration file package
```

Example:

```
sh refreshConfig.sh /opt/Bigdata/client /tmp/MRS-client/
MRS_Services_Client.tar
```

If the following information is displayed, the configurations have been updated successfully.

```
ReFresh components client config is complete.
Succeed to refresh components client config.
```

----End

### Method 2:

**Step 1** After the cluster is installed, run the following command to switch to user **omm**. If you use the client outside the cluster, switch to user **root**.

```
sudo su - omm
```

**Step 2** Go to the client directory.

```
cd Client installation directory
```

**Step 3** Run the following command and enter the name of an MRS Manager user with the download permission and its password (for example, the username is **admin** and the password is the one set during cluster creation) as prompted to update client configurations.

```
sh autoRefreshConfig.sh
```

**Step 4** After the command is executed, the following information is displayed, where *XXX* indicates the name of the component installed in the cluster. To update client configurations of all components, press **Enter**. To update client configurations of some components, enter the component names and separate them with commas (,).

Components "xxx" have been installed in the cluster. Please input the comma-separated names of the components for which you want to update client configurations. If you press Enter without inputting any component name, the client configurations of all components will be updated:

If the following information is displayed, the configurations have been updated:

```
Succeed to refresh components client config.
```

If the following information is displayed, the username or password is incorrect.

```
login manager failed,Incorrect username or password.
```

#### NOTE

- This script automatically connects to the cluster and invokes the **refreshConfig.sh** script to download and update the client configuration file.
- By default, the client uses the floating IP address specified by **wsom=xxx** in the **Version** file in the installation directory to update the client configurations. To update the configuration file of another cluster, modify the value of **wsom=xxx** in the **Version** file to the floating IP address of the corresponding cluster before performing this step.

----End

## 6.7.2 Viewing the Installed MRS Cluster Client

FusionInsight Manager supports unified management of cluster client installation information. After a user downloads and installs a client, FusionInsight Manager automatically records information about the installed (registered) client to facilitate query and management.

In addition, you can manually add or modify the information about clients that are not automatically registered, for example, clients installed in earlier versions.

#### NOTE

This section applies only to MRS 3.x or later.

### Viewing the Installed Cluster Client

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** and choose **Client Management** to view information about clients installed in the cluster.

You can view the IP address, installation path, component list, registration time, and installation user of the node where the client is located.

When the client is downloaded and installed in the cluster of the latest version, the client information is automatically registered.

**Figure 6-51** Client information

Client Management

The screenshot shows the 'Client Management' page with a table of registered clients. The table has columns for IP Address, Installation Path, Component, Registration Date, User, Platform Type, Version, Registration Method, and Operation. A single client is listed with the path /opt/client, registered on Sep 29, 2021, by user root, on an x86\_64 platform, with an automatic registration method. The interface includes buttons for 'Add', 'Export All', and 'Batch Delete', along with an 'Advanced Search' dropdown and refresh/refresh icons.

| IP Address | Installation ... | Component... | Registration...  | User | Platform Type | Version | Registration M... | Operation     |
|------------|------------------|--------------|------------------|------|---------------|---------|-------------------|---------------|
|            | /opt/client      |              | Sep 29, 2021 ... | root | x86_64        |         | Automatic         | Delete Modify |

- Step 3** To manually add information about an installed client, click **Add** and manually add the IP address, installation path, user, platform information, and registration information of the client as prompted.

Configure the client information and click **OK**.

You can also manually modify or delete the information about the manually registered client.

- Step 4** On the **Client Management** page, click **Export All** to export information about all registered clients to the local PC.

 **NOTE**

On the **Client Management** page, only components that have clients are displayed in the component list. Therefore, some components that do not have clients and have special components are not displayed.

----End

## 6.7.3 Batch Upgrading MRS Cluster Clients

The client package downloaded from FusionInsight Manager contains the client batch upgrade tool. When multiple clients need to be upgraded after the cluster upgrade or scale-out, you can use this tool to upgrade the clients in batches with a few clicks. In addition to upgrading clients in batches, this tool also provides the lightweight function of updating the `/etc/hosts` files on the nodes where the clients are located in batches.

 **NOTE**

This section applies only to MRS 3.x or later.

### Preparing for the Batch Upgrade

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster > Overview > More > Download Client** (for MRS 3.3.0 or later, click **Download Client** on the **Homepage** page) to download the client to a specified directory on the server.

For details, see [Installing an MRS Cluster Client](#).

Decompress the downloaded client package and find the **batch\_upgrade** directory, for example, `/tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_ClientConfig/batch_upgrade`.

- Step 3** Choose **Cluster > Client Management**. On the **Client Management** page, click **Export All** to export all client information to the local PC.
- Step 4** Decompress the exported client information and upload the **client-info.cfg** file to the **batch\_upgrade** directory.
- Step 5** Perform the following operations to supplement the missing passwords in the **client-info.cfg** file:

Run the **vi client-info.cfg** command to add a user password.

Example:

```
clientIp,clientPath,user,password
10.10.10.100,/home/omm/client /home/omm/client2,omm,Password
```

The fields in the configuration file are as follows:

- **clientIp**: indicates the IP address of the node where the client is located.
- **clientPath**: indicates the client installation path. Multiple paths are separated by spaces. Note that the path cannot end with a slash (/).
- **user**: indicates the username of the node.
- **password**: indicates the user password of the node.

 **NOTE**

- If the execution fails, view the **node.log** file in the **work\_space/log\_XXX** directory.
- There can be security risks if a configuration file contains the authentication password. You are advised to delete the configuration file or use other secure methods to keep the password.

----End

## Procedure

- Step 1** Log in to the client download node as the user who wants to install the client.
- Step 2** Perform the upgrade.

```
sh client_batch_upgrade.sh -u -f /tmp/FusionInsight-Client/
FusionInsight_Cluster_1_Services_Client.tar -g /tmp/FusionInsight-Client/
FusionInsight_Cluster_1_Services_ClientConfig/batch_upgrade/client-info.cfg
```

---

**NOTICE**

You are advised to delete the **client-info.cfg** file as soon as possible after the upgrade because the password has been configured.

---

- Step 3** After the upgrade is complete, verify the upgrade result by running the **sh client\_batch\_upgrade.sh -c** command.
- Step 4** If the client is faulty, run the **sh client\_batch\_upgrade.sh -s** command to roll back the client.

 NOTE

- The client batch upgrade tool moves the original client to the backup directory, and then uses the client package specified by the **-f** parameter to install the client. Therefore, if the original client contains customized content, manually save the customized content from the backup directory or move the customized content to the client directory after the upgrade before running the **-c** command. The backup path on the client is *{Original client path}-backup*.
- The **-u** command is the prerequisite for the **-c** and **-s** commands. You can run the **-c** command to commit the upgrade or the **-s** command to perform a rollback only after the **-u** command is executed to perform an upgrade.
- You can run the **-u** command multiple times to upgrade only the clients that fail to be upgraded.
- The client batch upgrade tool also supports the clients of earlier versions.
- When upgrading a client installed by a non-root user, ensure that the user has the read and write permissions on the directory where the client is located and the parent directory on the target node. Otherwise, the upgrade will fail.
- The client package specified by the **-f** parameter must be a full client package. The client packages of a single component or some components cannot be used as the input.

----End

## Updating the hosts Files in Batches

**Step 1** Complete all preparations by referring to [Preparing for the Batch Upgrade](#).

**Step 2** Check whether the user configured for the node where the **/etc/hosts** files need to be updated is **root**.

- If yes, go to [Step 3](#).
- If no, change the user to **root** and go to [Step 3](#).

**Step 3** Update the **/etc/hosts** files on the nodes where the client is located in batches.

```
sh client_batch_upgrade.sh -r -f /tmp/FusionInsight-Client/
FusionInsight_Cluster_1_Services_Client.tar -g /tmp/FusionInsight-Client/
FusionInsight_Cluster_1_Services_ClientConfig/batch_upgrade/client-info.cfg
```

 NOTE

- When you batch update the **/etc/hosts** files, the entered client package can be a complete client package or a client package that contains only configuration files (recommended).
- The user configured for the host where the **/etc/hosts** files need to be updated must be **root**. Otherwise, the update fails.

----End

## 6.8 Managing MRS Cluster Jobs

### 6.8.1 Stopping and Deleting an MRS Cluster Job

You can manually stop a running MRS job on the console.

After a job is executed, you can delete it if you do not need to view the job information.

## Stopping an MRS Cluster Job

Spark SQL jobs cannot be stopped. After a job is stopped, its status changes to **Terminated** and the job cannot be executed again.

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** Click **Jobs**.
- Step 4** Select a running job, and choose **More > Stop** in the **Operation** column.  
The job status changes from **Running** to **Terminated**.  
----End

## Deleting an MRS Cluster Job

You can delete a single job or multiple jobs in batches. A deleted job cannot be restored. Therefore, exercise caution when deleting a job.

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** Click **Jobs**.
- Step 4** Choose **More > Delete** from the **Operation** in the row of the target job to be deleted. Enter **DELETE** in the **Delete Job** dialog box and click **OK**.  
This step deletes only a single job.
- Step 5** Select multiple jobs and click **Delete** on the upper left of the job list. Enter **DELETE** in the **Delete Job** dialog box and click **OK**.  
You can delete one, multiple, or all jobs.  
----End

## 6.8.2 Configuring Notification Rules for MRS Jobs

MRS uses SMN to offer a publish/subscribe model to achieve one-to-multiple message subscriptions and notifications in a variety of message types (SMSs and emails). You can configure job notification rules to receive notifications immediately upon a job execution success or failure.

- Step 1** Log in to the management console.
- Step 2** Click **Service List**. Under **Management & Governance**, click **Simple Message Notification**.
- Step 3** Create a topic and add subscriptions to the topic. For details, see [Configuring Notifications for MRS Cluster Alarms and Events](#).

**Step 4** Go to the MRS management console, and click the cluster name to go to the cluster details page.

**Step 5** Click the **Alarms** tab, and choose **Notification Rules > Add Notification Rule**.

**Figure 6-52** Adding a notification rule

**Step 6** Configure a notification rule for sending job execution results to subscribers.

**Table 6-33** Parameters of adding a notification rule

| Parameter            | Description                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rule Name            | User-defined notification rule name. Only digits, letters, hyphens (-), and underscores (_) are allowed.                                                                                                |
| Message Notification | If you enable this function, subscription messages will be sent to subscribers.                                                                                                                         |
| Topic Name           | Select an existing topic or click <b>Create Topic</b> to create a topic.                                                                                                                                |
| Notification Type    | Select <b>Event</b> .                                                                                                                                                                                   |
| Subscription Items   | <ol style="list-style-type: none"> <li>Click  next to <b>Suggestion</b>.</li> <li>Click  next to <b>Manager</b>.</li> <li>Select <b>Job Running Succeeded</b> and <b>Job Running Failed</b>.</li> </ol> |

----End

## 6.9 Managing MRS Cluster Tenants

### 6.9.1 Introduction to MRS Multi-Tenancy

#### Overview

- Background:**

Modern enterprises' data clusters are becoming more and more centralized and cloud-based. Enterprise-class big data clusters must meet the following requirements:

  - Carry data of different types and formats and run jobs and applications of different types (such analysis, query, and stream processing).

- Isolate data of a user from that of another user who has demanding requirements on data security, such as a bank or government institute.

The preceding requirements bring the following challenges to the big data clusters:

- Proper allocation and scheduling of resources to ensure stable operating of applications and jobs.
- Strict access control to ensure data and service security.

Multi-tenancy isolates the resources of a big data cluster into resource sets. Users can lease desired resource sets to run applications and jobs and store data. In a big data cluster, multiple resource sets can be deployed to meet diverse requirements of multiple users.

MRS provides a complete enterprise-class big data multi-tenant solution.

- **Multi-tenancy:**

An MRS cluster provides various resources and services that can be shared among organizations, departments, or applications. The cluster provides logical entities, that is, tenants, to use these resources and services. Currently, only the analysis cluster supports tenant management.

A mode involving different tenants is called multi-tenant mode. Multi-tenancy refers to multiple resource sets (a resource set is a tenant) in the MRS cluster and is able to allocate and schedule resources. The resources include computing resources and storage resources. The MRS cluster offers multi-tenancy, supporting a layered tenant model and enabling dynamic tenant creation or deletion to isolate resources. It dynamically allocates and configures compute and storage resources for each tenant.

The computing resources indicate tenants' Yarn task queue resources. The task queue quota can be modified, and the task queue usage status and statistics can be viewed.

The storage resources can be stored on HDFS. You can add and delete the HDFS storage directories of tenants, and set the quotas of file quantity and the storage space of the directories.

Tenants can create and manage tenants in a cluster based on service requirements.

- Roles, computing resources, and storage resources are automatically created when tenants are created. By default, all permissions of the new computing resources and storage resources are allocated to a tenant's roles.
- Permissions to view the current tenant's resources, add a subtenant, and manage the subtenant's resources are granted to the tenant's roles by default.
- After you have modified the tenant's computing or storage resources, permissions of the tenant's roles are automatically updated.

MRS supports a maximum of 512 tenants. The default tenants created by the system include **default**. Tenants that are in the topmost layer with the default tenant are called level-1 tenants.

- **Resource pool:**

YARN task queues support only one scheduling policy, namely label based scheduling. This policy allows YARN task queues to select NodeManagers with specific node labels, ensuring that tasks run on designated nodes and utilize

target hardware resources. For example, YARN tasks requiring a large memory capacity can run on nodes labeled as large memory resources, preventing poor service performance.

In an MRS cluster, tenants logically partition nodes to form a resource pool with multiple NodeManagers. YARN task queues can be associated with specified resource pools by configuring queue capacity policies, ensuring efficient and independent resource utilization in the resource pools.

MRS supports a maximum of 50 resource pools. The system has a **default** resource pool.

- **Advantages:**

- Proper resource configuration and isolation

The resources of a tenant are isolated from those of another tenant. The resource use of a tenant does not affect other tenants. This mechanism ensures that each tenant can configure resources based on service requirements, improving resource utilization.

- Resource consumption measurement and statistics

Tenants are system resource applicants and consumers. System resources are planned and allocated based on tenants. Resource consumption by tenants can be measured and collected.

- Assured data security and access security

In multi-tenant scenarios, the data of each tenant is stored separately to ensure data security. The access to tenants' resources is controlled to ensure access security.

## Multi-Tenant Model

- **Multi-tenant model**

The following figure shows a multi-tenant model.

Figure 6-53 Multi-tenant model

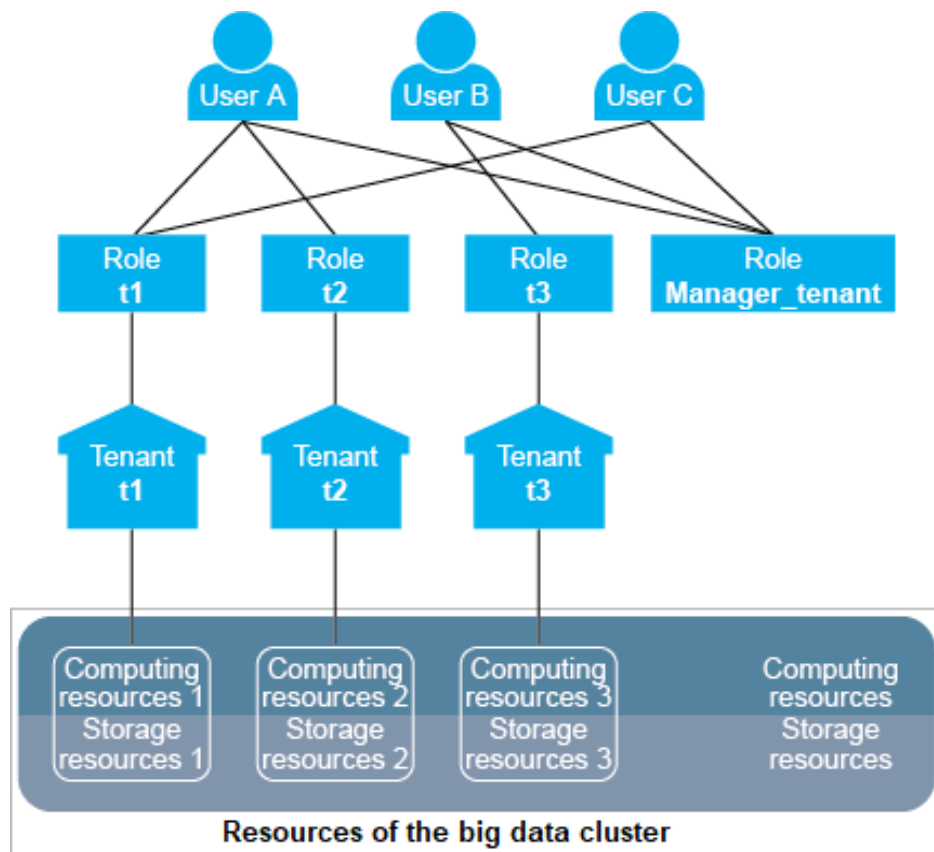

Table 6-34 describes the concepts involved in Figure 6-53.

Table 6-34 Concepts in the model

| Concept | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Users   | A natural person who has a username and password and uses the big data cluster.<br>There are three different users in the figure: users A, B, and C.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Role    | A role is a carrier of one or more permissions. Permissions are assigned to specific objects, for example, access permissions for the <code>/tenant</code> directory in HDFS.<br>There are four roles: <b>t1</b> , <b>t2</b> , <b>t3</b> , and <b>Manager_tenant</b> . <ul style="list-style-type: none"> <li>Roles <b>t1</b>, <b>t2</b>, and <b>t3</b> are automatically generated when tenants are created. The role names are the same as the tenant names. That is, roles <b>t1</b>, <b>t2</b>, and <b>t3</b> map to tenants <b>t1</b>, <b>t2</b>, and <b>t3</b>. Role names and tenant names need to be used in pair.</li> <li>Role <b>Manager_tenant</b> is defaulted in the cluster and cannot be used separately.</li> </ul> |

| Concept  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tenant   | <p>A tenant is a resource set in a big data cluster. Multiple tenants are referred to as multi-tenancy. The resource sets further divided under a tenant are called sub-tenants.</p> <p>There are three tenants: <b>t1</b>, <b>t2</b>, and <b>t3</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Resource | <ul style="list-style-type: none"> <li>• Compute resources include CPUs and memory. Compute resources are allocated to a tenant from the cluster's total resources. Each tenant's resources are isolated from others. According to the figure, compute resources 1, 2, and 3 are allocated to tenants <b>t1</b>, <b>t2</b>, and <b>t3</b> respectively from the cluster's total compute resources.</li> <li>• Storage resources include disks and third-party storage systems. Storage resources are allocated to each tenant from the cluster's total storage. Each tenant's storage is isolated from others. According to the figure, storage resources 1, 2, and 3 are allocated for tenants <b>t1</b>, <b>t2</b>, and <b>t3</b> respectively from the cluster's total storage resources.</li> </ul> |

To use a tenant's resources or add/delete sub-tenants, a user must be assigned both the tenant role and the **Manager\_tenant** role. [Table 6-35](#) lists the roles assigned to each user in [Figure 6-53](#).

**Table 6-35** Roles assigned to each user

| User   | Role                                                                                                                               | Permission                                                                                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User A | <ul style="list-style-type: none"> <li>• Role <b>t1</b></li> <li>• Role <b>t2</b></li> <li>• Role <b>Manager_tenant</b></li> </ul> | <ul style="list-style-type: none"> <li>• Uses the resources of tenants <b>t1</b> and <b>t2</b>.</li> <li>• Adds or deletes sub-tenants of tenants <b>t1</b> and <b>t2</b>.</li> </ul> |
| User B | <ul style="list-style-type: none"> <li>• Role <b>t3</b></li> <li>• Role <b>Manager_tenant</b></li> </ul>                           | <ul style="list-style-type: none"> <li>• Uses the resources of tenant <b>t3</b>.</li> <li>• Adds or deletes sub-tenants of tenant <b>t3</b>.</li> </ul>                               |
| User C | <ul style="list-style-type: none"> <li>• Role <b>t1</b></li> <li>• Role <b>Manager_tenant</b></li> </ul>                           | <ul style="list-style-type: none"> <li>• Uses the resources of tenant <b>t1</b>.</li> <li>• Adds or deletes sub-tenants of tenant <b>t1</b>.</li> </ul>                               |

A user can be assigned multiple roles, and one role can also be assigned to multiple users. Users are associated to tenants after being assigned the tenant roles. Therefore, tenants and users form a many-to-many relationship. Users can access resources across multiple tenants, and multiple users can share resources within the same tenant. For example, in [Figure 6-53](#), user A uses

the resources of tenants **t1** and **t2**, and users A and C uses the resources of tenant **t1**.

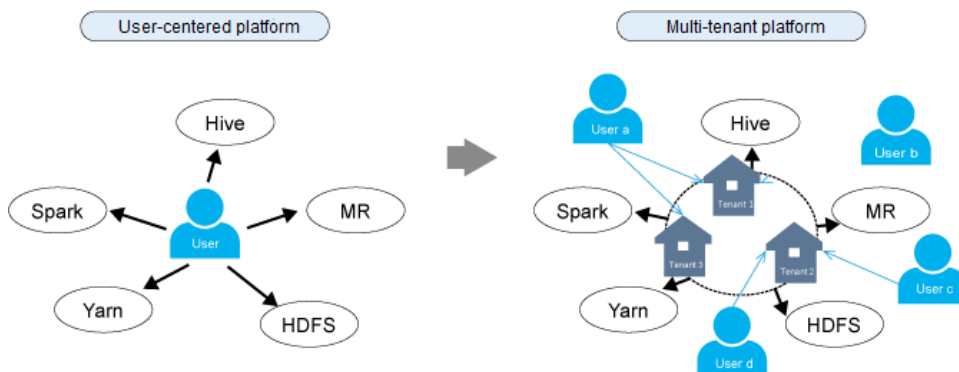

**NOTE**

The concepts of a parent tenant, sub-tenant, level-1 tenant, and level-2 tenant are all designed for the multi-tenant service scenarios. Pay attention to the differences between these concepts and the concepts of a leaf tenant resource and non-leaf tenant resource on FusionInsight Manager.

- Level-1 tenant: determined based on the tenant's level. For example, the first created tenant is a level-1 tenant and its sub-tenant is a level-2 tenant.
  - Parent tenant and sub-tenant: indicates the hierarchical relationship between tenants.
  - Non-leaf tenant resource: indicates the tenant type selected during tenant creation. This tenant type can be used to create sub-tenants.
  - Leaf tenant resource: indicates the tenant type selected during tenant creation. This tenant type cannot be used to create sub-tenants.
- **Multi-tenant platform:**

The MRS big data platform's core concept is the tenant, which enables the transition from user-centered to multi-tenant architecture to support enterprise multi-tenant applications. **Figure 6-54** shows the transformation of big data platforms.

**Figure 6-54** Platform transformation from user-centered to multi-tenant

On a user-centered big data platform, users can directly access and use all resources and services.

- However, user applications may use only partial cluster resources, resulting in low resource utilization.
- The data of different users may be stored together, decreasing data security.

On a multi-tenant big data platform, users use required resources and services by accessing the tenants.

- Resources are allocated and scheduled based on application requirements and used based on tenants, increasing resource utilization.
- Users can access the resources of tenants only after being associated with tenant roles, enhancing access security.
- The data of tenants is isolated, ensuring data security.

## Multi-Tenant Resource

MRS cluster resources are classified into compute resources and storage resources. The multi-tenant architecture implements resource isolation.

- **Compute Resources**

Compute resources include CPUs and memory. One tenant cannot occupy the compute resources of another tenant.

Compute resources are divided into static service resources and dynamic resources.

 **NOTE**

The resources allocated to YARN in a big data cluster are static service resources but can be dynamically allocated to job queues by YARN.

- **Static Service Resources**

Static service resources are compute resources allocated to each service and are not shared between services. The total compute resources of each service are fixed. These services include Flume, HBase, HDFS, and Yarn.

- **Dynamic Resources**

YARN provides distributed resource management for a big data cluster. The total volume of resources allocated to YARN can be configured. Then YARN allocates and schedules compute resources for job queues. For MapReduce, Spark, Flink, and Hive task queues, compute resources are allocated and scheduled by YARN.

YARN queues are fundamental units of scheduling compute resources.

The resources obtained by tenants using YARN queues are dynamic resources. Users can dynamically create and modify the queue quotas and view the status and statistics of the queues.

- **Resource pool:**

Enterprise IT systems often face complex cluster environments and diverse upper-layer requirements, such as the following scenarios:

- Heterogeneous cluster: The computing speed, storage capacity, and network performance of each node in the cluster are different. All the tasks of complex applications need to be properly allocated to each compute node in the cluster based on service requirements.
- Computing isolation: Data must be shared among multiple departments but computing resources must be distributed onto different compute nodes.

These require that the compute nodes be further partitioned.

Resource pools are used to specify the configuration of dynamic resources. YARN queues are associated with resource pools for resource allocation and scheduling.

One tenant can have only one default resource pool. Users can be assigned the role of a tenant to use the resources in the resource pool of the tenant. To use resources in multiple resource pools, a user can be assigned the roles of multiple tenants.

- **Dynamic resource scheduling:**

YARN dynamic resources support label-based scheduling. This policy creates labels for compute nodes (YARN NodeManagers) and adds the compute nodes with the same label into the same resource pool. Then YARN dynamically associates the queues with resource pools based on the resource requirements of the queues.

For example, a cluster has more than 40 nodes which are labeled by **Normal**, **HighCPU**, **HighMEM**, or **HighIO** based on their hardware and network configurations and added into four resource pools, respectively. [Table 6-36](#) describes the performance of each node in the resource pool.

**Table 6-36** Performance of each node in a resource pool

| Label   | Node Count | Hardware and Network Configuration | Added To        | Associated With           |
|---------|------------|------------------------------------|-----------------|---------------------------|
| Normal  | 10         | Minor                              | Resource pool A | Common queue              |
| HighCPU | 10         | High-performance CPU               | Resource pool B | Computing-intensive queue |
| HighMEM | 10         | Large memory                       | Resource pool C | Memory-intensive queue    |
| HighIO  | 10         | High-performance network           | Resource pool D | I/O-intensive queue       |

A queue can use only the compute nodes in its associated resource pool.

- A common queue is associated with resource pool A and uses **Normal** nodes with general hardware and network configurations.
- A computing-intensive queue is associated with resource pool B and uses **HighCPU** nodes with high-performance CPUs.
- A memory-intensive queue is associated with resource pool C and uses **HighMEM** nodes with large memory.
- An I/O-intensive queue is associated with resource pool C and uses **HighIO** nodes with high-performance network.

YARN queues are associated with specified resource pools to efficiently utilize resources in resource pools and maximize node performance.

FusionInsight Manager supports a maximum of 50 resource pools.  
The system has a default resource pool.

- **Storage resources**

Storage resources include disks and third-party storage systems. One tenant cannot access the data of another tenant.

As a distributed file storage service in a big data cluster, HDFS stores all the user data of the upper-layer applications in the big data cluster, including the data written to HBase tables or Hive tables.

A directory is the basic unit of allocating HDFS storage resources. HDFS supports the conventional hierarchical file structure. Users or applications can create directories and create, delete, move, or rename files in directories. Tenants can obtain storage resources from specified directories in the HDFS file system.

The storage resource scheduling mechanism is as follows:

- HDFS directories can be stored on nodes with specified labels or disks of specified hardware types.
  - When both real-time query and data analysis tasks are running in the same cluster, the real-time query tasks need to be deployed only on certain nodes, and the task data must also be stored on these nodes.
  - Based on actual service requirements, key data needs to be stored on highly reliable nodes.
- Administrators can flexibly configure HDFS data storage policies based on actual service requirements and data features to store data on specified nodes.
- For tenants, storage resources refer to the HDFS resources they use. Data of specified directories can be stored to the tenant-specified storage paths, thereby implementing storage resource scheduling and ensuring data isolation between tenants.
- Users can add or delete HDFS storage directories of tenants and set the file quantity quota and storage capacity quota of directories to manage storage resources.

## Schedulers

Multi-tenant schedulers are classified into the open-source Capacity scheduler and enhanced Superior scheduler. By default, the Superior scheduler is enabled for the MRS cluster.

- The Capacity scheduler is an open-source scheduler.
- The Superior scheduler is an enhanced version and named after the Lake Superior, indicating that the scheduler can manage a large amount of data.

### NOTE

You can check the scheduler type of YARN from the `yarn.resourcemanager.scheduler.class` value. For details about how to switch the scheduler, see [Switching the MRS Tenant Resource Scheduler](#).

To meet enterprise requirements and tackle scheduling challenges faced by the YARN community, the Superior scheduler makes the following enhancements in addition to inheriting the advantages of the Capacity scheduler and Fair scheduler:

- **Enhanced resource sharing policy**  
The Superior scheduler supports queue hierarchy. It integrates the functions of open-source schedulers and shares resources based on configurable policies. In terms of instances, administrators can use the Superior scheduler to configure an absolute value or percentage policy for queue resources. The resource sharing policy of the Superior scheduler enhances label-based scheduling of YARN as a resource pool feature. The nodes in the YARN cluster can be grouped based on the capacity or service type to ensure that queues can more efficiently utilize resources.
- **Tenant-based resource reservation policy**  
Some tenants may run critical tasks at some time, and their resource requirements must be preferentially addressed. The Superior scheduler builds a mechanism to support the resource reservation policy. Reserved resources can be allocated to the critical tasks running in the specified tenant queues in a timely manner to ensure proper task execution.
- **Fair sharing among tenants and resource pool users**  
The Superior scheduler allows shared resources to be configured for users in a queue. Each tenant may have users with different weights. Heavily weighted users may require more shared resources.
- **Ensured scheduling performance in a big cluster**  
The Superior scheduler receives heartbeats from each NodeManager and saves resource information in memory, which enables the scheduler to control cluster resource usage globally. The Superior scheduler uses the push scheduling model, which makes the scheduling more precise and efficient and remarkably improves cluster resource utilization. Additionally, the Superior scheduler delivers excellent performance when the interval between NodeManager heartbeats is long and prevents heartbeat storms in big clusters.
- **Priority policy**  
If the minimum resource requirement of a service cannot be met after the service obtains all available resources, a preemption occurs. The preemption function is disabled by default.

## Multi-Tenant Management

- **Unified multi-tenant management**  
Log in to the MRS console or FusionInsight Manager and click **Tenant Resources**. The displayed page integrates multiple functions such as tenant lifecycle management, tenant resource configuration, tenant service association, and tenant resource usage statistics, delivering a mature multi-tenant management model and achieving centralized tenant and service management.
  - Intuitive UI: MRS provides the graphical multi-tenant management interface and manages and operates multiple levels of tenants using the tree structure. Additionally, it integrates the basic information and resource quota of the current tenant in one interface to facilitate O&M and management, as shown in [Figure 6-55](#).

**Figure 6-55** Multi-tenant management (using Manager 3.x as an example)

- Hierarchical tenant management: MRS allows you to add sub-tenants to an existing tenant to re-configure resources. Sub-tenants of level-1 tenants are level-2 tenants. So on and so forth. FusionInsight Manager provides enterprises with a field-tested multi-tenant management model, enabling centralized tenant and service management.
- **Simplified permission management**

MRS hides internal permission management details from common users and simplifies permission management operations for administrators, improving usability and user experience of tenant permission management.

  - MRS employs role-based access control (RBAC) to configure different permissions for users based on service scenarios during multi-tenant management.
  - The administrator of tenants has tenant management permissions, including viewing resources and services of the current tenant, adding or deleting sub-tenants of the current tenant, and managing permissions of sub-tenants' resources. MRS supports setting of the administrator for a single tenant so that the management over this tenant can be delegated to a user who is not the system administrator.
  - Roles of a tenant have all permissions on the computing resources and storage resources of the tenant. When a tenant is created, the system automatically creates roles for this tenant. You can add a user and assign the tenant roles to the user so that the user can use the resources of the tenant.
- **Easy resource management**
  - Free resource configuration

You can configure the compute resources and storage resources during the creation of a tenant and add, modify, or delete the resources of the tenant.

Permissions of the roles that are granted to a tenant are updated automatically when you modify the computing or storage resources of the tenant.

– Resource usage statistics

Resource usage statistics are critical for administrators to determine O&M activities based on the status of cluster applications and services, improving the cluster O&M efficiency. MRS displays the resource statistics of tenants in **Resource Quota**, including the vCores, memory, and HDFS storage resources.

 NOTE

- The available resources of the Capacity scheduler and Superior scheduler are calculated as follows:
  - Capacity
 

Available YARN resources (memory and CPU) = Resource capacity (%) x Total capacity of the resource pool

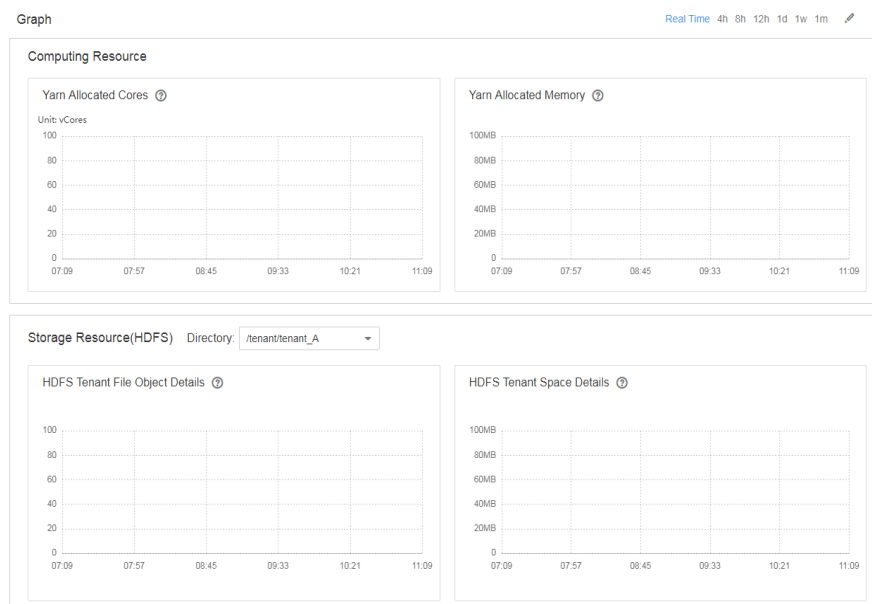

When a queue spans multiple resource pools, its available resources are the combined total of resources allocated by each pool.
  - Superior
 

The available YARN resources (memory and CPU) are allocated in proportion based on the queue weight.
- When the tenant administrator is bound to a tenant role, the tenant administrator has the permissions to manage the tenant and use all resources of the tenant.

– Graphical resource monitoring

Graphical resource monitoring supports the graphical display of monitoring metrics listed in [Table 6-37](#), as shown in [Figure 6-56](#).

**Figure 6-56** Refined monitoring (using Manager 3.x as an example)

By default, real-time monitoring data is displayed. You can click  to customize a time range. Click  and choose **Export** from the shortcut menu to export monitoring information.

**Table 6-37** Monitoring metrics

| Service | Metric Item                                                                                                                                                                     | Description                                                                                                                                                                                                                                                                                |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HDFS    | HDFS Tenant Space Details <ul style="list-style-type: none"> <li>Allocated Space</li> <li>Used Space</li> </ul>                                                                 | HDFS can monitor a specified storage directory. The storage directory is the same as the directory added by the current tenant in <b>Resource</b> .                                                                                                                                        |
|         | HDFS Tenant File Object Details <ul style="list-style-type: none"> <li>Number of Used File Objects</li> </ul>                                                                   |                                                                                                                                                                                                                                                                                            |
| YARN    | Yarn Allocated Cores <ul style="list-style-type: none"> <li>Maximum Number of CPU Cores in an AM</li> <li>Allocated Cores</li> <li>Number of Used CPU Cores in an AM</li> </ul> | Monitoring information of the current tenant is displayed. If no sub-item is configured for a tenant, this information is not displayed.<br><br>The monitoring data is obtained from <b>Scheduler &gt; Application Queues &gt; Queue: <i>Tenant name</i></b> on the native web UI of YARN. |
|         | Yarn Allocated Memory <ul style="list-style-type: none"> <li>Allocated Maximum AM Memory</li> <li>Allocated Memory</li> <li>Used AM Memory</li> </ul>                           |                                                                                                                                                                                                                                                                                            |

## 6.9.2 Using MRS Multi-Tenancy

### Scenarios

Tenants are used in resource control and service isolation scenarios. You need to determine the service scenarios of cluster resources and then plan tenants.

Multi-tenancy involves three types of operations: creating a tenant, managing tenants, and managing resources. [Table 6-38](#) describes these operations.

**Table 6-38** Multi-tenant operations

| Operation          | Action                                                                                                                                                                                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Creating a tenant  | <ul style="list-style-type: none"> <li>• Creating a tenant</li> <li>• Creating a sub-tenant</li> <li>• Adding a user and assigning a tenant role to the user</li> </ul>                                                                                                                               | <p>During the creation of a tenant, you can configure its computing resources, storage resources, and associated services based on service requirements. In addition, you can add users to the tenant and bind necessary roles to these users.</p> <p>A user to create a level-1 tenant needs to be bound to the <b>Manager_administrator</b> or <b>System_administrator</b> role.</p> <p>A user to create a sub-tenant needs to be bound to the role of the parent tenant at least.</p> |
| Managing tenants   | <ul style="list-style-type: none"> <li>• Managing a tenant directory</li> <li>• Restoring tenant data</li> <li>• Clearing non-associated queues of a tenant</li> <li>• Deleting a tenant</li> </ul>                                                                                                   | <p>You can edit tenants as services change.</p> <p>A user to manage or delete a level-1 tenant or restore tenant data needs to be assigned the <b>Manager_administrator</b> or <b>System_administrator</b> role.</p> <p>A user to manage or delete a sub-tenant needs to be assigned the role of the parent tenant at least.</p>                                                                                                                                                         |
| Managing resources | <ul style="list-style-type: none"> <li>• Creating a resource pool</li> <li>• Modifying a resource pool</li> <li>• Deleting a resource pool</li> <li>• Configuring a queue</li> <li>• Configuring the queue capacity policy of a resource pool</li> <li>• Clearing configuration of a queue</li> </ul> | <p>You can reconfigure resources for tenants as the services change.</p> <p>A user to manage resources needs to be assigned the <b>Manager_administrator</b> or <b>System_administrator</b> role.</p>                                                                                                                                                                                                                                                                                    |

## Creating Tenants and Sub-Tenants

Administrators need to determine the service scenarios of cluster resources and then plan tenants. After that, administrators add tenants and configure dynamic resources, storage resources, and associated services for the tenants on MRS.

**Table 6-39** shows the process for creating a tenant.

**Figure 6-57** Creating a tenant

**Table 6-39** Operations for creating a tenant

| Operation                                               | Description                                                                                                                                                                                                   |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Creating a tenant                                       | You can configure the compute resources, storage resources, and associated services of the tenant.                                                                                                            |
| Creating a sub-tenant                                   | You can configure the compute resources, storage resources, and associated services of the sub-tenant.                                                                                                        |
| Adding a user and assigning the tenant role to the user | If a user wants to use the resources of tenant <b>tenant1</b> or add or delete sub-tenants for <b>tenant1</b> , the user must be bound to both the <b>Manager_tenant</b> and <b>tenant1_Cluster ID</b> roles. |

## 6.9.3 Configuring MRS Tenants

### 6.9.3.1 Creating an MRS Tenant

You can create a tenant on MRS Manager to specify the resource usage.

#### Prerequisites

- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the HDFS directory.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants/sub-tenants under the parent tenant at every level does not exceed 100%.
- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

#### Adding a Tenant on the MRS Management Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS cluster details page, click **Tenant**.

**Step 4** Click **Create Tenant**. On the displayed page, configure tenant properties by referring to the following table.

**Table 6-40** Tenant property parameters (MRS 3.x)

| Parameter | Description                                                                                                                                                                                                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name      | <ul style="list-style-type: none"><li>• Name of the current tenant, which can contain digits, letters, and underscores (_).</li><li>• Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or YARN queue that exists in the current cluster.</li></ul> |

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tenant Type      | <p>Whether a tenant is a leaf tenant.</p> <p>In some versions, this parameter is named <b>Tenant Resource Type</b>.</p> <ul style="list-style-type: none"> <li>• When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li> <li>• When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li> </ul> <p><b>NOTE</b><br/>MRS 3.2.0 or later: If you select <b>ClickHouse</b> for <b>Service</b>, this parameter can only be set to <b>Leaf Tenant</b>.</p>                                                                                                                       |
| Compute Resource | <p>Compute resources can be used by the tenant.</p> <ul style="list-style-type: none"> <li>• When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the tenant name. <ul style="list-style-type: none"> <li>– A leaf tenant can directly submit jobs to the queue.</li> <li>– A non-leaf tenant cannot directly submit jobs to the queue. However, YARN adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li> </ul> </li> <li>• If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li> </ul> |

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration Mode                  | <p>If <b>Yarn</b> is selected for <b>Compute Resource</b>, this parameter can be set to <b>Basic</b> or <b>Advanced</b>.</p> <ul style="list-style-type: none"><li>• <b>Basic</b>: Configure the percentage of compute resources used by the tenant in the default resource pool by specifying <b>Default Resource Pool Capacity (%)</b>.</li><li>• <b>Advanced</b>: Configure the following parameters for advanced settings:<ul style="list-style-type: none"><li>– <b>Weight</b>: Tenant resource weight. The value ranges from 0 to 100. Tenant resource weight = Tenant weight/Total weight of tenants at the same level</li><li>– <b>Minimum Resources</b>: resources preempted by the tenant. The value is a percentage or absolute value of the parent tenant's resources. When a tenant's workload is light, their resources are automatically lent to other tenants. When available resources are fewer than <b>Minimum Resources</b>, the tenant can preempt the resources that were lent out.</li><li>– <b>Maximum Resources</b>: maximum resources that can be used by a tenant. The value is a percentage or absolute value of the parent tenant's resources.</li><li>– <b>Reserved Resources</b>: resources reserved for the tenant. The reserved resources cannot be used by other tenants even if no job is using resources of the tenant. The value is a percentage or absolute value of the parent tenant's resources.</li></ul></li></ul> |
| Storage Resource                    | <p>Storage resources selected for the current tenant.</p> <ul style="list-style-type: none"><li>• If <b>HDFS</b> is selected, the system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory. When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory.</li><li>• If <b>HDFS</b> is not selected, the system does not create a storage directory under the root directory of HDFS.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Maximum Number of Files/Directories | <p>Maximum number of files or directories that can be created in HDFS. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Space Quota | <p>Specifies the quota for HDFS storage space used by the current tenant. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p> <ul style="list-style-type: none"> <li>• The minimum value is <b>1</b>, and the unit is MB or GB.</li> <li>• This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used.</li> <li>• If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li> </ul> <p><b>NOTE</b><br/>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b> MB, the actual space for storing files is about 250 MB (500/2 = 250).</p> |
| Storage Path        | <p>HDFS directory for tenant resource data.</p> <ul style="list-style-type: none"> <li>• The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for tenant <b>ta1</b> is <b>/tenant/ta1</b>.</li> <li>• When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Service             | <p>Other service resources associated with the tenant. (This parameter is grayed out if the cluster has no components that support service association.)</p> <p>Click <b>Associate Service</b> and select a service name from the <b>Service</b> drop-down list box. If <b>Association Mode</b> is set to <b>Exclusive</b>, service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description         | Specifies the description of the current tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 6-41** Tenant parameters (MRS 2.x and earlier versions)

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                    | <ul style="list-style-type: none"><li>Name of the current tenant, which can contain digits, letters, and underscores (_).</li><li>Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or YARN queue that exists in the current cluster.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Tenant Type                             | Whether the tenant is a leaf tenant. <ul style="list-style-type: none"><li>When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Compute Resource                        | Compute resources can be used by the tenant. (In some versions, the parameter is named <b>Dynamic Resource</b> .) <ul style="list-style-type: none"><li>When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the tenant name.<ul style="list-style-type: none"><li>A leaf tenant can directly submit jobs to the queue.</li><li>A non-leaf tenant cannot directly submit jobs to the queue. However, YARN adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li></ul></li><li>If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li></ul> |
| Default Resource Pool Capacity (%)      | Percentage of the compute resources used by the current tenant in the <b>default</b> resource pool. This parameter is configured when YARN is the <b>Compute Resource</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Default Resource Pool Max. Capacity (%) | Maximum percentage of the compute resources used by the current tenant in the <b>default</b> resource pool. This parameter is configured when YARN is the <b>Compute Resource</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Resource         | <p>Storage resources selected for the current tenant.</p> <ul style="list-style-type: none"><li>• If <b>HDFS</b> is selected, the system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory. When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory.</li><li>• If <b>HDFS</b> is not selected, the system does not create a storage directory under the root directory of HDFS.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Storage Space Quota (MB) | <p>Specifies the quota for HDFS storage space used by the current tenant. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p> <ul style="list-style-type: none"><li>• The minimum value is <b>1</b>, and the unit is MB or GB.</li><li>• This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used.</li><li>• If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li></ul> <p><b>NOTE</b></p> <p>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b> MB, the actual space for storing files is about 250 MB (<math>500/2 = 250</math>).</p> |
| Storage Path             | <p>HDFS storage directory for the tenant.</p> <ul style="list-style-type: none"><li>• The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for tenant <b>ta1</b> is <b>/tenant/ta1</b>.</li><li>• When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Service                  | <p>Other service resources associated with the tenant. (This parameter is grayed out if the cluster has no components that support service association.)</p> <p>Click <b>Associate Service</b> and select a service name from the <b>Service</b> drop-down list box. If <b>Association Mode</b> is set to <b>Exclusive</b>, service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description              | Specifies the description of the current tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Step 5** Click **OK** to save. Wait until the tenant is created.

In the tenant list on the left, click the name of the created tenant to view its basic information, resource quotas, and charts.

 **NOTE**

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- If you want to use the tenant, create a system user and assign the Manager\_tenant role and the role corresponding to the tenant to the user. For details, see [Binding Tenant to an MRS Cluster User](#).

----End

## Adding a Tenant on Manager (for MRS 3.x and Later)

**Step 1** Log in to Manager and choose **Tenant Resources**.

**Step 2** Click . On the page that is displayed, configure tenant properties according to [Table 6-42](#).

**Table 6-42** Tenant property parameters (MRS 3.x)

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | <ul style="list-style-type: none"><li>• Name of the current tenant, which can contain digits, letters, and underscores (_).</li><li>• Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or YARN queue that exists in the current cluster.</li></ul>                                                                                                                                                                                                                                                                     |
| Tenant Type | <p>Whether a tenant is a leaf tenant.</p> <p>In some versions, this parameter is named <b>Tenant Resource Type</b>.</p> <ul style="list-style-type: none"><li>• When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>• When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li></ul> <p><b>NOTE</b><br/>MRS 3.2.0 or later: If you select <b>ClickHouse</b> for <b>Service</b>, this parameter can only be set to <b>Leaf Tenant</b>.</p> |

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Compute Resource   | <p>Compute resources can be used by the tenant.</p> <ul style="list-style-type: none"> <li>• When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the tenant name. <ul style="list-style-type: none"> <li>– A leaf tenant can directly submit jobs to the queue.</li> <li>– A non-leaf tenant cannot directly submit jobs to the queue. However, YARN adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li> </ul> </li> <li>• If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Configuration Mode | <p>If <b>Yarn</b> is selected for <b>Compute Resource</b>, this parameter can be set to <b>Basic</b> or <b>Advanced</b>.</p> <ul style="list-style-type: none"> <li>• <b>Basic</b>: Configure the percentage of compute resources used by the tenant in the default resource pool by specifying <b>Default Resource Pool Capacity (%)</b>.</li> <li>• <b>Advanced</b>: Configure the following parameters for advanced settings: <ul style="list-style-type: none"> <li>– <b>Weight</b>: Tenant resource weight. The value ranges from 0 to 100. Tenant resource weight = Tenant weight/Total weight of tenants at the same level</li> <li>– <b>Minimum Resources</b>: resources preempted by the tenant. The value is a percentage or absolute value of the parent tenant's resources. When a tenant's workload is light, their resources are automatically lent to other tenants. When available resources are fewer than <b>Minimum Resources</b>, the tenant can preempt the resources that were lent out.</li> <li>– <b>Maximum Resources</b>: maximum resources that can be used by a tenant. The value is a percentage or absolute value of the parent tenant's resources.</li> <li>– <b>Reserved Resources</b>: resources reserved for the tenant. The reserved resources cannot be used by other tenants even if no job is using resources of the tenant. The value is a percentage or absolute value of the parent tenant's resources.</li> </ul> </li> </ul> |

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Resource                    | <p>Storage resources selected for the current tenant.</p> <ul style="list-style-type: none"><li>• If <b>HDFS</b> is selected, the system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory. When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory.</li><li>• If <b>HDFS</b> is not selected, the system does not create a storage directory under the root directory of HDFS.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Maximum Number of Files/Directories | <p>Maximum number of files or directories that can be created in HDFS. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Storage Space Quota                 | <p>Specifies the quota for HDFS storage space used by the current tenant. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p> <ul style="list-style-type: none"><li>• The minimum value is <b>1</b>, and the unit is MB or GB.</li><li>• This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used.</li><li>• If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li></ul> <p><b>NOTE</b><br/>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500 MB</b>, the actual space for storing files is about 250 MB (<math>500/2 = 250</math>).</p> |
| Storage Path                        | <p>HDFS directory for tenant resource data.</p> <ul style="list-style-type: none"><li>• The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for tenant <b>ta1</b> is <b>/tenant/ta1</b>.</li><li>• When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service     | Other service resources associated with the tenant. (This parameter is grayed out if the cluster has no components that support service association.)<br>Click <b>Associate Service</b> and select a service name from the <b>Service</b> drop-down list box. If <b>Association Mode</b> is set to <b>Exclusive</b> , service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared. |
| Description | Specifies the description of the current tenant.                                                                                                                                                                                                                                                                                                                                                                             |

 NOTE

Roles, computing resources, and storage resources are automatically created when tenants are created.

- The new role has permissions on the computing and storage resources. This role and its permissions are automatically controlled by the system and cannot be manually managed by choosing **System > Permission > Role**. The role name is in the format of *Tenant name\_Cluster ID*. The ID of the first cluster is not displayed by default.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see [Binding Tenant to an MRS Cluster User](#).
- During the tenant creation, the system automatically creates a YARN queue named after the tenant. If the queue name already exists, the new queue is named **Tenant name-N**. *N* indicates a natural number starting from 1. When a same name exists, the value *N* increases automatically to differentiate the queue from others. For example, **saletenant**, **saletenant-1**, and **saletenant-2**.

If you need to associate a service, click **Associate Service**, configure other service resources associated with the tenant by referring to the following instructions, and click **OK**.

- Set **Service** to **HBase** and **Association Type** to **Exclusive** or **Shared**.

 NOTE

- **Exclusive** indicates that the service resources are used by the tenant exclusively and cannot be associated with other tenants.
- **Shared** indicates that the service resources can be shared with other tenants.
- MRS 3.2.0 or later: Select **ClickHouse** for **Service**.
  - **Association Type**: When **Service** is set to **ClickHouse**, **Association Type** can only be set to **Shared**.
  - **Associate Logical Cluster**: If the logical cluster function is not enabled for ClickHouse, **default\_cluster** is selected by default. If the function is enabled, select the logical cluster to which you want to associate.
  - **CPU Priority**: The CPU priority ranges from -20 to 19. This value is associated with the NICE value of the OS. A smaller value indicates a higher CPU priority.
  - **Memory**: The maximum value of this parameter is **100**, in percentage. For example, if this parameter is set to **80**, the total memory that can be used by the current tenant is calculated as follows: Available memory x 80%.

 NOTE

- Only HBase can be associated with a new tenant. However, HDFS, HBase, and YARN can be associated with existing tenants.
- To associate an existing tenant with service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Associate Service** to configure resources to be associated with the tenant.
- To disassociate an existing tenant from service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Delete** in the **Operation** column. In the displayed dialog box, select **I have read the information and understand the impact** and click **OK**.

**Step 3** Click **OK**. Wait until the system displays a message indicating that the tenant is successfully created.

----End

## Adding a Tenant on Manager (for MRS 2.x and Later)

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** Click **Create Tenant**. On the displayed page, configure tenant properties.

**Table 6-43** Tenant parameters (MRS 2.x and earlier versions)

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | <ul style="list-style-type: none"><li>• Name of the current tenant, which can contain digits, letters, and underscores (_).</li><li>• Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or YARN queue that exists in the current cluster.</li></ul>                             |
| Tenant Type | Whether the tenant is a leaf tenant. <ul style="list-style-type: none"><li>• When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>• When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li></ul> |

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Compute Resource                        | <p>Compute resources can be used by the tenant. (In some versions, the parameter is named <b>Dynamic Resource</b>.)</p> <ul style="list-style-type: none"><li>• When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the tenant name.<ul style="list-style-type: none"><li>– A leaf tenant can directly submit jobs to the queue.</li><li>– A non-leaf tenant cannot directly submit jobs to the queue. However, YARN adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li></ul></li><li>• If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li></ul> |
| Default Resource Pool Capacity (%)      | <p>Percentage of the compute resources used by the current tenant in the <b>default</b> resource pool. This parameter is configured when YARN is the <b>Compute Resource</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Default Resource Pool Max. Capacity (%) | <p>Maximum percentage of the compute resources used by the current tenant in the <b>default</b> resource pool. This parameter is configured when YARN is the <b>Compute Resource</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Storage Resource                        | <p>Storage resources selected for the current tenant.</p> <ul style="list-style-type: none"><li>• If <b>HDFS</b> is selected, the system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory. When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory.</li><li>• If <b>HDFS</b> is not selected, the system does not create a storage directory under the root directory of HDFS.</li></ul>                                                                                                                                                                                                                                                       |

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Space Quota (MB) | <p>Specifies the quota for HDFS storage space used by the current tenant. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p> <ul style="list-style-type: none"><li>• The minimum value is <b>1</b>, and the unit is MB or GB.</li><li>• This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used.</li><li>• If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li></ul> <p><b>NOTE</b><br/>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b> MB, the actual space for storing files is about 250 MB (<math>500/2 = 250</math>).</p> |
| Storage Path             | <p>HDFS storage directory for the tenant.</p> <ul style="list-style-type: none"><li>• The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for tenant <b>ta1</b> is <b>/tenant/ta1</b>.</li><li>• When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Service                  | <p>Other service resources associated with the tenant. (This parameter is grayed out if the cluster has no components that support service association.)</p> <p>Click <b>Associate Service</b> and select a service name from the <b>Service</b> drop-down list box. If <b>Association Mode</b> is set to <b>Exclusive</b>, service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description              | Specifies the description of the current tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Step 3** Click **OK** to save. Wait until the tenant is created.

 NOTE

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- If you want to use the tenant, create a system user and assign the `Manager_tenant` role and the role corresponding to the tenant to the user. For details, see [Binding Tenant to an MRS Cluster User](#).

----End

### 6.9.3.2 Creating an MRS Sub-Tenant

You can create sub-tenants on MRS and allocate resources of the current tenant to the sub-tenants based on the resource consumption and isolation planning and requirements of services.

If the tenant is a non-leaf tenant, you can add sub-tenants. Sub-tenants cannot be created for a leaf tenant.

#### Prerequisites

- A non-leaf tenant has been added by referring to [Creating an MRS Tenant](#).
- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a sub-tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the storage directory of the parent tenant.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.
- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

### Adding an MRS Sub-Tenant on the MRS Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS details page, click **Tenant**.

**Step 4** In the tenant list on the left, move the cursor to the tenant node to which a sub-tenant is to be added. Click **Create sub-tenant**. On the displayed page, configure the sub-tenant attributes according to the following table:

**Table 6-44** Tenant property parameters (MRS 3.x)

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name             | <ul style="list-style-type: none"><li>• Name of the current tenant, which can contain digits, letters, and underscores (_).</li><li>• Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or YARN queue that exists in the current cluster.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                      |
| Tenant Type      | <p>Whether a tenant is a leaf tenant.</p> <p>In some versions, this parameter is named <b>Tenant Resource Type</b>.</p> <ul style="list-style-type: none"><li>• When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>• When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li></ul> <p><b>NOTE</b><br/>MRS 3.2.0 or later: If you select <b>ClickHouse</b> for <b>Service</b>, this parameter can only be set to <b>Leaf Tenant</b>.</p>                                                                                                                  |
| Compute Resource | <p>Compute resources can be used by the tenant.</p> <ul style="list-style-type: none"><li>• When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the tenant name.<ul style="list-style-type: none"><li>– A leaf tenant can directly submit jobs to the queue.</li><li>– A non-leaf tenant cannot directly submit jobs to the queue. However, YARN adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li></ul></li><li>• If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li></ul> |

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration Mode                  | <p>If <b>Yarn</b> is selected for <b>Compute Resource</b>, this parameter can be set to <b>Basic</b> or <b>Advanced</b>.</p> <ul style="list-style-type: none"> <li>• <b>Basic:</b> Configure the percentage of compute resources used by the tenant in the default resource pool by specifying <b>Default Resource Pool Capacity (%)</b>.</li> <li>• <b>Advanced:</b> Configure the following parameters for advanced settings: <ul style="list-style-type: none"> <li>– <b>Weight:</b> Tenant resource weight. The value ranges from 0 to 100. Tenant resource weight = Tenant weight/Total weight of tenants at the same level</li> <li>– <b>Minimum Resources:</b> resources preempted by the tenant. The value is a percentage or absolute value of the parent tenant's resources. When a tenant's workload is light, their resources are automatically lent to other tenants. When available resources are fewer than <b>Minimum Resources</b>, the tenant can preempt the resources that were lent out.</li> <li>– <b>Maximum Resources:</b> maximum resources that can be used by a tenant. The value is a percentage or absolute value of the parent tenant's resources.</li> <li>– <b>Reserved Resources:</b> resources reserved for the tenant. The reserved resources cannot be used by other tenants even if no job is using resources of the tenant. The value is a percentage or absolute value of the parent tenant's resources.</li> </ul> </li> </ul> |
| Storage Resource                    | <p>Storage resources selected for the current tenant.</p> <ul style="list-style-type: none"> <li>• If <b>HDFS</b> is selected, the system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory. When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory.</li> <li>• If <b>HDFS</b> is not selected, the system does not create a storage directory under the root directory of HDFS.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Maximum Number of Files/Directories | <p>Maximum number of files or directories that can be created in HDFS. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Space Quota | <p>Specifies the quota for HDFS storage space used by the current tenant. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p> <ul style="list-style-type: none"> <li>• The minimum value is <b>1</b>, and the unit is MB or GB.</li> <li>• This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used.</li> <li>• If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li> </ul> <p><b>NOTE</b><br/>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b> MB, the actual space for storing files is about 250 MB (500/2 = 250).</p> |
| Storage Path        | <p>HDFS directory for tenant resource data.</p> <ul style="list-style-type: none"> <li>• The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for tenant <b>ta1</b> is <b>/tenant/ta1</b>.</li> <li>• When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Service             | <p>Other service resources associated with the tenant. (This parameter is grayed out if the cluster has no components that support service association.)</p> <p>Click <b>Associate Service</b> and select a service name from the <b>Service</b> drop-down list box. If <b>Association Mode</b> is set to <b>Exclusive</b>, service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description         | Specifies the description of the current tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 6-45** Tenant parameters (MRS 2.x and earlier versions)

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                    | <ul style="list-style-type: none"><li>Name of the current tenant, which can contain digits, letters, and underscores (_).</li><li>Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or YARN queue that exists in the current cluster.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Tenant Type                             | Whether the tenant is a leaf tenant. <ul style="list-style-type: none"><li>When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Compute Resource                        | Compute resources can be used by the tenant. (In some versions, the parameter is named <b>Dynamic Resource</b> .) <ul style="list-style-type: none"><li>When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the tenant name.<ul style="list-style-type: none"><li>A leaf tenant can directly submit jobs to the queue.</li><li>A non-leaf tenant cannot directly submit jobs to the queue. However, YARN adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li></ul></li><li>If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li></ul> |
| Default Resource Pool Capacity (%)      | Percentage of the compute resources used by the current tenant in the <b>default</b> resource pool. This parameter is configured when YARN is the <b>Compute Resource</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Default Resource Pool Max. Capacity (%) | Maximum percentage of the compute resources used by the current tenant in the <b>default</b> resource pool. This parameter is configured when YARN is the <b>Compute Resource</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Resource         | <p>Storage resources selected for the current tenant.</p> <ul style="list-style-type: none"><li>• If <b>HDFS</b> is selected, the system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory. When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory.</li><li>• If <b>HDFS</b> is not selected, the system does not create a storage directory under the root directory of HDFS.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Storage Space Quota (MB) | <p>Specifies the quota for HDFS storage space used by the current tenant. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p> <ul style="list-style-type: none"><li>• The minimum value is <b>1</b>, and the unit is MB or GB.</li><li>• This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used.</li><li>• If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li></ul> <p><b>NOTE</b></p> <p>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b> MB, the actual space for storing files is about 250 MB (<math>500/2 = 250</math>).</p> |
| Storage Path             | <p>HDFS storage directory for the tenant.</p> <ul style="list-style-type: none"><li>• The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for tenant <b>ta1</b> is <b>/tenant/ta1</b>.</li><li>• When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Service                  | <p>Other service resources associated with the tenant. (This parameter is grayed out if the cluster has no components that support service association.)</p> <p>Click <b>Associate Service</b> and select a service name from the <b>Service</b> drop-down list box. If <b>Association Mode</b> is set to <b>Exclusive</b>, service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description              | Specifies the description of the current tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Step 5** Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

 **NOTE**

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. This role and its permissions are automatically controlled by the system and cannot be manually managed by choosing **System > Permission > Role**. The role name is in the format of *Tenant name\_Cluster ID*. The ID of the first cluster is not displayed by default.
- When using this tenant, create a system user and assign the tenant role to the user. For details, see [Binding Tenant to an MRS Cluster User](#).
- The sub-tenant can further allocate the resources of its parent tenant. The sum of the resource percentages of direct sub-tenants under a parent tenant at each level cannot exceed 100%. The sum of the computing resource percentages of all level-1 tenants cannot exceed 100%.

----End

## Adding a Sub-Tenant on Manager (for MRS 3.x and Later)

**Step 1** Log in to FusionInsight Manager and choose **Tenant Resources**.

**Step 2** In the tenant list on the left, select a parent tenant and click . On the displayed page, set the parameters.

- To use a Superior scheduler cluster, configure sub-tenant properties by referring to [Table 6-46](#).
- To use the Capacity scheduler cluster, configure sub-tenant properties by referring to [Table 6-47](#).

 **NOTE**

- YARN in a new cluster uses the Superior scheduler by default. You can also switch the scheduler by referring to [Switching the MRS Tenant Resource Scheduler](#).
- To query the scheduler type, log in to Manager and search for the **yarn.resourcemanager.scheduler.class** parameter on the **All Configurations** page of the YARN service.

**Table 6-46** Sub-tenant parameters (Superior scheduler)

| Parameter              | Description                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------|
| Cluster                | Cluster to which the parent tenant belongs.                                                  |
| Parent Tenant Resource | Name of the parent tenant. (In some versions, the parameter is named <b>Parent Tenant</b> .) |

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                 | <ul style="list-style-type: none"> <li>• Name of the current tenant, which can contain digits, letters, and underscores (_).</li> <li>• Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or YARN queue that exists in the current cluster.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                |
| Tenant Resource Type | <p>Whether a tenant is a leaf tenant. (In some versions, the parameter is named <b>Tenant Type</b>.)</p> <ul style="list-style-type: none"> <li>• When <b>Leaf Tenant Resource</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added. (In some versions, the parameter is named <b>Leaf Tenant</b>.)</li> <li>• When <b>Non-leaf Tenant Resource</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant. However, the tenant depth cannot exceed 5 levels. (In some versions, the parameter is named <b>Non-Leaf Tenant</b>.)</li> </ul>                                                                                          |
| Compute Resource     | <p>Dynamic compute resources for the current tenant.</p> <ul style="list-style-type: none"> <li>• When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the tenant name. <ul style="list-style-type: none"> <li>– A leaf tenant can directly submit jobs to the queue.</li> <li>– A non-leaf tenant cannot directly submit jobs to the queue. However, YARN adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li> </ul> </li> <li>• If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li> </ul> |

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration Mode | <p>Configuration mode of compute resource parameters. If <b>Yarn</b> is selected for <b>Compute Resource</b>, this parameter can be set to <b>Basic</b> or <b>Advanced</b>.</p> <ul style="list-style-type: none"> <li>• <b>Basic</b>: Configure the percentage of compute resources used by the tenant in the default resource pool by specifying <b>Default Resource Pool Capacity (%)</b>.</li> <li>• <b>Advanced</b>: Configure the following parameters for advanced settings: <ul style="list-style-type: none"> <li>- <b>Weight</b>: Tenant resource weight. The value ranges from 0 to 100. Tenant resource weight = Tenant weight/Total weight of tenants at the same level</li> <li>- <b>Minimum Resources</b>: resources preempted by the tenant. The value is a percentage or absolute value of the parent tenant's resources. When a tenant's workload is light, their resources are automatically lent to other tenants. When available resources are fewer than <b>Minimum Resources</b>, the tenant can preempt the resources that were lent out.</li> <li>- <b>Maximum Resources</b>: maximum resources that can be used by a tenant. The value is a percentage or absolute value of the parent tenant's resources.</li> <li>- <b>Reserved Resources</b>: resources reserved for the tenant. The reserved resources cannot be used by other tenants even if no job is using resources of the tenant. The value is a percentage or absolute value of the parent tenant's resources.</li> </ul> </li> </ul> |
| Storage Resource   | <p>Storage resources selected for the current tenant.</p> <ul style="list-style-type: none"> <li>• When <b>HDFS</b> is selected, the system automatically creates a folder named after the sub-tenant in the HDFS parent tenant directory.</li> <li>• If <b>HDFS</b> is not selected, the system does not create a storage directory under the root directory of HDFS. If the parent tenant does not have storage resources, the sub-tenant cannot use storage resources.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Quota              | <p>Quota for files and directories. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Space Quota | <p>Quota for HDFS storage space used by the current tenant. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p> <ul style="list-style-type: none"> <li>The minimum value is <b>1</b>, and the maximum value is the total storage quota of the parent tenant. The unit is MB or GB.</li> <li>This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used.</li> <li>If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li> <li>If this quota is greater than the quota of the parent tenant, the actual storage space does not exceed the quota of the parent tenant.</li> </ul> <p><b>NOTE</b><br/>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b> MB, the actual space for storing files is about 250 MB (<math>500/2 = 250</math>).</p> |
| Storage Path        | <p>Specifies the tenant's HDFS storage directory.</p> <ul style="list-style-type: none"> <li>The system automatically creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is <b>ta1s</b> and the parent directory is <b>tenant/ta1</b>, the system sets this parameter for the sub-tenant to <b>tenant/ta1/ta1s</b>.</li> <li>The storage path is customizable in the parent directory. The parent directory for the storage path must be the storage directory of the parent tenant.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Service             | Whether to associate resources of other services. For details, see <a href="#">Step 4</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Description         | Description of the tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 6-47** Sub-tenant parameters (Capacity scheduler)

| Parameter              | Description                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------|
| Cluster                | Cluster to which the parent tenant belongs.                                                  |
| Parent Tenant Resource | Name of the parent tenant. (In some versions, the parameter is named <b>Parent Tenant</b> .) |

| Parameter                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                   | <ul style="list-style-type: none"><li>• Name of the current tenant, which can contain digits, letters, and underscores (_).</li><li>• Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or YARN queue that exists in the current cluster.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                    |
| Tenant Type                            | Whether a tenant is a leaf tenant. <ul style="list-style-type: none"><li>• When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>• When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li></ul>                                                                                                                                                                                                                                                                                                                                                          |
| Compute Resource                       | Dynamic compute resources for the current tenant. <ul style="list-style-type: none"><li>• When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the tenant name.<ul style="list-style-type: none"><li>- A leaf tenant can directly submit jobs to the queue.</li><li>- A non-leaf tenant cannot directly submit jobs to the queue. However, YARN adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li></ul></li><li>• If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li></ul> |
| Default Resource Pool Capacity (%)     | Percentage of computing resources used by the current tenant. The base value is the total resources of the parent tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Default Resource Pool Max Capacity (%) | Specifies the maximum percentage of the computing resources used by the current tenant. The base value is the total resources of the parent tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Storage Resource                       | Storage resources selected for the current tenant. <ul style="list-style-type: none"><li>• When <b>HDFS</b> is selected, the system automatically creates a folder named after the sub-tenant in the HDFS parent tenant directory.</li><li>• If <b>HDFS</b> is not selected, the system does not create a storage directory under the root directory of HDFS. If the parent tenant does not have storage resources, the sub-tenant cannot use storage resources.</li></ul>                                                                                                                                                                                                                            |
| Quota                                  | Quota for files and directories. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Space Quota | <p>Quota for HDFS storage space used by the current tenant. Set this parameter when <b>Storage Resource</b> is <b>HDFS</b>.</p> <ul style="list-style-type: none"><li>• The minimum value is <b>1</b>, and the maximum value is the total storage quota of the parent tenant. The unit is MB or GB.</li><li>• This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used.</li><li>• If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li><li>• If this quota is greater than the quota of the parent tenant, the actual storage space does not exceed the quota of the parent tenant.</li></ul> <p><b>NOTE</b><br/>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500 MB</b>, the actual space for storing files is about 250 MB (500/2 = 250).</p> |
| Storage Path        | <p>Specifies the tenant's HDFS storage directory.</p> <ul style="list-style-type: none"><li>• The system automatically creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is <b>ta1s</b> and the parent directory is <b>tenant/ta1</b>, the system sets this parameter for the sub-tenant to <b>tenant/ta1/ta1s</b>.</li><li>• The storage path is customizable in the parent directory. The parent directory for the storage path must be the storage directory of the parent tenant.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description         | Description of the current tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

 NOTE

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. This role and its permissions are automatically controlled by the system and cannot be manually managed by choosing **System** > **Permission** > **Role**. The role name is in the format of *Tenant name\_Cluster ID*. The ID of the first cluster is not displayed by default.
- When using this tenant, create a system user and assign the tenant role to the user. For details, see [Binding Tenant to an MRS Cluster User](#).
- The sub-tenant can further allocate the resources of its parent tenant. The sum of the resource percentages of direct sub-tenants under a parent tenant at each level cannot exceed 100%. The sum of the computing resource percentages of all level-1 tenants cannot exceed 100%.

**Step 3** Check whether the current tenant needs to be associated with resources of other services.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Click **Associate Service** to configure other service resources used by the current tenant.

1. Set **Services** to **HBase**.
2. Set **Association Type** as follows:
  - **Exclusive** indicates that the service resources are used by the tenant exclusively and cannot be associated with other tenants.
  - **Shared** indicates that the service resources can be shared with other tenants.

 NOTE

- Only HBase can be associated with a new tenant. However, HDFS, HBase, and YARN can be associated with existing tenants.
- To associate an existing tenant with service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Associate Service** to configure resources to be associated with the tenant.
- To disassociate an existing tenant from service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Delete** in the **Operation** column. In the displayed dialog box, select **I have read the information and understand the impact** and click **OK**.

3. Click **OK**.

**Step 5** Click **OK**. Wait until the system displays a message indicating that the tenant is successfully created.

----End

## Adding a Sub-Tenant on Manager (for MRS 2.x and Later)

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** In the tenant list on the left, move the cursor to the tenant node to which a sub-tenant is to be added. Click **Create sub-tenant**. On the displayed page, configure the sub-tenant attributes according to the following table:

**Table 6-48** Sub-tenant parameters

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parent tenant                           | Specifies the name of the parent tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Name                                    | <ul style="list-style-type: none"><li>• Name of the current tenant, which can contain digits, letters, and underscores (_).</li><li>• Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or YARN queue that exists in the current cluster.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                    |
| Tenant Type                             | Whether the tenant is a leaf tenant. <ul style="list-style-type: none"><li>• When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>• When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li></ul>                                                                                                                                                                                                                                                                                                                                                        |
| Dynamic Resource                        | Dynamic compute resources for the current tenant. <ul style="list-style-type: none"><li>• When <b>Yarn</b> is selected, the system automatically creates a queue in Yarn and the queue is named the same as the tenant name.<ul style="list-style-type: none"><li>– A leaf tenant can directly submit jobs to the queue.</li><li>– A non-leaf tenant cannot directly submit jobs to the queue. However, YARN adds an extra queue (hidden) named <b>default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue.</li></ul></li><li>• If <b>Yarn</b> is not selected, the system does not automatically create a queue.</li></ul> |
| Default Resource Pool Capacity (%)      | Specifies the percentage of the resources used by the current tenant. The base value is the total resources of the parent tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Default Resource Pool Max. Capacity (%) | Specifies the maximum percentage of the computing resources used by the current tenant. The base value is the total resources of the parent tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Storage Resource                        | Storage resources selected for the current tenant. <ul style="list-style-type: none"><li>• When <b>HDFS</b> is selected, the system automatically creates a folder named after the sub-tenant in the HDFS parent tenant directory.</li><li>• If <b>HDFS</b> is not selected, the system does not create a storage directory under the root directory of HDFS. If the parent tenant does not have storage resources, the sub-tenant cannot use storage resources.</li></ul>                                                                                                                                                                                                                            |

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Space Quota (MB) | <p>Quota for HDFS storage space used by the current tenant.</p> <ul style="list-style-type: none"><li>• The minimum value is <b>1</b>, and the maximum value is the total storage quota of the parent tenant. The unit is MB or GB.</li><li>• This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used.</li><li>• If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.</li><li>• If this quota is greater than the quota of the parent tenant, the actual storage space does not exceed the quota of the parent tenant.</li></ul> <p><b>NOTE</b><br/>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b> MB, the actual space for storing files is about 250 MB (<math>500/2 = 250</math>).</p> |
| Storage Path             | <p>Specifies the tenant's HDFS storage directory.</p> <ul style="list-style-type: none"><li>• The system automatically creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is <b>ta1s</b> and the parent directory is <b>tenant/ta1</b>, the system sets this parameter for the sub-tenant to <b>tenant/ta1/ta1s</b>.</li><li>• The storage path is customizable in the parent directory. The parent directory for the storage path must be the storage directory of the parent tenant.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Service                  | <p>Click <b>Associate Service</b> and select a service name from the <b>Service</b> drop-down list box. If <b>Association Mode</b> is set to <b>Exclusive</b>, service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description              | <p>Specifies the description of the current tenant.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Step 3** Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

 NOTE

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. This role and its permissions are automatically controlled by the system and cannot be manually managed by choosing **System** > **Permission** > **Role**. The role name is in the format of *Tenant name\_Cluster ID*. The ID of the first cluster is not displayed by default.
- When using this tenant, create a system user and assign the tenant role to the user. For details, see [Binding Tenant to an MRS Cluster User](#).
- The sub-tenant can further allocate the resources of its parent tenant. The sum of the resource percentages of direct sub-tenants under a parent tenant at each level cannot exceed 100%. The sum of the computing resource percentages of all level-1 tenants cannot exceed 100%.

----End

### 6.9.3.3 Binding Tenant to an MRS Cluster User

#### Scenario

A newly created tenant cannot directly log in to the cluster to access resources. You need to add a user for the tenant on FusionInsight Manager and bind the user to the role of the tenant to assign operation permissions to the user.

#### Prerequisites

You have clarified service requirements and created a tenant.

#### Procedure

**Step 1** Log in to FusionInsight Manager and choose **System** > **Permission** > **User**.

**Step 2** If you want to add a user to the system, click **Create**.

**Figure 6-58** Adding a user

User > Create

---

\* Username:

\* User Type:  Human-Machine  
 Machine-Machine

\* Password:

\* Confirm Password:

User Group: [Add](#) [Clear All](#) [Create User Group](#)

Primary Group:

Role: [Add](#) [Clear All](#) [Create Role](#)

Description:

If you want to bind tenant roles to an existing user in the system, locate the row of the user and click **Modify** in the **Operation** column.

Set user attributes according to [Table 6-49](#).

**Table 6-49** User parameters

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username         | <p>Indicates the current username. The value contains 3 to 32 characters, including digits, letters, underscores (_), hyphens (-), and spaces.</p> <ul style="list-style-type: none"> <li>The username cannot be the same as the OS username of any node in the cluster. Otherwise, the user cannot be used.</li> <li>A username that differs only in alphabetic case from an existing username is not allowed. For example, if <b>User1</b> has been created, you cannot create <b>user1</b>. Enter the correct username when using <b>User1</b>.</li> </ul> |
| User Type        | <p>The options are <b>Human-Machine</b> and <b>Machine-Machine</b>.</p> <ul style="list-style-type: none"> <li><b>Human-Machine</b> user: used for FusionInsight Manager O&amp;M and component client operations. If you select this option, set both <b>Password</b> and <b>Confirm Password</b> accordingly.</li> <li><b>Machine-Machine</b> user: used for application development. If you select this option, the password is randomly generated.</li> </ul>                                                                                              |
| Password         | <p>This parameter is mandatory if <b>User Type</b> is set to <b>Human-Machine</b>.</p> <p>The password must contain 8 to 64 characters of at least four types of the following: uppercase letters, lowercase letters, digits, special characters, and spaces. The password cannot be the username or the username spelled backwards.</p>                                                                                                                                                                                                                      |
| Confirm Password | Enter the password again.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameter   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Role        | Click <b>Add</b> to bind a tenant role to the user.<br><b>NOTE</b> <ul style="list-style-type: none"><li>If a user wants to use the resources of tenant <b>tenant1</b> and to add or delete sub-tenants for <b>tenant1</b>, the user must be bound to both the <b>Manager_tenant</b> and <b>tenant1_Cluster ID</b> roles.</li><li>If the tenant has been associated with the HBase service and Ranger authentication is enabled for the cluster, you need to configure the HBase execution permissions on the Ranger page.</li></ul> |
| Description | Indicates the description of the current user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Step 3** Click **OK**.

----End

### 6.9.3.4 Adding an MRS Tenant Resource Pool

In an MRS cluster, users can logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. The system contains a **default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

You can create a customized resource pool on MRS and add hosts that have not been added to other customized resource pools to it.

#### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

### Adding a Resource Pool on the MRS Management Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS details page, click **Tenant**.

**Step 4** Click the **Resource Pools** tab.

**Step 5** Click **Create Resource Pool**.

**Step 6** In **Create Resource Pool**, set the properties of the resource pool.

- Name:** Enter a name for the resource pool. The name of the newly created resource pool cannot be **default**. The name can contain digits, letters, and underscores (\_), and cannot start with an underscore (\_).

- **Resource Label:** Enter the resource label of the resource pool. The value can contain 1 to 50 characters, including digits, letters, underscores (\_), and hyphens (-), and must start with a digit or letter.
- **Available Hosts:** In the host list on the left, select a specified host name and add it to the resource pool. Only hosts in the cluster can be selected. The host list of a resource pool can be left blank.

**Step 7** Click **OK**.

**Step 8** After a resource pool is created, users can view the **Name**, **Members**, **Type**, **vCore** and **Memory** in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **default** resource pool.

----End

## Adding a Resource Pool on Manager

**Step 1** Log in to FusionInsight Manager. Choose **Tenant Resources**.

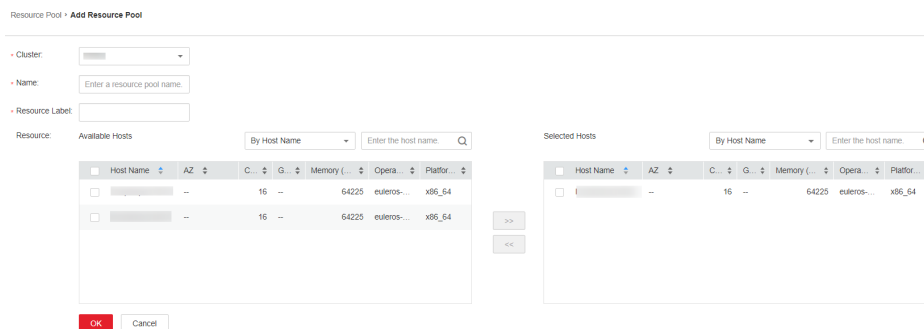

For MRS 2.x or earlier versions, select **Tenant**.

**Step 2** Click **Resource Pool** in the navigation pane, and click **Add Resource Pool**.

**Step 3** Set resource pool properties.

- **MRS cluster 3.x and later versions:**

**Figure 6-59** Adding resources

- **Cluster:** Select the cluster to which the resource pool is to be added.
- **Name:** Enter a name for the resource pool. The value can contain digits, letters, and underscores (\_), and cannot start with an underscore (\_).
- **Resource Label:** Enter the resource label of the resource pool. The value can contain 1 to 50 characters, including digits, letters, underscores (\_), and hyphens (-), and must start with a digit or letter.
- **Resource:** In the **Available Hosts** area, select specified hosts and click >> to add the hosts to the **Selected Hosts** area. Only hosts in the cluster can be selected. The host list of a resource pool can be left blank.

### NOTE

You can search for hosts by host name, number of CPU cores, memory, operating system, or platform type based on service requirements.

- **MRS 2.x and earlier versions:**

- **Name:** Enter a name for the resource pool. The name of the newly created resource pool cannot be **Default**.  
The name consists of 1 to 20 characters and can contain digits, letters, and underscores (\_) but cannot start with an underscore (\_).
- **Hosts:** In the host list on the left, select the name of a specified host and click >> to add the selected host to the resource pool. Only hosts in the cluster can be selected. The host list of a resource pool can be left blank.

**Step 4** Click **OK**.

After the resource pool is created, you can view it including the name, members, and mode in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **default** resource pool.

----End

### 6.9.3.5 Configuring the Queue Capacity Policy of a Resource Pool

After a resource pool is added, the capacity policies of available resources need to be configured for Yarn task queues. This ensures that tasks in the resource pool are running properly. Each queue can be configured with the queue capacity policy of only one resource pool. Users can view the queues in any resource pool and configure queue capacity policies. After the queue policies are configured, Yarn task queues and resource pools are associated.

You can configure queue policies on MRS.

#### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).
- A resource pool has been added.
- The task queue is not associated with other resource pools except the default **default** resource pool.

### Configuring a Queue Capacity Policy on the MRS Management Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS details page, click **Tenant**.

**Step 4** Click the **Resource Distribution Policies** tab.

**Step 5** In **Resource Pools**, select a specified resource pool.

**Available Resource Quota:** indicates that all resources in each resource pool are available for queues by default.

**Step 6** Locate the specified queue in the **Resource Allocation** table, and click **Modify** in the **Operation** column.

**Step 7** In **Modify Resource Allocation**, configure the resource capacity policy of the task queue in the resource pool.

- **Capacity (%)**: specifies the percentage of the current tenant's computing resource usage.
- **Maximum Capacity (%)**: specifies the percentage of the current tenant's maximum computing resource usage.

**Step 8** Click **OK** to save the settings.

----End

## Configuring the Queue Capacity Policy on Manager

For clusters of MRS 3.x and later

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Dynamic Resource Plan** and click the **Resource Distribution Policy** tab.

**Step 3** Select the name of the target cluster from **Cluster** and select a resource pool from **Resource Pool**.

**Step 4** Locate the row that contains the target queue in the **Resource Allocation** area, and click **Modify** in the **Operation** column.

**Step 5** Modify the resource allocation.

- **Capacity scheduler**
  - **Capacity (%)**: indicates the percentage of compute resources used by the current tenant.
  - **Maximum Capacity (%)**: indicates the maximum percentage of computing resources used by the current tenant.
- **Superior Scheduler**
  - a. On the **Resource Configuration Policy** tab of the **Modify Resource Allocation** window, set the resource configuration policy of the queue in the resource pool.

**Figure 6-60** Resource configuration policy

Modify Resource Allocation ✕

Resource Configuration Policy    User Policy

---

\* Weight:

\* Minimum Resource:  %  (MB)  vCores  
Resources guaranteed for the tenant (preemption supported). The value can be a percentage of the parent tenant's resources or an absolute value. When a tenant has a light workload, the resources of the tenant are automatically allocated to other tenants. When the available resources of the tenant do not meet the minimum threshold, the tenant can preempt the resources lent to other tenants.

\* Maximum Resource:  %  (MB)  vCores  
Maximum resources that a tenant can use. The value can be a percentage of the parent tenant's resources or an absolute value.

\* Reserved Resource:  %  (MB)  vCores  
Reserved resources for the tenant. Even if there is no job in a tenant, the reserved resources cannot be used by other tenants. The value can be the percentage or absolute value of the parent tenant's resources.  
Note: The default resource pool capacity equals to set weight and minimum resource percentage value in advanced configuration. When a percentage and an absolute value are configured at the same time: vCore = max. (percentage, absolute value) and memory = max. (percentage, absolute value)

- **Weight:** The task queue with a larger weight preempts resources first when resources are insufficient. Its initial value is the same as the minimum resource percentage.
  - **Minimum Resource:** indicates the minimum resources that a tenant can obtain.
  - **Maximum Resource:** indicates the maximum resources that a tenant can obtain.
  - **Reserved Resource:** indicates the resources that are reserved for the tenant's queues and cannot be lent to other tenants' queues.
- b. In the **Modify Resource Allocation** dialog box, click the **User Policy** tab and set the user policy.

 **NOTE**

**defaultUser(built-in)** indicates that the policy specified by **defaultUser** is used if a user does not specify a policy. The default policy cannot be deleted.

- Click **Add User Policy** to add a user policy.
  - **Username:** indicates the name of a user.
  - **Weight:** The task queue with a larger weight preempts resources first when resources are insufficient.
  - **Max vCores:** indicates the maximum number of virtual cores that the user can obtain.
  - **Max Memory(MB):** indicates the maximum memory that the user can obtain.

- Click **Modify** in the **Operation** column to modify an existing user policy.
- Click **Clear** in the **Operation** column to delete an existing user policy.

**Step 6** Click **OK** to save the settings.

----End

**For MRS clusters of 2.x and earlier:**

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** Click the **Dynamic Resource Plan** tab.

**Step 3** In **Resource Pools**, select a specified resource pool.

**Available Resource Quota:** indicates that all resources in each resource pool are available for queues by default.

**Step 4** Locate the specified queue in the **Resource Allocation** table, and click **Modify** in the **Operation** column.

**Step 5** In **Modify Resource Allocation**, configure the resource capacity policy of the task queue in the resource pool.

- **Capacity (%)**: specifies the percentage of the current tenant's computing resource usage.
- **Maximum Capacity (%)**: specifies the percentage of the current tenant's maximum computing resource usage.

**Step 6** Click **OK** to save the settings.

----End

### 6.9.3.6 Configuring the MRS Tenant Queue

You can modify the queue configuration of a specified tenant on MRS to scale in or out the queue based on service requirements. YARN queues are associated with resource pools for resource allocation and scheduling.

#### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).
- A tenant associated with Yarn and allocated dynamic resources has been added.

### Configuring a Tenant Queue on the MRS Management Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS details page, click **Tenant**.

**Step 4** Click the **Queue Configuration** tab.

**Step 5** In the tenant queue table, click **Modify** in the **Operation** column of the specified tenant queue.

 **NOTE**

- In the tenant list on the left of the **Tenant** tab, click the target tenant. In the window that is displayed, choose **Resource**. On the page that is displayed, click  to open the queue modification page.
- A queue can be bound to only one non-default resource pool.
- **For MRS 2.x and earlier versions:**

**Table 6-50** Queue configuration parameters

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Applications           | Specifies the maximum number of applications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Maximum AM Resource Percent    | Specifies the maximum percentage of resources that can be used to run the ApplicationMaster in a cluster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Minimum User Limit Percent (%) | <p>Specifies the minimum percentage of resources consumed by a user.</p> <p>The resources for each user in a queue are limited at any time. If applications of multiple users are running at the same time in a queue, the resource usage of each user fluctuates between the minimum value and the maximum value. The minimum value is determined by the number of running applications, while the maximum value is determined by this parameter.</p> <p>For example, assume that this parameter is set to <b>25</b>. If two users submit applications to the queue, each user can use a maximum of 50% resources; if three users submit applications to the queue, each user can use a maximum of 33% resources; if four users submit applications to the queue, each user can use a maximum of 25% resources.</p> |
| User Limit Factor              | Specifies the limit factor of the maximum user resource usage. The maximum user resource usage percentage can be obtained by multiplying the limit factor with the percentage of the tenant's actual resource usage in the cluster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Status                         | Specifies the current status of a resource plan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameter                                             | Description                                                                                                                                                                                                                                                 |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Resource Pool (Default Node Label Expression) | Specifies the resource pool used by a queue. The default value is <b>default</b> . If you want to change the resource pool, configure the queue capacity first. For details, see <a href="#">Configuring the Queue Capacity Policy of a Resource Pool</a> . |

- **For MRS cluster 3.x and later versions:**

**Table 6-51** Queue configuration parameters

| Parameter                 | Description                                                                                                                                                                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Master Shares (%)     | Indicates the maximum percentage of resources occupied by all ApplicationMasters in the current queue.                                                                                                                                                                                                              |
| Max Allocated vCores      | Indicates the maximum number of cores that can be allocated to a single YARN container in the current queue. The default value is <b>-1</b> , indicating that the number of cores is not limited within the value range.                                                                                            |
| Max Allocated Memory (MB) | Indicates the maximum memory that can be allocated to a single Yarn container in the current queue. The default value is <b>-1</b> , indicating that the memory is not limited within the value range.                                                                                                              |
| Max Running Apps          | Indicates the maximum number of tasks that can be executed at the same time in the current queue. The default value is <b>-1</b> , indicating that the number is not limited within the value range (the meaning is the same if the value is empty). The value <b>0</b> indicates that the task cannot be executed. |
| Max Running Apps per User | Maximum number of tasks that can be executed by each user in the current queue at the same time. The default value is <b>-1</b> , indicating that the number is not limited within the value range. If the value is <b>0</b> , the task cannot be executed.                                                         |
| Max Pending Apps          | Indicates the maximum number of tasks that can be suspended at the same time in the current queue. The default value is <b>-1</b> , indicating that the number is not limited within the value range (the meaning is the same if the value is empty). The value <b>0</b> indicates that tasks cannot be suspended.  |

| Parameter                | Description                                                                                                                                                                                                                                                                                                         |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Resource Allocation Rule | Indicates the rule for allocating resources to different tasks of a user. The rule can be FIFO or FAIR.<br><br>If a user submits multiple tasks in the current queue and the rule is FIFO, the tasks are executed one by one in sequential order. If the rule is FAIR, resources are evenly allocated to all tasks. |
| Default Resource Label   | Indicates that tasks are executed on a node with a specified resource label.<br><b>NOTE</b><br>If you need to use a new resource pool, change the default label to the new resource pool label.                                                                                                                     |
| Cross-Pool Scheduling    | Indicates whether containers in the current queue support cross-pool scheduling. This parameter is available for clusters of MRS 3.3.0 or later.<br><br>This function cannot be enabled for the default queue.                                                                                                      |
| Cross-Pool AM Scheduling | Indicates whether ApplicationMasters in the current queue support cross-pool scheduling. This parameter is available for clusters of MRS 3.3.0 or later.<br><br>This function cannot be enabled for the default queue.                                                                                              |
| Active                   | <ul style="list-style-type: none"><li>- <b>ACTIVE</b>: indicates that the current queue can receive and execute tasks.</li><li>- <b>INACTIVE</b>: indicates that the current queue can receive but cannot execute tasks. Tasks submitted to the queue are suspended.</li></ul>                                      |
| Open                     | <ul style="list-style-type: none"><li>- <b>OPEN</b>: indicates that the current queue is opened.</li><li>- <b>CLOSED</b>: indicates that the current queue is closed. Tasks submitted to the queue are rejected.</li></ul>                                                                                          |

----End

## Configuring a Tenant Queue on Manager

For clusters of MRS 3.x and later

**Step 1** On FusionInsight Manager, choose **Tenant Resources**.

**Step 2** Click the **Dynamic Resource Plan** tab.

**Step 3** Click the **Queue Configuration** tab.

**Step 4** Locate the row containing the specified tenant resource name and click **Modify** in the **Operation** column. Modify the parameters based on the scheduler type in use.

 **NOTE**

- YARN in a new cluster uses the Superior scheduler by default. You can switch the scheduler by referring to [Switching the MRS Tenant Resource Scheduler](#).
- To query the scheduler type, log in to Manager and search for the `yarn.resourcemanager.scheduler.class` parameter on the **All Configurations** page of the YARN service.
- You can also access the **Modify Queue Configuration** page as follows: In the tenant list on the **Tenant Resources Management** page, click the target tenant, click the **Resource** tab, and click  next to **Queue Configurations (Queue name)**.
- A queue can be bound to only one non-default resource pool. That is, a newly added resource pool can be bound to only one queue to serve as the default resource pool of the queue.
- For parameters such as **Max Allocated vCores**, **Max Allocated Memory(MB)**, **Max Running Apps**, **Max Running Apps per User**, and **Max Pending Apps**, if the value of a sub-tenant is **-1**, the value of the parent tenant can be set to a specific limit. If the parent tenant value is a specific limit, the sub-tenant value can be set to **-1**.
- **Max Allocated vCores** and **Max Allocated Memory(MB)** must be both changed to values other than **-1**.
- For queues with cross-resource-pool scheduling enabled, existing resource pools cannot be deleted during job running. Otherwise, running jobs may be continuously blocked because they cannot obtain resources. Similarly, if a new resource pool is configured for a queue during job running, the queue in the running state may not immediately use the resources in the new resource pool. The new resources are available only for jobs submitted after modification.
- To use a Superior scheduler cluster, configure sub-tenant properties by referring to the following table.

**Table 6-52** Queue configuration parameters

| Parameter                 | Description                                                                                                                                                                                                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Master Shares (%)     | Indicates the maximum percentage of resources occupied by all ApplicationMasters in the current queue.                                                                                                                   |
| Max Allocated vCores      | Indicates the maximum number of cores that can be allocated to a single YARN container in the current queue. The default value is <b>-1</b> , indicating that the number of cores is not limited within the value range. |
| Max Allocated Memory (MB) | Indicates the maximum memory that can be allocated to a single Yarn container in the current queue. The default value is <b>-1</b> , indicating that the memory is not limited within the value range.                   |

| Parameter                 | Description                                                                                                                                                                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Running Apps          | Indicates the maximum number of tasks that can be executed at the same time in the current queue. The default value is <b>-1</b> , indicating that the number is not limited within the value range (the meaning is the same if the value is empty). The value <b>0</b> indicates that the task cannot be executed. |
| Max Running Apps per User | Maximum number of tasks that can be executed by each user in the current queue at the same time. The default value is <b>-1</b> , indicating that the number is not limited within the value range. If the value is <b>0</b> , the task cannot be executed.                                                         |
| Max Pending Apps          | Indicates the maximum number of tasks that can be suspended at the same time in the current queue. The default value is <b>-1</b> , indicating that the number is not limited within the value range (the meaning is the same if the value is empty). The value <b>0</b> indicates that tasks cannot be suspended.  |
| Resource Allocation Rule  | Indicates the rule for allocating resources to different tasks of a user. The rule can be FIFO or FAIR.<br><br>If a user submits multiple tasks in the current queue and the rule is FIFO, the tasks are executed one by one in sequential order. If the rule is FAIR, resources are evenly allocated to all tasks. |
| Default Resource Label    | Indicates that tasks are executed on a node with a specified resource label.<br><br><b>NOTE</b><br>If you need to use a new resource pool, change the default label to the new resource pool label.                                                                                                                 |
| Cross-Pool Scheduling     | Indicates whether containers in the current queue support cross-pool scheduling. This parameter is available for clusters of MRS 3.3.0 or later.<br><br>This function cannot be enabled for the default queue.                                                                                                      |
| Cross-Pool AM Scheduling  | Indicates whether ApplicationMasters in the current queue support cross-pool scheduling. This parameter is available for clusters of MRS 3.3.0 or later.<br><br>This function cannot be enabled for the default queue.                                                                                              |

| Parameter | Description                                                                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active    | <ul style="list-style-type: none"> <li>- <b>ACTIVE</b>: indicates that the current queue can receive and execute tasks.</li> <li>- <b>INACTIVE</b>: indicates that the current queue can receive but cannot execute tasks. Tasks submitted to the queue are suspended.</li> </ul> |
| Open      | <ul style="list-style-type: none"> <li>- <b>OPEN</b>: indicates that the current queue is opened.</li> <li>- <b>CLOSED</b>: indicates that the current queue is closed. Tasks submitted to the queue are rejected.</li> </ul>                                                     |

- For a cluster using the Capacity scheduler, **Tenant Resource Name (Queue)** indicates the tenant and queue name. Configure sub-tenants properties by referring to the following table.

**Table 6-53** Queue configuration parameters

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Applications           | Specifies the maximum number of applications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Maximum AM Resource Percent    | Specifies the maximum percentage of resources that can be used to run the ApplicationMaster in a cluster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Minimum User Limit Percent (%) | <p>Specifies the minimum percentage of resources consumed by a user.</p> <p>The resources for each user in a queue are limited at any time. If applications of multiple users are running at the same time in a queue, the resource usage of each user fluctuates between the minimum value and the maximum value. The minimum value is determined by the number of running applications, while the maximum value is determined by this parameter.</p> <p>For example, assume that this parameter is set to <b>25</b>. If two users submit applications to the queue, each user can use a maximum of 50% resources; if three users submit applications to the queue, each user can use a maximum of 33% resources; if four users submit applications to the queue, each user can use a maximum of 25% resources.</p> |
| User Limit Factor              | Specifies the limit factor of the maximum user resource usage. The maximum user resource usage percentage can be obtained by multiplying the limit factor with the percentage of the tenant's actual resource usage in the cluster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter                                             | Description                                                                                                                                                                                                                                                 |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status                                                | Specifies the current status of a resource plan.                                                                                                                                                                                                            |
| Default Resource Pool (Default Node Label Expression) | Specifies the resource pool used by a queue. The default value is <b>default</b> . If you want to change the resource pool, configure the queue capacity first. For details, see <a href="#">Configuring the Queue Capacity Policy of a Resource Pool</a> . |

**Step 5** Click **OK**.

----End

**For MRS clusters of 2.x and earlier:**

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** Click the **Dynamic Resource Plan** tab.

**Step 3** Click the **Queue Configuration** tab.

**Step 4** In the tenant queue table, click **Modify** in the **Operation** column of the specified tenant queue.

 **NOTE**

In the tenant list on the left of the **Tenant** tab, click the target tenant. In the window that is displayed, choose **Resource**. On the page that is displayed, click the edit icon to open the queue modification page.

**Table 6-54** Queue configuration parameters

| Parameter                   | Description                                                                                               |
|-----------------------------|-----------------------------------------------------------------------------------------------------------|
| Maximum Applications        | Specifies the maximum number of applications.                                                             |
| Maximum AM Resource Percent | Specifies the maximum percentage of resources that can be used to run the ApplicationMaster in a cluster. |

| Parameter                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Minimum User Limit Percent (%)                        | <p>Specifies the minimum percentage of resources consumed by a user.</p> <p>The resources for each user in a queue are limited at any time. If applications of multiple users are running at the same time in a queue, the resource usage of each user fluctuates between the minimum value and the maximum value. The minimum value is determined by the number of running applications, while the maximum value is determined by this parameter.</p> <p>For example, assume that this parameter is set to <b>25</b>. If two users submit applications to the queue, each user can use a maximum of 50% resources; if three users submit applications to the queue, each user can use a maximum of 33% resources; if four users submit applications to the queue, each user can use a maximum of 25% resources.</p> |
| User Limit Factor                                     | <p>Specifies the limit factor of the maximum user resource usage. The maximum user resource usage percentage can be obtained by multiplying the limit factor with the percentage of the tenant's actual resource usage in the cluster.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Status                                                | <p>Specifies the current status of a resource plan.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Default Resource Pool (Default Node Label Expression) | <p>Specifies the resource pool used by a queue. The default value is <b>default</b>. If you want to change the resource pool, configure the queue capacity first. For details, see <a href="#">Configuring the Queue Capacity Policy of a Resource Pool</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 6.9.4 Managing MRS Tenant Resources

### 6.9.4.1 Managing the MRS Tenant Resource Directory

You can manage the HDFS storage directory used by a specific tenant on MRS. The management operations include adding a tenant directory, modifying the directory file quota, modifying the storage space, and deleting a directory.

#### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

- A tenant associated with HDFS storage resources has been added.

## Managing a Tenant Directory

**Step 1** Go to the **Tenant** page.

- On the MRS management console: Click the target cluster. On the cluster details page, click **Tenant**.
- On the Manager of an MRS 3.x or later cluster: Click **Tenant Resources**.
- On the Manager of an MRS 2.x or later cluster: Click **Tenant**.

**Step 2** In the tenant list on the left, click the target tenant.

**Step 3** Click the resource tab and perform the following operations to manage tenant directory:

- **View the tenant directory.**

View related information in the **HDFS Storage** pane.

- The **File Number Threshold** column provides the quota for files and directories of the tenant directory. (On the MRS management console, this parameter is **Maximum Number of Files/Directories**.)
- The **Storage Space Quota** column indicates storage space size of tenant directories.

- **Add a tenant directory.**

a. In the **HDFS Storage** pane, click **Create Directory**.

- **Parent Directory:** Select a storage directory of a parent tenant.

This parameter is not displayed if the current tenant is not a sub-tenant. If the parent tenant has multiple directories, select any of them.

- **Path:** Enter the tenant directory.

- If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.
- If the current tenant is a sub-tenant, the new path is created in the specified directory.

A complete HDFS storage directory can contain a maximum of 1,023 characters. An HDFS directory name contains digits, letters, spaces, and underscores (\_). The name cannot start or end with a space.

- **Maximum Number of Files/Directories:** Enter the quota of files and directories. This parameter is optional.
- **File Number Threshold (%)** is valid only when **Quota** is set. If the ratio of the number of used files to the value of **Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario. This parameter is available for clusters of MRS 3.x or later.

### NOTE

The number of used files is collected every hour. Therefore, the alarm indicating that the ratio of used files exceeds the threshold is delayed.

- **Storage Space Quota:** Specify the storage space size of the tenant directory.

To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB ( $500/2 = 250$ ).

- **Storage Space Threshold (%):** If the ratio of used storage space to the value of **Space Quota** exceeds this value, an alarm is generated. If this parameter is not specified, no alarm will be reported in this scenario. This parameter is available for clusters of MRS 3.x or later.

 **NOTE**

The used storage space is collected every hour. Therefore, the alarm indicating that the ratio of used storage space exceeds the threshold is delayed.

- b. Click **OK**. The system creates tenant directories in the HDFS root directory.
- **Modify a tenant directory.**
    - a. In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.
    - b. Change the parameter values based on service requirements.
    - c. Click **OK**.
  - **Delete a tenant directory.**
    - a. In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

The default HDFS storage directory set during tenant creation cannot be deleted. Only the newly added HDFS storage directory can be deleted.
    - b. Click **OK**. The tenant directory is deleted.

----End

### 6.9.4.2 Managing MRS Tenant Resource Pools

When hosts in a resource pool need to be adjusted based on service requirements, you can modify members in the resource pool on MRS.

#### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).
- To delete a resource pool, the following requirements must be met:
  - Any queue in a cluster cannot use the resource pool to be deleted as the default resource pool. Before deleting the resource pool, cancel the

default resource pool. For details, see [Configuring the MRS Tenant Queue](#).

- Resource distribution policies of all queues have been cleared from the resource pool being deleted. For details, see [Clearing the MRS Tenant Queue Configuration](#).

## Managing Resource Pools on the MRS Management Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the MRS details page, click **Tenant**.

**Step 4** Click the **Resource Pools** tab.

**Step 5** Locate the row that contains the specified resource pool, and click **Modify** in the **Operation** column.

**Step 6** Manage hosts in a resource pool.

- Adding a host: In the host list on the left, select the specified host name and add it to the resource pool.
- Deleting a host: In the host list on the right, click  next to a host to remove the host from the resource pool. The host list of a resource pool can be left blank.

**Step 7** Click **OK**.

**Step 8** Locate the row that contains the target resource pool in the **Resource Pools** tab, and click **Delete** in the **Operation** column. In the displayed dialog box, click **OK**.

----End

## Managing Resource Pools on Manager

**Step 1** Log in to Manager. Choose **Tenant Resources > Resource Pool**.

For MRS 2.x or earlier versions, choose **Tenant > Resource Pool**.

**Step 2** Locate the row that contains the specified resource pool, and click **Edit** in the **Operation** column.

For MRS 2.x and earlier versions and MRS 3.3.0 and later versions, click **Modify**.

**Step 3** Manage hosts in a resource pool.

- Adding a host: Select the name of a specified host in host list on the left and click >> to add the selected host to the resource pool.
- Deleting a host: In the host list on the right, select the name of a specified host and click << to add the selected host to the resource pool. The host list of a resource pool can be left blank.

**Step 4** Click **OK**.

**Step 5** Locate the row that contains the target resource pool in the **Resource Pools** tab, and click **Delete** in the **Operation** column. In the displayed dialog box, click **OK**.

----End

### 6.9.4.3 Clearing the MRS Tenant Queue Configuration

Users can clear the configuration of a queue on MRS Manager when the queue does not need resources from a resource pool or if a resource pool needs to be disassociated from the queue. Clearing queue configurations means that the resource capacity policy of the queue is canceled.

#### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).
- If a queue is to be unbound from a resource pool, this resource pool cannot serve as the default resource pool of the queue. Therefore, you must first change the default resource pool of the queue to another one. For details, see [Configuring the MRS Tenant Queue](#).

#### Clearing Queue Configuration

**Step 1** Go to the resource distribution policy page.

- On the Manager, the page path is as follows:
  - For MRS 3.x and later versions, choose **Tenant Resources > Dynamic Resource Plan > Resource Distribution Policy**.
  - For MRS 2.x and earlier versions, choose **Tenant > Dynamic Resource Plan > Resource Distribution Policy**.
- On the MRS console: Go to the cluster details page, click **Tenants** and then **Resource Distribution Policies**.

**Step 2** In the **Resource Pools** tab, select a specified resource pool.

**Step 3** Locate the specified queue in the **Resource Allocation** table, and click **Clear** in the **Operation** column.

In the displayed dialog box, click **Yes** to clear the queue configurations from the current resource pool.

#### NOTE

If no resource capacity policy is configured for a queue, the clearing function is unavailable for the queue by default.

----End

### 6.9.4.4 Restoring MRS Tenant Data After YARN Is Reinstalled

Tenant data is stored on Manager and in cluster components by default. When components are restored from faults or reinstalled, some tenant configuration data may be abnormal. In this case, you can manually restore the tenant data.

#### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

#### Restoring Tenant Data

**Step 1** Go to the **Tenant** page.

- On the MRS management console: Click the target cluster. On the cluster details page, click **Tenant**.
- On the Manager of an MRS 3.x or later cluster: Click **Tenant Resources**.
- On the Manager of an MRS 2.x or later cluster: Click **Tenant**.

**Step 2** In the tenant list on the left, click a tenant node.

**Step 3** Check the status of the tenant data.

1. In the **Summary** tab, check **Tenant Status**. A green icon indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resources** and check the status of **Yarn** or **HDFS Storage**. Green indicates that the resource is available, and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Good** indicates that the component can provide services for the associated tenant. **Bad** indicates that the component cannot provide services for the tenant.
4. If any check result is abnormal, go to **Step 4** to restore tenant data.

**Step 4** Click **Restore Tenant Data**.

To restore data on the Manager of an MRS 3.x or later cluster, click . In the displayed dialog box, enter the password of the current user and click **OK**.

**Step 5** In the displayed window, select one or more components whose data needs to be restored. Click **OK**. The system automatically restores the tenant data.

----End

### 6.9.4.5 Deleting an MRS Tenant

You can delete MRS tenants that are no longer used based on service requirements, releasing resources occupied by the tenants.

## Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).
- You have checked whether the tenant to be deleted has sub-tenants. If the tenant has sub-tenants, delete them; otherwise, you cannot delete the tenant.
- The role of the tenant to be deleted cannot be associated with any user or user group.

## Deleting a Tenant on the MRS Management Console

**Step 1** On the MRS details page, click **Tenants**.

**Step 2** In the tenant list on the left, move the cursor to the tenant node to be deleted and click **Delete**.

The **Delete Tenant** dialog box is displayed. If you want to save the tenant data, select **Reserve the data of this tenant**. Otherwise, the tenant's storage space will be deleted.

**Step 3** Click **OK**.

It takes a few minutes to save the configuration. After the tenant is deleted successfully, the role and storage space of the tenant are also deleted.

### NOTE

- After the tenant is deleted, the task queue of the tenant still exists in YARN.
- If you choose not to reserve data when deleting the parent tenant, data of sub-tenants is also deleted if the sub-tenants use storage resources.

----End

## Deleting a Tenant on Manager

**For MRS 3.x and later versions:**

**Step 1** Log in to Manager and choose **Tenant Resources**.

**Step 2** In the tenant list on the left, click the target tenant and click .

### NOTE

- If you want to retain the tenant data, select **Reserve the data of this tenant resource**. Otherwise, the storage space of the tenant will be deleted.
- To delete a tenant without retaining the tenant data as a user who does not belong to the supergroup, you should first log in to the HDFS client as a user who belongs to the supergroup and then manually clear the storage space of that tenant to avoid residual data.

**Step 3** In the **Delete Tenant** dialog box, enter **DELETE** in the confirmation text box. Click **OK**.

It takes a few minutes to save the configuration. After the tenant is deleted successfully, the role and storage space of the tenant are also deleted.

 NOTE

After the tenant is deleted, the task queue of the tenant still exists in YARN. The queue of the tenant is not displayed on the role management page in YARN.

----End

**For MRS 2.x and earlier versions:**

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** In the tenant list on the left, move the cursor to the tenant node to be deleted and click **Delete**.

The **Delete Tenant** dialog box is displayed. If you want to save the tenant data, select **Reserve the data of this tenant**. Otherwise, the tenant's storage space will be deleted.

**Step 3** Click **OK**.

It takes a few minutes to save the configuration. After the tenant is deleted successfully, the role and storage space of the tenant are also deleted.

 NOTE

- After the tenant is deleted, the task queue of the tenant still exists in YARN.
- If you choose not to reserve data when deleting the parent tenant, data of sub-tenants is also deleted if the sub-tenants use storage resources.

----End

## 6.9.4.6 Managing Global User Policies When Using Superior Scheduler

### Scenario

If a tenant uses a Superior scheduler, you can configure the global policy for users to use the resource scheduler, including:

- Maximum running apps
- Maximum pending apps
- Default queue

### Procedure

- Add a policy.
  - a. On FusionInsight Manager, choose **Tenant Resources**.
  - b. Choose **Dynamic Resource Plan**.
  - c. Click the **Global User Policy** tab.

 NOTE

**defaults(default setting)** indicates that the policy specified for **defaults** is used if a user does not have a global policy. The default policy cannot be deleted.

- d. Click **Create Global User Policy**. In the displayed dialog box, set the following parameters:

**Figure 6-61** Creating a global user policy

### Global User Policy

\* Cluster:

\* Username:

Max Running Apps:

Max Pending Apps:

Default Queue:

- **Cluster:** Select the target cluster.
  - **Username:** indicates the user for whom resource scheduling is controlled. Enter an existing username in the current cluster.
  - **Max Running Apps:** indicates the maximum number of tasks that the user can run in the current cluster.
  - **Max Pending Apps:** indicates the maximum number of tasks that the user can suspend in the current cluster.
  - **Default Queue:** indicates the queue of the user. Enter the name of an existing queue in the current cluster.
- Modify a policy.
    - a. On FusionInsight Manager, choose **Tenant Resources**.
    - b. Choose **Dynamic Resource Plan**.
    - c. Click the **Global User Policy** tab.
    - d. In the row that contains the desired user policy, click **Modify** in the **Operation** column.
    - e. In the displayed dialog box, modify parameters and click **OK**.
  - Delete a policy.
    - a. On FusionInsight Manager, choose **Tenant Resources**.
    - b. Choose **Dynamic Resource Plan**.
    - c. Click the **Global User Policy** tab.
    - d. In the row that contains the desired user policy, click **Delete** in the **Operation** column.  
In the displayed dialog box, click **OK**.

## 6.9.4.7 Clearing Tenant's Non-Associated Queues Using Capacity Scheduler

### Scenario

If Yarn uses the Capacity scheduler, deleting a tenant only sets the queue capacity of the tenant to **0** and the tenant status to **STOPPED** but does not clear the queues of the tenant in Yarn. Limited by the Yarn mechanism, queues cannot be dynamically deleted. You can run commands to manually delete residual queues.

### Impact on the System

- During the script execution, the Controller service is restarted, Yarn configurations are synchronized, and the active and standby ResourceManagers are restarted.
- FusionInsight Manager becomes inaccessible during the restart of the Controller service.
- After the active and standby ResourceManagers are restarted, an alarm is generated indicating that Yarn and components that depend on Yarn are temporarily unavailable.

### Prerequisites

Queues of a deleted tenant still exist.

### Procedure

**Step 1** Check that queues of the deleted tenant still exist.

1. On FusionInsight Manager, choose **Cluster**, click the name of the target cluster, and choose **Services > Yarn**. Click the link of the active ResourceManager in **ResourceManager WebUI** to go to the ResourceManager web UI.
2. Click **Scheduler** in the navigation tree on the left. In the right pane, you can view that queues of the tenant still exist in the **STOPPED** state and their **Configured Capacity** is **0**.

**Step 2** Log in to the active management node as user **omm**.

**Step 3** Switch the directory and execute the **cleanQueuesAndRestartRM.sh** script.

```
cd ${BIGDATA_HOME}/om-server/om/sbin
./cleanQueuesAndRestartRM.sh -c Cluster ID
```

#### NOTE

You can choose **Cluster**, click the cluster name, and choose **Cluster Properties** on FusionInsight Manager to view the cluster ID.

During the script execution, you need to enter **yes** and the password.

```
Running the script will restart Controller and restart ResourceManager.
Are you sure you want to continue connecting (yes/no)?yes
Please input admin password:
Begin to backup queues ...
...
```

- Step 4** After the script is executed successfully, log in to FusionInsight Manager, choose **Cluster**, click the cluster name, and choose **Services > Yarn**. Click the link of the active ResourceManager in **ResourceManager WebUI** to go to the ResourceManager web UI.
- Step 5** Click **Scheduler** in the navigation tree on the left. In the right pane, you can view that queues of the tenant have been cleared.
- End

## 6.9.5 Switching the MRS Tenant Resource Scheduler

### Scenario

The newly installed MRS cluster uses the Superior scheduler by default. If the cluster is upgraded from an earlier version, you can switch the YARN scheduler from the Capacity scheduler to the Superior scheduler with a few clicks.

### Prerequisites

- The network connectivity of the cluster is proper and secure, and the YARN service status is normal.
- During scheduler switching, tenants cannot be added, deleted, or modified. In addition, services cannot be started or stopped.

### Switching from the Capacity Scheduler to the Superior Scheduler

#### Impact on the system

- Because the ResourceManager is restarted during scheduler switching, submitting jobs to YARN will fail at that time.
- During scheduler switching, tasks in a job being executed on YARN will continue, but new tasks cannot be started.
- After scheduler switching is complete, jobs executed on YARN may fail, causing service interruptions.
- After scheduler switching is complete, parameters of the Superior scheduler are used for tenant management.
- After scheduler switching is complete, tenant queues whose capacity is 0 in the Capacity scheduler cannot be allocated resources in the Superior scheduler. As a result, jobs submitted to these tenant queues fail to be executed. Therefore, you are advised not to set the capacity of a tenant queue to 0 in the Capacity scheduler.
- After scheduler switching is complete, you cannot add or delete resource pools, YARN node labels, or tenants during the observation period. If such an operation is performed, the scheduler cannot be rolled back to the Capacity scheduler.

#### NOTE

The recommended observation period for scheduler switching is one week. If resource pools, YARN node labels, or tenants are added or deleted during this period, the observation period ends immediately.

- Rollback may cause the loss of partial or all Yarn job information.

### Procedure

**Step 1** Modify YARN service parameters and ensure that the YARN service status is normal.

1. Log in to FusionInsight Manager as an administrator.
2. Log in to FusionInsight Manager and choose **Cluster > Services > Yarn**. Click **Configurations** then **All Configurations**, search for **yarn.resourcemanager.webapp.pagination.enable**, and check whether the value is **true**.
  - If yes, go to **Step 1.3**.
  - If no, set the parameter to **true** and click **Save** to save the configuration. On the **Dashboard** tab page of YARN, choose **More > Restart Service**, verify the identity, and click **OK**. After the service is restarted, go to **Step 1.3**.
3. Choose **Cluster > Name of the desired cluster > Services**, and check whether the YARN service status is normal.

**Step 2** Log in to the active management node as user **omm**.

**Step 3** Switch the scheduler.

The following switching modes are available:

**0**: converts the Capacity scheduler configurations into the Superior scheduler configurations and then switches the Capacity scheduler to the Superior scheduler.

**1**: converts the Capacity scheduler configurations into the Superior scheduler configurations only.

**2**: switches the Capacity scheduler to the Superior scheduler only.

- Mode **0** is recommended if the cluster environment is simple and the number of tenants is less than 20.

Run the following command:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c Cluster ID -m 0
```

#### NOTE

You can choose **Cluster**, click the cluster name, and choose **Cluster Properties** on FusionInsight Manager to view the cluster ID.

```
Start to convert Capacity scheduler to Superior Scheduler, clusterId=1
Start to convert Capacity scheduler configurations to Superior. Please wait...
Convert configurations successfully.
Start to switch the Yarn scheduler to Superior. Please wait...
Switch the Yarn scheduler to Superior successfully.
```

- If the cluster environment or tenant information is complex and you need to retain the queue configurations of the Capacity scheduler on the Superior scheduler, it is recommended that you use mode **1** first to convert the Capacity scheduler configurations, check the converted configurations, and then use mode **2** to switch the Capacity scheduler to the Superior scheduler.
  - a. Run the following command to convert the Capacity scheduler configurations into the Superior scheduler configurations:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c
Cluster ID -m 1
```

```
Start to convert Capacity scheduler to Superior Scheduler, clusterId=1
Start to convert Capacity scheduler configurations to Superior. Please wait...
Convert configurations successfully.
```

- b. Run the following command to switch the Capacity scheduler to the Superior scheduler:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c
Cluster ID -m 2
```

```
Start to convert Capacity scheduler to Superior Scheduler, clusterId=1
Start to switch the Yarn scheduler to Superior. Please wait...
Switch the Yarn scheduler to Superior successfully.
```

- If you do not need to retain the queue configurations of the Capacity scheduler, use mode 2.
  - a. Log in to FusionInsight Manager and delete all tenants except the default tenant.
  - b. On FusionInsight Manager, delete all resource pools except the default resource pool.

Run the following command to switch the Capacity scheduler to the Superior scheduler:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c
Cluster ID -m 2
```

```
Start to convert Capacity scheduler to Superior Scheduler, clusterId=1
Start to switch the Yarn scheduler to Superior. Please wait...
Switch the Yarn scheduler to Superior successfully.
```

#### NOTE

You can query the scheduler switching logs on the active management node.

- `${BIGDATA_LOG_HOME}/controller/aos/switch_scheduler.log`
- `${BIGDATA_LOG_HOME}/controller/aos/aos.log`

----End

## Rollback Operations

You can manually switch the Superior scheduler back to the Capacity scheduler. However, this operation is only a workaround and is not allowed in most cases.

If the customer has special requirements for switching back to the Capacity scheduler, the following conditions must be met:

- The observation period has not expired.
- No resource pool, YARN node label, or tenant is added or deleted during the observation period.

---

#### NOTICE

If resource pools, YARN node labels, or tenants are added or deleted, resource pools or queues may not exist after the Superior scheduler is switched back to the Capacity scheduler. As a result, the Capacity scheduler cannot run properly.

---

The procedure is as follows:

**Step 1** Change the scheduler to the Capacity scheduler and start YARN.

1. Log in to FusionInsight Manager.
2. Go to the **Configurations** page of YARN and modify the parameters listed in [Table 6-55](#).

**Table 6-55** Modifying YARN configuration items

| Parameter                                     | Description                                                                        |
|-----------------------------------------------|------------------------------------------------------------------------------------|
| yarn.resourcemanager.scheduler.class          | org.apache.hadoop.yarn.server.resourcemanager.scheduler.capacity.CapacityScheduler |
| yarn.http.rmwebapp.external.classes           | Left empty                                                                         |
| hadoop.http.rmwebapp.scheduler.page.classes   | Left empty                                                                         |
| yarn.resourcemanager.webapp.pagination.enable | false                                                                              |

3. Click **Save** and then click **OK** in the displayed dialog box.
4. Roll restart the YARN service, enter the password, and click **OK**.

**Step 2** Log in to the active management node and restart the AOS service.

1. Log in to the active OMS server as user **omm** using PuTTY.
2. Run the following command to disable logout upon timeout:

```
TMOUT=0
```

 **NOTE**

After the operations in this section are complete, run the **TMOUT=Timeout interval** command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

3. Run the following command to restart the AOS service:  
**`\${BIGDATA\_HOME}/om-server/om/sbin/aos\_cmd.sh restart**

----End

## 6.10 Managing MRS Cluster Users

### 6.10.1 Cluster User Permissions

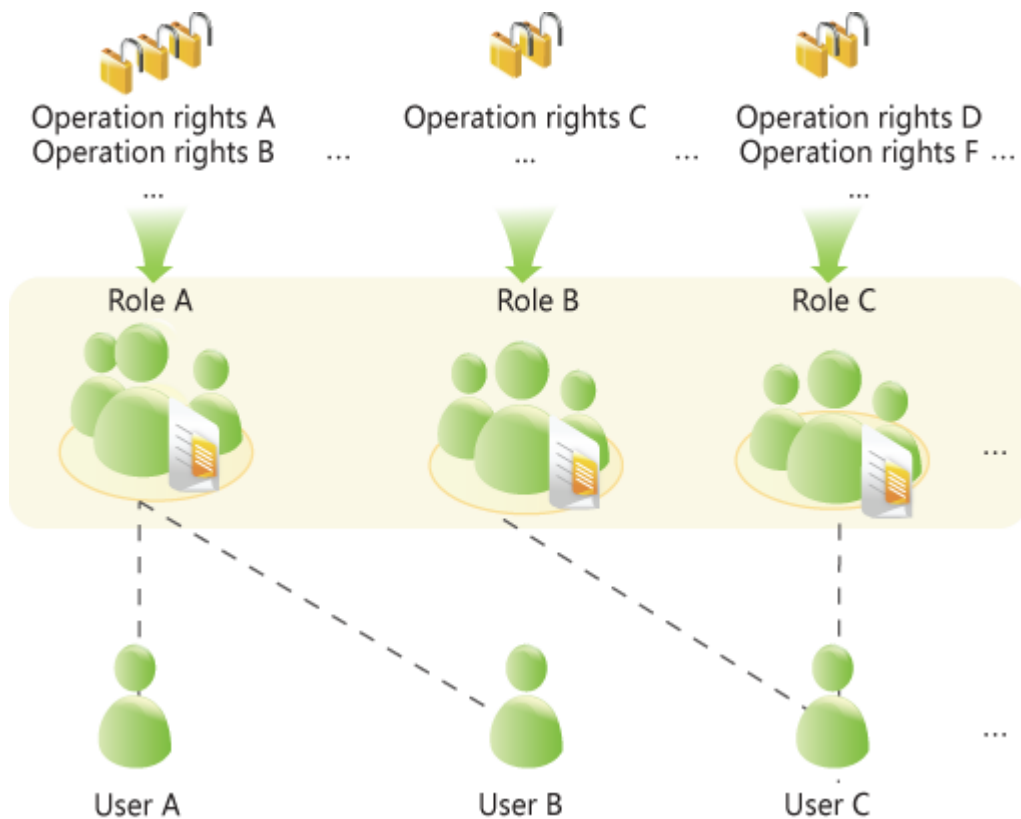

### 6.10.1.1 MRS Cluster User Permission Model

#### Role-based Access Control

MRS adopts the role-based access control (RBAC) mode to manage rights on the big data system. It integrates the right management functions of the components to centrally manage rights. Common users are shielded from internal right management details, and the right management operations are simplified for administrators, improving right management usability and user experience.

The right model of MRS consists four parts: users, user groups, roles, and rights.

**Figure 6-62** Right model

- **Right**

Right, which is defined by components, allows users to access a certain resource of one component. Different components have different rights for their resources.

For example:

- HDFS provides read, write, and execute permissions on files.
- HBase provides create, read, and write permissions on tables.

- **Role**

Role is a collection of component rights. Each role can have multiple rights of multiple components. Different roles can have the rights of a resource of one component.

- **User group**

User group is a collection of users. When a user group is bound to a role, users in this group obtain the rights defined by the role.

Different user groups can be associated with the same role. A user group can also be associated with no role, and this user group does not have the rights of any component resources.

 **NOTE**

In some components, the system grants related rights to specific user groups by default.

- **User**

A user is a visitor to the system. Each user has the rights of the user group and role associated with the user. Users need to be added to the user group or associated with roles to obtain the corresponding rights.

## Policy-based Access Control

The Ranger component uses policy-based access control (PBAC) to manage rights and implement fine-grained data access control on components such as HDFS, Hive, and HBase.

 **NOTE**

The component supports only one right control mechanism. After the Ranger right control policy is enabled for the component, the right on the component in the role created on FusionInsight Manager becomes invalid (The ACL rules of HDFS and Yarn still take effect). You need to add a policy on the Ranger management page to grant rights on resources.

The Ranger right model consists of multiple right policies. A right policy consists of the following parts:

- **Resource**

Resources are provided by components and can be accessed by users, such as HDFS files or folders, queues in Yarn, and databases, tables, and columns in Hive.

- **User**

A User is a visitor to the system. The rights of each user are obtained based on the policy associated with the user. Information about users, user groups, and roles in the LDAP is periodically synchronized to the Ranger.

- **Permission**

In a policy, you can configure various access conditions for resources, such as file read and write, permission conditions, rejection conditions, and exception conditions.

## Permission Mechanism

MRS adopts the Lightweight Directory Access Protocol (LDAP) to store data of users and user groups. Information about role definitions is stored in the relational database and the mapping between roles and rights is saved in components.

MRS uses Kerberos for unified authentication.

The user permission verification process is as follows:

1. A client (a user terminal or MRS component service) invokes the MRS authentication interface.
2. MRS uses the login username and password for Kerberos authentication.
3. If the authentication succeeds, the client sends a request for accessing the server (an MRS component service).
4. The server finds the user group and role to which the login user belongs.
5. The server obtains all rights of the user group and the role.
6. The server checks whether the client has the right to access the resources it applies for.

**Example (RBAC):**

There are three files in HDFS, that is, fileA, fileB, and fileC.

- roleA has read and write right for fileA, and roleB has the read right for fileB.
- groupA is bound to roleA, and groupB is bound to roleB.
- userA belongs to groupA and roleB, and userB belongs to groupB.

When userA successfully logs in to the system and accesses the HDFS:

1. HDFS obtains the role (roleB) to which userA is bound.
2. HDFS also obtains the role (roleA) to which the user group of userA is bound.
3. In this case, userA has all the rights of roleA and roleB.
4. As a result, userA has read and write rights for fileA, has the read right on fileB, and has no right for fileC.

Similarly, when userB successfully logs in to the system and accesses the HDFS:

1. userB only has the rights of roleB.
2. As a result, userB has the read right on fileB, and has no rights for fileA and fileC.

### 6.10.1.2 MRS Cluster User Identity Authentication Policy

The big data platform performs user identity authentication to prevent invalid users from accessing the cluster. The cluster provides authentication capabilities in both security mode and normal mode.

#### Security Mode

The clusters in security mode use the Kerberos authentication protocol for security authentication. The Kerberos protocol supports mutual authentication between clients and servers. This eliminates the risks incurred by sending user credentials over the network for simulated authentication. In clusters, KrbServer provides the Kerberos authentication support.

**Kerberos user object**

In the Kerberos protocol, each user object is a principal. A complete principal consists of username and domain name. In O&M or application development scenarios, the user identity must be verified before a client connects to a server. Users for O&M and service operations are classified into human-machine and machine-machine users. The password of human-machine users is manually

configured, while the password of machine-machine users is generated by the system randomly.

### Kerberos authentication

Kerberos supports password and keytab authentication. The validity period of authentication is 24 hours by default.

- Password authentication: User identity is verified by entering the correct password. This mode mainly used in O&M scenarios where human-machine users are used. The configuration command is **kinit** *Username*.
- Keytab authentication: Keytab files contain users' principal and encrypted credential information. When keytab files are used for authentication, the system automatically uses encrypted credential information to perform authentication and the user password does not need to be entered. This mode is mainly used in component application development scenarios where machine-machine users are used. Keytab authentication can also be configured using the **kinit** command.

## Normal Mode

Different components in a normal cluster use the native open-source authentication mode and do not support the **kinit** authentication command. FusionInsight Manager (including DBService, KrbServer, and LdapServer) uses the username and password for authentication. [Table 6-56](#) lists the authentication modes used by components.

**Table 6-56** Component authentication modes

| Service    | Authentication Mode                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------|
| IoTDB      | Simple authentication                                                                                               |

| ZooKeeper | Simple authentication                                                                                                                  |

The authentication modes are as follows:

- Simple authentication: When the client connects to the server, the client automatically authenticates the user (for example, the OS user **root** or **omm**) by default. The authentication is imperceptible to the administrator or service user, which does not require **kinit**.
- Username and password authentication: Use the username and password of human-machine users in the cluster for authentication.
- No authentication: Any user can access the server by default.

### 6.10.1.3 MRS Cluster User Permission Authentication Policy

#### Security Mode

After a user is authenticated by the big data platform, the system determines whether to verify the user's permission based on the actual permission management configuration to ensure that the user has limited or all permission on resources. If the user does not have the permission for accessing cluster resources, the system administrator must grant the required permission to the user. Otherwise, the user fails to access the resources. The cluster provides permission verification capabilities in both security mode and normal mode. The specific permission items of the components are the same in the two modes.

By default, the Ranger service is installed and Ranger authentication is enabled for a newly installed cluster in security mode. You can set fine-grained security access policies for accessing component resources through the permission plug-in of the component. If Ranger authentication is not required, administrators can manually disable it on the service page. After Ranger authentication is disabled, the system continues to perform permission control based on the role model of FusionInsight Manager when accessing component resources.

In a cluster in security mode, the following components support Ranger authentication: HDFS, YARN, Kafka, Hive, HBase, Storm, Impala, HetuEngine, CDL, and Spark2x.

For a cluster upgraded from an earlier version, Ranger authentication is not used by default when users access component resources. The administrator can manually enable Ranger authentication after installing Ranger.

By default, all components in the cluster of the security edition authenticate access. The authentication function cannot be disabled.

## Normal Mode

Different components in a normal cluster use their own native open-source authentication behavior. [Table 6-57](#) lists detailed permission verification modes.

In a normal cluster, Ranger supports permission control on component resources based on OS users. The following components support Ranger authentication: HBase, HDFS, Hive, Spark2x, and YARN.

**Table 6-57** Component permission verification modes in normal clusters

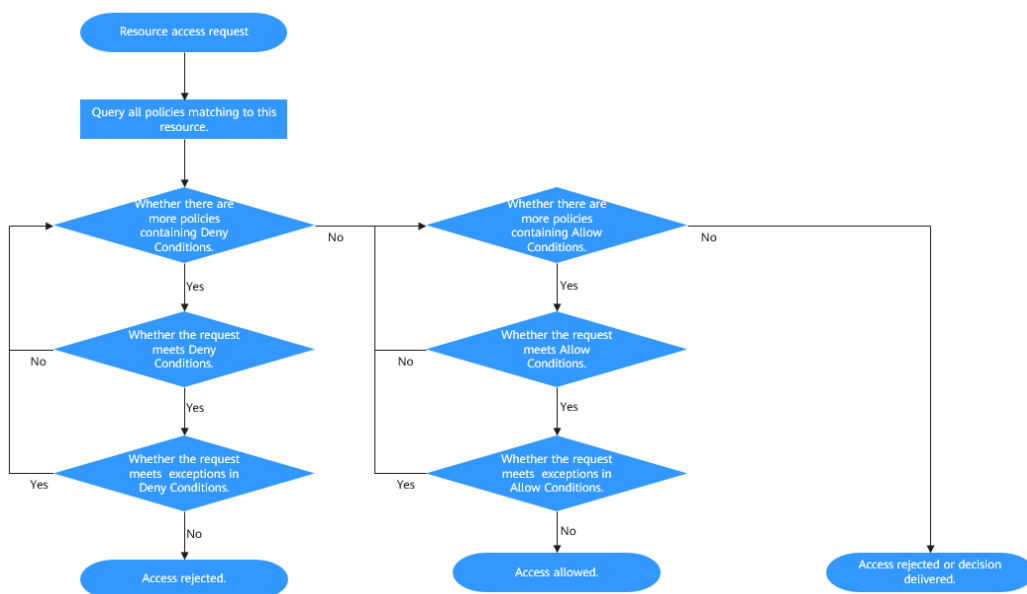

| Service    | Permission Verification | Permission Verification Enabling and Disabling |
|------------|-------------------------|------------------------------------------------|
| IoTDB      | Required                | Not supported                                  |
| ClickHouse | Required                | Not supported                                  |
| Flume      | Not required            | Not supported                                  |
| HBase      | Not required            | Supported                                      |
| HDFS       | Required                | Supported                                      |
| HetuEngine | Not required            | Not supported                                  |
| Hive       | Not required            | Not supported                                  |
| Hue        | Not required            | Not supported                                  |
| Kafka      | Not required            | Not supported                                  |
| Loader     | Not required            | Not supported                                  |
| MapReduce  | Not required            | Not supported                                  |
| Oozie      | Required                | Not supported                                  |
| Spark2x    | Not required            | Not supported                                  |
| Storm      | Not required            | Not supported                                  |
| YARN       | Not required            | Supported                                      |
| ZooKeeper  | Required                | Supported                                      |
| CDL        | Not required            | Not supported                                  |

## Condition Priorities of the Ranger Permission Policy

When configuring a permission policy for a resource, you can configure Allow Conditions, Exclude from Allow Conditions, Deny Conditions, and Exclude from Deny Conditions for the resource, to meet unexpected requirements in different scenarios.

The priorities of different conditions are listed in descending order: Exclude from Deny Conditions > Deny Conditions > Exclude from Allow Conditions > Allow Conditions

The following figure shows the process of determining condition priorities. If the component resource request does not match the permission policy in Ranger, the system rejects the access by default. However, for HDFS and Yarn, the system delivers the decision to the access control layer of the component for determination.

For example, if you want to grant the read and write permissions of the **FileA** folder to the **groupA** user group, but the user in the group is not **UserA**, you can add an allowed condition and an exception condition.

### 6.10.1.4 Default Permissions of the MRS Cluster

#### Role

| Default Role          | Description                                                                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Manager_administrator | Manager administrator who has all permissions for Manager.<br>Manager administrators can create first-level tenants, create and modify user groups, and specify user permissions. |
| Manager_operator      | Manager operator who has all the permissions on the <b>Homepage</b> , <b>Cluster</b> , <b>Hosts</b> , and <b>O&amp;M</b> tab pages.                                               |

| Default Role              | Description                                                                                                                                                                                                                                                                      |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Manager_auditor           | Manager auditor who has all permissions on the <b>Audit</b> tab page.<br>Manager auditors can view and manage Manager system audit logs.                                                                                                                                         |
| Manager_viewer            | Manager viewer who has the permission to view information about <b>Homepage, Cluster, Hosts, Alarm, Events</b> , and <b>System &gt; Permission</b> , and download clients. (Only MRS 3.2.0 or later supports client download.)                                                   |
| Manager_tenant            | Manager tenant administrator.<br>This role can create and manage sub-tenants for the non-leaf tenants to which the current user belongs. It has the permission to view alarms and events on <b>O&amp;M &gt; Alarm</b> .                                                          |
| System_administrator      | System administrator, this role has Manager system administrator rights and all services administrator rights.                                                                                                                                                                   |
| default                   | This role is the default role created for the <b>default</b> tenant. It has the management permissions on the Yarn component and the default queue. The default role of the default tenant that is not the first cluster to be installed is <b>c&lt;cluster ID&gt;_default</b> . |
| Manager_administrator_180 | FusionInsight Manager System administrator group. Internal system user group, which is used only between components.                                                                                                                                                             |
| Manager_auditor_181       | FusionInsight Manager system auditor group. Internal system user group, which is used only between components.                                                                                                                                                                   |
| Manager_operator_182      | FusionInsight Manager system operator group. Internal system user group, which is used only between components.                                                                                                                                                                  |
| Manager_viewer_183        | FusionInsight Manager system viewer group. Internal system user group, which is used only between components.                                                                                                                                                                    |
| System_administrator_186  | System administrator group. Internal system user group, which is used only between components.                                                                                                                                                                                   |
| Manager_tenant_187        | Tenant system user group. Internal system user group, which is used only between components.                                                                                                                                                                                     |
| default_1000              | This group is created for tenant. Internal system user group, which is used only between components.                                                                                                                                                                             |

## User group

| Type          | Default User Group                                                                                                                      | Description                                                                                                                                                                                                                                                                                                                                      |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OS User Group | hadoop                                                                                                                                  | Users added to this group are granted the permission to submit all Yarn queue tasks.                                                                                                                                                                                                                                                             |
|               | hadoopmanager                                                                                                                           | Users added to this user group can have the O&M manager rights of HDFS and Yarn. The O&M manager of HDFS can access the NameNode WebUI and perform active to standby switchover manually. The O&M manager of Yarn can access the ResourceManager WebUI, operate NodeManager nodes, refresh queues, and set node labels, but cannot submit tasks. |
|               | hetuadmin                                                                                                                               | HetuEngine administrator group. Users in this group have the permission to perform operations on HSConsole.                                                                                                                                                                                                                                      |
|               | hive                                                                                                                                    | Common user group. Hive users must belong to this user group.                                                                                                                                                                                                                                                                                    |
|               | iotdbgroup                                                                                                                              | Users added to this user group have the administrator rights of the IoTDB component.                                                                                                                                                                                                                                                             |
|               | kafka                                                                                                                                   | Kafka common user group. A user in this group can access a topic only when a user in the kafkaadmin group grants the read and write permission of the topic to the user.                                                                                                                                                                         |

Users added to this group have the read and write permissions on all topics.                                                                                                                                                                                                                               |
|               | cdladmin                                                                                                                                | CDL administrator group. Only users in this group can access CDL APIs.                                                                                                                                                                                                                                                                           |
|               | cdl                                                                                                                                     | Common user group of CDL. Users in this group can create and query CDL jobs.                                                                                                                                                                                                                                                                     |
|               | storm                                                                                                                                   | Users who are added to the storm user group can submit topologies and manage their own topologies.                                                                                                                                                                                                                                               |
|               | stormadmin                                                                                                                              | Users who are added to the stormadmin user group can have the storm administrator rights and can submit topologies and manage all topologies.                                                                                                                                                                                                    |
|               | supergroup                                                                                                                              | Users added to this user group have the administrator rights of HBase, HDFS, and Yarn and can use Hive.                                                                                                                                                                                                                                          |
| yarnviewgroup | Indicates the read-only user group of the Yarn task. Users in this user group can have the view permission on Yarn and MapReduce tasks. |                                                                                                                                                                                                                                                                                                                                                  |

| Type          | Default User Group | Description                                                                                                                                                                                                                                         |
|---------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | check_sec_ldap     | Perform internal test on the active LDAP to see whether it works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. Internal system user group, which is used only between components. |
|               | compcommon         | System internal group for accessing cluster system resources. All system users and system running users are added to this user group by default.                                                                                                    |
| OS User Group | wheel              | Primary group of the FusionInsight internal running user omm.                                                                                                                                                                                       |
|               | ficommon           | System common group that corresponds to <b>compcommon</b> for accessing cluster common resource files stored in the OS.                                                                                                                             |

 **NOTE**

If the current cluster is not the cluster that is installed for the first time in FusionInsight Manager, the default user group name of all components except Manager in the cluster is *c<cluster ID>\_ default user group name*, for example, **c2\_hadoop**.

## User

For details, see [MRS Cluster User Accounts](#).

## Service-related User Security Parameters

- **HDFS**  
The **dfs.permissions.superusergroup** parameter specifies the administrator group with the highest permission on the HDFS. The default value is **supergroup**.
- **Spark2x**  
The **spark.admin.acls** parameter specifies the administrator list of the Spark2x. Members in the list are authorized to manage all Spark tasks. Users not added in the list cannot manage all Spark tasks. The default value is **admin**.

### 6.10.1.5 Synchronizing IAM Users to MRS

IAM user synchronization is to synchronize IAM users bound with MRS policies to the MRS system and create accounts with the same usernames but different passwords as the IAM users. Then, you can use an IAM username (the password needs to be reset by user **admin** of Manager) to log in to Manager for cluster management, and submit jobs on the GUI in a cluster with Kerberos authentication enabled.

**Table 6-58** compares IAM users' permission policies and the synchronized users' permissions on MRS. For details about the default permissions on Manager, see [Default Permissions of the MRS Cluster](#).

**Table 6-58** Policy and permission mapping after synchronization

| Policy Type  | IAM Policy           | User's Default Permissions on MRS After Synchronization                                                                                                                                                                                                         | Have Permission to Perform the Synchronization | Have Permission to Submit Jobs |
|--------------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|--------------------------------|

| Custom      | Custom policy        | <ul style="list-style-type: none"> <li>• Manager_viewer</li> <li>• default</li> <li>• launcher-job</li> </ul>                                                                                                                                                   | <ul style="list-style-type: none"> <li>• If custom policies use RBAC policies as a template, refer to the RBAC policies.</li> <li>• If custom policies use fine-grained policies as a template, refer to the fine-grained policies. The fine-grained policies are recommended.</li> </ul> | Yes                            |

 NOTE

To facilitate user permission management, use fine-grained policies rather than RBAC policies. In fine-grained policies, the Deny action takes precedence over other actions.

- A user has permission to synchronize IAM users only when the user has the Tenant Administrator role or has the Server Administrator, Tenant Guest, and MRS Administrator roles at the same time.
- A user with the **action:mrs:cluster:syncUser** policy has permission to synchronize IAM users.

## Synchronizing IAM Users

- Step 1** Create a user and authorize the user to use MRS. For details, see [Creating an IAM User and Granting MRS Permissions](#).
- Step 2** Log in to the MRS management console and create a cluster. For details, see [Manually Buying an MRS Cluster](#).
- Step 3** In the navigation pane on the left, choose **Active Clusters**. Click a cluster name to go to the cluster details page.
- Step 4** On the **Dashboard** tab page, click **Synchronize** next to **IAM User Sync** to synchronize IAM users.
- Step 5** In the **IAM User Sync** dialog box, search for the user group to which the IAM user to be synchronized belongs and click the user group name. In the **User** column, select the desired IAM user and click **Synchronize**.

 NOTE

- You can select all users to synchronize them at a time.
  - If you select user groups only, users will not be synchronized. You must select specific user names in the user group.
  - All user groups are displayed. Those cannot be selected cannot be synchronized.
- Step 6** After a synchronization request is sent, choose **Operation Logs** in the navigation tree on the left of the MRS console to check whether the synchronization is successful. For details about the logs, see [Viewing MRS Operation Logs](#).
  - Step 7** After the synchronization is successful, use the user synchronized with IAM to perform subsequent operations.

 NOTE

- When the policy of the user group to which the IAM user belongs changes from **MRS ReadOnlyAccess** to **MRS CommonOperations**, **MRS FullAccess**, or **MRS Administrator**, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from **MRS CommonOperations**, **MRS FullAccess**, or **MRS Administrator** to **MRS ReadOnlyAccess**, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.
- After you click **Synchronize** on the right side of **IAM User Sync**, the cluster details page is blank for a short time, because user data is being synchronized. The page will be properly displayed after the data synchronization is complete.

- Submitting jobs in a security cluster: Users can submit jobs using the job management function on the GUI in the security cluster. For details, see [Running a MapReduce Job](#).
- All tabs are displayed on the cluster details page, including **Components**, **Tenants**, and **Backups & Restorations**.
- Logging in to Manager
  - a. Log in to Manager as user **admin**. For details, see [Accessing MRS Manager](#).
  - b. Initialize the password of the user synchronized with IAM. For details, see [Initializing MRS Cluster User Passwords](#).
  - c. Modify the role bound to the user group to which the user belongs to control user permissions on Manager. For details, see [Managing MRS Cluster User Groups](#). For details about how to create and modify a role, see [Creating a Role](#). After the component role bound to the user group to which the user belongs is modified, it takes some time for the role permissions to take effect.
  - d. Log in to Manager using the user synchronized with IAM and the password after the initialization in [Step 7.b](#).

 **NOTE**

If the IAM user's permission changes, go to [Step 4](#) to perform second synchronization. After the second synchronization, a system user's permissions are the union of the permissions defined in the IAM system policy and the permissions of roles added by the system user on Manager. After the second synchronization, a custom user's permissions are subject to the permissions configured on Manager.

- System user: If all user groups to which an IAM user belongs are bound to system policies (RABC policies and fine-grained policies belong to system policies), the IAM user is a system user.
- Custom user: If the user group to which an IAM user belongs is bound to any custom policy, the IAM user is a custom user.

#### **Step 8** Undo IAM user synchronization.

To undo the synchronization of an IAM user, select the user in the **User** column in the **Synchronized** tab and click **Undo Sync**.

To undo the synchronization of all users in an IAM user group, select the user group in the **User Group** column in the **Synchronized** tab and click **Undo Sync**.

----End

## 6.10.2 MRS Cluster User Accounts

This section describes information about default users in MRS clusters.

### Account List (MRS 3.x and Later Versions)

- **User types**

The MRS cluster provides the following three types of users. The system administrator needs to periodically change the passwords. It is not recommended to use the default passwords.

| User Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System users          | <ul style="list-style-type: none"> <li>● User created on FusionInsight Manager for O&amp;M and service scenarios. There are two types of users:                             <ul style="list-style-type: none"> <li>– <b>Human-machine</b> user: used in scenarios such as FusionInsight Manager O&amp;M and operations on a component client. When creating a user of this type, you need to set password and confirm password by referring to <a href="#">Creating an MRS Cluster User</a>.</li> <li>– <b>Machine-machine</b> user: used for system application development.</li> </ul> </li> <li>● User who runs OMS processes</li> </ul> |
| Internal system users | Internal user to perform Kerberos authentication, process communications, save user group information, and associate user permissions. It is recommended that internal system users not be used in O&M scenarios. Operations can be performed as user <b>admin</b> or another user created by the system administrator based on service requirements.                                                                                                                                                                                                                                                                                       |
| Database users        | <ul style="list-style-type: none"> <li>● User who manages OMS database and accesses data</li> <li>● User who runs service components (Hue, Hive, HetuEngine, Loader, Oozie, Ranger, JobGateway, and DBService) in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                  |

- **System user**

 **NOTE**

- User **root** of the OS is required, the password of user **root** on all nodes must be the same.
- User **ldap** of the OS is required. Do not delete this account. Otherwise, the cluster may not work properly. The OS administrator maintains the password management policies.

| User Type            | Username | Initial Password      | Description                                                                                                                                                                                                                                                                                                                                     | Password Change Method                                                                                 |
|----------------------|----------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| System administrator | admin    | User-defined password | <p>FusionInsight Manager administrator.</p> <p><b>NOTE</b><br/>By default, user <b>admin</b> does not have the management permission on other components. For example, when accessing the native UI of a component, the user fails to access the complete component information due to insufficient management permission on the component.</p> | For details, see <a href="#">Changing or Resetting the Password for User admin of an MRS Cluster</a> . |
| Node OS user         | ommdba   | Random password       | User that creates the system database. This user is an OS user generated on the management node and does not require a unified password. This account cannot be used for remote login.                                                                                                                                                          | For details, see <a href="#">Changing the Passwords for OS Users of an MRS Cluster Node</a> .          |
|                      | omm      | Random password       | Internal running user of the system. This user is an OS user generated on all nodes and does not require a unified password.                                                                                                                                                                                                                    |                                                                                                        |

- **Internal system user**

| User Type                  | Default User             | Initial Password                                                                                                                                                  | Description                                                                  | Password Change Method                                                                                                                                                                                                                                                    |

 **NOTE**

Log in to FusionInsight Manager, choose **System > Permission > Domain and Mutual Trust**, and check the value of **Local Domain**. In the preceding table, all letters in the system domain name contained in the username of the system internal user are lowercase letters.

For example, if **Local Domain** is set to **9427068F-6EFA-4833-B43E-60CB641E5B6C.COM**, the username of default HDFS startup user is **hdfs/hadoop.9427068f-6efa-4833-b43e-60cb641e5b6c.com**.

- **Database user**

The system database users include OMS database users and DBService database users.

## Account List (MRS 2.x and Earlier Versions)

- **User type**

The MRS cluster provides the following three types of users. Periodically change the passwords and do not use the default passwords.

| User Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System users          | <ul style="list-style-type: none"><li>• User created on Manager for MRS cluster O&amp;M and service scenarios. There are two types of system users:<ul style="list-style-type: none"><li>– <b>Human-machine</b> user: used for Manager O&amp;M scenarios and component client operation scenarios.</li><li>– <b>Machine-machine</b> user: used for MRS cluster application development scenarios.</li></ul></li><li>• User who runs OMS processes</li></ul> |
| Internal system users | Internal user to perform Kerberos authentication, process communications, save user group information, and associate user permissions. It is recommended that internal system users not be used in O&M scenarios. Operations can be performed as user <b>admin</b> or another user created by the system administrator based on service requirements.                                                                                                       |
| Database users        | <ul style="list-style-type: none"><li>• User who manages OMS database and accesses data</li><li>• User who runs the database of service components (Hive, Loader, and DBService)</li></ul>                                                                                                                                                                                                                                                                  |

- **System user**

 **NOTE**

- User **ldap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

| User Type                               | Username | Initial Password                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

- **User group information**

| Default User Group    | Description                                                                                                                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| supergroup            | Primary group of user <b>admin</b> , which has no additional permissions in the cluster with Kerberos authentication disabled.                                                                                                 |
| check_sec_ldap        | Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. This is an internal system user group used only between components. |
| Manager_tenant        | Tenant system user group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.                                                               |
| System_administrator  | MRS cluster system administrator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.                                                 |
| Manager_viewer        | MRS Manager system viewer group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.                                                        |
| Manager_operator      | MRS Manager system operator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.                                                      |
| Manager_auditor       | MRS Manager system auditor group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.                                                       |
| Manager_administrator | MRS Manager system administrator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.                                                 |
| compcommon            | MRS cluster internal group, used to access public resources in the cluster. All system users and system running users are added to this user group by default.                                                                 |
| default_1000          | User group created for tenants. This is an internal system user group used only between components.                                                                                                                            |
| launcher-job          | MRS internal group, which is used to submit jobs using V2 APIs.                                                                                                                                                                |

| Default User Group | Description                                                                                                                                                                                                                                                     |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hadoop             | Users added to this user group have the permission to submit tasks to all YARN queues. Such user is available only in clusters with Kerberos authentication enabled.                                                                                            |
| hbase              | Common user group. Users added to this user group will not have any additional permission. Such user is available only in clusters with Kerberos authentication enabled.                                                                                        |
| hive               | Users added to this user group can use Hive. Such user is available only in clusters with Kerberos authentication enabled.                                                                                                                                      |
| spark              | Common user group. Users added to this user group will not have any additional permission. Such user is available only in clusters with Kerberos authentication enabled.                                                                                        |
| kafka              | Kafka common user group. Users added to this group need to be granted with read and write permission by users in the <b>kafkaadmin</b> group before accessing the desired topics. Such user is available only in clusters with Kerberos authentication enabled. |
| kafkasuperuser     | Users added to this group have permissions to read data from and write data to all topics. Such user is available only in clusters with Kerberos authentication enabled.                                                                                        |
| kafkaadmin         | Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics. Such user is available only in clusters with Kerberos authentication enabled.                        |
| storm              | Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies. Such user is available only in clusters with Kerberos authentication enabled.                                                     |
| stormadmin         | Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies. Such user is available only in clusters with Kerberos authentication enabled.                                              |
| opentsdb           | Common user group. Users added to this user group will not have any additional permission. Such user is available only in clusters with Kerberos authentication enabled.                                                                                        |

| Default User Group | Description                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| presto             | Common user group. Users added to this user group will not have any additional permission. Such user is available only in clusters with Kerberos authentication enabled. |
| flume              | Common user group. Users added to this user group will not have any additional permission. Such user is available only in clusters with Kerberos authentication enabled. |
| launcher-job       | MRS internal group, which is used to submit jobs using V2 APIs. Such user is available only in clusters with Kerberos authentication enabled.                            |

| OS User Group | Description                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|
| wheel         | Primary group of MRS internal running user <b>omm</b> .                                                                              |
| ficommon      | MRS cluster common group that corresponds to <b>comppcommon</b> for accessing public resource files stored in the OS of the cluster. |

- **Database user**

MRS cluster system database users include OMS database users and DBService database users.

 **NOTE**

Do not delete database users. Otherwise, the cluster or components may not work properly.

| User Type          | Default User | Initial Password  | Description                                                                                               |
|--------------------|--------------|-------------------|-----------------------------------------------------------------------------------------------------------|
| OMS database       | ommdba       | dbChangeMe@123456 | OMS database administrator who performs maintenance operations, such as creating, starting, and stopping. |
|                    | omm          | ChangeMe@123456   | User for accessing OMS database data                                                                      |
| DBService database | omm          | dbserverAdmin@123 | Administrator of the GaussDB database in the DBService component                                          |

| User Type | Default User | Initial Password | Description                                                                                                                         |
|-----------|--------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------|
|           | hive         | HiveUser@        | User for Hive to connect to the DBService database.                                                                                 |
|           | hue          | HueUser@123      | User for Hue to connect to the DBService database.                                                                                  |
|           | ranger       | RangerUser@      | User for Ranger to connect to the DBService database. Such user is available only in clusters with Kerberos authentication enabled. |
|           | sqoop        | SqoopUser@       | User for Loader to connect to the DBService database.                                                                               |

### 6.10.3 Managing MRS Cluster Roles

The administrator can create and manage different roles in Manager and use them to authorize access to Manager and components based on various service scenarios.

The Manager of MRS 3.x and later versions supports a maximum of 5,000 roles (including system built-in roles but excluding roles automatically created by tenants).

The Manager of MRS2.x and earlier versions supports a maximum of 1000 roles.

#### Creating a Role

**For MRS 3.x and later versions:**

**Step 1** Log in to FusionInsight Manager, choose **System > Permission > Role**.

**Step 2** On the displayed page, click **Create Role** and fill in **Role Name** and **Description**.

The role name consists of 3 to 50 characters, including digits, letters, and underscores (\_). It cannot be the same as an existing role name in the system. The role name cannot start with **Manager**, **System**, or **default**. For example, the role name cannot be **Manager\_test**.

**Figure 6-63** Creating a role

Role > Create Role

---

\* Role Name:

Configure Resource Permission:

| All resources |                    |
|---------------|--------------------|
| All resources | Description        |
| Manager       | Cluster Management |
| 312fts        |                    |

Description:

**Step 3** In the **Configure Resource Permission** area, click the cluster whose permissions are to be added and select service permissions for the role.

When setting permissions for a component, enter a resource name in the search text box in the upper right corner and click the search icon to view the search result.

The search result contains only directories, but not subdirectories. Search by keyword supports fuzzy match and is case-insensitive.

**NOTE**

- For components (except HDFS and Yarn) for which Ranger authorization has been enabled, the permissions of non-default roles on Manager do not take effect. You need to configure Ranger policies to assign permissions to user groups.
- If the resource requests of HDFS and Yarn are beyond the Ranger policies, the ACL rules of the components still take effect.
- A maximum of 1000 permissions can be set for a component at a time.

**Step 4** Click **OK**.

----End

**For MRS 2.x and earlier:**

**Step 1** On MRS Manager, choose **System > Manage Role**.

**Step 2** On the displayed page, click **Create Role** and fill in **Role Name** and **Description**.

**Role Name** is mandatory and contains 3 to 30 characters. Only digits, letters, and underscores (\_) are allowed. **Description** is optional.

**Step 3** In **Permission**, set role permission.

1. Click **Service Name** and select a name in **View Name**.
2. Select one or more permissions.

 **NOTE**

- The **Permission** parameter is optional.
- If you select **View Name** to set component permissions, you can enter a resource name in the **Search** box in the upper right corner and click . The search result is displayed.
- The search result contains only directories, but not subdirectories. Search by keyword supports fuzzy match and is case-insensitive. Results of the next page can be searched.

**Step 4** Click **OK**. Return to **Manage Role**.

----End

## Managing Roles

**Step 1** Log in to Manager.

**Step 2** Go to the role management page.

- For MRS 3.x and later versions, choose **System > Permission > Role**.
- For MRS 2.x and earlier versions, choose **System > Manage Role**.

**Step 3** In the role list, perform the following operations on the role as you need:

- To modify role information, locate the target role, and click **Modify** in the **Operation** column.
- To export role information, click **Export All** in **TXT** or **CSV** format. Role information includes the role name and description.

 **NOTE**

Exporting role information is available in MRS 3.x or later only.

- To delete a role, locate the row that contains the role and click **Delete**. To delete multiple roles in batches, select the target roles and click **Delete** above the role list. A role bound to a user cannot be deleted. To delete such a role, disassociate the role from the user by modifying the user first.

----End

## Example: Creating a Manager Role (MRS 3.x and Later)

**Step 1** Choose **System > Permission > Role**.

**Step 2** On the displayed page, click **Create Role** and fill in **Role Name** and **Description**.

**Step 3** In the **Configure Resource Permission** area, click **Manager** and set permissions for the role.

**Figure 6-64** Setting permissions

| Resource Name | Resource Type       | Permission                    |                                     |                                    |
|---------------|---------------------|-------------------------------|-------------------------------------|------------------------------------|
|               |                     | <input type="checkbox"/> view | <input type="checkbox"/> management | <input type="checkbox"/> Recursive |
| Cluster       | Manager access path | <input type="checkbox"/>      | <input type="checkbox"/>            |                                    |
| User          | Manager access path | <input type="checkbox"/>      | <input type="checkbox"/>            |                                    |
| Audit         | Manager access path |                               | <input type="checkbox"/>            |                                    |
| Tenant        | Manager access path |                               | <input type="checkbox"/>            |                                    |
| System        | Manager access path |                               | <input type="checkbox"/>            |                                    |

Manager permissions:

- Cluster
  - **view** permission: permission to view information on the **Cluster** page and view alarms and events under **O&M > Alarm**.
  - **management** permission: permission for management on the **Cluster** and **O&M** pages.
- User
  - **view** permission: permission to view information on pages under **System > Permission**.
  - **management** permission: permission for management on pages under **System > Permission**.
- Audit
  - management** permission: permission for management on the **Audit** page.
- Tenant
  - management** permission: permission for management on the **Tenant** page and permission to view alarms and events under **O&M > Alarm**.
- System
  - management** permission: permission for management on all pages except those under **Permission** on the **System** page and permission to view alarms and events under **O&M > Alarm**.

**Step 4** Click **OK**.

----End

## 6.10.4 Managing MRS Cluster User Groups

Administrators can create and manage different user groups based on service scenarios on Manager. A user group is bound to a role to obtain operation permissions. After a user is added to a user group, the user can obtain the operation permissions of the user group. A user group can be used to classify users and manage multiple users.

The Manager of an MRS 3.x or later cluster supports a maximum of 5000 user groups (including built-in user groups).

The Manager of an MRS 2.x or earlier cluster supports a maximum of 100 user groups (including built-in user groups).

### Prerequisites

- You have learned service requirements and created roles required by service scenarios.
- You have logged in to Manager.

### Creating a User Group

**For MRS 3.x and later versions:**

**Step 1** Choose **System > Permission > User Group**.

**Step 2** Above the user group list, click **Create User Group**.

**Figure 6-65** Creating a user group

User Group > **Create User Group**

---

\* Group Name:

Role: [Add](#) [Clear All](#)

User: [Add](#) [Clear All](#)

Description:

**Step 3** Set **Group Name** and **Description**.

The group name contains 1 to 64 characters, including case-insensitive letters, digits, underscores (\_), hyphens (-), and spaces. It cannot be the same as an existing user group name in the system.

**Step 4** In the **Role** area, click **Add** to select a role and add it.

 **NOTE**

- For components (except HDFS and Yarn) for which Ranger authorization has been enabled, the permissions of non-default roles on Manager do not take effect. You need to configure Ranger policies to assign permissions to user groups.
- If the resource requests of HDFS and Yarn are beyond the Ranger policies, the ACL rules of the components still take effect.

**Step 5** In the **User** area, click **Add** to select a user and add it.

**Step 6** Click **OK**.

The user group is created.

----**End**

**For MRS 2.x and earlier:**

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Manage User Group**.

**Step 3** Above the user group list, click **Create User Group**.

**Step 4** Set **Group Name** and **Description**.

**Group Name** is mandatory and contains 3 to 20 characters. Only digits, letters, and underscores (\_) are allowed. **Description** is optional.

**Step 5** In **Role**, click **Select and Add Role** to select and add specified roles.

If you do not add the roles, the user group you are creating now does not have the permission to use MRS clusters.

**Step 6** Click **OK**.

----End

## Managing User Groups

**Step 1** Log in to Manager.

**Step 2** Go to the user group management page.

- For MRS 3.x and later versions, choose **System > Permission > User Group**.
- For MRS 2.x and earlier versions, Click **System**. In the **Permission** area, click **Manage User Group**.

**Step 3** In the user group list, perform the following operations on a user group as you need.

- Viewing user group information: By default, all user groups are displayed in the user group list. You can click the arrow on the left of a user group name to view details about the user group, including the user quantity, specific users, and bound roles of the user group.
- Modifying user group information: Locate the row that contains the user group to be modified and click **Modify**.
- Exporting user group information: Click **Export All** to export all user group information at a time in **TXT** or **CSV** format.

The user group information contains the user group name, description, user list, and role list.

### NOTE

Exporting user group information is supported in MRS 3.x or later only.

- Deleting a user group: Locate the row that contains the target user group and click **Delete**. To delete multiple user groups in batches, select the target user groups and click **Delete** above the user group list. A user group that contains users cannot be deleted. To delete such a user group, delete all its users by modifying the user group first.

----End

## 6.10.5 Managing MRS Cluster Users

### 6.10.5.1 Creating an MRS Cluster User

By default, only user **admin** has the highest operation permissions of Manager. Administrators need to create users on Manager and assign operation permissions to the users based on service requirements.

The FusionInsight Manager of an MRS 3.x or later cluster supports a maximum of 50000 users (including built-in users).

The MRS Manager of an MRS 2.x or earlier cluster supports a maximum of 1000 users.

#### Creating a User (MRS 3.x and Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** On the **User** page, click **Create**.

**Step 4** Set **Username**. The username can contain digits, letters, underscores (`_`), hyphens (`-`), and spaces. It is case-insensitive and cannot be the same as any existing username in the system or OS.

**Step 5** Set **User Type** to **Human-Machine** or **Machine-Machine**.

- **Human-Machine** user: used for FusionInsight Manager O&M and component client operations. If you select this option, you also need to select the password policy and set **Password** and **Confirm Password**.
- **Machine-Machine** user: used for component application development. If you select this option, the password is randomly generated.

**Step 6** In the **User Group** area, click **Add** to add one or more user groups to the list.

#### NOTE

- If the selected user group has been bound to a role or a permission policy has been configured in Ranger, the user can obtain the corresponding permissions.
- After FusionInsight Manager is installed, some user groups generated by default have special permissions. Select desired user groups based on the descriptions on the UI.
- If existing user groups cannot meet your requirements, click **Create User Group** to create a user group. For details, see [Creating a User Group](#).

**Step 7** Select a group from the **Primary Group** drop-down list to create directories and files.

The drop-down list contains all groups selected in **User Group**.

#### NOTE

A user can belong to multiple groups (including the primary group and secondary groups). The primary group is set to facilitate maintenance and comply with the permission mechanism of the Hadoop community. The primary group has the same permission control functionality as other groups.

**Step 8** In the **Role** area, click **Add** to bind roles to the user.

 NOTE

- Adding a role when you create a user can specify the user permissions.
- If the permissions granted to the user from the user group cannot meet service requirements, you can bind other created roles to the user. You can also click **Create Role** to create a role first. For details, see [Creating a Role](#).  
It takes 3 minutes to make role permission assignment to the user take effect. If the permissions obtained from the user group are enough, you do not need to add a role.
- After Ranger authentication is enabled for a component, you need to configure Ranger policies to assign permissions to the user except the permissions of default user group or role.
- If a user is not added to a user group or assigned a role, the user cannot view information or perform operations after logging in to FusionInsight Manager.

**Step 9** Enter information in **Description**.

**Step 10** Click **OK**.

After a human-machine user is created, you need to change the initial password as prompted after logging in to FusionInsight Manager.

----End

## Creating a User (MRS 2.x and Earlier)

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Manage User**.

**Step 3** On the **User** page, click **Create**.

**Step 4** Configure parameters as prompted and enter a username in **Username**.

 NOTE

- A username that differs only in alphabetic case from an existing username is not allowed. For example, if **User1** has been created, you cannot create **user1**.
- When you use the user you created, enter the exactly correct username, which is case-sensitive.
- **Username** is mandatory and contains 3 to 20 characters. Only digits, letters, and underscores (\_) are allowed.
- **root**, **omm**, and **ommdba** are reserved system user. Select another username.

**Step 5** Set **User Type** to **Human-Machine** or **Machine-Machine**.

- **Human-machine** user: used for MRS Manager O&M scenarios and component client operation scenarios. If you select this user type, you need to enter a password and confirm the password in **Password** and **Confirm Password** accordingly.
- **Machine-machine** users: used for MRS application development scenarios. If you select this user type, you do not need to enter a password, because the password is randomly generated.

**Step 6** In **User Group**, click **Select and Join User Group** to select user groups and add users to them.

 **NOTE**

- If roles have been added to user groups, the users can be granted with permissions of the roles.
- If you want to grant new users with Hive permissions, add the users to the Hive group.
- If a user needs to manage tenant resources, the user group must be assigned the **Manager\_tenant** role and the role corresponding to the tenant.

**Step 7** In **Primary Group**, select a group as the primary group for users to create directories and files. The drop-down list contains all groups selected in **User Group**.

**Step 8** In **Assign Rights by Role**, click **Select and Add Role** to add roles for users based on onsite service requirements.

 **NOTE**

- If the permissions granted to the user from the user group cannot meet service requirements, you can bind other created roles to the user. It takes 3 minutes to make role permissions granted to the new user take effect.
- Adding a role when you create a user can specify the user permissions.
- A new user can access web UIs of HDFS, HBase, Yarn, Spark, and Hue even when roles are not assigned to the user.

**Step 9** In **Description**, provide description based on onsite service requirements.

**Description** is optional.

**Step 10** Click **OK**.

If a new user is used in the MRS cluster for the first time, for example, used for logging in to MRS Manager or using the cluster client, the password must be changed.

----End

### 6.10.5.2 Modifying MRS Cluster User Information

You can modify user information on Manager, including the user group, primary group, role permission assignment, and user description.

#### Modifying User Information (MRS 3.x or Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the target user and click **Modify** in the **Operation** column.

Modify the parameters based on service requirements.

 **NOTE**

It takes three minutes at most for the change of the user group or role permissions to take effect.

MRS 3.1.2 or later:

- Users (except **admin**) cannot modify their own password policies.
- Locked users cannot modify their password policies.
- After the password policy bound to a user is modified, the modification takes effect when the user changes the password next time.
- After the password policy bound to a user is modified, if the remaining password validity period is greater than the password validity period in the new password policy, the password validity period is set to the validity period in the new password policy. If the remaining password validity period is less than the password validity period in the new password policy, the password validity period remains unchanged.

**Step 4** Click **OK**.

----End

## Modifying User Information (MRS 2.x and Earlier)

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Manage User**.

**Step 3** In the row of a user to be modified, click **Modify**.

 **NOTE**

If you change user groups for a user or assign role permissions to a user, it takes 3 minutes to apply the new configurations.

**Step 4** Click **OK**. The modification is complete.

----End

### 6.10.5.3 Locking an MRS Cluster User

A user may be suspended for a long period of time due to service changes. For security purposes, you can lock such a user. You can lock a user in using either of the following methods:

- Automatic locking: You can set **Password Retries** in the password policy to automatically lock the user whose login attempts exceed this parameter value. For details, see [Configuring Password Policies for MRS Cluster Users](#).
- Manual locking: You manually lock a user.

This section describes how to lock a user manually. Machine-machine users cannot be locked. For details about how to unlock an MRS cluster user, see [Unlocking a User Created on Manager](#).

## Impact on the System

A locked user cannot log in to Manager or perform identity authentication in the cluster. A locked user can be used only after being manually unlocked or the lock time expires.

## Locking a User

**For MRS 3.x and later versions:**

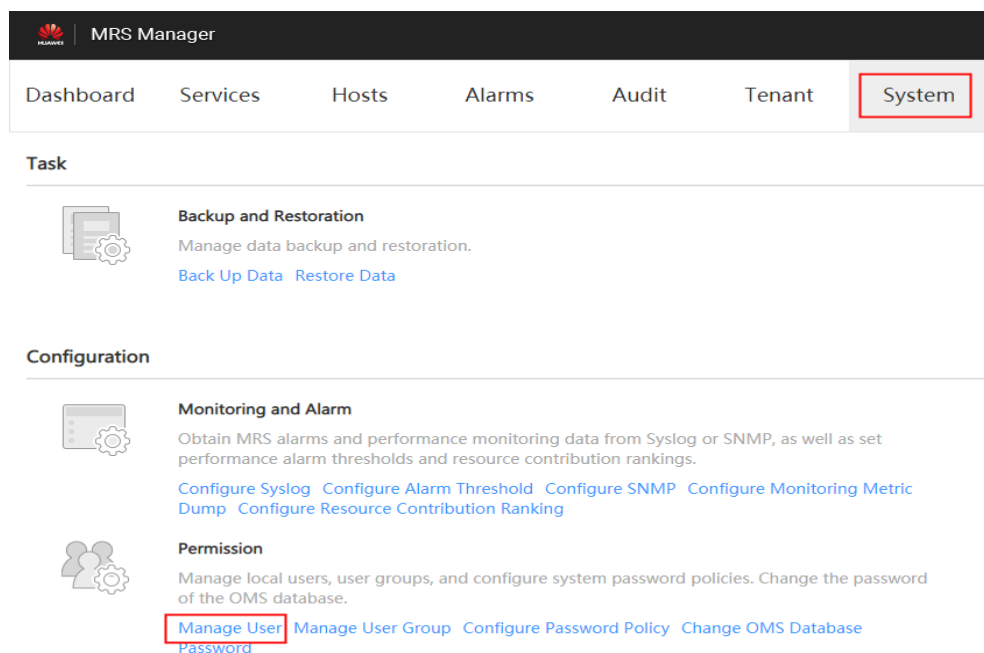

- Step 1** Log in to Manager.
- Step 2** Choose **System > Permission > User**.
- Step 3** Locate the row that contains the target user and click **Lock** in the **Operation** column.
- Step 4** In the window that is displayed, select **I have read the information and understand the impact**. Click **OK**.

----End

**For MRS 2.x and earlier:**

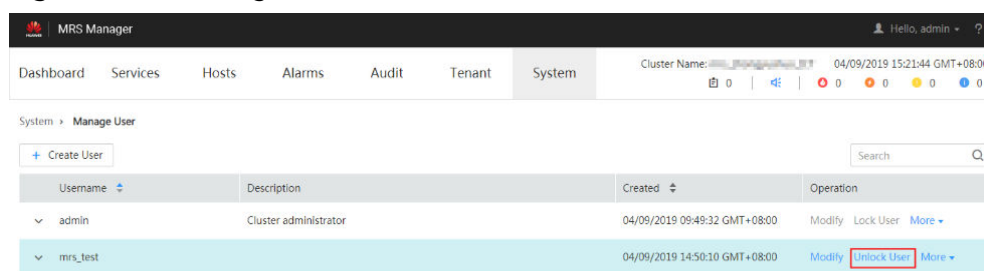

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage User**.

**Figure 6-66** User management

- Step 3** In the row of a user you want to lock, click **Lock User**.

**Figure 6-67** Locking a user

**Step 4** In the window that is displayed, click **OK** to lock the user.

----End

### 6.10.5.4 Deleting an MRS Cluster User

Based on service requirements, you can delete system users that are no longer used on Manager.

 **NOTE**

- After a user is deleted, the provisioned ticket granting ticket (TGT) is still valid within 24 hours. The user can use the TGT for security authentication and access the system.
- If a new user has the same name as the deleted user, the new user will inherit all owner permissions of the deleted user. You are advised to determine whether to delete the resources owned by the deleted user based on service requirements, for example, files in HDFS.
- The default user **admin** cannot be deleted.

### Deleting a Cluster User (MRS 3.x or Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the target user, click **More**, and select **Delete**.

 **NOTE**

To delete users in batches, select the users at a time and click **Delete**.

**Step 4** In the displayed dialog box, click **OK**.

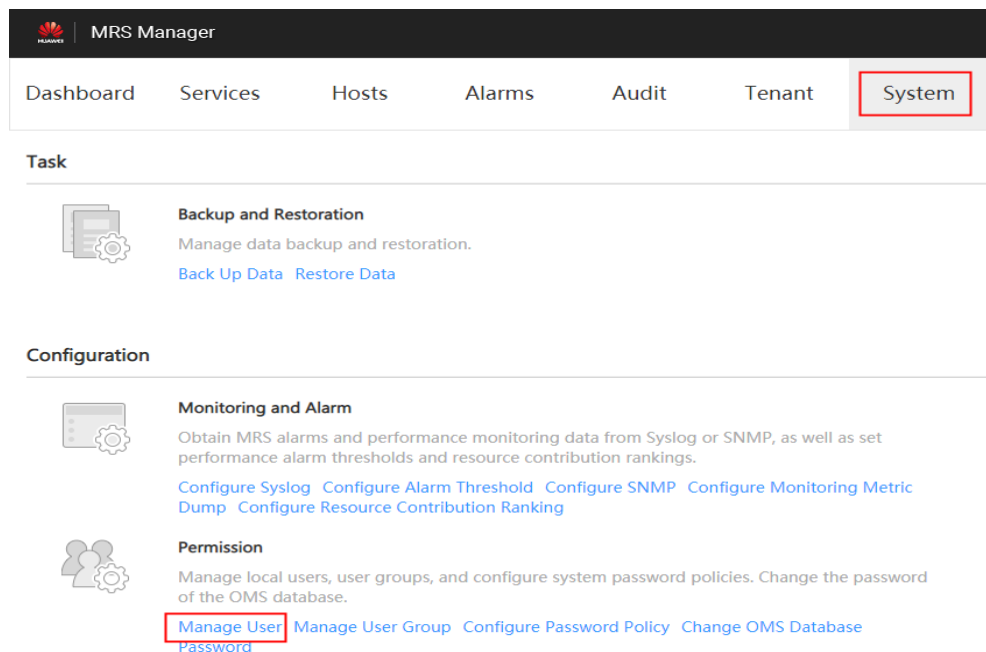

----End

### Deleting a Cluster User (MRS 2.x and Earlier)

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Manage User**.

**Figure 6-68** User management

**Step 3** In the row that contains the user to be deleted, choose **More > Delete**.

**Figure 6-69** Deleting a user

**Step 4** Click **OK**.

**NOTE**

If you want to create a new user with the same name as user A after deleting user A who has submitted a job on the client or MRS console, you need to delete user A's residual folders when deleting user A. Otherwise, the newly created user A may fail to submit a job.

To delete residual folders, log in to each Core node in the MRS cluster and run the following commands. In the following commands, **\$user** indicates the folder named after the username.

```
cd /srv/BigData/hadoop/data1/nm/localdir/usercache/
rm -rf $user
```

----End

### 6.10.5.5 Initializing MRS Cluster User Passwords

To reset a forgotten password or periodically change a public account password, administrator can initialize a new password on the Manager. The system user must then change the password upon their first login.

#### Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after initializing the password of the MRS cluster user.

#### Initializing the Password of a Human-Machine User

**For MRS 3.x and later versions:**

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **System > Permission > User**.
- Step 3** Locate the row that contains the target user, click **More**, and select **Initialize Password**. In the displayed dialog box, enter the password of the current login user and click **OK**. In the **Initialize Password** dialog box, click **OK**.
- Step 4** Set **New Password** and **Confirm Password**, and click **OK**.

The password must meet the following complexity requirements:

- Contains at least 8 characters.
- Contains at least four types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (~!@#%&\*()-\_+=|[{]}';<.>/\?).
- Cannot be the same as the username or the username spelled backwards.
- Cannot be a common easily-cracked password.
- Cannot be the same as the password used in the latest *N* times. *N* indicates the value of **Repetition Rule** configured in [Configuring Password Policies for MRS Cluster Users](#).

----End

**For MRS 2.x and earlier:**

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage User**.
- Step 3** Locate the row that contains the user whose password is to be initialized, choose **More > Initialize password**, and change the password as prompted.

In the window that is displayed, enter the password of the current administrator account and click **OK**. Then in **Initialize password**, click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters (~!@#%&\*()-\_+=\|[{]}';<.>/\?).

- The password cannot be the username or the reverse username.

----End

## Initializing the Password of a Machine-Machine User

**Step 1** Prepare a client based on service conditions and log in to the node with the client installed.

**Step 2** Run the following command to switch the user:

```
sudo su - omm
```

**Step 3** Run the following command to switch to the client directory, for example, **/opt/client**:

```
cd /opt/client
```

**Step 4** Run the following command to set environment variables:

```
source bigdata_env
```

**Step 5** Run the following command to log in to the console as user **kadmin/admin**:

```
kadmin -p kadmin/admin
```

### NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

**Step 6** Run the following command to reset the password of a component running user. This operation takes effect on all servers:

```
cpw Component running user name
```

For example, **cpw oms/manager**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|[]{};:'",.<.>/?).
- The password cannot be the username or the reverse username.

----End

### 6.10.5.6 Downloading MRS Cluster User Credentials

If you develop big data applications and run them in an MRS cluster that requires Kerberos authentication, you need to prepare a user authentication file for accessing the MRS cluster. The keytab file in the authentication files is used for user authentication.

This topic describes how to download user authentication files and export the keytab file on MRS Manager.

 NOTE

After a user password is changed, the exported keytab file becomes invalid, and you need to export a keytab file again.

## Prerequisites

Before downloading the keytab file of a Human-Machine user, the password of the user must be changed at least once on the Manager portal or a client; otherwise, the downloaded keytab file cannot be used. For details, see [Changing the Passwords for Manager Users of an MRS Cluster](#).

## Downloading the Authentication Credential

**Step 1** Log in to Manager.

For MRS 3.x and later versions, choose **System > Permission > User**.

For versions earlier than MRS 3.x, choose **System > Permission > Manage User**.

**Step 2** Locate the row that contains the user whose keytab file needs to be exported, choose **More > Download Authentication Credential**, specify the save path after the file is automatically generated, and keep the file properly.

The authentication credential includes the **krb5.conf** file of the Kerberos service.

After the authentication credential file is decompressed, you can obtain the following two files:

- The **krb5.conf** file contains the authentication service connection information.
- The **user.keytab** file contains user authentication information.

----End

## 6.10.6 Unlocking an MRS Cluster User

### 6.10.6.1 Unlocking an LDAP User in the MRS Cluster

To unlock a user who has been locked out due to excessive incorrect password attempts, log in to the MRS cluster node and run commands to unlock the user, or use Manager to unlock the user if they were created on Manager.

If the service is abnormal, the internal user of the system may be locked. Unlock the user promptly, or the cluster cannot run properly. For the internal user list, see [MRS Cluster User Accounts](#). Internal users cannot be unlocked on Manager.

## Unlocking a User Created on Manager

**For MRS 3.x and later versions:**

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the target user and click **Unlock** in the **Operation** column.

**Step 4** In the window that is displayed, select **I have read the information and understand the impact**. Click **OK**.

----End

**For MRS 2.x and earlier:**

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Manage User**.

**Figure 6-70** User management

**Step 3** In the row of a user to be unlocked, click **Unlock User**.

**Figure 6-71** Unlocking a user

**Step 4** In the window that is displayed, click **OK** to unlock the user.

----End

## Unlocking an Internal User

This function is available in MRS 3.x and later only.

**Step 1** Use the following method to confirm whether the internal system username is locked:

1. OLdap port number obtaining method:
  - a. Log in to Manager, choose **System > OMS > oldap > Modify Configuration**.
  - b. The **LDAP Listening Port** parameter value is **oldap port**.
2. Domain name obtaining method:
  - a. Log in to Manager, choose **System > Permission > Domain and Mutual Trust**.
  - b. The **Local Domain** parameter value is the domain name.  
For example, the domain name of the current system is **9427068F-6EFA-4833-B43E-60CB641E5B6C.COM**.

3. Run the following command on each node in the cluster as user **omm** to query the number of password authentication failures:

```
ldapsearch -H ldaps://OMS Floating IP Address:Oldap port -LLL -x -D
cn=root,dc=hadoop,dc=com -b krbPrincipalName=Internal system
username@Domain name,cn=Domain
name,cn=krbcontainer,dc=hadoop,dc=com -w Password of LDAP
administrator -e ppolicy | grep krbLoginFailedCount
```

#### NOTE

- To obtain the floating IP address of OMS, log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of OMS. Record the value of **inet**. If the floating IP address of OMS cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.
- LDAP administrator password: Obtain the default password of LDAP administrator **cn=root,dc=hadoop,dc=com** by referring to [MRS Cluster User Accounts](#).

For example, run the following command to check the number of password authentication failures for user **oms/manager**:

```
ldapsearch -H ldaps://10.5.146.118:21750 -LLL -x -D
cn=root,dc=hadoop,dc=com -b krbPrincipalName=oms/
manager@9427068F-6EFA-4833-
B43E-60CB641E5B6C.COM,cn=9427068F-6EFA-4833-
B43E-60CB641E5B6C.COM,cn=krbcontainer,dc=hadoop,dc=com -w
Password of user cn=root,dc=hadoop,dc=com -e ppolicy | grep
krbLoginFailedCount
```

```
krbLoginFailedCount: 5
```

4. Log in to Manager, choose **System > Permission > Security Policy > Password Policy**.
5. Check the value of the **Password Retries** parameter. If the value is less than or equal to the value of **krbLoginFailedCount**, the user is locked.

#### NOTE

You can also check whether internal users are locked by viewing operations logs.

- Step 2** Log in to the active management node as user **omm** and run the following command to unlock the user:

```
sh ${BIGDATA_HOME}/om-server/om/share/om/acs/config/unlockuser.sh --
userName Internal system username
```

```
Example: sh ${BIGDATA_HOME}/om-server/om/share/om/acs/config/
unlockuser.sh --userName oms/manager
```

----End

### 6.10.6.2 Unlocking the LDAP Management Account of the MRS Cluster

If the LDAP user **cn=pg\_search\_dn,ou=Users,dc=hadoop,dc=com** and LDAP management accounts **cn=krbkdc,ou=Users,dc=hadoop,dc=com** and **cn=krbadmin,ou=Users,dc=hadoop,dc=com** are locked, the administrator must unlock these accounts.

#### NOTE

- If you input an incorrect password for the LDAP user or management account for five consecutive times, the LDAP user or management account is locked. The account is automatically unlocked after 5 minutes.
- This function is available in MRS 3.x and later only.

**Step 1** Log in to the active management node as user **omm**.

**Step 2** Run the following command to go to the related directory:

```
cd ${BIGDATA_HOME}/om-server/om/ldapserver/ldapserver/local/script
```

**Step 3** Run the following command to unlock the LDAP user or management account:

```
./ldapserver_unlockUsers.sh USER_NAME
```

In the command, *USER\_NAME* indicates the name of the user to be unlocked.

For example, to unlock the LDAP management **account** **cn=krbkdc,ou=Users,dc=hadoop,dc=com**, run the following command:

```
./ldapserver_unlockUsers.sh krbkdc
```

After the script is executed, enter the password of user **krbkdc** next to **ROOT\_DN\_PASSWORD**. If the following information is displayed, the unlocking is successful:

```
Unlock user krbkdc successfully.
```

----End

### 6.10.7 Configuring Password Policies for MRS Cluster Users

To keep up with service security requirements, you can set password security rules, user login security rules, and user locking rules on Manager.

#### NOTE

- Modify password policies based on service security requirements, because they involve user management security. Otherwise, security risks may be incurred.
- Change the user password after modifying the password policy, and then the new password policy can take effect.
- This password policy is used for human-machine users created on MRS. A maximum of 32 password policies can be created.

## Adding a Password Policy

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > Security Policy > Password Policy**.

**Step 3** Click **Add Password Policy** and modify the password policy as prompted.

For details about the parameters, see [Table 6-59](#).

**Table 6-59** Password policy parameters

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Password Policy Name           | The value is a string of 3 to 32 characters, including case-insensitive letters, digits, underscores (_), and hyphens (-). It cannot start with a hyphen (-).                                                                                                                                                                                                                                                                                                                                                 |
| Minimum Password Length        | Indicates the minimum number of characters a password contains. The value ranges from <b>8</b> to <b>32</b> .                                                                                                                                                                                                                                                                                                                                                                                                 |
| Character Types                | Indicates how many character types in the following types a password can contain at least: uppercase letters, lowercase letters, digits, spaces, and special characters (~!?,,;:_'(){}[]/<>@#\$\$%^&*+ \=). The value can be <b>4</b> or <b>5</b> . The default value is <b>4</b> , which means that a password can contain uppercase letters, lowercase letters, digits, and special characters. If you set the parameter to <b>5</b> , a password can contain all the five character types mentioned above. |
| Password Retries               | Indicates the number of consecutive wrong password attempts allowed before the system locks the user. The value ranges from <b>3</b> to <b>30</b> .                                                                                                                                                                                                                                                                                                                                                           |
| User Lock Duration (Min)       | Indicates the time period in which a user is locked when the user lockout conditions are met. The value ranges from <b>5</b> to <b>120</b> .                                                                                                                                                                                                                                                                                                                                                                  |
| Password Validity Period (Day) | Indicates the validity period of a password. The value ranges from <b>0</b> to <b>90</b> . <b>0</b> indicates that the password is permanently valid.                                                                                                                                                                                                                                                                                                                                                         |
| Repetition Rule                | Indicates the number of previous passwords that cannot be reused when you change the password. The value ranges from <b>1</b> to <b>5</b> . The default value is <b>1</b> .<br>This policy applies to only human-machine accounts.                                                                                                                                                                                                                                                                            |

| Parameter                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Password Expiration Notification (Days)                    | Indicates the number of days in advance users are notified that their passwords are about to expire. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When a user logs in to Manager, a message is displayed, indicating that the password is about to expire and asking the user whether to change the password. The value ranges from <b>0</b> to <i>X</i> ( <i>X</i> must be set to the half of the password validity period and rounded down). Value <b>0</b> indicates that no notification is sent. The default value is <b>5</b> . |
| Interval for Deleting Authentication Failure Records (Min) | Indicates the interval of retaining incorrect password attempts. The value ranges from <b>0</b> to <b>1440</b> . <b>0</b> indicates that incorrect password attempts are permanently retained, and <b>1440</b> indicates that incorrect password attempts are retained for one day.                                                                                                                                                                                                                                                                                                                                                                                           |

**Step 4** Click **OK** to save the configurations.

A new user uses the default password policy. After a new password policy is created, you can manually select the password policy when creating a user. You can modify the password policy of an existing user. For details, see [Modifying MRS Cluster User Information](#).

**Step 5** To delete a manually added password policy, perform the following operations:

Click **Delete** in the row that contains the target password policy. In the dialog box that is displayed, click **OK**.

 **NOTE**

The default password policy and the password policy that has been bound to a user cannot be deleted.

----End

## Modifying a Password Policy

**Step 1** Log in to Manager.

**Step 2** Enter the password policy configuration page.

- For MRS 2.x and earlier versions: Choose **System > Password Policy Configuration**.
- For MRS 3.x and later versions, choose **System > Permission > Security Policy > Password Policy**, and click **Modify** in the row that contains the password policy you want to modify.

**Step 3** Modify password policies as prompted.

**Table 6-60** Password policy parameters

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Minimum Password Length                 | Indicates the minimum number of characters a password contains. The value ranges from 8 to 32. The default value is <b>8</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Character Types                         | Indicates how many character types in the following types a password can contain at least: uppercase letters, lowercase letters, digits, spaces, and special characters (~`!?,,:;-'(){}[]/<>@#\$\$%^&*+ \=). <ul style="list-style-type: none"> <li>For MRS 3.x and later versions, the value can be <b>4</b> or <b>5</b>. The default value is <b>4</b>, which means that a password can contain uppercase letters, lowercase letters, digits, and special characters. If you set the parameter to <b>5</b>, a password can contain all the five character types mentioned above.</li> <li>For MRS2.x and earlier versions, the value can be <b>3</b> or <b>4</b>. The default value <b>3</b> indicates that the password must contain at least three types of the following characters: uppercase letters, lowercase letters, digits, special characters, and spaces.</li> </ul> |
| Password Retries                        | Indicates the number of consecutive wrong password attempts allowed before the system locks the user. The value ranges from <b>3</b> to <b>30</b> . The default value is <b>5</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| User Lock Duration (Min)                | Indicates the time period in which a user is locked when the user lockout conditions are met. The value ranges from <b>5</b> to <b>120</b> . The default value is <b>5</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Password Validity Period (Day)          | Indicates the validity period (days) of a password. The value ranges from 0 to 90. Value <b>0</b> means that the password is permanently valid. The default value is <b>90</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Repetition Rule                         | Indicates the number of previous passwords that cannot be reused when you change the password. The value ranges from <b>1</b> to <b>5</b> . The default value is <b>1</b> . This parameter is required for clusters of MRS 3.x or later. This policy applies to only human-machine accounts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Password Expiration Notification (Days) | Indicates the number of days in advance users are notified that their passwords are about to expire. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When a user logs in to Manager, a message is displayed, indicating that the password is about to expire and asking the user whether to change the password. The value ranges from <b>0</b> to <i>X</i> ( <i>X</i> must be set to the half of the password validity period and rounded down). Value <b>0</b> indicates that no notification is sent. The default value is <b>5</b> .                                                                                                                                                                                                      |

| Parameter                                                  | Description                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interval for Deleting Authentication Failure Records (Min) | Indicates the interval (minutes) of retaining incorrect password attempts. The value ranges from 0 to 1440. <b>0</b> indicates that incorrect password attempts are permanently retained, and <b>1440</b> indicates that incorrect password attempts are retained for one day. The default value is <b>5</b> . |

**Step 4** Click **OK** to save the configurations. Change the user password after modifying the password policy, and then the new password policy can take effect.

 **NOTE**

For MRS 3.1.2 and later:

- Users (except **admin**) cannot modify their own password policies.
- When a user's password policy is updated, the password's remaining validity period is adjusted as follows: if it is longer than the new policy's validity period, it is shortened to match the new policy; otherwise, it remains unchanged.

----End

## 6.10.8 Configuring the Private Attribute of MRS Cluster Users

User **admin** or administrators who are bound to the Manager\_administrator role can configure the independent attribute on Manager so that common users (all service users in the cluster) can set or cancel their own independent attributes.

After the independent attribute option is toggled on, service users need to log in to the system and set the independent attribute.

 **NOTE**

This topic is available for MRS 3.x and later only.

### Constraints

- Administrators cannot set or cancel the independent attribute of a user.
- Administrators cannot obtain the authentication credentials of independent users.

### Prerequisites

You have obtained the required administrator username and password.

### Enabling or Disabling User Private Attributes

- Step 1** Log in to FusionInsight Manager as user **admin** or a user bound to the Manager\_administrator role.
- Step 2** Choose **System > Permission > Security Policy > Independent Configurations**.
- Step 3** Toggle on or off **Independent Attribute**, enter the password as prompted, and click **OK**.

**Step 4** After the identity is authenticated, wait until the OMS configuration is modified and click **Finish**.

 **NOTE**

After the independent attribute is disabled:

- A user who has the attribute can cancel it from the drop-down list of the username in the upper right corner of the page. The user cannot set the independent attribute again once it is cancelled. After the attribute is cancelled, existing independent tables will retain the attribute. However, the user cannot create independent tables again.
- Users without this attribute cannot set or cancel the attribute.

----End

## Configuring the Independent Attribute

**Step 1** Log in to FusionInsight Manager as a service user.

---

**NOTICE**

Administrators cannot initialize the password of the user after the independent attribute is set. If the user password is forgotten, the password cannot be retrieved.

User **admin** cannot set the independent attribute.

---

**Step 2** Move the cursor to the username in the upper right corner of the page.

**Step 3** Select **Set Independent** or **Cancel Independent**.

 **NOTE**

- If the independent attribute is toggled on and has been set for the service user, **Cancel Independent** is displayed.
- If the independent attribute is toggled on but has been cancelled for the service user, **Set Independent** is displayed.
- If the independent attribute is toggled off but has been set for the service user, **Cancel Independent** is displayed.
- If the independent attribute is toggled off and has been cancelled for the service user, no option related to the independent attribute is displayed.

**Step 4** Enter the password as prompted and click **OK**.

**Step 5** After the identity is authenticated, click **OK** in the dialog box.

----End

## 6.11 Managing MRS Cluster Metadata

### 6.11.1 MRS Cluster Metadata Overview

MRS's data connections manage external source connections used by components in a cluster. For example, they associate Hive metadata with external relational databases.

- Local metadata: Metadata is stored in the local GaussDB of a cluster. When the cluster is deleted, the metadata is also deleted. To retain the metadata, manually back up the metadata in the database in advance.
- External data connection: You can associate the MRS cluster with an external data connection that is in the same VPC and subnet as the MRS cluster. Metadata is stored in the associated database and is not deleted even if the cluster is deleted. Multiple MRS clusters can share the same metadata.

MRS clusters support the following types of external data connections:

- Clusters with Hive installed can connect to RDS for PostgreSQL. The database version is **PostgreSQL14**.
- Clusters where Hive or Ranger is installed can connect to RDS for MySQL. The database version is **MySQL 5.7.x/MySQL 8.0**.
- Only MRS 3.1.2-LTS.3, MRS 3.1.5, and MRS 3.3.0-LTS clusters can connect to GaussDB(for MySQL).
- If the cluster supports LakeFormation, you can select LakeFormation as the data connection.

When Hive metadata is switched between different clusters, MRS synchronizes only the permissions in the metadata database of the Hive component. The permission model on MRS is maintained on MRS Manager. Therefore, when Hive metadata is switched between clusters, the permissions of users or user groups cannot be automatically synchronized to MRS Manager of another cluster.

## 6.11.2 Storing Ranger Metadata to RDS

This topic describes how to switch the Ranger metadata of the existing cluster to the metadata stored in the RDS database. This operation enables MRS clusters to share the same metadata, retains the metadata when the cluster is deleted, and avoids Ranger metadata migration during cluster migration.

### Disabling Ranger Authentication for Cluster Components

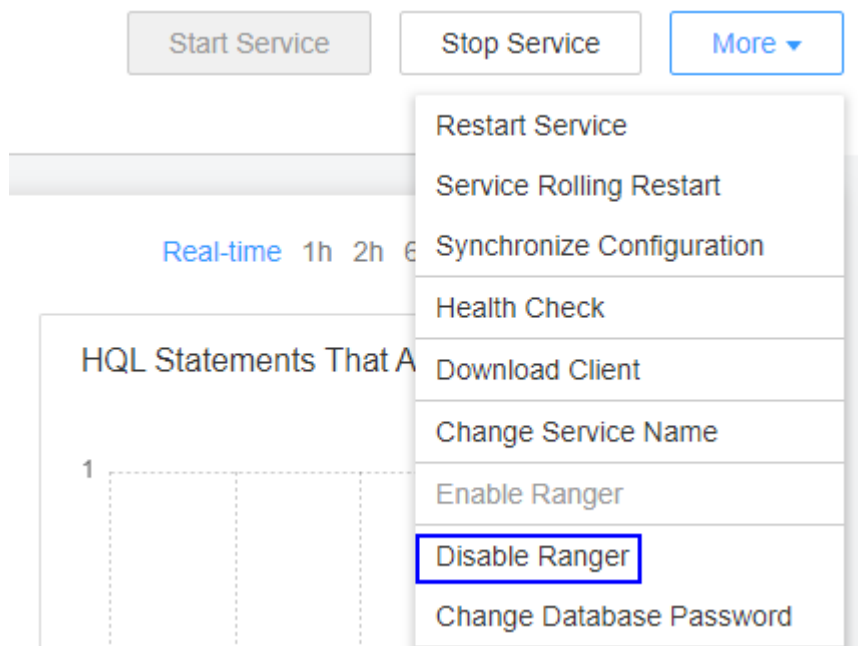

This operation is required only for **MRS 3.1.0 or later**.

**Step 1** Log in to FusionInsight Manager and choose **Cluster > Services > Service Name**.

Currently, the following components in an MRS 3.1.x cluster support Ranger authentication: HDFS, HBase, Hive, Spark, Impala, Storm, and Kafka.

**Step 2** In the upper right corner of the **Dashboard** page, click **More** and select **Disable Ranger**. If **Disable Ranger** is dimmed, Ranger authentication is disabled, as shown in [Figure 6-72](#).

**Figure 6-72** Disabling Ranger authentication

**Step 3** (Optional) To use an existing authentication policy, perform this step to export the authentication policy on the Ranger web page. After the Ranger metadata is switched, you can import the existing authentication policy again. The following uses Hive as an example. After the export, a policy file in JSON format is generated in a local directory.

1. Log in to FusionInsight Manager.
2. Choose **Cluster > Services > Ranger** to go to the Ranger service overview page.
3. Click **RangerAdmin** in the **Basic Information** area to go to the Ranger web UI.

The **admin** user in Ranger belongs to the **User** type. To view all management pages, click the username in the upper right corner and select **Log Out** to log out of the system.

4. Log in to the system as user **rangeradmin** (default password: **Rangeradmin@123**) or another user who has the Ranger administrator permissions. For details about the user and its default password, see [User Account List](#).
5. Click the export button  in the row where the Hive component is located to export the authentication policy.

**Figure 6-73** Exporting authentication policies

6. Click **Export**. After the export is complete, a policy file in JSON format is generated in a local directory.

**Figure 6-74** Exporting Hive authentication policies

----End

## Creating and Configuring an RDS DB Instance

**Step 1** Log in to the RDS console and buy an RDS DB instance. For details, see [Buying a DB Instance](#).

### NOTE

- To ensure network communications between the cluster and the MySQL or PostgreSQL database, create the instance in the same VPC and subnet as the cluster.
- Security group rules of the RDS DB instance must allow inbound access from MySQL (default port 3306) and PostgreSQL (default port 5432).

For example, click the instance name on the RDS console to go to the instance management page. In the **Connection Information** area, click the name next to **Security Group**. On the page that is displayed, click the **Inbound Rules** tab, and click **Add Rule**. In the displayed **Add Inbound Rule** dialog box, in the **Protocol & Port** area, select **TCP** and enter port number **3306**. In the **Source** area, select **IP address** and enter the IP addresses of all nodes where the MetaStore instances of Hive are located.

- Ranger can interconnect with RDS for MySQL databases of the **MySQL 5.7.x and 8.0** versions only.
- Hive can interconnect with RDS for MySQL and PostgreSQL databases. The supported versions are **MySQL 5.7.x and 8.0** and **PostgreSQL14**.

**Step 2** In the navigation pane of the RDS management console, choose **Instances**. Locate the row containing the RDS DB instance used by MRS data connections, click **More** in the **Operation** column, and select **Log In** to log in to the DB instance as user **root**.

**Figure 6-75** Logging in to an RDS DB instance

**Step 3** On the home page of the instance, click **Create Database** to create a database.

### NOTE

If no new database is created, the MRS data connections will fail to configure.

**Figure 6-76** Creating a database

The screenshot shows a 'Create Database' dialog box. The title bar contains the text 'Create Database' and a close button (X). The dialog has two input fields: 'Name' with a placeholder 'Database Name' and 'Character Set' with 'utf8' selected. A warning message 'Only user databases can be created' is displayed between the fields. At the bottom, there are 'OK' and 'Cancel' buttons.

**Step 4** On the top of the page, choose **Account Management > User Management**.

**NOTE**

- For clusters earlier than MRS 3.x, if the selected data connection is **RDS MySQL database**, ensure that the database user is **root**. If the user is not **root**, create a user and grant permissions to the user by referring to [Step 4](#) to [Step 6](#).
- For MRS 3.x or later clusters, when **Type** is set to **RDS MySQL database**, **Username** must not be **root**. In this case, create a user and grant permissions to the user by referring to [Step 4](#) to [Step 6](#).

**Step 5** Click **Create User** to create a non-root user and select all permissions listed in **Global Permissions**.

**NOTE**

If you are configuring an external RDS data connection for Ranger, you can select only the SELECT, INSERT, CREATE, RELOAD, CREATE USER, and GRANT permissions.

**Figure 6-77** Creating a user

The screenshot shows the 'Create User' form in the 'User Management' section. The form is organized into several sections:

- Basic Information:** Contains fields for Username (filled with 'mrs\_test01'), Host (filled with '%'), Password, and Confirm Password.
- Advanced Settings:** A section that is currently collapsed.
- Global Permissions:** A list of permissions with checkboxes:
  - Permission
  - SELECT
  - INSERT
  - UPDATE
  - DELETE
  - CREATE
- Object Permissions:** A section that is currently collapsed.
- Role:** A section that is currently collapsed.

**Step 6** On the top of the page, choose **SQL Operations > SQL Query**, switch to the target database by database name, and run the following SQL statements to grant permissions to the database user. In the following statements, *db\_name* and *db\_user* indicate the name of the database to be connected to MRS and the name of the new user, respectively.

```
grant all privileges on db_name.* to db_user'@%' with grant option;
grant reload on *.* to db_user'@%' with grant option;
flush privileges;
```

**Figure 6-78** Assigning permissions to database users

----End

## Creating an RDS Data Connection for an Existing MRS Cluster

Perform the following steps to create an RDS data connection for an existing MRS cluster.

- Step 1** Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.
- Step 2** Click **Create Data Connection**.
- Step 3** Configure parameters according to [Table 6-61](#).

**Table 6-61** Parameters for creating a data connection

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type              | The type of an external source connection. Value options are as follows: <ul style="list-style-type: none"> <li>• <b>RDS PostgreSQL database.</b> Clusters with Hive installed can connect to this type of database.</li> <li>• <b>RDS MySQL database.</b> Clusters with Hive or Ranger installed can connect to this type of database.</li> </ul> |
| Name              | The name of a data connection.                                                                                                                                                                                                                                                                                                                     |
| Database Instance | The RDS database instance. This instance must be created in RDS before being referenced here, and the database must have been created. For details, see <a href="#">Creating and Configuring an RDS DB Instance</a> . Click <b>View DB Instance</b> to view the created DB instances.                                                              |
| Database          | The name of the database to be connected to.                                                                                                                                                                                                                                                                                                       |
| Username          | The username for logging in to the database to be connected.                                                                                                                                                                                                                                                                                       |
| Password          | The password for logging in to the database to be connected.                                                                                                                                                                                                                                                                                       |

 NOTE

If the selected data connection is an **RDS MySQL** database, ensure that the database user is a **root** user. If the user is not **root**, perform operations by referring to [Creating and Configuring an RDS DB Instance](#).

**Step 4** Click **OK**.

----End

## Configuring a Ranger Data Connection

**Step 1** Log in to the MRS console.

**Step 2** Click the name of the cluster to view its details.

**Step 3** Click **Manage** on the right of **Data Connection** to go to the data connection configuration page.

**Step 4** Click **Configure Data Connection** and set related parameters.

- **Component Name:** Ranger
- **Module Type:** Ranger metadata
- **Connection Type:** RDS MySQL database
- **Connection Instance:** Select a created RDS MySQL DB instance. For details about how to create a data connection, see [Creating an RDS Data Connection for an Existing MRS Cluster](#).

**Step 5** Select **I understand the consequences of performing the scale-in operation** and click **Test**.

**Step 6** After the test is successful, click **OK** to complete the data connection configuration.

**Step 7** Log in to FusionInsight Manager.

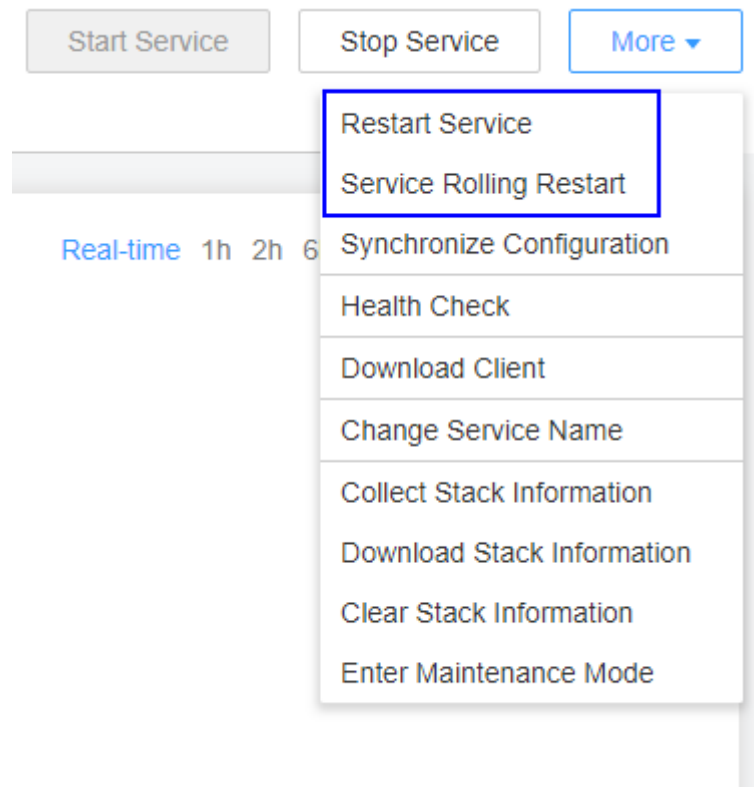

**Step 8** Choose **Cluster > Services > Ranger** to go to the Ranger service overview page.

**Step 9** Choose **More > Restart Service** or **More > Service Rolling Restart**.

If you choose **Restart Service**, services will be interrupted during the restart. If you select **Service Rolling Restart**, rolling restart can minimize the impact or do not affect service running.

Restarting Ranger will affect the permissions of all components controlled by Ranger and may affect service running. Restart Ranger when the cluster is idle or during off-peak hours. Before the Ranger component is restarted, the policies in the Ranger component still take effect.

**Figure 6-79** Restarting a service

**Step 10** Enable Ranger authentication for the component to be authenticated. The Hive component is used as an example.

Currently, the following components in an MRS 3.1.x cluster support Ranger authentication: HDFS, HBase, Hive, Spark, Impala, Storm, and Kafka.

1. Log in to FusionInsight Manager and choose **Cluster** > **Services** > *Service Name*.
2. In the upper right corner of the **Dashboard** page, click **More** and select **Enable Ranger**.

**Figure 6-80** Enabling Ranger authentication

**Step 11** Log in to the Ranger web UI and click the import button  in the row of the Hive component.

**Figure 6-81** Clicking the import button

**Step 12** Import parameters.

- Click **Select file** and select the authentication policy file downloaded in [Step 3.6](#).
- Select **Merge If Exist Policy**.

**Figure 6-82** Importing authentication policies

**Import Policy** ✕

**ⓘ** 'Override Policy' has higher priority than 'Merge If Exist Policy', if user selects both of them, then only 'Override Policy' take effect.

**Select File :**  
Select file  Merge If Exist Policy:  Override Policy:   
Ranger\_Policies\_20210331\_180915.json ✕

**ⓘ** All services gets listed on service destination when Zone destination is blank. When zone is selected at destination, then only services associated with that zone will be listed.

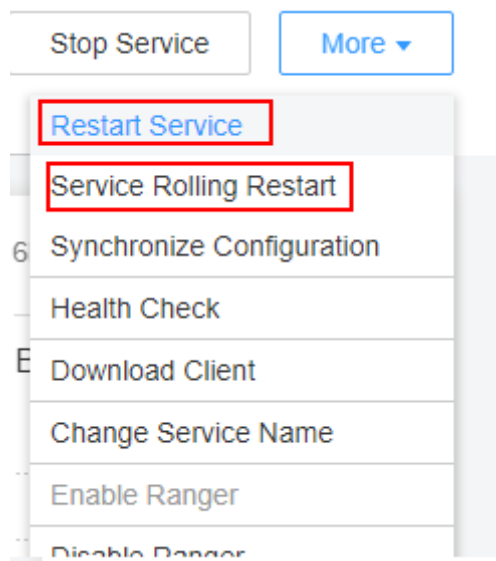

**Specify Zone Mapping :**  
Source:  To: Destination:

**Specify Service Mapping:**  
Source:  To: Destination:  ✕

**Step 13** Restart the component for which Ranger authentication is enabled.

1. Log in to FusionInsight Manager.
2. Choose **Cluster > Services > Hive** to go to the Hive service overview page.
3. Choose **More > Restart Service** or **More > Service Rolling Restart**.

**Figure 6-83** Restarting a service

If you choose **Restart Service**, services will be interrupted during the restart. If you select **Service Rolling Restart**, rolling restart can minimize the impact or do not affect service running.

----End

### 6.11.3 Storing Hive Metadata to RDS

This section describes how to switch the Hive metadata of an active cluster to the metadata stored in a local database or RDS database. This operation enables MRS clusters to share the same metadata, retains the metadata when the cluster is deleted, and avoids Hive metadata migration during cluster migration.

#### Creating and Configuring an RDS DB Instance

**Step 1** Log in to the RDS console and buy an RDS DB instance. For details, see [Buying a DB Instance](#).

##### NOTE

- To ensure network communications between the cluster and the MySQL or PostgreSQL database, create the instance in the same VPC and subnet as the cluster.
- Security group rules of the RDS DB instance must allow inbound access from MySQL (default port 3306) and PostgreSQL (default port 5432).

For example, click the instance name on the RDS console to go to the instance management page. In the **Connection Information** area, click the name next to **Security Group**. On the page that is displayed, click the **Inbound Rules** tab, and click **Add Rule**. In the displayed **Add Inbound Rule** dialog box, in the **Protocol & Port** area, select **TCP** and enter port number **3306**. In the **Source** area, select **IP address** and enter the IP addresses of all nodes where the MetaStore instances of Hive are located.

- Ranger can interconnect with RDS for MySQL databases of the **MySQL 5.7.x and 8.0** versions only.
- Hive can interconnect with RDS for MySQL and PostgreSQL databases. The supported versions are **MySQL 5.7.x and 8.0** and **PostgreSQL14**.

**Step 2** In the navigation pane of the RDS management console, choose **Instances**. Locate the row containing the RDS DB instance used by MRS data connections, click **More** in the **Operation** column, and select **Log In** to log in to the DB instance as user **root**.

**Figure 6-84** Logging in to an RDS DB instance

**Step 3** On the home page of the instance, click **Create Database** to create a database.

##### NOTE

If no new database is created, the MRS data connections will fail to configure.

**Figure 6-85** Creating a database

The screenshot shows a 'Create Database' dialog box. The title bar contains the text 'Create Database' and a close button (X). The dialog has two input fields: 'Name' with a placeholder 'Database Name' and 'Character Set' with 'utf8' selected. A warning message 'Only user databases can be created' is displayed below the Name field. At the bottom, there are 'OK' and 'Cancel' buttons.

**Step 4** On the top of the page, choose **Account Management > User Management**.

**NOTE**

- For clusters earlier than MRS 3.x, if the selected data connection is **RDS MySQL database**, ensure that the database user is **root**. If the user is not **root**, create a user and grant permissions to the user by referring to [Step 4](#) to [Step 6](#).
- For MRS 3.x or later clusters, when **Type** is set to **RDS MySQL database**, **Username** must not be **root**. In this case, create a user and grant permissions to the user by referring to [Step 4](#) to [Step 6](#).

**Step 5** Click **Create User** to create a non-root user and select all permissions listed in **Global Permissions**.

**NOTE**

If you are configuring an external RDS data connection for Ranger, you can select only the SELECT, INSERT, CREATE, RELOAD, CREATE USER, and GRANT permissions.

**Figure 6-86** Creating a user

The screenshot shows the 'Create User' form in the 'User Management' section. The form is organized into several sections:

- Basic Information:** Contains fields for Username (filled with 'mrs\_test01'), Host (filled with '%'), Password, and Confirm Password.
- Advanced Settings:** A section that is currently collapsed.
- Global Permissions:** A list of permissions with checkboxes:
  - Permission
  - SELECT
  - INSERT
  - UPDATE
  - DELETE
  - CREATE
- Object Permissions:** A section that is currently collapsed.
- Role:** A section that is currently collapsed.

**Step 6** On the top of the page, choose **SQL Operations > SQL Query**, switch to the target database by database name, and run the following SQL statements to grant permissions to the database user. In the following statements, *db\_name* and *db\_user* indicate the name of the database to be connected to MRS and the name of the new user, respectively.

```
grant all privileges on db_name.* to db_user'@%' with grant option;
grant reload on *.* to db_user'@%' with grant option;
flush privileges;
```

**Figure 6-87** Assigning permissions to database users

----End

## Creating an RDS Data Connection for an Existing MRS Cluster

Perform the following steps to create an RDS data connection for an existing MRS cluster.

- Step 1** Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.
- Step 2** Click **Create Data Connection**.
- Step 3** Configure parameters according to [Table 6-62](#).

**Table 6-62** Parameters for creating a data connection

| Parameter         | Description                                                                                                                                                                                                                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type              | The type of an external source connection. Value options are as follows: <ul style="list-style-type: none"> <li>• <b>RDS PostgreSQL database.</b> Clusters with Hive installed can connect to this type of database.</li> <li>• <b>RDS MySQL database.</b> Clusters with Hive or Ranger installed can connect to this type of database.</li> </ul> |
| Name              | The name of a data connection.                                                                                                                                                                                                                                                                                                                     |
| Database Instance | The RDS database instance. This instance must be created in RDS before being referenced here, and the database must have been created. For details, see <a href="#">Creating and Configuring an RDS DB Instance</a> . Click <b>View DB Instance</b> to view the created DB instances.                                                              |
| Database          | The name of the database to be connected to.                                                                                                                                                                                                                                                                                                       |
| Username          | The username for logging in to the database to be connected.                                                                                                                                                                                                                                                                                       |
| Password          | The password for logging in to the database to be connected.                                                                                                                                                                                                                                                                                       |

 NOTE

If the selected data connection is an **RDS MySQL** database, ensure that the database user is a **root** user. If the user is not **root**, perform operations by referring to [Creating and Configuring an RDS DB Instance](#).

**Step 4** Click **OK**.

----End

## Configuring a Hive Data Connection

This function is not supported in MRS 3.0.5.

**Step 1** Log in to the MRS console. In the navigation pane on the left, choose **Active Clusters**.

**Step 2** Click the name of a cluster to go to the cluster details page.

**Step 3** On the **Dashboard** tab page, click **Manage** next to **Data Connection**.

**Step 4** On the **Data Connections** page, the data connections of the cluster are displayed. You can click **Disassociate** to delete a data connection.

**Step 5** If there is no associated data connection on the **Data Connection** dialog box, click **Configure Data Connection** to add a connection.

 NOTE

Only one data connection can be configured for a module type. For example, after a data connection is configured for Hive metadata, no other data connection can be configured for it. If no module type is available, the **Configure Data Connection** button is unavailable.

**Table 6-63** Configuring a Hive data connection

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Component            | Hive                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Module Type          | Hive metadata                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Data Connection Type | <ul style="list-style-type: none"><li>• RDS PostgreSQL database (supported for clusters of MRS 1.9.x)</li><li>• RDS MySQL database</li><li>• Local database</li></ul>                                                                                                                                                                                                                                                                                     |
| Instance             | This parameter is valid only when <b>Data Connection Type</b> is set to <b>RDS PostgreSQL database</b> or <b>RDS MySQL database</b> . Select the name of the connection between the MRS cluster and the RDS database. This instance must be created before being referenced here. You can click <b>Create Data Connection</b> to create a data connection. For details, see <a href="#">Creating an RDS Data Connection for an Existing MRS Cluster</a> . |

**Figure 6-88** Configuring a data connection

**Configure Data Connection**

Component Name

Module Type

Data Connection Type

Instance  [Create Data Connection](#)

**Step 6** Click **Test** to test connectivity of the data connection.

**Step 7** After the data connection is successful, click **OK**.

**Step 8** Upload the open-source driver package of PostgreSQL or MySQL to all nodes where MetaStore instances are deployed to replace the existing driver package of the cluster.

- PostgreSQL: Upload the driver package **postgresql-42.2.5.jar** to the **\$ {BIGDATA\_HOME}/third\_lib/Hive** directory on all MetaStore instance nodes. Download the open-source driver package from <https://repo1.maven.org/maven2/org/postgresql/postgresql/42.2.5/>.
- MySQL: Log in to the MySQL official website (<https://www.mysql.com/>), choose **Downloads > Community > MySQL Connectors > Connector/J** to download the driver package of the required version, and upload the driver package to the **/opt/Bigdata/FusionInsight\_HD\_\*/install/FusionInsight-Hive-\*/hive-\*/lib/** directory on all Metastore instance nodes.

**Step 9** On the cluster details page, click the **Components** tab and click **Hive**. On the service details page, choose **More > Restart Service** and click **OK** to restart the Hive service.

**NOTE**

- If IAM users are not synchronized, click the **Dashboard** tab on the cluster details page, click **Synchronize** on the right of **IAM User Sync**, and then restart the Hive service.
- Hive will create necessary database tables in the specified database after restart. (If tables already exist, they will not be created.)

----End

## 6.11.4 Configuring a LakeFormation Data Connection

### 6.11.4.1 LakeFormation Overview

LakeFormation is a one-stop enterprise-class data lake and warehouse construction service. It provides APIs and a GUI for unified management of data lake metadata, and is compatible with Hive metadata and Ranger permission models. LakeFormation can connect to multiple compute engines and big data cloud services seamlessly to ensure quick building and easy operation of data lakes and unleash rich value of service data.

You can create a LakeFormation instance and connect it to an MRS cluster for centrally manage data lake metadata and permission.

### Restrictions and Constraints

- **Before interconnecting LakeFormation with MRS clusters, pay attention to the following restrictions:**
  - MRS clusters and LakeFormation instances must belong to the same cloud account and region.
  - The VPC of the access client created by LakeFormation must be in the same VPC of the MRS clusters.
  - The MRS cluster can only interconnect with the catalog named **hive** in the LakeFormation instance.
  - For existing MRS clusters, you need to migrate the metadata database and permission policies to the LakeFormation instance, and then configure the interconnection.
  - If metadata in multiple MRS clusters needs to be migrated to the same LakeFormation instance, the database names of the MRS clusters must be unique.
- **After MRS is interconnected with LakeFormation, MRS components are subject to the following constraints:**
  - Hive does not support temporary tables.
  - Hive does not support cross-cluster column encryption.
  - Hive WebHCat cannot interconnect with LakeFormation.
  - Hive cannot create an internal table if the designated directory already contains files.
  - Before creating a Hudi table, you need to add the path authorization of the Hudi table directory on LakeFormation to grant OBS read and write permissions.
  - Fields in a Hudi table cannot be edited on the LakeFormation console. You can only add, delete, or modify table fields on the Hudi client.
  - When Flink reads and writes Hive tables, only **hive\_sync.mode=jdbc** can be used to synchronize Hive tables. HMS is not supported.
  - If a low-permission user lacks OBS path access permission for the default database, Spark will display a permission error message but will still successfully create the database.
- **After MRS is interconnected with LakeFormation, the permission policy restrictions are as follows:**

- In LakeFormation authorization, only LakeFormation roles can be used as authorization entities. IAM users or user groups cannot be used as authorization entities.
- The PolicySync process does not modify the default policy of the RangerAdmin Hive module in the cluster. The default policy still takes effect.
- After the PolicySync process is started, it compares the permissions with those of LakeFormation instances and deletes the non-default policies that do not exist in LakeFormation. You are advised to migrate the permission policies to LakeFormation instances first.
- For the Hive module on the RangerAdmin web UI, do not add or delete non-default policies. Grant permissions on the data permission page of LakeFormation instances.
- After the interconnection between the MRS cluster and LakeFormation is canceled, the non-default policies of RangerAdmin will not be cleared. You need to manually clear them.
- Hive does not support SQL statements for granting permissions. You need to grant permissions on the **Data Permissions** page.
- MRS does not support LakeFormation row filtering.

## 6.11.4.2 Preparing for a LakeFormation Data Connection

### Creating a LakeFormation Instance

- Step 1** Log in to the Huawei Cloud management console, click  in the upper left corner, and choose **Analytics > DataArts LakeFormation**. The LakeFormation console is displayed.
- Step 2** Click **Buy Instance** in the upper right corner of the page and create a LakeFormation instance by referring to [Creating a LakeFormation Instance](#).
- Step 3** Create the **hive** catalog and the **default** database. If the catalog and database already exist in the instance, skip this step. For details, see [Managing Metadata](#).

MRS can interconnect with LakeFormation only when the catalog name of the LakeFormation instance is **hive**.

1. Ensure that the instance name displayed in the upper left corner is the name of the newly created instance. Then, choose **Metadata > Catalog** page. You only need one **hive** catalog per instance. If you already have one in the current instance, you can skip creating another one.
2. Click **Create** in the upper right corner. On the displayed page, set the following parameters, and click **Submit**.
  - **Catalog Name:** Enter **hive**. Do not use custom names.
  - **Select Location:** Click  to select the OBS storage path corresponding to the catalog, for example, **obs://lakeformation-test/hive** (which must be an existing path), and click **OK**.
  - Set other parameters based on the site requirements.

< Create Catalog

---

**Basic Information**

\* Catalog Name  Select  +

Location

Catalog Type  Description

---

**Database Storage Locations**

| No. | Location |
|-----|----------|
|     |          |

---

- In the navigation pane on the left, choose **Metadata > Database**, click **Create Database**, configure the following parameters, and click **Submit**. You only need one **default** database per instance. If you already have one in the current instance, you can skip creating another one.
  - Database Name:** Enter **default**. Do not use custom names.
  - Catalog:** **hive**
  - Select Location:** Click **+** to select a location in the Hive Catalog storage path, for example, **obs://lakeformation-test/hive/default** (which must be an existing path), and click **OK**.
  - Set other parameters based on the site requirements.

< Create Database

---

**Basic Information**

\* Database  \* Catalog

Name

\* Select  + Description

Location

---

**Data Table Storage Locations**

| No. | Location |
|-----|----------|
|     |          |

---

**Function Storage Locations**

| No. | Location |
|-----|----------|
|     |          |

---

**Step 4** Choose **Data Permissions > Data Authorization** in the navigation pane on the left. On the displayed page, you can grant permissions to access Hive Catalog to users and user groups based on service requirements. For details, see [Granting Permissions](#).

**Step 5** Choose **Clients** in the navigation pane on the left. Click **Create** to create a client for access management. The VPC and Subnet must be the same as those of the MRS cluster you want to interconnect. For details, see [Managing Access Clients](#).

×

### Create Client

If no VPC or subnet is available, [create one](#) .

\* Client

\* VPC

\* Subnet

 Ensure that your current account has enough quotas for resources like VPCEP and private DNS. Otherwise, the creation will fail, the client will be rolled back and deleted, and any related resources will be reclaimed. 

You can obtain the VPC and subnet of the MRS cluster on the **Dashboard** page of the cluster on the MRS management console.

Go to the client details page, record the access IP address of the client.

----End

## Creating an Agency for Interconnecting with LakeFormation

**Step 1** Log in to Huawei Cloud management console and go to the **Identity and Access Management** console page.

**Step 2** In the navigation pane on the left, choose **Agencies**. Click **Create Agency** in the upper right corner, set related parameters, and click **Next**.

Refer to the following descriptions to configure the parameters:

- **Agency Name:** For example, enter **visit\_lakeformation\_agency**.
- **Agency Type:** Select **Account**.
- **Delegated Account:** Enter the name of the delegated Huawei Cloud account.
- **Validity Period:** Set this parameter as you need.

Figure 6-89 Creating an agency

\* Agency Name

\* Agency Type  Account  
 Delegate another Huawei Cloud account to perform operations on your resources.  
 Cloud service  
 Delegate a cloud service to access your resources in other cloud services.

\* Delegated Account

\* Validity Period

Description

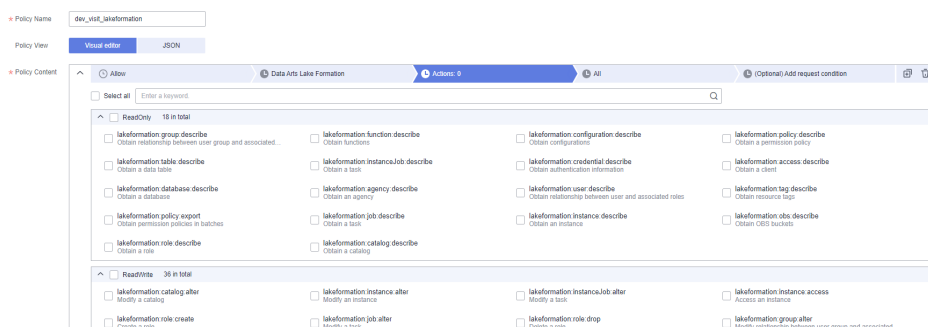

0/255

**Step 3** In the upper right corner of the **Select Policy/Role** page, click **Create Policy**, configure the following information, and click **Next**.

- **Policy Name:** For example, enter **dev\_visit\_lakeformation**.
- **Policy View:** Select **Visual editor** or **JSON**.
- **Policy Content:**

The policy must contain **lakeformation:policy:export** and **lakeformation:role:describe**. Set other parameters as you need.

- If you are using the visual editor, set the **Policy Content** as follows: Select **Data Arts LakeFormation** for **Cloud Service** and select the required permissions in **Actions**. Set other parameters as you need.

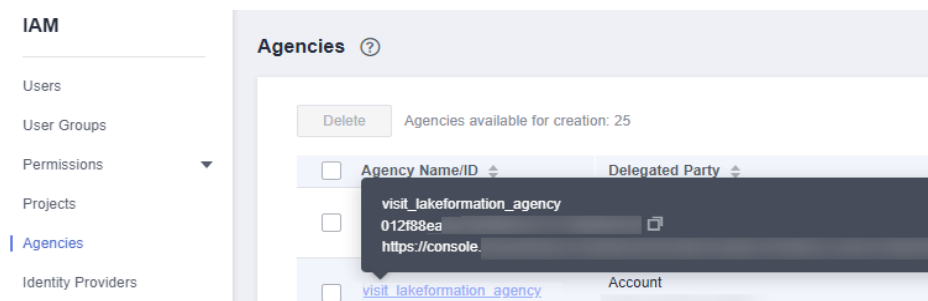

- If you are using the JSON view, configure the policy content by referring to the following content:

```
{
 "Version": "1.1",
 "Statement": [
 {
 "Effect": "Allow",
```

```
"Action": [
 "lakeformation:table:create",
 "lakeformation:database:alter",
 "lakeformation:table:alter",
 "lakeformation:database:drop",
 "lakeformation:database:create",
 "lakeformation:role:describe",
 "lakeformation:policy:create",
 "lakeformation:policy:export",
 "lakeformation:function:alter",
 "lakeformation:function:describe",
 "lakeformation:table:drop",
 "lakeformation:catalog:describe",
 "lakeformation:table:describe",
 "lakeformation:function:drop",
 "lakeformation:database:describe",
 "lakeformation:function:create",
 "lakeformation:transaction:operate",
 "lakeformation:policy:drop"
]
}
]
```

- Step 4** Select the new policy name, for example, **dev\_visit\_lakeformation**, and click **Next**.
- Step 5** Select the desired scope requiring minimum authorization and click **OK** to create an agency.
- Step 6** On the **Agencies** page, move the cursor to the name of the newly created agency to obtain the ID of the agency that has the permission to access LakeFormation.

**Figure 6-90** Viewing an agency ID

----End

## Creating an Agency for Interconnecting with OBS

- Step 1** Log in to Huawei Cloud management console and go to the **Identity and Access Management** console page.
- Step 2** In the navigation pane on the left, choose **Agencies**. Click **Create Agency** in the upper right corner, set related parameters, and click **Next**.

Refer to the following descriptions to set the parameters:

- **Agency Name:** For example, enter **visit\_obs\_agency**.
- **Agency Type:** Select **Account**.
- **Delegated Account:** Enter the name of the delegated Huawei Cloud account.

- **Validity Period:** Set this parameter as you need.

**Step 3** In the upper right corner of the **Select Policy/Role** page, click **Create Policy**, configure the following information, and click **Next**.

- **Policy Name:** For example, enter **dev\_visit\_obs**.
- **Policy View:** Select **JSON**.
- **Policy Content:** Enter the following information.

```
{
 "Version": "1.1",
 "Statement": [
 {
 "Effect": "Allow",
 "Action": [
 "obs:bucket:GetBucketLocation",
 "obs:bucket:ListBucketMultipartUploads",
 "obs:object:GetObject",
 "obs:object:ModifyObjectMetaData",
 "obs:object:DeleteObject",
 "obs:object:ListMultipartUploadParts",
 "obs:bucket:HeadBucket",
 "obs:object:AbortMultipartUpload",
 "obs:bucket:ListBucket",
 "obs:object:PutObject"
],
 "Resource": [
 "OBS:*:*:bucket:*",
 "OBS:*:*:object:*"
]
 }
]
}
```

#### NOTE

In the **Resource** parameter, **bucket** indicates the OBS bucket name, and **object** indicates the OBS object name. Specify the names as needed. If this parameter is set to \*, the policy applies to all OBS buckets or objects.

- Set other parameters as you need.

**Step 4** Select the new policy name, for example, **dev\_visit\_obs**, and click **Next**.

**Step 5** Select the desired scope requiring minimum authorization and click **OK** to create an agency.

**Step 6** On the **Agencies** page, move the cursor to the name of the newly created agency to obtain the ID of the agency that has the permission to access OBS.

----End

## Creating an ECS/BMS Agency

**Step 1** Log in to Huawei Cloud management console and go to the **Identity and Access Management** console page.

**Step 2** In the navigation pane on the left, choose **Agencies**. Click **Create Agency** in the upper right corner, set related parameters, and click **Next**.

Refer to the following descriptions to set the parameters:

- **Agency Name:** For example, enter **lakeformation\_test**.
- **Agency Type:** Select **Cloud service**.

- **Cloud Service:** Select **ECS BMS**.
- **Validity Period:** Set this parameter as you need.

**Step 3** In the upper right corner of the **Select Policy/Role** page, click **Create Policy**, configure the following information, and click **Next**.

- **Policy Name:** Enter a policy name.
- **Policy View:** Select **JSON**.
- **Policy Content:** Configure the parameter as follows.

```
{
 "Version": "1.1",
 "Statement": [
 {
 "Action": [
 "iam:agencies:assume"
],
 "Resource": {
 "uri": [
 "/iam/agencies/ID of the agency that grants LakeFormation access permission to your account",
 "/iam/agencies/ID of the agency that grants the OBS access permission to your account"
]
 },
 "Effect": "Allow"
 }
]
}
```

#### NOTE

- To obtain the ID of the agency that has the permission to access LakeFormation, refer to [Step 6](#).
- To obtain the ID of the agency that has the permission to access OBS, refer to [Step 6](#).

**Step 4** Select the name of the newly created custom agency and click **Next**.

**Step 5** Select the desired scope requiring minimum authorization and click **OK** to create an agency.

----End

## Creating a LakeFormation Connection

#### NOTE

You need to contact technical support to be added in the whitelist before you create a LakeFormation data connection.

**Step 1** Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.

**Step 2** Click **Create Data Connection**.

**Step 3** Set parameters by referring to [Table 6-64](#) and click **OK**.

**Table 6-64** LakeFormation data connection

| Parameter              | Description                                                                                                                                                                                                                                                                  |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                   | Select <b>LakeFormation</b> . Only MRS 3.3.0-LTS supports this connection type.                                                                                                                                                                                              |

## Obtaining the Account ID

**Step 1** Log in to the management console as the user for interconnecting MRS with LakeFormation.

**Step 2** Hover over the username and choose **My Credentials** from the drop-down list.

**Step 3** On the **API Credentials** page, obtain the **Account ID** and view the **Project ID** in the project list.

IAM User Name:  Account Name:

IAM User ID:  Account ID: 20490i

---

Projects

| Project ID | Project Name | Region |
|------------|--------------|--------|
| 1c0fbdb    |              |        |

**Step 4** Grant the current user the permission to use LakeFormation.

1. Click in the upper left corner and choose **Analytics > LakeFormation**.
2. Check whether the service authorization page is displayed, or go to the Service Authorization page to check whether the service has been authorized.

- Select the checkbox to agree with the LakeFormation Service Statement and click **Authorize**.
- If no, the current user has the permission to perform operations on LakeFormation.

----End

### 6.11.4.3 Configuring a LakeFormation Data Connection During Cluster Creation

You can configure a LakeFormation data connection when you create an MRS 3.3.0-LTS cluster. You need to configure MRS cluster parameters to interconnect with LakeFormation after the cluster is created.

#### Configuring a LakeFormation Data Connection During Cluster Creation

- Step 1** Go to the [Buy Cluster](#) page.
- Step 2** Click **Buy Cluster**. The page for buying a cluster is displayed.
- Step 3** On the page for buying a cluster, click the **Custom Config** tab.
- Step 4** Create a cluster by referring to [Configuring Custom Topology](#). The cluster must meet the requirements described in [Table 6-65](#).

**Table 6-65** Data connection parameters

| Parameter       | Description                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version Type    | LTS                                                                                                                                                                               |
| Cluster Version | Version of the MRS cluster to be interconnected<br>Currently, LakeFormation data connections can be configured during creation of MRS 3.3.0-LTS clusters and later versions only. |

| Parameter                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                        |                          |                      |                                            | ## Configuring the MRS 3.3.0-LTS Cluster

**Step 1** Log in to FusionInsight Manager of the MRS cluster. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#).

**Step 2** Configure the Guardian component.

1. On FusionInsight Manager, click **Cluster**, choose **Services > Guardian**, click **Configurations**, and then **All Configurations**. Search for and modify the following parameters, and click **Save**.

**Table 6-66** Guardian parameters

| Parameter                             | Description                                                                                                                                                                                                                                                                    | Value                                                                              |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| token.server.access.iam.domain.id     | Account ID of the user who accesses IAM<br>Obtain the account ID by referring to <a href="#">Obtaining the Account ID</a> .                                                                                                                                                    | xxx                                                                                |
| token.server.access.iam.project.id    | Project ID of the user who accesses IAM<br>Obtain the project ID by referring to <a href="#">Obtaining the Account ID</a> .                                                                                                                                                    | xxx                                                                                |
| token.server.access.label.agency.name | Name of an IAM agency.<br>The agency must have the permission to access OBS.<br>Set the value to the name of the agency created in <a href="#">Creating an Agency for Interconnecting with OBS</a> .                                                                           | visit_obs_agency                                                                   |
| fs.obs.delegation.token.providers     | Name of the class that generates <b>delegation.token</b> . The default value is empty.<br>Select both the following parameters: <ul style="list-style-type: none"><li>- com.huawei.mrs.dt.MRSDelegationTokenProvider</li><li>- com.huawei.mrs.dt.GuardianDTPProvider</li></ul> | com.huawei.mrs.dt.MRSDelegationTokenProvider,com.huawei.mrs.dt.GuardianDTPProvider |
| fs.obs.guardian.accesslabel.enabled   | Whether to enable <b>access label</b> for using Guardian to connect to OBS.                                                                                                                                                                                                    | true                                                                               |

| Parameter               | Description                 | Value |
|-------------------------|-----------------------------|-------|
| fs.obs.guardian.enabled | Whether to enable Guardian. | true  |

- In the **Dashboard** tab of the Guardian service, choose **More > Restart Service**.

**Step 3** Interconnecting Hive with OBS

- Log in to FusionInsight Manager, click **Cluster**, choose **Services > Hive**, click **Configurations**, and then **All Configurations**.
- In the navigation pane on the left, choose **HiveServer > Customization**. Configure the following parameters.

**Table 6-67** Custom HiveServer parameters

| Parameter                      | Description                                                                                                                                                                                                                                               | Example Value                                                                                                                      |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| hive.server.customized.configs | <ul style="list-style-type: none"> <li>Add the <b>hive.metastore.warehouse.dir</b> parameter.</li> <li>Set this parameter to the OBS storage path of the hive Catalog, which is obtained in <a href="#">Creating a LakeFormation Instance</a>.</li> </ul> | <ul style="list-style-type: none"> <li>Name: hive.metastore.warehouse.dir</li> <li>Value: obs://lakeformation-test/hive</li> </ul> |

**Figure 6-92** Configuring **hive.metastore.warehouse.dir**

- Click **Save**.

**Step 4** Interconnecting Spark with OBS If your cluster does not have the Spark component, skip this step.

- Log in to FusionInsight Manager and choose **Cluster > Services > Spark**. Click **Configurations** then **All Configurations**.
- In the navigation pane on the left, choose **JDBCServer > Customization**. Add custom parameters and set them by referring to the following table.

**Table 6-68** Spark parameters

| Custom Item                        | Value                                                                                                                                                                                                                                                                                                    |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spark.hive-site.customized.configs | <ul style="list-style-type: none"><li>Parameter: <b>hive.metastore.warehouse.dir</b></li><li>Value: Set this parameter to the OBS storage path of the hive Catalog, which is obtained in <a href="#">Creating a LakeFormation Instance</a>. For example, <b>obs://lakeformation-test/hive</b>.</li></ul> |

- In the navigation pane on the left, choose **SparkResource** > **Customization**. Set parameters by referring to [Table 6-68](#).
- Click **Save**.

**Step 5** In the **Components** tab of the MRS cluster, check whether there are expired components. If there are, click **Restart** in the **Operation** column to restart these components.

**Step 6** Download and reinstall the complete MRS cluster client. For details, see [Installing a Client \(MRS 3.x or Later\)](#).

**Step 7** Update the built-in client configuration file of the cluster to submit jobs on the management console.

On the dashboard page of the MRS cluster, obtain the EIP, use this IP address to log in to a Master node, and run the following commands to refresh the built-in client of the cluster:

```
su - omm
```

```
sh /opt/executor/bin/refresh-client-config.sh
```

**Step 8** Log in to the node where the client is installed and check the database on the Hive client to verify that the interconnection is successful.

```
source Client installation path//bigdata_env
```

```
kinit Component service user
```

```
beeline
```

```
show databases;desc database default;
```

```
!q
```

**Step 9** On the Spark client, check the database to ensure that the interconnection is successful. If your cluster does not have the Spark component, skip this step.

```
source Client installation path//Spark/component_env
```

```
spark-sql
```

```
show databases;desc database default;
```

```
----End
```

## 6.11.5 Managing MRS Cluster Data Connections

This topic describes how to create, view, and delete a cluster data connection on the MRS console.

### Creating a Data Connection

**Step 1** Log in to the MRS management console. In the navigation pane, choose **Data Connections**.

**Step 2** Click **Create Data Connection**.

For details about how to configure an RDS for MySQL data connection, see [Creating an RDS Data Connection for an Existing MRS Cluster](#).

For details about how to configure a LakeFormation data connection, see [Creating a LakeFormation Connection](#).

**Step 3** Click **OK**.

----End

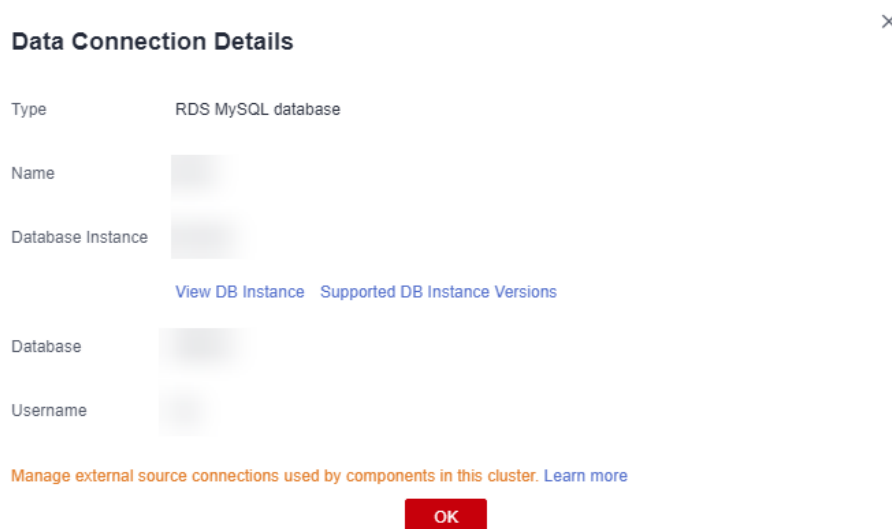

### Checking Data Connection Information

**Step 1** Log in to the MRS management console. In the navigation pane, choose **Data Connections**.

**Step 2** In the data connection list, click the desired data connection. On the page that is displayed, view its details.

For example, the data connection information of the RDS MySQL database is as follows:

**Figure 6-93** Viewing the data connection information of the RDS MySQL database

----End

## Deleting a Data Connection

- Step 1** Log in to the MRS management console. In the navigation pane, choose **Data Connections**.
- Step 2** In the **Operation** column of the data connection list, click **Delete** in the row where the data connection to be deleted is located. Enter **DELETE** in the **Delete Data Connection** dialog box and click **OK**.

If the selected data connection has been associated with a cluster, the deletion does not affect the cluster.

----End

# 6.12 Managing Static Service Resources in an MRS Cluster

## 6.12.1 Overview of Static Service Resources

### Introduction

A cluster allocates static service resources to services Flume, HBase, HDFS, and YARN. The total volume of computing resources allocated to each service is fixed, and they are static. A tenant can exclusively use or share a service to obtain the resources required for running this service.

### Static Service Pool

Static service pools are used to specify service resource configurations.

Static service pools centrally manage resources that can be used by each service.

- Limits the total number of resources that can be used by each service. Specifically, the total number of CPU, I/O, and memory resources can be configured on the nodes where services Flume, HBase, HDFSioTDB, Kafka (Kafka supports static service pools only in MRS 3.2.0 or later), and YARN are deployed.
- Isolates the resources of services in a cluster from those of other services. In this way, the load of one service has very limited impact on other services.

### Scheduling Mechanism

The time-based dynamic resource scheduling mechanism enables different volumes of static resources to be configured for services at different time, optimizing service running environments and improving the cluster efficiency.

In a complex cluster environment, multiple services share resources in the cluster, but the resource service period of each service may be different.

The following use a bank customer as an example:

- The HBase query service is heavy in the daytime.

- The query service is light, but the Hive analysis service is heavy at night.

If fixed resources are allocated to each service, the following problems may occur:

- The query service cannot obtain sufficient resources while the resources for the analysis service are idle in the daytime.
- The analysis service cannot obtain sufficient resources while the resources for the query service are idle at night.

As a result, the cluster resource utilization is low and the service capability is weak. Resolve the problem in the following ways:

- Sufficient resources need to be configured for HBase in the daytime.
- Sufficient resources need to be configured for Hive at night.

The time-based dynamic scheduling mechanism can efficiently utilize resources and run tasks.

## 6.12.2 Configuring Static Resources for an MRS Cluster

You can adjust resource base on Manager and customize resource configuration groups if you need to control service resources used on each node in a cluster or the available CPU or I/O quotas on each node at different time segments.

### Impact on the System

- After a static service pool is configured, the configuration of affected services expires. You need to restart the services. Services are unavailable during restart.
- After a static service pool is configured, the maximum number of resources used by each service and role instance cannot exceed the upper limit.

### Configuring Static Resources (MRS 3.x and Later)

#### Modify the Resource Adjustment Base

**Step 1** Log in to FusionInsight Manager and choose **Cluster > Static Service Pool Configurations**.

**Step 2** Click **Configuration** in the upper right corner. The page for configuring resource pools is displayed.

**Step 3** Change the values of **CPU (%)** and **Memory (%)** in the **System Resource Adjustment Base** area.

Modifying the system resource adjustment base changes the maximum physical CPU and memory usage on nodes by services. If multiple services are deployed on the same node, the maximum physical resource usage of all services cannot exceed the adjusted CPU or memory usage.

**Step 4** Click **Next**.

To modify parameters again, click **Previous**.

#### Modify the Default Resource Configuration Group

**Step 5** Click **default**. In the **Configure weight** table, set **CPU LIMIT(%)**, **CPU SHARE(%)**, **I/O(%)**, and **Memory(%)** for each service.

**Figure 6-94** Weight Configuration

| Services | CPU LIMIT (%) | CPU SHARE (%) | I/O (%) | Memory (%) |
|----------|---------------|---------------|---------|------------|
| Flume    | 0             | 0             | 0       | 0          |
| HBase    | 0             | 0             | 0       | 0          |
| HDFS     | 0             | 0             | 0       | 0          |
| Impala   | 0             | 0             | 0       | 0          |
| Kudu     | 0             | 0             | 0       | 0          |
| Yarn     | 0             | 0             | 0       | 0          |
| Total:   | 0             | 0             | 0       | 0          |

**NOTE**

- The sum of **CPU LIMIT(%)** and **CPU SHARE(%)** used by all services can exceed 100%.
- The sum of **I/O(%)** used by all services can exceed 100% but cannot be 0.
- The sum of **Memory(%)** used by all services can be greater than, smaller than, or equal to 100%.
- **Memory(%)** cannot take effect dynamically and can only be modified in the default configuration group.
- **CPU LIMIT(%)** is used to configure the ratio of the number of CPU cores that can be used by a service to those can be allocated to related nodes.
- **CPU SHARE(%)** is used to configure the ratio of the time when a service uses a CPU core to the time when other services use the CPU core. That is, the ratio of time when multiple services compete for the same CPU core.

**Step 6** Click **Generate detailed configurations based on weight configurations**. FusionInsight Manager generates the actual values of the parameters in the default weight configuration table based on the cluster hardware resources and allocation information.

**Step 7** Click **OK**.

In the displayed dialog box, click **OK**.

**Add a Customized Resource Configuration Group**

**Step 8** Determine whether to automatically adjust resource configurations at different time segments.

- If yes, go to [Step 9](#).
- If no, use the default configurations, and no further action is required.

**Step 9** Click **Configuration**, change the system resource adjustment base values, and click **Next**.

**Step 10** Click **Add** to add a resource configuration group.

**Figure 6-95** Adding a resource configuration group

The screenshot shows a web interface for configuring resource groups. At the top, there are tabs for 'default', 'dynamic-config1', and 'Add'. Below this, the interface is divided into three steps:

- Step 1: Scheduling Time** - A link labeled 'Configuration' is visible.
- Step 2: Weight Configuration** - This step contains a table with columns for 'Services', 'CPU LIMIT (%)', 'CPU SHARE (%)', and 'I/O (%)'. The table lists services: Flume, HBase, HDFS, Impala, Kudu, and Yarn, each with input fields set to '0'. A 'Total' row shows 0 for all columns. A 'Service Name' search box is on the right.
- Step 3:** A button labeled 'Generate detailed configurations based on weight configurations' and another 'Service Name' search box.

**Step 11** In **Step 1: Scheduling Time**, click **Configuration**.

The page for configuring the time policy is displayed.

Modify the following parameters based on service requirements and click **OK**.

- **Repeat:** If this parameter is selected, the customized resource configuration is applied repeatedly based on the scheduling period. If this parameter is not selected, set the date and time when the configuration of the group of resources can be applied.
- **Repeat Policy:** The available values are **Daily**, **Weekly**, and **Monthly**. This parameter is valid only when **Repeat** is selected.
- **On:** indicates the time period between the start time and end time when the resource configuration is applied. Set a unique time range. If the time range overlaps with that of an existing group of resource configuration, the time range cannot be saved.

 NOTE

- The default group of resource configuration takes effect in all undefined time segments.
- The newly added resource group is a parameter set that takes effect dynamically in a specified time range.
- The newly added resource group can be deleted. A maximum of four resource configuration groups that take effect dynamically can be added.
- Select a repetition policy. If the end time is earlier than the start time, the resource configuration ends in the next day by default. For example, if a validity period ranges from 22:00 to 06:00, the customized resource configuration takes effect from 22:00 on the current day to 06:00 on the next day.
- If the repetition policy types of multiple configuration groups are different, the time ranges can overlap. The policy types are listed as follows by priority from low to high: daily, weekly, and monthly. The following is an example. There are two resource configuration groups using the monthly and daily policies, respectively. Their application time ranges in a day overlap as follows: 04:00 to 07:00 and 06:00 to 08:00. In this case, the configuration of the group that uses the monthly policy prevails.
- If the repetition policy types of multiple resource configuration groups are the same, the time ranges of different dates can overlap. For example, if there are two weekly scheduling groups, you can set the same time range on different day for them, such as to 04:00 to 07:00, on Monday and Wednesday, respectively.

**Step 12** Modify the resource configuration of each service in **Step 2: Weight Configuration**.

**Step 13** Click **Generate detailed configuration**. FusionInsight Manager generates the actual values of the parameters in the default weight configuration table based on the cluster hardware resources and allocation information.

**Step 14** Click **OK**.

In the displayed dialog box, click **OK**.

----End

## Configuring Static Resources (MRS 2.x and Earlier)

**Step 1** Modify the system resource adjustment base.

1. On MRS Manager, click **System**. In the **Resource** area, click **Configure Static Service Pool**.
2. Click **Configuration**. The service pool configuration group management page is displayed.
3. In the **System Resource Adjustment Base** area, change the values of **CPU(%)** and **Memory(%)**.

Modifying **System Resource Adjustment Base** limits the maximum physical CPU and memory resource percentage of nodes that can be used by the Flume, HBase, HDFS, Impala and YARN services. If multiple services are deployed on the same node, the maximum physical resource usage of all services cannot exceed the adjusted CPU or memory usage.

4. Click **Next**.

If you need to modify the parameters again, click **Previous** in the lower part of the page.

**Step 2** Modify the **default** configuration group of the service pool.

1. In the **Service Pool Configuration** table, set **CPU LIMIT(%)**, **CPU SHARE(%)**, **I/O(%)**, and **Memory(%)** for the Flume, HBase, HDFS, Impala, and YARN services.

 **NOTE**

- The sum of **CPU LIMIT(%)** used by all services can exceed 100%.
  - The sum of **CPU SHARE(%)** and **I/O(%)** used by all services must be 100%. For example, if CPU resources are allocated to the HDFS and YARN services, the total CPU resources allocated to the two services are 100%.
  - The sum of **Memory(%)** used by all services can be greater than, smaller than, or equal to 100%.
  - **Memory(%)** cannot take effect dynamically and can only be modified in the default configuration group.
2. Click in the blank area of the page to complete the editing. MRS Manager generates the correct values of service pool parameters in the **Detailed Configuration** area based on the cluster hardware resources and allocation information.
  3. You can click the edit icon on the right of **Detailed Configuration** to modify the parameter values of the service pool based on service requirements.

In the **Service Pool Configuration** area, click the specified service name. The **Detailed Configuration** area displays only the parameters of the service. Manually changing parameter values does not refresh the service resource usage. In added configuration groups, the configuration group numbers of the parameters that take effect dynamically will be displayed. For example, HBase: RegionServer: dynamic-config1.RES\_CPUSET\_PERCENTAGE. The parameter functions do not change.

**Table 6-69** Parameters of the static service pool

| Parameter                                                          | Description                                         |
|--------------------------------------------------------------------|-----------------------------------------------------|
| - RES_CPUSET_PERCENTAGE<br>- dynamic-configX.RES_CPUSET_PERCENTAGE | Configures the service CPU percentage.              |
| - RES_CPU_SHARE<br>- dynamic-configX.RES_CPU_SHARE                 | Configures the service CPU usage share.             |
| - RES_BLKIO_WEIGHT<br>- dynamic-configX.RES_BLKIO_WEIGHT           | Configures service I/O usage.                       |
| HBASE_HEAPSIZE                                                     | Configures the maximum JVM memory for RegionServer. |
| HADOOP_HEAPSIZE                                                    | Configures the maximum JVM memory of a DataNode.    |

| Parameter                           | Description                                                                     |
|-------------------------------------|---------------------------------------------------------------------------------|
| yarn.nodemanager.resource.memory-mb | Configures the memory that can be used by NodeManager on the current node.      |
| dfs.datanode.max.locked.memory      | Configures the maximum memory that can be used by a DataNode as the HDFS cache. |
| FLUME_HEAPSIZE                      | Configures the maximum JVM memory that can be used by each Flume instance.      |
| IMPALAD_MEM_LIMIT                   | Configures the maximum memory that can be used by an Impalad instance.          |

**Step 3** Add a customized resource configuration group.

1. Determine whether to automatically adjust resource configurations based on the time.  
If yes, go to [Step 3.2](#).  
If no, go to [Step 4](#).
2. Click  to add a resource configuration group. In the **Scheduling Time** area, click the edit icon. The time policy configuration page is displayed.  
Modify the following parameters based on service requirements and click **OK**.
  - **Repeat**: If selected, the resource configuration group runs repeatedly based on the scheduling period. If not selected, set the date and time when the configuration of the group of resources can be applied.
  - **Repeat Policy**: can be set to **Daily**, **Weekly**, and **Monthly**. This parameter is valid only when **Repeat** is selected.
  - **Between**: indicates the time period between the start time and end time when the resource configuration is applied. Set a unique time range. If the time range overlaps with that of an existing group of resource configuration, the time range cannot be saved. This parameter is valid only when **Repeat** is selected.

 NOTE

- The default group of resource configuration takes effect in all undefined time segments.
  - The newly added resource group is a parameter set that takes effect dynamically in a specified time range.
  - The newly added resource group can be deleted. A maximum of four resource configuration groups that take effect dynamically can be added.
  - Select a repetition policy. If the end time is earlier than the start time, the resource configuration ends in the next day by default. For example, if a validity period ranges from 22:00 to 06:00, the customized resource configuration takes effect from 22:00 on the current day to 06:00 on the next day.
  - If the repetition policy types of multiple configuration groups are different, the time ranges can overlap. The policy types are listed as follows by priority from low to high: daily, weekly, and monthly. The following is an example. There are two resource configuration groups using the monthly and daily policies, respectively. Their application time ranges in a day overlap as follows: 04:00 to 07:00 and 06:00 to 08:00. In this case, the configuration of the group that uses the monthly policy prevails.
  - If the repetition policy types of multiple resource configuration groups are the same, the time ranges of different dates can overlap. For example, if there are two weekly scheduling groups, you can set the same time range on different day for them, such as to 04:00 to 07:00, on Monday and Wednesday, respectively.
3. On the **Service Pool Configuration** page, modify the resource configuration of each service. Click the blank area on the page to complete the editing, and go to [Step 4](#).

You can click the edit icon on the right of **Service Pool Configuration** to modify the parameters. Click the edit icon in the **Detailed Configuration** area to manually update the parameter values generated by the system based on service requirements.

**Step 4** Saves the settings.

Click **Save**. In the **Save Configuration** dialog box, select **Restart the affected services or instances**. Click **OK** to save the settings and restart related services.

After the system displays "Operation succeeded", click **Finish**. The service is started successfully.

----End

### 6.12.3 Checking the Static Resources of an MRS Cluster

The big data management platform can manage and isolate service resources that are not running on YARN using static service resource pools. The system supports time-based automatic adjustment of static service resource pools. This enables the cluster to automatically adjust the parameter values at different periods to ensure more efficient resource utilization.

System administrators can view the monitoring indicators of resources used by each service in the static service pool on Manager. The monitoring indicators are as follows:

- CPU usage of services
- Total disk I/O read rate of services

- Total disk I/O write rate of services
- Total used memory of services

## Checking Static Resources (MRS 3.x and Later)

**Step 1** Log in to FusionInsight Manager and choose **Cluster > Static Service Pool Configurations**.

**Step 2** In the configuration group list, click a configuration group, for example, **default**.

**Step 3** Check the system resource adjustment base values.

- **System Resource Adjustment Base** indicates the maximum volume of resources that can be used by each node in the cluster. If a node has only one service, the service exclusively occupies the available resources on the node. If a node has multiple services, all services share the available resources on the node.
- **CPU** indicates the maximum number of CPUs that can be used by services on a node.
- **Memory** indicates the maximum memory that can be used by services on a node.

**Step 4** In **Chart**, view the metric data of the cluster service resource usage.

### NOTE

- You can click **Add Service to Chart** to add static service resource data of specific services (up to 12 services) to the chart.
- For details about how to manage a chart, see [Viewing MRS Cluster Resource Monitoring Metrics](#).

----End

## Checking Static Resources (MRS 2.x and Earlier)

**Step 1** On MRS Manager, click **System**. In the **Resource** area, click **Configure Static Service Pool**.

**Step 2** Click **Status**.

**Step 3** Check the system resource adjustment base values.

- **System Resource Adjustment Base** indicates the maximum volume of resources that can be used by each node in the cluster. If a node has only one service, the service exclusively occupies the available resources on the node. If a node has multiple services, all services share the available resources on the node.
- **CPU(%)** indicates the maximum number of CPUs that can be used by services on a node.
- **Memory(%)** indicates the maximum memory that can be used by services on a node.

**Step 4** Check the cluster service resource usage.

In the chart area, select **All services** from the service drop-down list box. The resource usage status of all services in the service pool is displayed.

 **NOTE**

**Effective Configuration Group** indicates the resource control configuration group used by the cluster service. By default, the **default** configuration group is used at all time every day, indicating that the cluster service can use all CPUs and 70% memory of the node.

**Step 5** View the resource usage of a single service.

In the chart area, select a service from the service drop-down list box. The resource usage status of the service is displayed.

**Step 6** You can set the interval for automatically refreshing the page.

**Step 7** In the **Period** area, select a time range for viewing service resources.

**Step 8** Click **View** to view the service resource data in the corresponding time range.

**Step 9** Customize a service resource report.

1. Click **Customize** and select the service source indicators to be displayed.
2. Click **OK** to save the selected monitoring metrics for display.

 **NOTE**

Click **Clear** to cancel all the selected monitoring metrics in a batch.

**Step 10** Export a monitoring report.

Click **Export**. MRS Manager will generate a report about the selected service resources in a specified time of period. Save the report.

 **NOTE**

To view the curve charts of monitoring metrics in a specified period, click **View**.

----**End**

# 7 MRS Cluster O&M

---

## 7.1 Cluster O&M

### Account Maintenance Suggestions

It is recommended that the administrator conduct routine checks on the accounts. The check covers the following items:

- Check whether the accounts of the OS, Manager, and each component are necessary and whether temporary accounts have been deleted.
- Check whether the permissions of the accounts are appropriate. Different administrators have different rights.
- Check and audit the logins and operation records of all types of accounts.

### Password Maintenance Suggestions

Accessing portal requires identity authentication. The complexity and validity period of an account password must meet your security requirements.

Refer to the following suggestions to maintain passwords:

- Assign dedicated personnel to keep OS passwords.
- Use passwords that meet certain strength requirements, such as minimum password length or mixing of letter cases.
- Encrypt passwords before transferring them, and do not transfer them via email.
- Encrypt passwords for storage.
- Remind enterprise users to change passwords during system handover.
- Change passwords periodically.

### Log Maintenance Suggestions

Operation logs help discover exceptions such as illegal operations and login by unauthorized users. The system records important operations in logs. You can use operation logs to locate problems.

- **Checking Logs Regularly**  
Check system logs periodically and handle exceptions such as unauthorized operations or logins in a timely manner.
- **Backing Up Logs Regularly**  
Audit logs provided by Manager and clusters record user activity and operation information. You can export audit logs from Manager. If there are too many audit logs in the system, you can configure dump parameters to dump audit logs to a specified server to ensure that the cluster nodes disk space is sufficient.
- **Maintenance Owner**  
Network monitoring engineers and system maintenance engineers

## Manager Routine Maintenance

To ensure long-term and stable running of the system, administrators or maintenance engineers need to periodically check items listed in the following table and rectify the detected faults based on the check results. It is recommended that administrators or engineers record the result in each task scenario and sign off based on the enterprise management regulations.

**Table 7-1** Routine maintenance check items

| Routine Maintenance Frequency | Role                              | Check Item                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Daily                         | Check the cluster service status. | <ul style="list-style-type: none"> <li>• Check whether the running status and configuration status of each service are normal and whether the status icons are green.</li> <li>• Check whether the running status and configuration status of the role instances in each service are normal and whether the status icons are green.</li> <li>• Check whether the active/standby status of role instances in each service can be properly displayed.</li> <li>• Check whether the dashboard of the services and role instances can be displayed properly.</li> </ul> |
|                               | Check the cluster host status.    | <ul style="list-style-type: none"> <li>• Check whether the running status of each host is normal and whether the status icon is green.</li> <li>• Check the current disk usage, memory usage, and CPU usage of each host. Check whether the current memory usage and CPU usage are increasing.</li> </ul>                                                                                                                                                                                                                                                           |

| Routine Maintenance Frequency | Role                                 | Check Item                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                               | Check the cluster alarm information. | Check whether alarms were generated for unhandled exceptions on the previous day, including alarms that were automatically cleared.                                                                                                                                                                                                                                                                                      |
|                               | Check the cluster audit information. | Check whether critical and major operations are performed on the previous day and whether the operations are valid.                                                                                                                                                                                                                                                                                                      |
|                               | Check the cluster backup status.     | Check whether OMS, LDAP, DBService, and NameNode have been automatically backed up on the previous day.                                                                                                                                                                                                                                                                                                                  |
|                               | View the health check result.        | Perform a health check on Manager and download the health check report to check whether the current cluster is abnormal. You are advised to enable the automatic health check, export the latest cluster health check result, and repair unhealthy items based on the result.                                                                                                                                            |
|                               | Check the network communication.     | Check the cluster network status and check whether the network communication between nodes is delayed.                                                                                                                                                                                                                                                                                                                   |
|                               | Check the storage status.            | <p>Check whether the total data storage volume of the cluster increases abruptly.</p> <ul style="list-style-type: none"> <li>● Check whether the disk usage is close to the threshold. If yes, locate the causes. For example, check whether the junk data or cold data left by services needs to be cleared.</li> <li>● Check whether disk partitions need to be expanded based on the service growth trend.</li> </ul> |

To change the password of a machine-machine user, you need to download the keytab file again.                                                                                                                                                                                                                                                 |
|                                   | Analyze alarms.                | Export and analyze alarms generated in a specified period.                                                                                                                                                                                                                                                                                                                                                                                     |
|                                   | Scan disks.                    | Check the disk health status. You are advised to use a dedicated disk check tool.                                                                                                                                                                                                                                                                                                                                                              |
|                                   | Collect statistics on storage. | Check in batches whether the disk data of cluster nodes is evenly stored, filter out the disks whose data increases significantly or is insufficient, and check whether the disks are normal.                                                                                                                                                                                                                                                  |
|                                   | Record changes.                | Arrange and record the operations on cluster configuration parameters and files to provide reference for fault analysis and handling.                                                                                                                                                                                                                                                                                                          |
| Monthly                           | Analyze logs.                  | <ul style="list-style-type: none"> <li>• Collect and analyze hardware logs of cluster node servers, such as BMC system logs.</li> <li>• Collect and analyze the OS logs of the cluster node servers.</li> <li>• Collect and analyze cluster logs.</li> </ul>                                                                                                                                                                                   |
|                                   | Diagnose the network.          | Analyze the network health status of the cluster.                                                                                                                                                                                                                                                                                                                                                                                              |
|                                   | Manage hardware.               | Check the equipment room environment and clean the devices.                                                                                                                                                                                                                                                                                                                                                                                    |

## 7.2 Logging In to an MRS Cluster

### 7.2.1 Checking MRS Active/Standby Management Nodes

Some O&M operation scripts and commands need to be run or can be run only on the active management node. You can log in to a Master node or the Manager (MRS 3.x or later) to determine the active and standby management nodes (active and standby OMS nodes).

An active/standby switchover can be implemented between Master1 and Master2. For this reason, Master1 may not be the active management node.

#### Running the Script to Determine Active and Standby Nodes

**Step 1** Obtain information about the master nodes of the MRS cluster.

1. Log in to the MRS management console, choose **Active Clusters** and click the name of the target cluster to access its details page.
2. In the **Nodes** tab, view Master node names. The node that contains **master1** in its name is the Master1 node. The node that contains **master2** in its name is the Master2 node.

**Step 2** Determine the active and standby management nodes of the cluster.

1. Remotely log in to the Master1 node. For details, see [Logging In to an MRS Cluster Node](#).

Master nodes support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation.

2. Run the following commands to switch the user:

```
sudo su - root
```

```
su - omm
```

3. Run the following command to identify the active and standby management nodes:

- For versions earlier than **MRS 3.x**, run the following command:

```
sh ${BIGDATA_HOME}/om-0.0.1/sbin/status-oms.sh
```

- For **MRS 3.x** and later versions, run the following command:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh
```

In the command output, the node whose **HAActive** is **active** is the active management node (mgtomsdat-sh-3-01-1 in the following example), and the node whose **HAActive** is **standby** is the standby management node (mgtomsdat-sh-3-01-2 in the following example).

```
Ha mode
double
NodeName HostName HAVersion StartTime HAActive
HAAllResOK HARunPhase
192-168-0-30 mgtomsdat-sh-3-01-1 V100R001C01 20xx-11-18 23:43:02
active normal Activated
192-168-0-24 mgtomsdat-sh-3-01-2 V100R001C01 20xx-11-21 07:14:02
standby normal Deactivated
```

**NOTE**

If the Master1 node to which you have logged in is the standby management node and you need to log in to the active management node, run the following command:

```
ssh IP address of Master2 node
```

----End

## Logging in to Manager to Determine Active and Standby Nodes

This section applies only to MRS 3.x or later.

**Step 1** Log in to Manager. For details, see [Accessing MRS Manager](#).

**Step 2** Click **Hosts**. The **Hosts** page is displayed.

**Step 3** View and record the IP addresses of the active and standby management nodes.

**Figure 7-1** Viewing and recording the IP addresses

Hosts

| <input type="checkbox"/> | Host Name | Management IP Addr... | Service IP Address | Running Status |
|--------------------------|-----------|-----------------------|--------------------|----------------|
| <input type="checkbox"/> | 1         |                       |                    | ● Normal       |
| <input type="checkbox"/> | 2         |                       |                    | ● Normal       |
| <input type="checkbox"/> | 3         |                       |                    | ● Normal       |
| <input type="checkbox"/> | ★ 7       |                       |                    | ● Normal       |
| <input type="checkbox"/> | ★ 8       |                       |                    | ● Normal       |
| <input type="checkbox"/> | 9         |                       |                    | ● Normal       |

- If a host name starts with ★, it is the active management node (active OMS node). View and record the value of **Management IP Address** in the row containing the active node.
- If a host name starts with ☆, the host is a standby management node (standby OMS node). View and record the value of **Management IP Address** in the row containing the standby node.

----End

## 7.2.2 Logging In to an MRS Cluster Node

This section describes how to remotely log in to an ECS in an MRS cluster using the remote login (VNC mode) function provided on the ECS management console or a key or password (SSH mode). Remote login (VNC mode) is mainly used for emergency O&M. In other scenarios, it is recommended that you log in to the ECS using SSH.

**NOTE**

To log in to a cluster node using SSH, you need to add an inbound rule to the security group of the cluster. Set **Source** to *IPv4 address of the client/32* or *IPv6 address of the client/128* and set the port number to **22**. For details, see [Adding a Security Group Rule](#).

## Logging In to an ECS Using VNC

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Active Clusters** in the navigation pane, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.
- Step 4** In the upper right corner, click **Remote Login**.
- Step 5** Enter the username and password for logging in to the Master node as prompted.
  1. If you select **Password** for **Login Mode**, you need to enter **root** in **Username** and the password you set during cluster creation in **Password**.

**Figure 7-2** Selecting password as the login mode

\* Login Mode: Password (selected), Key Pair

Username: root

Keep your password secure. The system cannot retrieve your password.

\* Password: [input field]

\* Confirm Password: [input field]

2. If you select **Key Pair** for **Login Mode** when creating a cluster, perform the following operations to log in to the cluster:
  - a. After the cluster is created, assign an EIP and bind it to the Master node of the cluster. For details, see [Assigning an EIP and Binding It to an ECS](#).
  - b. Remotely log in to the Master node in SSH mode as user **root** using the key file.
  - c. Run the **passwd root** command to set a password for user **root**.
  - d. Go back to the login interface, and enter **root** and the password set in [Step 5.2.c](#) to log in to the node.

----End

## Logging In to an ECS Using a Key Pair (SSH)

### Logging In to the ECS from Local Windows

To log in to the Linux ECS from local Windows, perform the operations described in this section. The following procedure uses PuTTY as an example to log in to the ECS.

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Active Clusters** in the navigation pane, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.

**Step 4** Click the **EIPs** tab, click **Bind EIP** to bind an EIP to the ECS, and record the EIP. If an EIP has been bound to the ECS, skip this step.

**Step 5** Check whether the private key file has been converted to **.ppk** format.

- If yes, go to **Step 10**.
- If no, go to **Step 6**.

**Step 6** Run PuTTY.

**Step 7** In the **Actions** area, click **Load** and import the private key file you used during ECS creation.

Ensure that the private key file is in the format of **All files (\*.\*)**.

**Step 8** Click **Save private key**.

**Step 9** Save the converted private key, for example, **kp-123.ppk**, to a local directory.

**Step 10** Run PuTTY.

**Step 11** Choose **Connection > Data**. Enter the image username in **Auto-login username**.

 **NOTE**

The image username for cluster nodes is **root**.

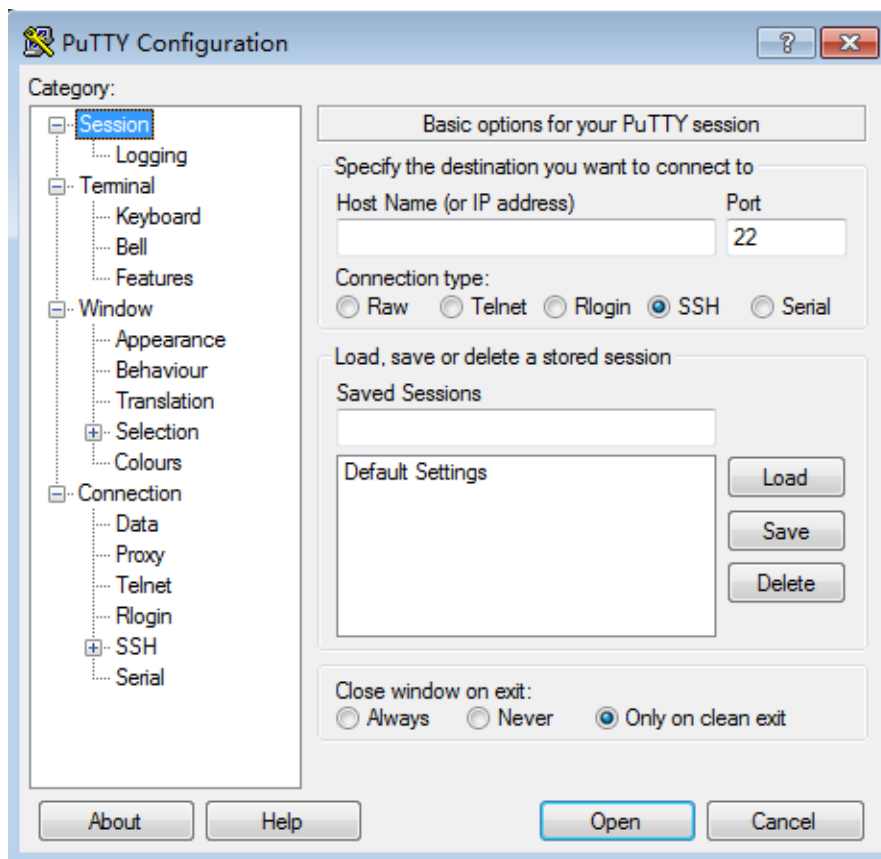

**Step 12** Choose **Connection > SSH > Auth**. In the last configuration item **Private key file for authentication**, click **Browse** and select the private key in .ppk format or the private key saved in **Step 9**.

**Step 13** Click **Session**.

1. **Host Name (or IP address)**: Enter the EIP bound to the ECS.
2. **Port**: Enter **22**.
3. **Connection Type**: Select **SSH**.
4. **Saved Sessions**: Task name, which can be clicked for remote connection when you use PuTTY next time

Figure 7-3 Clicking Session

**Step 14** Click **Open** to log in to the ECS.

If you log in to the ECS for the first time, PuTTY displays a security warning dialog box, asking you whether to accept the ECS security certificate. Click **Yes** to save the certificate to your local registry.

----End

### Logging In to the ECS from Local Linux

To log in to the Linux ECS from local Linux, perform the operations described in this section. The following procedure uses private key file **kp-123.pem** as an example to log in to the ECS. The name of your private key file may differ.

**Step 1** On the Linux CLI, run the following command to change operation permissions:

```
chmod 400 /path/kp-123.pem
```

#### NOTE

In the preceding command, replace *path* with the actual path where the key file is saved.

**Step 2** Run the following command to log in to the ECS:

```
ssh -i /path/kp-123.pem Default username@EIP
```

For example, if the default username is **root** and the EIP is **123.123.123.123**, run the following command:

```
ssh -i /path/kp-123.pem root@123.123.123.123
```

 **NOTE**

- *path* indicates the path where the key file is saved.
- *EIP* indicates the EIP bound to the ECS.
- The image username is **root** for cluster nodes.

----End

## Logging In to an ECS Using a Password (SSH)

### Logging In to the ECS from Local Windows

To log in to the Linux ECS from local Windows, perform the operations described in this section. The following procedure uses PuTTY as an example to log in to the ECS.

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Active Clusters** in the navigation pane, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.
- Step 4** Click the **EIPs** tab, click **Bind EIP** to bind an EIP to the ECS, and record the EIP. If an EIP has been bound to the ECS, skip this step.
- Step 5** Run PuTTY.
- Step 6** Click **Session**.
  1. **Host Name (or IP address)**: Enter the EIP bound to the ECS.
  2. **Port**: Enter **22**.
  3. **Connection Type**: Select **SSH**.
  4. **Saved Sessions**: Task name, which can be clicked for remote connection when you use PuTTY next time

**Figure 7-4** Clicking **Session**

**Step 7** Click **Window** and select **UTF-8** for **Remote character set:** in **Translation**.

**Step 8** Click **Open** to log in to the ECS.

If you log in to the ECS for the first time, PuTTY displays a security warning dialog box, asking you whether to accept the ECS security certificate. Click **Yes** to save the certificate to your local registry.

**Step 9** After the SSH connection to the ECS is set up, enter the username and password as prompted to log in to the ECS.

**NOTE**

The username is **root** and the password is the one you set during cluster creation.

----End

**Logging In to the ECS from Local Linux**

If the local host runs Linux, perform steps **Step 1** to **Step 4** to bind an EIP to the ECS, and run the following command on the CLI to log in to the ECS: **ssh EIP bound by the ECS**

## 7.3 Viewing MRS Cluster Monitoring Metrics

## 7.3.1 Viewing MRS Cluster Resource Monitoring Metrics

MRS cluster nodes are classified into management nodes, control nodes, and data nodes. The change trends of key host monitoring metrics on each type of node can be calculated and displayed as curve charts in reports based on the customized periods. MRS cluster metrics are monitored periodically. The average historical monitoring interval is about 5 minutes.

You can view the overall resource overview of a cluster on the MRS management console or Manager.

### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

### Viewing Monitoring Information on the MRS Management Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the **Dashboard** tab, click **Synchronize** next to **IAM User Sync** to synchronize IAM users.

**Step 4** After the synchronization is complete, click the **Monitor** tab to view the monitoring metric report of the cluster.

**Step 5** In time range area, specify a period to view monitoring data.

**Step 6** Customize a monitoring report.

1. Click **Customize** and select monitoring metrics to display.
2. Click **OK** to save the selected monitoring metrics for display.

#### NOTE

Click **Clear All** to deselect all selected metrics in batches.

**Step 7** Export a monitoring report.

1. Select a period.
2. Click **Export**. MRS will generate a report about the selected monitoring metrics in a specified time range. Save the report.

----End

### Viewing Monitoring Information on Manager (MRS 3.x and Later)

**Step 1** Log in to Manager.

**Step 2** Choose **Homepage**.

**Step 3** In the upper right corner of the chart area, click  and choose **Customize** from the displayed menu.

 **NOTE**

Monitoring data of the past 1 hour is displayed at an interval of 5 minutes. After you enter the **Real-time Monitoring** page, you can view that real-time monitoring data is displayed on the right of the monitoring chart at an interval of 5 minutes.

**Step 4** In the navigation pane, select an entity and some monitoring metrics.

**Step 5** Click **OK** to view the metric details.

**Step 6** Export a monitoring report.

- Exporting all monitoring data
  - a. On the **Homepage**, select a time range in the upper right corner of the chart area, for example, **1w**.

Real-time data is displayed by default, which cannot be exported. You can click  to customize a time range.
  - b. In the upper right corner of the chart area, click  and choose **Export** from the displayed menu.
- Exporting monitoring data of a specified monitoring item
  - a. On the **Homepage**, click  in the upper right corner of any monitoring report pane in the chart area of the target cluster.
  - b. Select a time range to obtain monitoring data, for example, **1w**.

Real-time data is displayed by default, which cannot be exported. You can click  to customize a time range.
  - c. Click **Export**.

 **NOTE**

The interval on the horizontal axis of the chart varies depending on the time period you specify. Data monitoring rules are as follows:

- If the disk usage of the partition where GaussDB is deployed exceeds 80%, real-time monitoring data and monitoring data whose interval is 5 minutes will be deleted.
- **Storage resources (HDFS) in Tenant Resources (0 to 300 hours)**: The interval is 1 hour. The cluster must have been installed for at least 1 hour, and monitoring data of a maximum of 3 months is saved.
- **0 to 25 hours**: The interval is 5 minutes. The cluster must have been installed for at least 10 minutes, and monitoring data of a maximum of 15 days is saved.
- **25 to 150 hours**: The interval is 30 minutes. The cluster must have been installed for at least 30 minutes, and monitoring data of a maximum of 3 months is saved.
- **150 to 300 hours**: The interval is 1 hour. The cluster must have been installed for at least 1 hour, and monitoring data of a maximum of 3 months is saved.
- **300 hours to 300 days**: The interval is 1 day. The cluster must have been installed for at least 1 day, and monitoring data of a maximum of 6 months is saved.
- **Over 300 days**: The interval is 7 days. The cluster must have been installed for more than 7 days, and monitoring data of a maximum of 1 year is saved.

----End

## Viewing Monitoring Information on Manager (MRS 2.x and Earlier)

**Step 1** Log in to Manager and click **System**.

**Step 2** In **Period**, you can specify a period to view monitoring data. The options are as follows:

Real-time, last 3 hours, last 6 hours, last 24 hours, last 1 week, last 1 month, last 3 months, last 6 months, and custom time range

**Step 3** Click **View** to view monitoring data in a specified period.

- You can view **Health Status** and **Roles** of each service on the **Service Summary** page of MRS Manager.
- Click  above the curve chart to view details about a metric.

**Step 4** Customize a monitoring report.

Click **Customize** and select monitoring metrics to be displayed on MRS Manager. Click **OK** to save the selected monitoring metrics for display. Click **Clear** to cancel all the selected monitoring metrics in a batch.

MRS Manager supports a maximum of 14 monitoring metrics, but at most 12 customized monitoring metrics can be displayed on the page.

**Step 5** Set an automatic refresh interval or click  for an immediate refresh. If you select **Full Screen**, the **Dashboard** window will be maximized.

The following refresh interval options are supported:

- **Refresh every 60 seconds**
- **Refresh every 120 seconds**
- **Stop refreshing**

**Step 6** Export a monitoring report.

Select a period. Click **Export**. MRS Manager will generate a report about the selected monitoring metrics in a specified time of period. Select a directory to save the report.

To view the curve charts of monitoring metrics in a specified period, click **View**.

 **NOTE**

You can query top, bottom, and average value curves for key service and host monitoring metrics on MRS Manager, which displays resource distribution information. MRS Manager also shows monitoring data for the last hour.

You can also modify the resource distribution on MRS Manager to display both the top and bottom value curves in service and host resource distribution figures.

Resource distribution of some monitoring metrics is not recorded.

- View the resource distribution of service monitoring metrics.
  1. On MRS Manager page, click **Services**.
  2. Select the target service from the service list.
  3. Click **Resource Distribution**.

Select key metrics of the service from **Metric**. MRS Manager displays the resource distribution of the metrics in the last hour.
- View the resource distribution of host monitoring metrics.
  1. On MRS Manager, click **Hosts**.
  2. Click the name of the specified host in the host list.
  3. Click **Resource Distribution**.

Select key metrics of the host from **Metrics**. MRS Manager displays the resource distribution of the metrics in the last hour.
- Configure resource distribution.
  1. On MRS Manager, click **System**.
  2. In **Configuration**, click **Configure Resource Contribution Ranking** under **Monitoring and Alarm**.
  3. Change the number of resources to be displayed. The sum of the maximum value and minimum value of resource distribution cannot be greater than 5.

Set **Number of Top Resources** to the number of top values.

Set **Number of Bottom Resources** to the number of bottom values.
  4. Click **OK** to save the configurations.

The message "Number of top and bottom resources saved successfully" is displayed in the upper right corner of the page.

----End

## 7.3.2 Viewing MRS Cluster Component Monitoring Metrics

You can manage the following status and metrics of all components (including role instances) on the MRS console: Status information includes operation, health, configuration, and role instance status. Indicator information includes key monitoring indicators for each component.

### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

## Viewing the Monitoring Information on the MRS Management Console

- Step 1** Log in to the MRS console.
- Step 2** Choose **Active Clusters** and click a cluster name to go to the cluster details page.
- Step 3** On the **Dashboard** tab, click **Synchronize** next to **IAM User Sync** to synchronize IAM users.
- Step 4** On the MRS cluster details page, click **Components**.
- Step 5** View component monitoring information.
1. Click a specified service in the list to view its status and metric information.
  2. Select and view component-level monitoring metrics.
    - a. In the **Charts** area, click **Customize** to customize service monitoring metrics.
    - b. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
- Step 6** View role instance monitoring information.
1. In the component list, click a service name.
  2. Click **Instance** to view the status of each role instance in the component.  
You can filter all instances of the same role in the upper right corner of the list. You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. You can click **Reset** to reset the search criteria. Fuzzy search is supported.
  3. Click the target role instance to view its status and metric information.
  4. Customize and view monitoring graphs.
    - a. In the **Charts** area, click **Customize** to customize service monitoring metrics.
    - b. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.

----End

## Viewing Component Monitoring Information on Manager

- Step 1** Log in to Manager.
- Step 2** Go to the **Service Management** page.
- For MRS 3.x and later, choose **Cluster > Services**.
  - For MRS 2.x and earlier, click **Services**.
- Step 3** View component monitoring information.
1. Click a specified service in the list to view its status and metrics.
  2. Customize and export monitoring charts.
    - a. In the **Chart** tab, click  and **Customize** to customize service monitoring metrics.
    - b. Set a time range and click  and **Export** to export the monitoring data.

**Step 4** View role instance monitoring information.

1. Click the service name.
2. Click **Instances** to view the role status.
3. Click the target role instance to view its status and metric information.
4. Customize and export monitoring charts.
  - a. In the **Chart** tab, click  and **Customize** to customize metric chart.
  - b. Select a time range. The monitoring data within the time range is displayed.

----End

## Component Resource Monitoring Summary

 **NOTE**

This function is supported only in MRS 3.x and later versions.

Log in to FusionInsight Manager and choose **Cluster > Services > Target service**. Click **Resource**. The resource monitoring page is displayed.

Some services in the cluster provide service-level resource monitoring metrics. By default, the monitoring data of the latest 12 hours is displayed. You can click  to set a time range. You can click  to export the corresponding report information. If a monitoring item has no data, the report cannot be exported. The following table lists the services and monitoring items that support resource monitoring.

**Table 7-2** Service resource monitoring

| Service | Monitoring Metric             | Description                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HDFS    | Resource Usage (by Tenant)    | <ul style="list-style-type: none"> <li>• Collects statistics on HDFS resource usage by tenant.</li> <li>• Views the metrics <b>Capacity</b> or <b>Number of File Objects</b>.</li> </ul>                                                                                                                                                                                                                                    |
|         | Resource Usage (by User)      | <ul style="list-style-type: none"> <li>• Collects statistics on HDFS resource usage by user.</li> <li>• Views the metrics <b>Used Capacity</b> or <b>Number of File Objects</b>.</li> </ul>                                                                                                                                                                                                                                 |
|         | Resource Usage (by Directory) | <ul style="list-style-type: none"> <li>• Collects statistics on HDFS resource usage by directory.</li> <li>• Views the metrics <b>Used Capacity</b> or <b>Number of File Objects</b>.</li> <li>• You can click  to configure space monitoring. Alternatively, you can specify an HDFS file system directory for monitoring.</li> </ul> |

| Service    | Monitoring Metric                       | Description                                                                                                                                                                                                  |

|            | Automatic Balancer                      | Collects statistics on the execution speed of HDFS automatic balancer and the total capacity of the current balancer migration.                                                                              |
|            | NameNode RPC Open Connections (by User) | Displays the number of connections of each user in the Client RPC requests connected to NameNodes.                                                                                                           |
|            | Slow DataNodes                          | Displays DataNode that transmits or processes data slowly in the cluster.                                                                                                                                    |
|            | Slow Disks                              | Displays the disk that processes data slowly on the DataNode in the cluster.                                                                                                                                 |
| HBase      | Operation Requests in Tables            | Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests in all tables on all RegionServers.                                                                                  |
|            | Operation Requests on RegionServers     | Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests and number of all operation requests in RegionServer.                                                                |
|            | Operation Requests for Service          | Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests in all regions on RegionServers.                                                                                     |
|            | HFiles on RegionServers                 | Displays the number of HFiles in all RegionServers.                                                                                                                                                          |
| HetuEngine | Coordinator Resource Usage              | Displays the coordinator resource usage in the selected queue.                                                                                                                                               |

| Service | Monitoring Metric                           | Description                                                                                                                                                                                                                                                                  |
|---------|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | Coordinator Resource Usage Ratio            | Displays the coordinator resource usage in the selected queue.                                                                                                                                                                                                               |
|         | Worker Resource Usage                       | Displays the worker resource usage in the selected queue.                                                                                                                                                                                                                    |
|         | Worker Resource Usage Ratio                 | Displays the worker resource usage in the selected queue.                                                                                                                                                                                                                    |
|         | Number of Coordinators and Workers          | Displays the number of coordinators and workers in the selected queue.                                                                                                                                                                                                       |
| Hive    | HiveServer2-Background-Pool Threads (by IP) | Displays the number of HiveServer2-Background-Pool threads of top users. These threads are measured and displayed in a measurement period.                                                                                                                                   |
|         | HiveServer2-Handler-Pool Threads (by IP)    | Displays the number of HiveServer2-Handler-Pools of top users collected and displayed in a period.                                                                                                                                                                           |
|         | Used MetaStore Number (by IP)               | Collects statistics on and displays the MetaStore usage of top users in a period.                                                                                                                                                                                            |
|         | Number of Hive jobs                         | Displays the number of user-related jobs collected by Hive in a period.                                                                                                                                                                                                      |
|         | Number of Files Accessed in the Split Phase | Displays the number of files accessed by the underlying file storage system (HDFS by default) in the Split phase in a period.                                                                                                                                                |
|         | Hive Basic Operation Time                   | Collects time for creating a directory (mkdirTime), creating a file (touchTime), writing a file (writeFileTime), renaming a file (renameTime), moving a file (moveTime), deleting a file (deleteFileTime), and deleting a directory (deleteCatalogTime) in a period of time. |
|         | Table Partitions                            | Displays the number of partitions in all Hive tables, which is displayed in the following format: <i>database # table name, number of table partitions</i> .                                                                                                                 |
|         | HQL Map Count                               | Collects statistics on HQL statements executed in a period and the number of Map statements invoked during the execution. The displayed information includes users, HQL statements, and the number of Map statements.                                                        |

| Service           | Monitoring Metric                              | Description                                                                                                                                                                                                                                    |
|-------------------|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | HQL Access Statistics                          | Displays the number of HQL access times in a period.                                                                                                                                                                                           |
| Kafka             | Kafka Disk Usage Distribution                  | Displays the disk usage distribution statistics of the Kafka cluster.                                                                                                                                                                          |
| Spark/<br>Spark2x | HQL Access Statistics                          | Collects HQL access statistics in a period, including the username, HQL statement, and HQL statement execution times.                                                                                                                          |
| Yarn              | Used resources (by Task)                       | <ul style="list-style-type: none"> <li>Displays the number of CPU cores and memory used by a task.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>                                                                    |
|                   | Resource Usage (by Tenant)                     | <ul style="list-style-type: none"> <li>Displays the number of CPU cores and memory used by a tenant.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>                                                                  |
|                   | Resource usage ratio (by Tenant)               | <ul style="list-style-type: none"> <li>Displays the ratio of the number of CPU cores to the memory used by a tenant.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>                                                  |
|                   | Task Duration Ranking                          | Displays Yarn tasks sorted by time consumption.                                                                                                                                                                                                |
|                   | ResourceManager RPC Open Connections (by User) | Displays the number of client RPC connections to ResourceManager by user.                                                                                                                                                                      |
|                   | HBase Operation Count                          | Collects statistics on the number and proportion of operations corresponding to each Yarn operation type.                                                                                                                                      |
|                   | Ranking of Tasks in a Queue by Resource Usage  | <ul style="list-style-type: none"> <li>Displays the resources consumed by the tasks running in a queue after the queue (tenant) is selected on the GUI.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>               |
|                   | Ranking of Users in a Queue by Resource Usage  | <ul style="list-style-type: none"> <li>Displays the resources consumed by the users who are running tasks in the queue after a queue (tenant) is selected on the GUI.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul> |
| ZooKeeper         | Used Resources (By Second-Level Znode)         | <ul style="list-style-type: none"> <li>Displays the ZooKeeper level-2 znode resource status.</li> <li>Views the metrics <b>By Znode quantity</b> or <b>By capacity</b>.</li> </ul>                                                             |

| Service | Monitoring Metric                            | Description                                               |
|---------|----------------------------------------------|-----------------------------------------------------------|
|         | Number of Connections (by Client IP Address) | Displays the ZooKeeper client connection resource status. |

### 7.3.3 Viewing MRS Node Resource Monitoring Metrics

You can view the status and metrics of each node in the MRS cluster in real time to see the current resource usage.

#### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

#### Viewing Host Monitoring Charts

##### Operations on the MRS management console:

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.
- Step 3** Click **Nodes** and expand the node group information to view the status of all hosts.
- Step 4** The host list of a group contains the **Node Name/Resource ID, IP, Status, Specifications, Disks, and AZ**.
- Step 5** Click the target node in the list to view its status and metric information.
- Step 6** Click the **Monitoring** tab to view the monitoring charts of the current node.

----End

##### Operations on Manager:

- MRS 3.x and later:
  - a. Log in to FusionInsight Manager.
  - b. Click **Hosts** to view the host list.
  - c. In the host list, click the specified host name to view the host overview information.

The host details page contains the basic information area, disk status area, instance list area, and monitoring charts.
  - d. Click the **Chart** tab to view the full monitoring chart information about the host.

The **Chart** page displays all monitoring charts of the host.

- MRS 2.x and earlier:
  - a. Log in to MRS Manager.
  - b. Click **Hosts** to view the status of all hosts.
  - c. Click the target host in the host list to view its status and metric information.
  - d. Customize and export monitoring charts.
    - i. In the **Charts** area, click **Customize** to customize service monitoring metrics.
    - ii. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
    - iii. Click **Export** to export the displayed metrics.

## Viewing Host Resource Overview

This function is only available in MRS 3.x or later.

**Step 1** Log in to FusionInsight Manager and choose **Hosts > Resource Overview**.

**Step 2** View the distribution information.

In the **Distribution** tab, you can view the resource distribution of the cluster. By default, the monitoring data of the last hour is displayed. You can click  to set a time range.

**Figure 7-5** Distribution tab

- Click **Select Metric** to specify the metrics you want to check. After you select a metric, the host distribution in each range of the metric is displayed.
- When you place the cursor on a color column, the number of hosts in the range is displayed. You can click a color column to view the list of hosts in the metric range.
  - You can click a host name in the **Host Name** column to access the host details page.
  - Click **View Trends** of a host in the **Operation** column of the list. The metric trends will be displayed. In the current cluster, if you have selected **Host CPU-Memory-Disk Usage**, **View Trends** is unavailable.

- You can click **Export Data** to export the maximum, minimum, and average values of the current metric of all nodes in the cluster within the time range you have specified.

**Table 7-3** Metrics

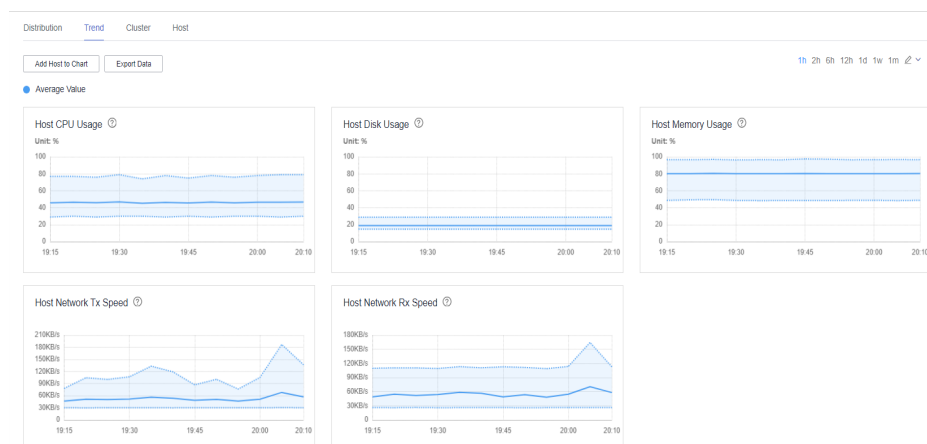

| Category        | Metric                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| CPU             | <ul style="list-style-type: none"> <li>● CPU Usage of Processes Whose Priorities Have Been Changed</li> <li>● CPU Usage of User Space Processes</li> <li>● CPU Usage of Kernel Space Processes</li> <li>● Host CPU Usage</li> <li>● CPU Total Time</li> <li>● CPU Idle Time</li> </ul> |
| Host Status     | <ul style="list-style-type: none"> <li>● Host File Handle Usage</li> <li>● Average OS Load in 1 Minute</li> <li>● Average OS Load in 5 Minutes</li> <li>● Average OS Load in 15 Minutes</li> <li>● Host PID Usage</li> </ul>                                                           |

**Step 3** Click the **Trend** tab to view host monitoring trends.

The resource monitoring trend page of the cluster is displayed. By default, the monitoring data of the past one hour (**1h**) is displayed. You can click  to set a time range.

**Figure 7-6** Trend tab

- You can click **Add Host to Chart** to add trend lines of up to 12 hosts to the trend charts.
- Click  and **Customize** to select the metrics to be displayed on the page.

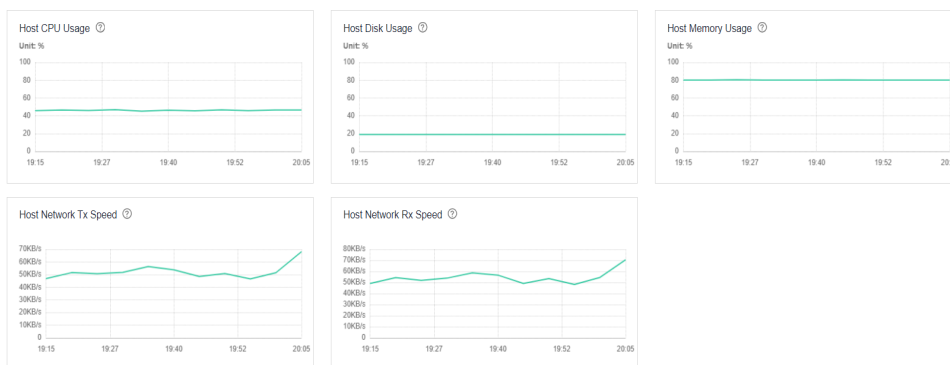

- You can click **Export Data** to export the maximum, minimum, and average values of all nodes in the cluster for all selected metrics within the time range you have specified.

**Step 4** Click the **Cluster** tab to view the cluster information.

You can view the resource monitoring page of each cluster on FusionInsight Manager at the same time.

By default, the monitoring data of the past one hour (1h) is displayed. You can click  to set a time range.

**Figure 7-7** Cluster tab

- Click  and **Customize** to select the metrics to be displayed on the page.
- You can click **Export Data** to export the metric values of each cluster within the time range you have specified.

**Step 5** Click the **Host** tab to view the host information.

You can view the host resource status, including basic configuration (CPU/ memory) and disk configuration.

Click **Export Data** to export the configuration list of all hosts in the cluster.

**Figure 7-8** Host tab

- Basic Configurations (CPU/Memory)

You can hover your cursor over the pie chart to view the number of hosts of each hardware configuration in the cluster. The information is displayed in the format of *Number of cores (CPU architecture) Memory size*.

You can click a slice on the pie chart to view the list of hosts.

- **Disk Configurations**

The horizontal axis indicates the total disk capacity (including the OS disk) of a node, and the vertical axis indicates the number of logical disks (including the OS disk).

You can hover your cursor over a dot to view information about disks of the current configuration, including the quantity of disks, total capacity, and number of hosts.

You can click a dot on the chart to view the list of hosts.

----End

## 7.3.4 Dumping MRS Cluster Monitoring Data

### Scenarios

The monitoring data reporting function writes the monitoring data collected in the system into a text file and uploads the file to a specified server in FTP or SFTP mode. You can configure interconnection parameters on Manager to save monitoring data to a specified FTP server. In this way, MRS clusters can interconnect with third-party systems.

The FTP protocol does not encrypt data, which poses potential security risks. Therefore, the SFTP protocol is recommended. The ECS corresponding to the dump server must be in the same VPC as the Master nodes of the MRS cluster, and the Master nodes can access the IP address and specified port of the dump server. The FTP service on the dump server is running properly.

Manager supports the collection of all the monitoring data in the managed clusters. The collection period is 30 seconds, 60 seconds, or 300 seconds. The monitoring data is stored in different monitoring files on the FTP server by collection period.

**Table 7-4** Monitoring data files

| Monitoring Data   | Description                                                                                                                                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Collection period | <ul style="list-style-type: none"><li>• 30s: real-time metrics that are collected every 30s by default</li><li>• 60s: real-time metrics that are collected every 60s by default</li><li>• 300s: all metrics that are not collected every 30s or 60s</li></ul> |

| Monitoring Data                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File name format                       | <ul style="list-style-type: none"> <li>MRS 3.x and later:<br/><b>metric_Monitoring data collection period_File creation time.log</b></li> <li>Examples: <b>metric_60_20160908085915.log</b> and <b>metric_300_20160908085613.log</b></li> <li>Versions earlier than MRS 3.x:<br/><i>Cluster name_metric_Monitoring data collection period_File creation time.log</i></li> </ul>                                                                                                                                             |
| Content format (MRS 3.x as an example) | <ul style="list-style-type: none"> <li>Cluster ID Cluster name Display name Service name  <b>Metric ID</b> Collection time Collection host@m@Sub-metric Unit Metric value</li> <li>Example:<br/>The actual files do not contain the parameter names in the format description.</li> </ul> <pre>1 xx1 Host Host 10000413 2019/06/18 10:05:00 10-66-254-146 KB/s 309.910 1 xx1 Host Host 10000413 2019/06/18 10:05:00 10-66-254-152 KB/s 72.870 2 xx2 Host Host 10000413 2019/06/18 10:05:00 10-66-254-163 KB/s 100.650</pre> |

With the **Metric ID** obtained from the reported file, the third-party can obtain metric details by querying the metric set file in the *FusionInsight installation path/om-server/om/etc/om/all-shown-metric-zh\_CN* on the active/standby OMS node. The file contains the detailed information about all metrics. The content is as follows (taking MRS 3.x as an example):

```
Real-Time Metric ID,5-Minute Metric ID,Metric Name,Metric Collection Period (s),Collected by
Default,Service Belonged To,Role Belonged To
00101,10000101,JobHistoryServer non-heap memory usage,30,false,Mapreduce,JobHistoryServer
00102,10000102,JobHistoryServer non-heap memory allocation volume,30,false,Mapreduce,JobHistoryServer
00103,10000103,JobHistoryServer heap memory usage,30,false,Mapreduce,JobHistoryServer
00104,10000104,JobHistoryServer heap memory allocation volume,30,false,Mapreduce,JobHistoryServer
00105,10000105,Number of blocked threads,30,false,Mapreduce,JobHistoryServer
00106,10000106,Number of running threads,30,false,Mapreduce,JobHistoryServer
00107,10000107,GC time,30,false,Mapreduce,JobHistoryServer
00110,10000110,JobHistoryServer CPU usage,30,false,Mapreduce,JobHistoryServer
...
```

- Metric ID meaning:
  - For metrics whose collection period is 30s/60s, you can find the corresponding metric description by referring to the first column, that is, **Real-Time Metric ID**.
  - For metrics whose collection period is 300s, you can find the corresponding metric description by referring to the second column, that is, **5-Minute Metric ID**.
- Field description:
  - Real-Time Metric ID**: indicates the ID of the metric whose collection period is 30s or 60s.
  - 5-Minute Metric ID**: indicates the ID of a 5-minute (300s) metric.
  - Metric Collection Period (s)**: indicates the collection period of real-time metrics. The value can be **30** or **60**.

**Service Belonged To:** indicates the name of the service to which a metric belongs, for example, HDFS and HBase.

**Role Belonged To:** indicates the name of the role to which a metric belongs, for example, JobServer and RegionServer.

## Dumping MRS Cluster Monitoring Data (MRS 3.x and Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Interconnection > Upload Performance Data**.

**Step 3** Toggle on **Upload Performance Data**.

The performance data upload service is disabled by default.  indicates that the service is enabled.

**Step 4** Set the upload parameters according to [Table 7-5](#).

**Table 7-5** Upload parameters

| Parameter               | Description                                                                                                                                                                                                                               |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FTP IP Address Mode     | Specifies the server IP address mode. This parameter is mandatory. The value can be <b>IPV4</b> or <b>IPV6</b> .                                                                                                                          |
| FTP IP Address          | Specifies the IP address of the FTP server for storing monitoring files after the monitoring metric data is interconnected. This parameter is mandatory.                                                                                  |
| FTP Port                | Specifies the port for connecting to the FTP server. This parameter is mandatory.                                                                                                                                                         |
| FTP Username            | Specifies the username for logging in to the FTP server. This parameter is mandatory.                                                                                                                                                     |
| FTP Password            | Specifies the password for logging in to the FTP server. This parameter is mandatory.                                                                                                                                                     |
| Save Path               | Specifies the path for storing monitoring files on the FTP server. This parameter is mandatory.                                                                                                                                           |
| Dump Interval (second)  | Specifies the interval at which monitoring files are periodically stored on the FTP server, in seconds. This parameter is mandatory. The system will periodically upload files to the corresponding FTP server at the specified interval. |
| Dump Mode               | Specifies the protocol used for sending monitoring files. This parameter is mandatory. The value can be <b>SFTP</b> or <b>FTP</b> . You are advised to use the SFTP mode based on SSH v2. Otherwise, security risks may be incurred.      |
| SFTP Service Public Key | Specifies the public key of the FTP server. This parameter is optional. It is valid only when <b>Dump Mode</b> is set to <b>SFTP</b> .                                                                                                    |

**Step 5** Click **OK**.

 **NOTE**

If the dump mode is SFTP and the public key of the SFTP service is empty, the system displays a security risk warning. You need to evaluate the security risk and then save the configuration.

----End

## Dumping MRS Cluster Monitoring Data (MRS 2.x and Earlier)

- Step 1** On MRS Manager, click **System**.
- Step 2** In **Configuration**, click **Configure Monitoring Metric Dump** under **Monitoring and Alarm**.
- Step 3** [Table 7-6](#) describes the parameters for dumping.

**Table 7-6** Parameters

| Parameter               | Description                                                                                                                                                                                    | Mandatory |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| Dump Monitoring Metric  | Whether to enable monitoring metric data interconnection.                                                                                                                                      | Yes       |
| FTP IP Address          | FTP server for storing monitoring files after monitoring metric data is interconnected.                                                                                                        | Yes       |
| FTP Port                | Port for connecting to the FTP server.                                                                                                                                                         | Yes       |
| FTP Username            | Username for logging in to the FTP server.                                                                                                                                                     | Yes       |
| FTP Password            | Password for logging in to the FTP server.                                                                                                                                                     | Yes       |
| Save Path               | Path for storing monitoring files on the FTP server.                                                                                                                                           | Yes       |
| Dump Interval (second)  | Interval at which monitoring files are periodically stored on the FTP server, in seconds. The system will periodically upload files to the corresponding FTP server at the specified interval. | Yes       |
| Dump Mode               | Protocol used for sending monitoring files. The options are <b>FTP</b> and <b>SFTP</b> .                                                                                                       | Yes       |
| SFTP Service Public Key | Public key of the FTP server. This parameter is available only when <b>Dump Mode</b> is set to <b>SFTP</b> . You are advised to configure a public key. Otherwise, security risks may arise.   | No        |

- Step 4** Click **OK**.

----End

## 7.4 Checking MRS Cluster Health

## 7.4.1 Performing a Health Check for an MRS Cluster

The cluster health check includes three key items: object health, related alarms, and custom metrics. The check result may not match the health status shown on the UI. A health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions properly.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

To ensure that cluster parameters, configurations, and monitoring are correct and that the cluster can run stably for a long time, you can perform a health check during routine maintenance.

### Prerequisites

- The IAM users have been synchronized in advance. You can do this by clicking **Synchronize** next to **IAM User Sync** on the **Dashboard** page of the cluster details.
- You have logged in to MRS Manager. For how to log in, see [Accessing MRS Manager](#).

### Health Check on the MRS Management Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** Start the health check.

#### NOTE

Health check operations on the MRS management console are valid for clusters of **MRS 1.9.2** only.

- Perform the health check for all services.

Choose **Management Operations > Start Cluster Health Check**.

- Perform the health check for a service.

Click **Components**. In the service list, click the target service name and choose **More > Start Service Health Check**.

- Perform the health check for a host.

Click **Nodes**, expand the node group information, select the check box of the target hosts, and choose **Node > Start Host Health Check**.

----End

### Performing a Health Check on Manager

For MRS 3.x and later versions:

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Health Check**.

By default, all saved health check reports are displayed in a list. For details, see [Table 7-7](#).

**Step 3** Start health checks.

- Start a health check.  
Click **Start Check**. In the displayed dialog box, click **OK** to start a health check.
- Set periodic automatic health check.  
Click **Configuration**, select **Enable**, set the check period to **Daily**, **Weekly**, or **Monthly** based on your needs, and click **OK** to save the configuration.

----End

**For MRS 2.x or earlier:**

**Step 1** Log in to MRS Manager.

**Step 2** Start health checks.

- Start a health check.  
Click **Services** and choose **More > Start Service Health Check**.
- Set periodic automatic health check.
  - a. Click **System**, click **Check Health Status** under **Maintenance**, and click **Configure Health Check**.
  - b. Set the **Max. Number of Health Check Reports**. The value must be an integer ranging from 1 to 100.
  - c. Click **Periodic Health Check** to enable this function. Set the check period to **Daily**, **Weekly**, or **Monthly** based on O&M requirements, and click **OK** to save the configuration.

----End

## 7.4.2 Performing Health Checks on MRS Cluster Nodes

If the running status of a host is not **Normal**, you can perform health checks on the host to check whether some basic functions are abnormal. During routine O&M, you can perform host health checks to ensure that the configuration parameters and monitoring of each role instance on the host are normal and can run stably for a long time.

### Performing Health Checks on Cluster Nodes (MRS 3.x and Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Hosts**.

**Step 3** Select the check box of the target host.

**Step 4** Select **Health Check** from the **More** drop-down list to start the health check.

To export the result of the health check, click **Export Report** in the upper left corner. If any problem is detected, click **Help**.

----End

## Performing Health Checks on Cluster Nodes (MRS 2.x and Earlier)

**Step 1** Log in to MRS Manager.

**Step 2** Click **Hosts**.

**Step 3** Select the check box of the host for which you want to check the health status.

**Step 4** Choose **More > Start Host Health Check** to start the health check for the host.

----End

## 7.4.3 Viewing and Exporting a Health Check Report

You can view the health check result on MRS and export it for further analysis.

### Viewing the Health Check Report on the Management Console

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** On the cluster details page, choose **Management Operations > View Cluster Health Check Report**.

#### NOTE

Health check operations on the MRS management console are valid for clusters of **MRS 1.9.2** only.

**Step 4** Click **Export Report** on the health check report pane to export the report and view detailed information about check items.

----End

### Viewing the Health Check Report on Manager (MRS 3.x and Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Health Check**.

- View the health check report.

All saved check reports are listed by default. You can filter the check object and result status in the upper right corner of the list. If **Check Type** is **Cluster**, **View Help** is displayed in the **Check Object** drop-down list. During a health check, the system determines whether check objects are healthy based on their historical monitoring metric data.

**Table 7-7** Parameters for a health check report

| Item         | Description                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Check Object | Object to be checked. You can expand the list to view its details.                                                                                                               |
| Status       | Check result status. Value options are <b>No problems found, Problems found, and Checking.</b>                                                                                   |
| Check Type   | Entity on which the check is to be performed. Value options are <b>System, Cluster, Host, Service, and OMS.</b> If you select <b>Cluster</b> , all items are checked by default. |
| Start Mode   | Whether the health check is automatically or manually performed                                                                                                                  |
| Start Time   | Start time of the check                                                                                                                                                          |
| End Time     | End time of the check                                                                                                                                                            |
| Operation    | Operations you can perform. Value options are <b>Export Report</b> and <b>View Help.</b>                                                                                         |

- Export the health check report.  
Locate the row containing the target health check report and click **Export Report** in the **Operation** to download the report.

----End

## Viewing the Health Check Report on Manager (MRS 2.x and Earlier)

**Step 1** Log in to MRS Manager.

**Step 2** View or export the health check report.

- View the health check report.
  - a. Click **Services**.
  - b. Choose **More > View Cluster Health Check Report** to view the health check report of a cluster. Click **Export Report** on the health check report pane to export the report and view detailed information about check items.
- Download the health check report.
  - a. Choose **System > Maintenance > Check Health Status**.
  - b. Locate the row that contains the target health check report and click **Download** to download the report file.
- Configuring the Number of Health Check Reports to Be Reserved  
Health check reports of MRS clusters, services, and hosts may vary with the time and scenario. You can modify the number of health check reports to be reserved on MRS Manager for later comparison. This setting is valid for health check reports of clusters, services, and hosts. Report files are saved in **\$BIGDATA\_DATA\_HOME/Manager/healthcheck** on the active management node by default and are automatically synchronized to the standby management node.

- a. Choose **System > Maintenance > Check Health Status > Configure Health Check**.
- b. Set **Max. Number of Health Check Reports** to the number of health check reports to be reserved. The value ranges from 1 to 100. The default value is 50.
- c. Click **OK** to save the settings.

----End

## 7.5 Adjusting the Capacity of an MRS Cluster

### 7.5.1 Scaling Out an MRS Cluster

The storage and computing capabilities of MRS can be improved by simply adding Core nodes or Task nodes instead of modifying system architecture, reducing O&M costs. Core nodes can process and store data. You can add Core nodes to expand the node quantities and handle peak loads. Task nodes are used to process data instead of storing persistent data.

#### NOTE

- Only Master, Core, and Task nodes can be added.
- When you log in to a node added for scale-out as user **root**, the password set during cluster creation is required.

### Constraints

- When you expand a node group where HBase is installed:  
If automatic DNS registration is not enabled for a node in the cluster, do not start HBase when you expand the node group. Then, update the HBase client configuration by referring to [Updating the MRS Cluster Client After the Server Configuration Expires](#) and start the HBase instances on the node to be expanded.  
Automatic DNS registration is enabled by default in the following versions: MRS 1.9.3, MRS 3.1.0, MRS 3.1.2-LTS, MRS 3.1.5, and MRS 3.2.0-LTS  
You can check whether this DNS function is supported by checking whether the **features** field in the response body contains **register\_dns\_server**. For details, see [Querying the Metadata of a Cluster Version](#).
- After a scale-out, the clients installed on nodes in the cluster do not need to be updated. For details about how to update the client installed on nodes outside the cluster, see [Updating the MRS Cluster Client After the Server Configuration Expires](#).
- If you need to balance HDFS data after scale-out, see [Balancing DataNode Capacity](#). For details about how to balance Kafka data, see [Kafka Balancing Tool Instructions](#).

### Scaling Out a Cluster Billed in Pay-per-Use Mode

**Step 1** Log in to the MRS console.

- Step 2** Choose **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** Click the **Nodes** tab. In the **Operation** column of the node group, click **Scale Out**. The **Scale Out** page is displayed.
- The scale-out operation can only be performed on the running clusters.
- Step 4** Set the type of **System Disk** and **Data Disk**, **Scale-Out Nodes**, **Enable Components** and **Run Bootstrap Action**, and click **OK**. The **Enable Components** and **Run Bootstrap Action** parameters may not be supported by clusters of some versions. The operations are subject to the UI.

×

### Scale Out

|                     |                                            |                                  |                                |
|---------------------|--------------------------------------------|----------------------------------|--------------------------------|
| Node Type           | <input type="text" value="Analysis Core"/> |                                  |                                |
| Node Specifications | 8 vCPUs 32 GB   Sit3.2xlarge.4             |                                  |                                |
| System Disk         | <input type="text" value="High I/O"/>      | <input type="text" value="480"/> | <input type="text" value="+"/> |
| Data Disk           | <input type="text" value="High I/O"/>      | <input type="text" value="600"/> | <input type="text" value="+"/> |
| Disks               | <input type="text" value="1"/>             |                                  |                                |
| Current Nodes       | 3                                          |                                  |                                |
| Scale-Out Nodes     | <input type="text" value="0"/>             |                                  |                                |

Insufficient node quota. [Increase quota](#)

#### NOTE

- If the Task node group does not exist in the cluster, configure the Task node by referring to [Related Tasks](#).
- If a bootstrap action is added during cluster creation, the **Run Bootstrap Action** parameter is valid. If this function is enabled, the bootstrap actions added during cluster creation will be run on all the scaled out nodes.
- If the **New Specifications** parameter is available, the specifications that are the same as those of the original nodes have been sold out or discontinued. Nodes with new specifications will be added.
- Before scaling out the cluster, check whether its security group configuration is correct. Ensure that an inbound security group rule contains a rule in which **Protocol & Port** is set to **All**, and **Source** is set to a trusted accessible IP address range.

**Step 5** In the **Add Node** dialog box, click **OK**.

**Step 6** A dialog box is displayed in the upper right corner of the page, indicating that the scale-out task is submitted successfully.

The following parameters explain the cluster scale-out process:

- During scale-out: If a cluster is being scaled out, its status is **Scaling out**. The submitted jobs will be executed and you can submit new jobs. You are not allowed to continue to scale out or delete the cluster. You are advised not to restart the cluster or modify the cluster configuration.
- Successful scale-out: The cluster status is **Running**. The resources used in the old nodes and expanded nodes are charged.
- Failed scale-out: The cluster status is **Running**. You can execute jobs and scale out the cluster again.

After the cluster is scaled out, you can view the node information of the cluster on the **Nodes** page.

----End

## Scaling Out a Cluster Billed in Yearly/Monthly Mode

**Step 1** Log in to the MRS console.

**Step 2** Choose **Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** Click the **Nodes** tab. In the **Operation** column of the node group, click **Scale Out**. The **Scale Out** page is displayed.

The scale-out operation can only be performed on the running clusters.

**Step 4** Set the type of the **System Disk** and **Data Disk**, **Scale-Out Nodes**, **Enable Components** and **Run Bootstrap Action**. The system displays the expiration time of the cluster and the fee required for adding nodes. **Enable Components** and **Run Bootstrap Action** may not be supported by clusters of some versions. The operations are subject to the UI.

### NOTE

- If a bootstrap action is added during cluster creation, the **Run Bootstrap Action** parameter is valid. If this function is enabled, the bootstrap actions added during cluster creation will be run on all the scaled out nodes.
- If the **New Specifications** parameter is available, the specifications that are the same as those of the original nodes have been sold out or discontinued. Nodes with new specifications will be added.
- Before scaling out the cluster, check whether its security group configuration is correct. Ensure that an inbound security group rule contains a rule in which **Protocol & Port** is set to **All**, and **Source** is set to a trusted accessible IP address range.
- Click **Submit Order**.  
On the **Purchase MapReduce Service** page, click **Pay**.
- Click **Confirm order, not pay**.  
On the cluster information page, choose **Fee > My Order** and click **Pay**.

**Step 5** After the payment is successful, return to the MRS management console to view the cluster status.

The following parameters explain the cluster scale-out process:

- During scale-out: If a cluster is being scaled out, its status is **Scaling out**. The submitted jobs will be executed and you can submit new jobs. You are not allowed to continue to scale out or delete the cluster. You are advised not to restart the cluster or modify the cluster configuration.
- Successful scale-out: The cluster status is **Running**. The resources used in the old nodes and expanded nodes are charged.
- Failed scale-out: The cluster status is **Running**. You can execute jobs and scale out the cluster again.

After the cluster is scaled out, you can view the node information of the cluster on the **Nodes** page.

----End

## Adding a Task Node

You can scale out an MRS cluster by manually adding task nodes.

**To add a task node to a custom cluster, perform the following steps:**

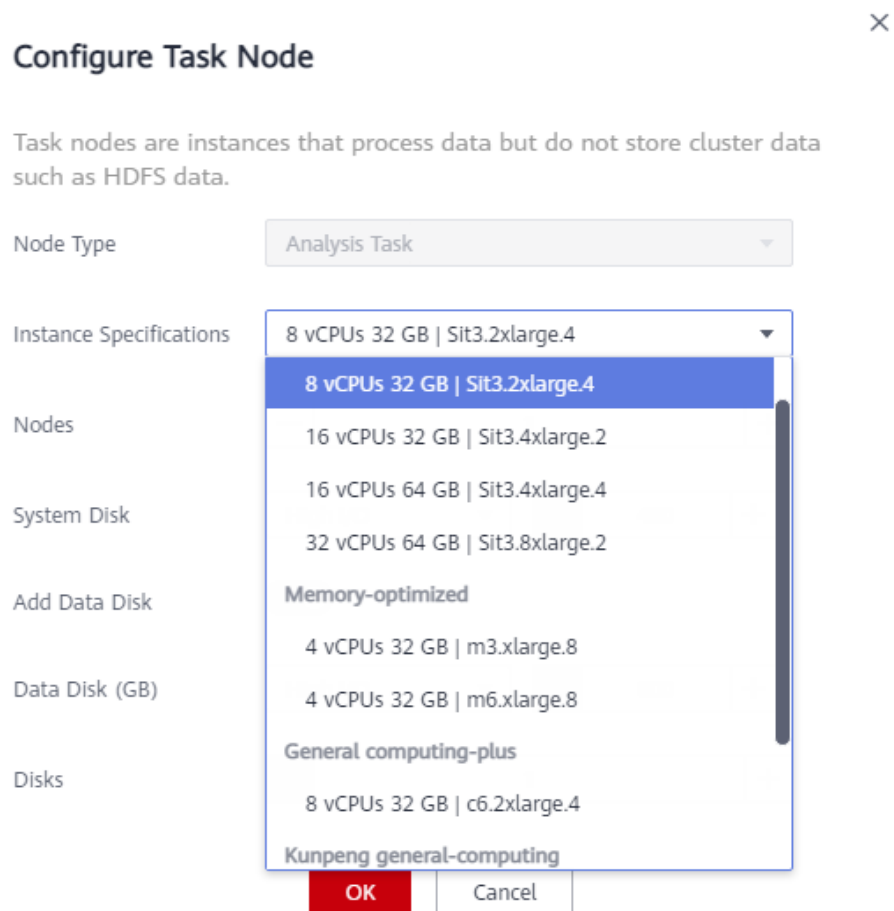

1. On the cluster details page, click the **Nodes** tab and click **Add Node Group**. The **Add Node Group** page is displayed.
2. Select **Task** for **Node Type**. Retain the default value **NM** for **Deploy Roles**. To deploy the NodeManager role, the node type must be **Task**. Set other parameters as required.

**Figure 7-9** Adding a task node group

**To add a task node to a non-custom cluster, perform the following steps:**

1. On the cluster details page, click the **Nodes** tab and click **Configure Task Node**. The **Configure Task Node** page is displayed.

2. On the **Configure Task Node** page, set **Node Type**, **Instance Specifications**, **Nodes**, **System Disk**. In addition, if **Add Data Disk** is enabled, configure the storage type, size, and number of data disks.

3. Click **OK**.

## Adding a Node Group

### NOTE

Used to add node groups and applies to customized clusters of MRS 3.x.

1. On the cluster details page, click the **Nodes** tab and click **Add Node Group**. The **Add Node Group** page is displayed.

**Figure 7-10** Clicking Add Node Group

2. Set the parameters as needed.
3. Click **OK**.

## 7.5.2 Expanding a Data Disk of an MRS Cluster Node

As your business grows, more data disk capacity is needed.

This section describes how to expand a data disk on the MRS console.

If the cluster version is MRS 3.1.0 (patch 3.1.0.0.11 or a later patch must be installed), MRS 3.1.5 (patch 3.1.5.0.3 or a later patch must be installed), or MRS 3.3.0-LTS, expand the data disk capacity by referring to [One-Click Data Disk Expansion](#).

If the cluster version is MRS 3.1.2-LTS.3 or MRS 3.2.0-LTS.1, you can expand the data disk capacity by referring to [Manual Data Disk Expansion](#).

### NOTE

All data disks of selected nodes will be expanded.

## Constraints

- A data disk capacity can only be expanded, and cannot be reduced.
- A data disk can be expanded to a maximum of 32 TB.
- Local disks cannot be expanded.
- System disks cannot be expanded.
- Only the EVS disks, disk partitions, and file systems mounted to the cluster nodes by default during creation can be expanded.
- The cloud server to which an EVS disk is mounted must be in the running state. The EVS disk must be in in-use or available state.

## One-Click Data Disk Expansion

If the cluster version is MRS 3.1.0 (patch 3.1.0.0.11 or a later patch must be installed), MRS 3.1.5 (patch 3.1.5.0.3 or a later patch must be installed), or MRS 3.3.0-LTS, perform the following steps to expand the data disk capacity:

**Step 1** Log in to the MRS console. On the **Active Clusters** page that is displayed, click the name of the desired cluster in the cluster list.

**Step 2** On the MRS details page, click **Nodes**.

**Step 3** Locate the node group where the target disk belongs, click **Expand Data Disk Capacity** in the **Operation** column.

**Step 4** Select the nodes to be expanded, set the target capacity, and click **OK**.

If there are a large number of nodes, you can fuzzy search for nodes by name or IP address, or filter nodes by data disk capacity.

 **NOTE**

- The estimated price is based on the disk capacity displayed and may be inaccurate. You will be billed based on the actual disk capacity of the node. Synchronize the disk information before expanding for more accurate estimated price.
- If the data disk of a node group has been expanded, same expansion will be performed for subsequent scale-out of the node group or cluster cloning.
- When multiple nodes are selected for scale-out, some disks mounted to the nodes may have higher capacity than the target volume. In this case, the disks will not be expanded or billed.
- Only the data disks mounted to a node by default during cluster creation can be expanded. For data disks mounted by yourself, only the EVS disks can be expanded. For details, see [Extending Partitions and File Systems for Data Disks \(Linux\)](#) or contact Huawei Cloud technical support.
- When a disk partition or file system is being expanded, the additional capacity can be expanded only to the tail partition of the disk. A system disk has multiple partitions and cannot be expanded.

**Step 5** Check whether the data disk is expanded.

1. In the disk column, check whether the data disk is expanded to the target volume.
2. Log in to FusionInsight Manager, view the disk information of the expanded node, and check whether the corresponding disk partition is expanded.

----End

## Manual Data Disk Expansion

For clusters of MRS 3.1.2-LTS.3, and MRS 3.2.0-LTS.1 versions, perform the following steps to expand data disks:

1. Contact Huawei Cloud technical support to enable the data disk expansion function.
2. Expand an EVS disk by referring to [One-Click Data Disk Expansion](#).  
Only EVS disks can be expanded to the target volume. Disk partitions and file systems cannot be expanded automatically.
3. Expand a disk partition and file system.  
Download the data disk expansion patches by referring to [Patch Download Addresses](#). Expand a disk partition and file system by referring to the **README.md** file in the patch description.
4. If there is a data disk mounted by a user and the disk partition and file system cannot be expanded, handle the problem by referring to [Extending](#)

[Partitions and File Systems for Data Disks \(Linux\)](#) or contact Huawei Cloud technical support.

## 7.5.3 Scaling In an MRS Cluster

You can reduce the number of core or task nodes to scale in a cluster based on service requirements so that MRS delivers better storage and computing capabilities at lower O&M costs.

The scale-in operation is not allowed for a cluster that is performing active/standby synchronization.

### NOTE

Only pay-per-use clusters can be scaled in. For details about how to scale in a yearly/monthly node, see [Unsubscribing from a Specified Node in a Yearly/Monthly MRS Cluster](#).

## Background

A cluster can have three types of nodes, master, core, and task nodes. Currently, only core and task nodes can be removed. To scale in a cluster, you only need to adjust the number of nodes on the MRS console. MRS then automatically selects the nodes to be removed.

The policies for MRS to automatically select nodes are as follows:

- MRS does not select the nodes with basic components installed, such as ZooKeeper, DBService, KrbServer, and LdapServer, because these basic components are the basis for the cluster to run.
- Core nodes store cluster service data. When scaling in a cluster, ensure that all data on the core nodes to be removed has been migrated to other nodes. You can perform follow-up scale-in operations only after all component services

are decommissioned, for example, removing nodes from Manager and deleting ECSs. When selecting core nodes, MRS preferentially selects the nodes with a small amount of data and healthy instances to be decommissioned to prevent decommissioning failures. For example, if DataNodes are installed on core nodes in an analysis cluster, MRS preferentially selects the nodes with small data volume and good health status during scale-in.

When core nodes are removed, their data is migrated to other nodes. If the user business has cached the data storage path, the client will automatically update the path, which may increase the service processing latency temporarily. Cluster scale-in may slow the response of the first access to some HBase on HDFS data. You can restart HBase or disable or enable related tables to resolve this issue.

- Task nodes are computing nodes and do not store cluster data. Data migration is not involved in removing task nodes. Therefore, when selecting task nodes, MRS preferentially selects nodes whose health status is faulty, unknown, or subhealthy. On the **Components** tab of the MRS console, click a service and then the **Instances** tab to view the health status of the node instances.

## Scale-In Verification Policy

To prevent component decommissioning failures, components provide different decommissioning constraints. Scale-in is allowed only when the constraints of all installed components are met. [Table 7-8](#) describes the scale-in verification policies.

**Table 7-8** Decommissioning constraints

| Component          | Constraint                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HDFS/DataNode      | <p>The number of available nodes after the scale-in is greater than or equal to the number of HDFS copies and the total HDFS data volume does not exceed 80% of the total HDFS cluster capacity.</p> <p>This ensures that the remaining space is sufficient for storing existing data after the scale-in and reserves some space for future use.</p> <p><b>NOTE</b></p> <p>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total.</p> |
| HBase/RegionServer | <p>The total available memory of RegionServers on all nodes except the nodes to be removed is greater than 1.2 times of the memory which is currently used by RegionServers on these nodes.</p> <p>This ensures that the node to which the region on a decommissioned node is migrated has sufficient memory to bear the region of the decommissioned node.</p>                                                                                                                                                           |

| Component                       | Constraint                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storm/<br>Supervisor            | After the scale-in, ensure that the number of slots in the cluster is sufficient for running the submitted tasks.<br>This prevents no sufficient resources being available for running the stream processing tasks after the scale-in.                                                                                                                                                                                                                        |
| Flume/<br>FlumeServer           | If FlumeServer is installed on a node and Flume tasks have been configured for the node, the node cannot be deleted.<br>This prevents the deployed service program from being deleted by mistake.                                                                                                                                                                                                                                                             |
| ClickHouse/<br>ClickHouseServer | For details, see <a href="#">Constraints on ClickHouseServer Scale-in</a> .<br>This ensures that data on the decommissioned nodes is migrated to in-use nodes.                                                                                                                                                                                                                                                                                                |
| Kudu/<br>KuduTserver            | Rule: When you decommission a Kudu Tserver, all other Kudu instance nodes in the cluster must be normal for the process to succeed.<br>Cause: During the decommissioning of a KuduTserver, a rebalance command is executed to migrate the tablets from the decommissioned instance to other KuduTserver nodes in the cluster. If any other KuduTserver nodes are in an abnormal state, the rebalance command will fail, resulting in decommissioning failure. |

## Scaling In a Cluster by Specifying the Node Quantity

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

**Step 3** Click the **Nodes** tab. In the **Operation** column of the node group, click **Scale In** to go to the **Scale In** page.

This operation can be performed only when the cluster and all nodes in it are running.

**Step 4** Set **Scale-In Type** to **Node quantity**.

**Step 5** Set **Scale-In Nodes** and click **OK**.

## Scale In

To improve scale-in reliability, MRS features standard scale-in rules for big data service components. If you perform the scale-in, the server and data disks will be deleted and cannot be recovered. [Learn more](#)

|                                                                                              |                                                                                                  |
|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Scale-In Type                                                                                | <input checked="" type="radio"/> Node quantity <input type="radio"/> Specific node               |

| Current Nodes                                                                                | 4                                                                                                |
| * Scale-In Nodes                                                                             | <input type="button" value="-"/> <input type="text" value="1"/> <input type="button" value="+"/> |
| <input type="checkbox"/> I understand the consequences of performing the scale-in operation. |                                                                                                  |
| <input type="button" value="OK"/> <input type="button" value="Cancel"/>                      |                                                                                                  |

### NOTE

- Before scaling in the cluster, check whether its security group configuration is correct. Ensure that an inbound security group rule contains a rule in which **Protocol & Port** is set to **All**, and **Source** is set to a trusted accessible IP address range.
- If damaged data blocks exist in HDFS, the cluster may fail to be scaled in. Contact Huawei Cloud technical support.

**Step 6** A dialog box displayed in the upper right corner of the page indicates that the task of removing the node is submitted successfully.

The cluster scale-in process is explained as follows:

- During scale-in: The cluster status is **Scaling In**. The submitted jobs will be executed, and you can submit new jobs. You are not allowed to continue to scale in or delete the cluster. You are advised not to restart the cluster or modify the cluster configuration.
- Successful scale-in: The cluster status is **Running**. The resources used after the cluster scale-in are billed.
- Failed scale-in: The cluster status is **Running**. You can execute jobs or scale-in the cluster again.

After the cluster is scaled in, you can view the node information of the cluster on the **Nodes** page.

----End

## Scaling In a Cluster by Removing Nodes that Are No Longer Needed

Delete a node when it is no longer needed. Before deleting a node, decommission the role instance of the component and back up the node's data. For details about

how to remove ClickHouseServer nodes, see [Scaling In ClickHouseServer Nodes](#). Only pay-per-use nodes can be scaled in.

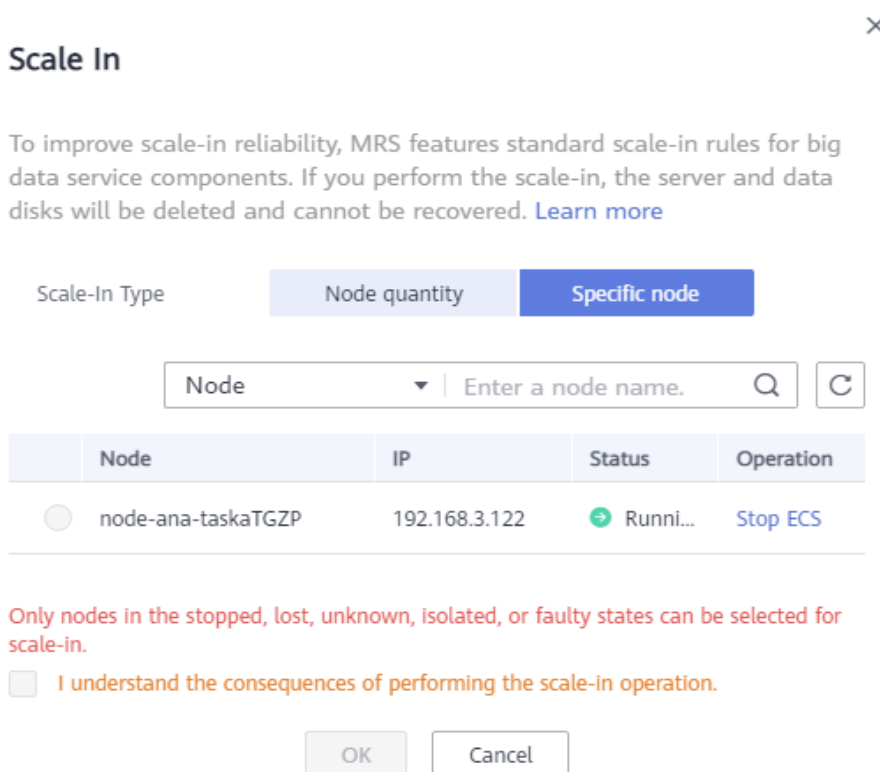

- Step 1** Log in to the MRS management console.
- Step 2** Click the name of the cluster to go to its details page.
- Step 3** Click the **Nodes** tab.
- Step 4** Locate the row that contains the target node group and click **Scale In** in the **Operation** column to go to the **Scale In** page.
- Step 5** Set **Scale-In Type** to **Specific node** and select the node to be removed.

Nodes in the **Stopped**, **Lost**, **Unknown**, **Isolated**, or **Faulty** status can be specified for scale-in. If the node cannot be selected, click **Stop ECS** to go to the ECS console to stop the node. On the cluster details page of the MRS console, click the **Alarms** tab and check whether any service fault alarms are generated after the node is stopped. If no such an alarm is generated, go back to the **Scale In** page and select the corresponding node for scale-in. If such an alarm is generated, clear the alarm before the scale-in.

**NOTE**

This operation may cause data loss. Decommission nodes before scale-in. For details, see [Decommissioning and Recommissioning an MRS Role Instance](#).

**Figure 7-11** Removing a specific node

- Step 6** Select **I understand the consequences of performing the scale-in operation**, Click **OK**.

**Step 7** Click the **Components** tab and check whether each component is normal. If any component is abnormal, wait for 5 to 10 minutes and check the component status again. If the fault persists, contact Huawei Cloud technical support.

**Step 8** Click the **Alarms** tab and check whether there are exception alarms. If there are exception alarms, clear them before performing other operations.

----End

## 7.5.4 Scaling In ClickHouseServer Nodes

If ClickHouse is deployed in the MRS cluster, check the data to prevent data loss during node deletion before scaling in ClickHouseServer nodes.

### Constraints on ClickHouseServer Scale-in

**Table 7-9** Scale-in constraints

| Dimension | Constraints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scale     | <ul style="list-style-type: none"><li>If a cluster has only one shard, the instance nodes cannot be removed from the cluster.</li><li>Multiple instance nodes in the same shard <b>must be decommissioned or recommissioned at the same time</b>. To query cluster shard information, perform the following steps:<ol style="list-style-type: none"><li>Log in to the node where the HDFS clients are installed as the client installation user and run the following commands:<pre>cd <i>Client installation directory</i> source bigdata_env Security mode kinit <i>ClickHouse service user</i> clickhouse client --host <i>IP address of the ClickHouse instance</i> --port 9440 --secure</pre>In normal mode, run the following command:<pre>clickhouse client --host <i>IP address of the ClickHouse instance</i> --user <i>Username</i> --password --port 9000</pre><i>Enter the user password.</i></li><li>Run the following command to query the cluster shard information:<pre>select cluster,shard_num,replica_num,host_name from system.clusters;</pre></li></ol></li></ul> |

| Dimension       | Constraints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cluster Storage | <p>Ensure that the disk space of nodes that will not be decommissioned is sufficient for storing data of all decommissioned nodes. There must be approximately 10% redundant storage space after decommissioning to ensure that the remaining instances can run properly. The procedure is as follows:</p> <ol style="list-style-type: none"><li>1. Run the following command to check the disk usage on each node:<br/><b>select * from system.disks;</b><br/><b>free_space</b> indicates the free disk space, and <b>total_space</b> indicates the total disk space. The used space is calculated by subtracting the value of <b>free_space</b> from that of <b>total_space</b>, and its unit is byte.</li><li>2. Run the preceding command on a node you want to decommission and calculate the data volume on the node using the preceding formula.</li><li>3. Run the preceding command on a node that will not be decommissioned, and then use the following formula: (Value of <b>free_space</b> - Data volume of the node to be decommissioned)/Value of <b>total_space</b>. If the result is greater than 10%, the node can be decommissioned.</li></ol> |
| Cluster Status  | <p>If there is any faulty ClickHouseServer instance node in the cluster, all instance nodes in the cluster cannot be decommissioned.</p> <p>Log in to Manager, choose <b>Cluster &gt; Services &gt; ClickHouse</b>, click <b>Instance</b>, and view the running status of each node in the cluster.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Database        | <p>If a database is deployed only on an instance node you want to decommission, the instance node cannot be decommissioned. To remove the instance node, you need to create the database on all ClickHouseServer instance nodes in the cluster. The procedure is as follows:</p> <ol style="list-style-type: none"><li>1. Run the <b>select * from system.databases;</b> command to collect the database list of each node.<br/><b>name</b> indicates the database name. <b>engine</b> indicates the database engine, and the default value is <b>Atomic</b>. If the default engine is used, you do not need to specify the engine when creating a table.</li><li>2. For the database deployed only on the instance node to be decommissioned, run the following command to create the database:<br/><b>create database xxx engine=xxx on cluster xxx;</b></li></ol>                                                                                                                                                                                                                                                                                              |

| Dimension                  | Constraints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Non-replicated Table | <p>If a local non-replicated table is deployed only on an instance node you want to decommission, the instance node cannot be decommissioned. To decommission the node, create a local non-replicated table with the same name on any node that will not be decommissioned.</p> <p>For example, the current cluster has two shards, shard 1 has two nodes A and B, and shard 2 has two nodes C and D. The non-replicated table <b>test</b> was created without the <b>ON CLUSTER</b> keyword, so the table is created only on node A.</p> <p>In this case, to decommission nodes A and B in shard 1, you need to create the table <b>test</b> on node C or D in shard 2.</p> <p>Run the following command to list the data tables of each node:</p> <pre><b>select database,name,engine,create_table_query from system.tables where database != 'system';</b></pre> <p>Perform the following operations according to the result:</p> <ul style="list-style-type: none"> <li>• Check the <b>engine</b> column. The table that does not contain the <b>Replicated</b> field is a local non-replicated table.</li> <li>• If there are no replicated tables on any nodes that will not be decommissioned, create one based the table created by <b>create_table_query</b>. The following creation statement is an example:<br/><b>CREATE TABLE {database}.{table} ('column name' type...) ENGINE = MergeTree;</b></li> </ul> |
| Replicated Table           | <p>If a replicated table exists only on some nodes in the cluster, the nodes where the replicated table is deployed cannot be decommissioned. You need to manually create the replicated table on all instance nodes where no replicated table is deployed in the cluster before decommissioning.</p> <p>For example, the current cluster has two shards, shard 1 has two nodes A and B, and shard 2 has two nodes C and D. The replicated table <b>test</b> was created without the <b>ON CLUSTER</b> keyword, so the table is created only on nodes A and B.</p> <p>To decommission nodes A and B in shard 1, you need to create the table <b>test</b> on nodes C and D in shard 2.</p> <p>Run the following command to list the data tables of each node:</p> <pre><b>select database,name,engine,create_table_query from system.tables where database != 'system';</b></pre> <p>Perform the following operations according to the result:</p> <ul style="list-style-type: none"> <li>• Check the <b>engine</b> column. The table that contains the <b>Replicated</b> field is a replicated table.</li> <li>• If there are no replicated tables on any nodes that will not be decommissioned, create one based the table created by <b>create_table_query</b>.</li> </ul>                                                                                                                                             |

| Dimension         | Constraints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Distributed Table | <p>Distributed tables will not be migrated automatically for decommissioning. Create distributed tables on the nodes that will not be decommissioned.</p> <p>Run the following command to list data tables of each node and check the <b>engine</b> column. These tables are distributed tables if this column contains field <b>Distributed</b>.</p> <p><b>select database,name,engine from system.tables where database != 'system';</b></p> <p><b>NOTE</b><br/>Creating distributed tables on these nodes will not affect the decommissioning, but may affect subsequent service operations.</p> |
| View              | <p>Views will not be automatically migrated for decommissioning, and views do not store data. Run the following command to list data tables of each node and check the <b>engine</b> column. These tables are views if this column contains field <b>View</b>.</p> <p><b>select database,name,engine from system.tables where database != 'system';</b></p> <p>Run the following command to delete the views one by one:</p> <p><b>drop view {database_name}.{table_name};</b></p>                                                                                                                  |

| Dimension          | Constraints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Materialized Views | <p>Materialized views will not be automatically migrated for Decommissioning. Create materialized views on the nodes that will not be decommissioned. If the materialized view of a node to be decommissioned does not display the specified aggregation table but uses an embedded table, the node cannot be decommissioned.</p> <p>Run the following command to list data tables of each node and check the <b>engine</b> column. These tables are materialized views if this column contains field <b>MaterializedView</b>.</p> <pre><b>select database,name,engine, create_table_query from system.tables where database != 'system';</b></pre> <p>Embedded tables are initialized with a <b>POPULATE</b> field in their <b>create_table_query</b> column. Views are created at initialization, and new data is ignored. Aggregation tables without the <b>POPULATE</b> field insert new data directly into views and support tables, requiring manual data loading. The table creation operations of the aggregation table and embedded table are different.</p> <p>Perform the following operations to process the materialized views of the node to be decommissioned:</p> <ol style="list-style-type: none"> <li>1. Record the materialized views and delete them.<br/><b>drop view {database_name}.{table_name};</b></li> <li>2. After the node decommissioning is complete, delete and recreate the corresponding materialized views on in-use nodes to update the materialized views.</li> <li>3. To create an aggregation table, specify <b>WHERE</b> to search for historical data and manually import the historical data to the materialized views. Otherwise, historical data cannot be imported to the materialized views based on unified conditions. As a result, data is imported repeatedly. For example, an update point can be specified to ensure that data before the update point is manually loaded in <b>INSERT</b> mode. <ul style="list-style-type: none"> <li>• Add <b>WHERE { Time field (for example, date)}&gt;= toDate ({ Current time (for example, '2022-12-01 00:00:00')})</b> to the table creation statement.</li> <li>• <b>insert into {table} select {Table field} from {Source table} where {Time field}&lt; toDate ({Current time})</b> is used to load original data.</li> </ul> </li> <li>4. Embedded tables will lose data generated during table creation. You can specify <b>WHERE</b> to filter out all historical data. In this case, an empty table is created, and you only need to manually insert all data in the historical data source table.</li> </ol> |

| Dimension                     | Constraints                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tables of Third-Party Engines | <p>Currently, tables of third-party engines cannot be automatically migrated for decommissioning.</p> <p>Run the following command to list data tables of each node and check the <b>engine</b> column. These tables are tables of third-party engines if this column does not contain any of the following fields: <b>MergeTree</b>, <b>View</b>, <b>MaterializedView</b>, <b>Distributed</b>, and <b>Log</b>. (The <b>engine</b> column of a third-party engine table may contain field <b>Memory</b>, <b>HDFS</b>, or <b>MySQL</b>.)</p> <pre><b>select database,name,engine from system.tables where database != 'system';</b></pre> <p>Create third-party engine tables on the nodes that will not be decommissioned and delete those from the nodes that will be decommissioned.</p>                                                                                                                                                                                                                                                                                                                            |
| Detached Data                 | <p>If the table on a node to be decommissioned has been detached and data still exists in the <b>detached</b> directory, the node cannot be decommissioned. You need to attach the data in the <b>detached</b> directory to other directories before decommissioning.</p> <ol style="list-style-type: none"> <li>1. Run the following command to view the <b>system.detached_parts</b> system catalog of the node to be decommissioned:<br/><pre><b>select * from system.detached_parts;</b></pre></li> <li>2. If <b>detached part</b> data exists and these partitions are no longer used, run the following command to delete the <b>detached part</b> data:<br/><pre><b>ALTER TABLE {table_name} DROP DETACHED PARTITION {partition_expr} SETTINGS allow_drop_detached = 1;</b></pre></li> <li>3. Run the following command to check whether there is any <b>detached part</b> data in the <b>system.detached_parts</b> system catalog:<br/><pre><b>select * from system.detached_parts;</b></pre></li> </ol> <p>If the command output is empty, there is no <b>detached part</b> data in this system catalog.</p> |

## Scaling In ClickHouseServer Nodes

Before removing ClickHouseServer instance nodes, you need to decommission them. Multiple node replicas of the same shard **must be decommissioned at the same time**. If there is a faulty ClickHouseServer instance node in the cluster, all instance nodes of the cluster cannot be decommissioned. For more constraints, see [Constraints on ClickHouseServer Scale-in](#).

 NOTE

- Perform the decommissioning in idle hours because the operation will occupy certain bandwidth resources.
- The decommissioning operation can be performed only to ClickHouseServer. ClickHouseBalancer cannot be decommissioned.
- **This operation is only supported for MRS 3.1.2 and later.**

**Step 1** Use PuTTY to log in to the node where ClickHouseServer is installed as user **root** and run the following command:

```
echo 'select * from system.clusters' | curl -k 'https://IP address of the node
where the ClickHouseServer instance is located:Port number/' -u ck_user.Password
--data-binary @-
```

Record the nodes of the same shard. In the following command output, the nodes with the same number in bold belong to the same shard.

```
[root@kwephispra44948 ~]# echo 'select * from system.clusters' | curl -k 'https://10.112.17.189:21422/' -u
ck_user:Bigdata_2013 --data-binary @-
default_cluster 1 1 1 kwephispra44947 10.112.17.150 21427 0 0 0
default_cluster 1 1 2 kwephispra44948 10.112.17.189 21427 0 0 0
```

 NOTE

- To view the port number of ClickHouseServer instance nodes, log in to FusionInsight Manager, choose **Cluster > Services > ClickHouse**, click **Configuration > All Configurations**, and choose **ClickHouseServer (Role)** on the left.  
In security mode (Kerberos authentication enabled), check the value of **https\_port**, which is the port of a ClickHouseServer instance node.  
In common mode (Kerberos authentication disabled), check the value of **http\_port**, which is the port of a ClickHouseServer instance node.
- **ck\_user** indicates the created ClickHouse user, which must be bound to a role with the ClickHouse administrator permission. For details about how to create a user and a role, see [Creating an MRS Cluster User](#) and [Managing MRS Cluster Roles](#), respectively.

**Step 2** Log in to the MRS console and click the cluster name to go to the cluster details page.

**Step 3** Click the **Components** tab and click **ClickHouse**. Then switch to **Instances**, select the **ClickHouseServer** instances to be removed, click **More**, and select **Decommission**.

**Step 4** Click the **Components** tab and click **ClickHouse**. Then click **More**, and select **Synchronize Configuration**.

**Step 5** Click the **Nodes** tab and click the ClickHouseServer instance node that has been decommissioned.

**Step 6** On the ECS page, click **Stop**. In the displayed dialog box, select **Forcibly stop the preceding ECSs** and click **Yes**.

**Step 7** Go back to the MRS console, click the **Nodes** tab, locate the row that contains the target node group, and click **Scale In** in the **Operation** column to go to the **Scale In** page.

**Step 8** Set **Scale-In Type** to **Specific node** and select the node to be removed.

**Step 9** Select **I understand the consequences of performing the scale-in operation**. Click **OK**.

- Step 10** Click the **Components** tab and check whether each component is normal. If any component is abnormal, wait for 5 to 10 minutes and check the component status again. If the fault persists, contact Huawei Cloud technical support.
- Step 11** Click the **Alarms** tab and check whether there are exception alarms. If there are exception alarms, clear them before performing other operations.

----End

## 7.5.5 Unsubscribing from a Specified Node in a Yearly/ Monthly MRS Cluster

You can reduce the number of specific nodes to scale in a cluster so that MRS delivers better storage and computing capabilities at lower O&M costs based on service requirements.

Currently, you can unsubscribe from a maximum of 20 Core nodes at a time, but there must be at least 2 Core nodes available after unsubscription.

### NOTE

You can unsubscribe from a node only after the node is successfully isolated or decommissioned. Otherwise, data loss may occur.

## Usage Restrictions

- If the number of Core nodes in the cluster is less than or equal to the number of HDFS copies, MRS does not support node unsubscription to ensure data reliability. The number of HDFS copies can be queried using the **dfs.replication** parameter in the HDFS parameter configuration.
- MRS does not support unsubscription from nodes where ZooKeeper, Kudu, Kafka, or ClickHouse is deployed.

## How to Unsubscribe from a Specified Node in a Yearly/Monthly Cluster

- Step 1** Disable the auto-renewal function of the cluster where the node to be unsubscribed from is located. For details, see [Disabling Auto-Renewal](#).
- Step 2** Log in to the MRS console.
- Step 3** On the **Active Clusters** page, and click the name of the target cluster to be operated. The cluster details page is displayed.
- Step 4** On the **Dashboard** page of the cluster, click **Synchronize** on the right of **IAM User Sync**.
- Step 5** Unsubscribe from or isolate a node.

 NOTE

Currently, only clusters of the following versions support unsubscription from specified nodes in yearly/monthly clusters. For clusters of other versions, contact technical support.

- MRS 2.1.0 (patch 2.1.0.5 or later)
- MRS 3.1.0 (patch 3.1.0.0.2 or later)
- MRS 3.1.5
- MRS 3.2.0-LTS.1 (patch 3.2.0-LTS.1.3 or later)
- If the cluster is earlier than MRS 2.x:
  - a. Click **Isolate Node** in the **Operation** column of the node group to be unsubscribed from.
  - b. Select the node to be unsubscribed from and click **OK**.

The time required for isolating a node depends on the data volume on the node. A larger data volume indicates a longer time.

After the node is isolated, the node status changes to **Isolated**. The **Unsubscribe from Node** button is displayed on the **Nodes** tab page.
- If the cluster is MRS 3.1.0, 3.1.5, or 3.2.0-LTS.1:
  - a. Click **Decommission Node** in the **Operation** column of the node group to be unsubscribed from.
  - b. Select the node to be decommissioned and click **OK**.

The time required for decommissioning a node depends on the data volume on the node. A larger data volume indicates a longer time.

After the node is decommissioned, the node status changes to **Decommissioned**.

 NOTE

- For clusters of MRS 3.x (except MRS 3.1.0, 3.1.5, and 3.2.0-LTS.1), perform the following operations:
  1. To unsubscribe a node that has HDFS DataNode, YARN NodeManager, or HBase RegionServer instances, decommission these instances on the Manager first. For details, see [Decommissioning and Recommissioning an MRS Role Instance](#).
  2. Log in to the MRS management console, on the **Nodes** tab, select the nodes to be unsubscribed from, and choose **Node Operation** > **Isolate Host**. After the host is isolated, contact the technical engineer to unsubscribe from the node.
- Only one node can be isolated or decommissioned at a time. You can unsubscribe from a node only after the node is successfully isolated or decommissioned.
- If the node fails to isolate or decommission, log in to Manager. Click , search for the name of the task that fails to isolate or decommission the host in the task list, click the name, and rectify the fault as prompted.

**Step 6** On the cluster details page, choose **Nodes** > **Unsubscribe from Node**.

**Step 7** Select the node to be unsubscribed from and click **OK**.

Currently, you can unsubscribe from a maximum of 20 Core nodes at a time, but there must be at least 2 Core nodes available after unsubscription.

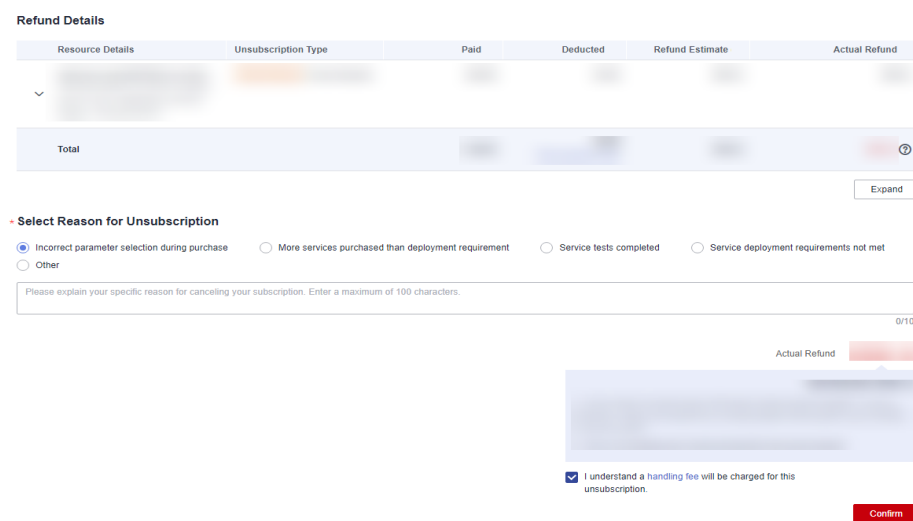

**Figure 7-12** Selecting a node to be unsubscribed from

**Step 8** On the **Refund Details** page, select "I understand a handling fee will be charged for this unsubscription" as prompted if needed, and click **Confirm**. If this check box does not appear, skip this step.

The cluster status changes to **Scaling in**. After the scale-in is complete, the cluster status changes to **Running**, and the specified node is deleted.

**Figure 7-13** Refund details

**Step 9** (Optional) To enable auto-renewal for a cluster, see [Enabling Auto-Renewal](#).

----End

## 7.5.6 MRS Task Node Auto Scaling

### 7.5.6.1 Automatic Scaling of Task Nodes in an MRS Cluster

In big data application scenarios, especially real-time data analysis and processing, the number of cluster nodes needs to be dynamically adjusted according to data volume changes to provide the required number of resources. The auto scaling function of MRS enables the task nodes of a cluster to be automatically scaled to match cluster loads. If the data volume changes periodically, you can configure an

auto scaling rule so that the number of task nodes can be automatically adjusted in a fixed period of time before the data volume changes.

- Auto scaling rules: You can increase or decrease task nodes based on real-time cluster loads. Auto scaling will be triggered with a certain delay when the data volume changes.
- Resource plans: Set the task node quantity based on the time range. If the data volume changes periodically, you can create resource plans to resize the cluster before the data volume changes, thereby avoiding delays in increasing or decreasing resources.

You can configure either auto scaling rules or resource plans or both to trigger auto scaling. Configuring both resource plans and auto scaling rules improves the cluster node scalability to cope with occasionally unexpected data volume peaks.

In some service scenarios, resources need to be reallocated or service logic needs to be modified after cluster scale-out or scale-in. If you manually scale out or scale in a cluster, you can log in to cluster nodes to reallocate resources or modify service logic. If you use auto scaling, MRS enables you to customize automation scripts for resource reallocation and service logic modification. Automation scripts can be executed before and after auto scaling and automatically adapt to service load changes, all of which eliminates manual operations. In addition, automation scripts can be fully customized and executed at various moments, meeting your personalized requirements and improving auto scaling flexibility.

- Auto scaling rules:
  - You can set a maximum of five rules for scaling out or in a cluster, respectively.
  - The system determines the scale-out and then scale-in based on your configuration sequence. Important policies take precedence over other policies to prevent repeated triggering when the expected effect cannot be achieved after a scale-out or scale-in.
  - Comparison factors include greater than, greater than or equal to, less than, and less than or equal to.
  - Cluster scale-out or scale-in can be triggered only after the configured metric threshold is reached for consecutive  $5n$  (the default value of  $n$  is 1) minutes.
  - After each scale-out or scale-in, there is a cooling duration that is greater than 0 and lasts 10 minutes by defaults.
  - In each cluster scale-out or scale-in, at least one node and at most 100 nodes can be added or reduced.
  - The number of task nodes in a cluster is limited to the default number of nodes configured by users or the node quantity range in the resource plan that takes effect in the current time period. The node quantity range in the resource plan that takes effect in the current time period has a higher priority.
- Resource plans (setting the number of Task nodes by time range):
  - You can specify a Task node range (minimum number to maximum number) in a time range. If the number of Task nodes is beyond the Task node range in a resource plan, the system triggers cluster scale-out or scale-in.

- You can set a maximum of five resource plans for a cluster.
- A resource plan cycle is by day. The start time and end time can be set to any time point between 00:00 and 23:59. The start time must be at least 30 minutes earlier than the end time. Time ranges configured for different resource plans cannot overlap.
- After a resource plan triggers cluster scale-out or scale-in, there is 10-minute cooling duration. Auto scaling will not be triggered again within the cooling time.
- When a resource plan is enabled, the number of Task nodes in the cluster is limited to the default node range configured by you in other time periods except the time period configured in the resource plan.
- Automation scripts:
  - You can set an automation script so that it can automatically run on cluster nodes when auto scaling is triggered.
  - You can set a maximum number of 10 automation scripts for a cluster.
  - You can specify an automation script to be executed on one or more types of nodes.
  - Automation scripts can be executed before or after scale-out or scale-in.
  - Before using automation scripts, upload them to a cluster VM or OBS file system in the same region as the cluster. The automation scripts uploaded to the cluster VM can be executed only on the existing nodes. If you want to make the automation scripts run on the new nodes, upload them to the OBS file system.

## Node Auto Scaling Metrics

- **Node group dimension policy**

When adding a rule, you can refer to [Table 7-10](#) to configure the corresponding metrics.

**Table 7-10** Auto scaling metrics

| Cluster Type      | Metric                       | Value Type | Description                                                                                                  |
|-------------------|------------------------------|------------|--------------------------------------------------------------------------------------------------------------|
| Streaming cluster | StormSlotAvailable           | Integer    | Number of available Storm slots<br>Value range: 0 to 2147483646                                              |
|                   | StormSlotAvailablePercentage | Percentage | Percentage of available Storm slots, that is, the proportion of the available slots<br>Value range: 0 to 100 |
|                   | StormSlotUsed                | Integer    | Number of the used Storm slots<br>Value range: 0 to 2147483646                                               |
|                   | StormSlotUsedPercentage      | Percentage | Percentage of the used Storm slots, that is, the proportion of the used slots<br>Value range: 0 to 100       |

| Cluster Type     | Metric                                   | Value Type | Description                                                                                                                                  |
|------------------|------------------------------------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|                  | StormSupervisorMemAverageUsage           | Integer    | Average memory usage of the Supervisor process of Storm<br>Value range: 0 to 2147483646                                                      |
|                  | StormSupervisorMemAverageUsagePercentage | Percentage | Average percentage of the memory used by the Supervisor process of Storm to the total memory of the system<br>Value range: 0 to 100          |
|                  | StormSupervisorCPUAverageUsagePercentage | Percentage | Average percentage of the CPUs used by the Supervisor process of Storm to the total CPUs<br>Value range: 0 to 6000                           |
| Analysis cluster | YARNAppPending                           | Integer    | Number of pending tasks on YARN<br>Value range: 0 to 2147483646                                                                              |
|                  | YARNAppPendingRatio                      | Ratio      | Ratio of pending tasks on YARN, that is, the ratio of pending tasks to running tasks on YARN<br>Value range: 0 to 2147483646                 |
|                  | YARNAppRunning                           | Integer    | Number of running tasks on YARN<br>Value range: 0 to 2147483646                                                                              |

|              | YARNMemoryAvailable           | Integer    | Available memory on YARN. The unit is MB.<br>Value range: 0 to 2147483646                                                            |
|              | YARNMemoryAvailablePercentage | Percentage | Percentage of available memory on YARN, that is, the proportion of available memory to total memory on YARN<br>Value range: 0 to 100 |
|              | YARNMemoryPending             | Integer    | Pending memory on YARN<br>Value range: 0 to 2147483646                                                                               |

 **NOTE**

- When the value type is percentage or ratio in [Table 7-10](#), the valid value can be accurate to percentile. The percentage metric value is a decimal value with a percent sign (%) removed. For example, 16.80 represents 16.80%.
- Hybrid clusters support all metrics of analysis and streaming clusters.

- **Resource pool policy**

When adding a rule, you can refer to [Table 7-11](#) to configure the corresponding metrics.

 **NOTE**

Auto scaling policies can be configured for a cluster by resource pool in MRS 3.1.5 or later.

**Table 7-11** Rule configuration description

| Cluster Type            | Metric                                | Value Type | Description                                                                                                                                               |
|-------------------------|---------------------------------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Analysis/Custom cluster | ResourcePoolMemoryAvailable           | Integer    | Available memory on YARN in the resource pool. The unit is MB.<br>Value range: 0 to 2147483646                                                            |
|                         | ResourcePoolMemoryAvailablePercentage | Percentage | Percentage of available memory on YARN in the resource pool, that is, the proportion of available memory to total memory on YARN<br>Value range: 0 to 100 |
|                         | ResourcePoolCPUAvailable              | Integer    | Number of available vCPUs on YARN in the resource pool<br>Value range: 0 to 2147483646                                                                    |
|                         | ResourcePoolCPUAvailablePercentage    | Percentage | Percentage of available vCPUs on YARN in the resource pool. that is, the proportion of available vCPUs to total vCPUs<br>Value range: 0 to 100            |

When adding a resource plan, you can set parameters by referring to [Table 7-12](#).

**Table 7-12** Configuration items of a resource plan

| Configuration Item | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Effective On       | The effective date of a resource plan. <b>Daily</b> is selected by default. You can also select one or multiple days from Monday to Sunday.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Time Range         | Start time and End time of a resource plan are accurate to minutes, with the value ranging from <b>00:00</b> to <b>23:59</b> . For example, if a resource plan starts at 8:00 and ends at 10:00, set this parameter to 8:00-10:00. The end time must be at least 30 minutes later than the start time.                                                                                                                                                                                                                                                                                                     |
| Node Range         | The number of nodes in a resource plan ranges from <b>0</b> to <b>500</b> . In the time range specified in the resource plan, if the number of Task nodes is less than the specified minimum number of nodes, it will be increased to the specified minimum value of the node range at a time. If the number of Task nodes is greater than the maximum number of nodes specified in the resource plan, the auto scaling function reduces the number of Task nodes to the maximum value of the node range at a time. The minimum number of nodes must be less than or equal to the maximum number of nodes. |

 **NOTE**

- When a resource plan is enabled, the **Default Range** value on the auto scaling page forcibly takes effect beyond the time range specified in the resource plan. For example, if **Default Range** is set to **1-2**, **Time Range** is between **08:00-10:00**, and **Node Range** is **4-5** in a resource plan, the number of Task nodes in other periods (0:00-8:00 and 10:00-23:59) of a day is forcibly limited to the default node range (1 to 2). If the number of nodes is greater than 2, auto scale-in is triggered; if the number of nodes is less than 1, auto scale-out is triggered.
  - When a resource plan is not enabled, the **Default Range** takes effect in all time ranges. If the number of nodes is not within the default node range, the number of Task nodes is automatically increased or decreased to the default node range.
  - Time ranges of resource plans cannot be overlapped. The overlapped time range indicates that two effective resource plans exist at a time point. For example, if resource plan 1 takes effect from **08:00** to **10:00** and resource plan 2 takes effect from **09:00** to **11:00**, the time range between **09:00** to **10:00** is overlapped.
  - The time range of a resource plan must be on the same day. For example, if you want to configure a resource plan from **23:00** to **01:00** (the next day), configure two resource plans whose time ranges are **23:00-00:00** and **00:00-01:00**, respectively.
- **Automation scripts**  
When adding an automation script, you can set related parameters by referring to [Table 7-13](#).

**Table 7-13** Configuration items of an automation script

| Configuration Item | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | <p>Automation script name.</p> <p>The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space.</p> <p>The value can contain 1 to 64 characters.</p> <p><b>NOTE</b></p> <p>A name must be unique in the same cluster. You can set the same name for different clusters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Script Path        | <p>Script path. The value can be an OBS file system path or a local VM path.</p> <ul style="list-style-type: none"><li>• An OBS file system path must start with <b>obs://</b> and end with <b>.sh</b>, for example, <b>obs://mrs-samples/xxx.sh</b>.</li><li>• A local VM path must start with a slash (/) and end with <b>.sh</b>. For example, the path of the example script for installing the Zepelin is <b>/opt/bootstrap/zepelin/zepelin_install.sh</b>.</li></ul>                                                                                                                                                                                                                                                                                                                                                   |
| Execution Node     | <p>Select a type of the node where an automation script is executed.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• If you select <b>Master</b> nodes, you can choose whether to run the script only on the active Master nodes by enabling or disabling the <b>Active Master</b> switch.</li><li>• If you enable it, the script runs only on the active Master nodes. If you disable it, the script runs on all Master nodes. This switch is disabled by default.</li></ul>                                                                                                                                                                                                                                                                                                                                 |
| Parameter          | <p>Automation script parameter. The following predefined variables can be imported to obtain auto scaling information:</p> <ul style="list-style-type: none"><li>• <b>`\${mrs_scale_node_num}`</b>: Number of auto scaling nodes. The value is always positive.</li><li>• <b>`\${mrs_scale_type}`</b>: Scale-out/in type. The value can be <b>scale_out</b> or <b>scale_in</b>.</li><li>• <b>`\${mrs_scale_node_hostnames}`</b>: Host names of the auto scaling nodes. Use commas (,) to separate multiple host names.</li><li>• <b>`\${mrs_scale_node_ips}`</b>: IP address of the auto scaling nodes. Use commas (,) to separate multiple IP addresses.</li><li>• <b>`\${mrs_scale_rule_name}`</b>: Name of the triggered auto scaling rule. For a resource plan, this parameter is set to <b>resource_plan</b>.</li></ul> |

| Configuration Item  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Executed            | <p>Time for executing an automation script. The following four options are supported: <b>Before scale-out</b>, <b>After scale-out</b>, <b>Before scale-in</b>, and <b>After scale-in</b>.</p> <p><b>NOTE</b><br/>Assume that the execution nodes include Task nodes.</p> <ul style="list-style-type: none"><li>• The automation script executed before scale-out cannot run on the Task nodes to be added.</li><li>• The automation script executed after scale-out can run on the added Task nodes.</li><li>• The automation script executed before scale-in can run on Task nodes to be deleted.</li><li>• The automation script executed after scale-in cannot run on the deleted Task nodes.</li></ul> |
| Action upon Failure | <p>Whether to continue to execute subsequent scripts and scale-out/in after the script fails to be executed.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• You are advised to set this parameter to <b>Continue</b> in the commissioning phase so that the cluster can continue the scale-out/in operation no matter whether the script is executed successfully.</li><li>• If the script fails to be executed, view the log in <code>/var/log/Bootstrap</code> on the cluster VM.</li><li>• The scale-in operation cannot be rolled back. Therefore, the <b>Action upon Failure</b> can only be set to <b>Continue</b> after scale-in.</li></ul>                                         |

 **NOTE**

The automation script is triggered only during auto scaling. It is not triggered when the cluster node is manually scaled out or in.

## 7.5.6.2 Adding an Auto Scaling Policy for MRS Task Nodes

### Configuring Auto Scaling During Cluster Creation

When you create a cluster, you can configure the auto scaling function in advanced configuration parameters.

 **NOTE**

Auto scaling policies can be configured during cluster creation only for analysis, streaming, and hybrid clusters.

**Step 1** Log in to the MRS management console.

**Step 2** When you buy a cluster containing task nodes, configure the cluster software and hardware information by referring to [Manually Buying an MRS Cluster](#). Then, on the **Set Advanced Options** page, enable **Analysis Task** and configure or modify auto scaling rules and resource plans.

**Figure 7-14** Configuring auto scaling rules when creating a cluster

**NOTE**

You can configure the auto scaling rules by referring to the following scenarios:

- [Scenario 1: Using Auto Scaling Rules Alone](#)
- [Scenario 2: Using Resource Plans Alone](#)
- [Scenario 3: Using Auto Scaling Rules and Resource Plans Together](#)

----End

## Adding an Auto Scaling Policy for a Cluster

After a cluster is created, you can configure rules for the task node group in a cluster by node group or resource pool.

The node group policy and resource pool policy are mutually exclusive. You can configure either of them as needed.

MRS 3.1.5 or later supports the specified resource pool policy.

| Item                                   | By Node Group                                   | By Resource Pool                                                                |
|----------------------------------------|-------------------------------------------------|---------------------------------------------------------------------------------|
| Auto scaling object                    | All nodes in the task node group                | Task nodes in the resource pool specified by an auto scaling policy             |
| Resource pool ownership of added nodes | Default resource pool                           | Resource pool specified by the auto scaling policy                              |
| Scale-in object                        | Random scale-in of nodes in the task node group | Random scale-in of nodes in a resource pool specified by an auto scaling policy |

### Prerequisites

- A task node group has been configured by referring to [Adding a Task Node](#).
- A resource pool has been added by referring to [Adding an MRS Tenant Resource Pool](#) if you plan to configure auto scaling policies by resource pool.

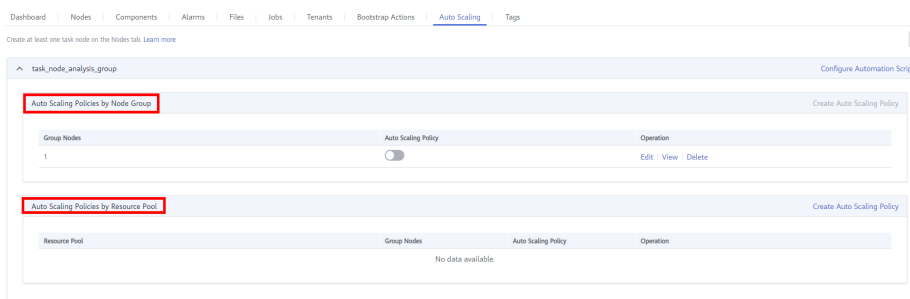

### Procedure

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Active Clusters**, select a running cluster, and click its name to go its details page.

**Step 3** On the page that is displayed, click the **Auto Scaling** tab.

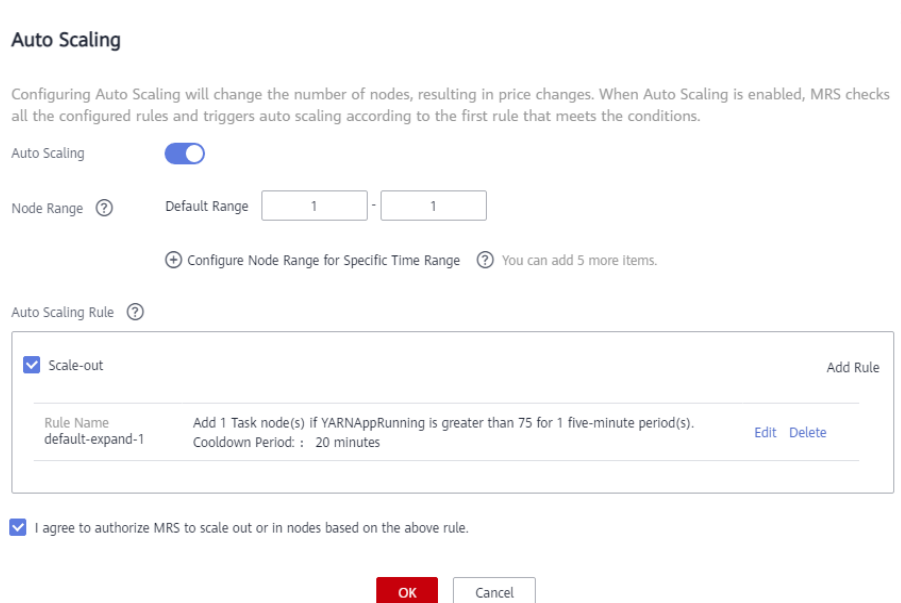

You can configure policies by resource pool or node group as needed.

### NOTE

- Auto scaling policies of different node groups are mutually exclusive. That is, you can enable auto scaling policies only for one node group.
- An auto scaling rule adjusts the number of nodes, but also affects the actual price. Exercise caution when adding an auto scaling rule.

**Step 4** Click **Create Auto Scaling Policy** to create an auto scaling policy.

 NOTE

You can configure the auto scaling rules by referring to the following scenarios:

- [Scenario 1: Using Auto Scaling Rules Alone](#)
- [Scenario 2: Using Resource Plans Alone](#)
- [Scenario 3: Using Auto Scaling Rules and Resource Plans Together](#)

----End

## Scenario 1: Using Auto Scaling Rules Alone

Scenario where only auto scaling rules are configured: The number of nodes needs to be dynamically adjusted based on the YARN resource usage. When the available YARN memory is less than 20%, five nodes need to be added. When the available YARN memory is greater than 70%, five nodes need to be reduced. The number of nodes in a task node group ranges from 1 to 10.

**Step 1** Go to the **Auto Scaling** page to configure auto scaling rules.

- Configure the **Default Range** parameter.  
Enter a task node range, in which auto scaling is performed. This constraint applies to all scale-in and scale-out rules. The maximum value range allowed is 0 to 500.  
The value range in this example is 1 to 10.
- Configure an auto scaling rule.  
To enable **Auto Scaling**, you must configure a scale-out or scale-in rule.
  - Select **Scale-Out** or **Scale-In**.
  - Click **Add Rule**.

**Figure 7-15** Adding a rule

**Add Rule**

Rule Name:

If:

Last For:  five-minute periods

Add:  nodes

Cooldown Period:  minutes

- Configure **Rule Name**, **If**, **Last For**, **Add**, and **Cooldown Period**. For details about auto scaling metrics, see [Automatic Scaling of Task Nodes in an MRS Cluster](#).

- d. Click **OK**.

You can view, edit, or delete the rules you configured in the **Scale-out** or **Scale-in** area on the **Auto Scaling** page. You can click **Add Rule** to configure multiple rules.

**Step 2** Click **OK**.

 **NOTE**

If you want to configure an auto scaling rule for an existing cluster, select **I agree to authorize MRS to scale out or in nodes based on the above rule**.

----End

## Scenario 2: Using Resource Plans Alone

If the data volume changes regularly every day and you want to scale out or in a cluster before the data volume changes, you can create resource plans to adjust the number of Task nodes as planned in the specified time range.

For example: A real-time processing service sees a sharp increase in data volume from 7:00 to 13:00 on Monday, Tuesday, and Saturday. Assume that an MRS streaming cluster is used to process the service data. Five task nodes are required from 7:00 to 13:00 on Monday, Tuesday, and Saturday, while only two are required at other time.

**Step 1** Go to the **Auto Scaling** page to configure a resource plan.

 **NOTE**

A resource plan can be configured to adjust the number of nodes, which affects the actual price. Exercise caution when performing this operation.

**Step 2** For example, the **Default Range** of node quantity is set to **2-2**, indicating that the number of task nodes is fixed to 2 except the time range specified in the resource plan.

**Step 3** Click **Configure Node Range for Specific Time Range** under **Default Range** or **Add Resource Plan**.

**Step 4** Configure **Effective On**, **Time Range**, and **Node Range**.

For example, set **Effective On** to **Monday, Tuesday, and Saturday**, **Time Range** to **07:00-13:00**, and **Node Range** to **5-5**. This indicates that the number of task nodes is fixed at 5 from 07:00 to 13:00.

Click **Configure Node Range for Specific Time Range** to configure multiple resource plans.

 NOTE

- **Effective On** is set to **Daily** by default. You can also select one or multiple days from Monday to Sunday.
- If you do not set **Node Range**, its default value will be used.
- If you set both **Node Range** and **Time Range**, the node range you set will be used during the time range you set, and the default node range will be used beyond the time range you set. If the time is not within the configured time range, the default range is used.

----End

### Scenario 3: Using Auto Scaling Rules and Resource Plans Together

If the data volume is not stable and the expected fluctuation may occur, the fixed Task node range cannot guarantee that the requirements in some service scenarios are met. In this case, it is necessary to adjust the number of Task nodes based on the real-time loads and resource plans.

For example: A real-time processing service sees an unstable increase in data volume from 7:00 to 13:00 on Monday, Tuesday, and Saturday. For example, 5 to 8 task nodes are required from 7:00 to 13:00 on Monday, Tuesday, and Saturday, and 2 to 4 are required beyond this period. You can set an auto scaling rule based on a resource plan. When the data volume exceeds the expected value, the number of Task nodes changes with resource loads, without exceeding the node range specified in the resource plan. When a resource plan is triggered, the number of nodes is adjusted within the specified node range with minimum affect. That is, increase nodes to the upper limit and decrease nodes to the lower limit.

**Step 1** Go to the **Auto Scaling** page to configure auto scaling rules.

An auto scaling rule adjusts the number of nodes, but also affects the actual price. Exercise caution when adding an auto scaling rule.

- **Default Range**  
Enter a task node range, in which auto scaling is performed. This constraint applies to all scale-in and scale-out rules.  
For example, this parameter is set to **2-4** in this scenario.
- **Auto Scaling**  
To enable **Auto Scaling**, you must configure a scale-out or scale-in rule.
  - a. Select **Scale-Out** or **Scale-In**.
  - b. Click **Add Rule**. The **Add Rule** page is displayed.

Figure 7-16 Adding a rule

## Add Rule

|                                                                         |                                                                                                                       |
|-------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Rule Name                                                               | <input type="text" value="default-expand-2"/>                                                                         |
| If                                                                      | <input type="text" value="YARNAppRunning"/> <input type="text" value="Greater than"/> <input type="text" value="75"/> |
| Last For                                                                | <input type="text" value="1"/> five-minute periods                                                                    |
| Add                                                                     | <input type="text" value="1"/> nodes                                                                                  |
| Cooldown Period                                                         | <input type="text" value="20"/> minutes                                                                               |
| <input type="button" value="OK"/> <input type="button" value="Cancel"/> |                                                                                                                       |

- c. Configure the **Rule Name**, **If**, **Last for**, **Add**, and **Cooldown Period** parameters.
- d. Click **OK**.

You can view, edit, or delete the rules you configured in the **Scale-out** or **Scale-in** area on the **Auto Scaling** page.

**Step 2** Configure a resource plan.

1. Click **Configure Node Range for Specific Time Range** under **Default Range** or **Add Resource Plan**.
2. Configure **Effective On**, **Time Range**, and **Node Range**.

For example, set **Effective On** to **Monday, Tuesday, and Saturday**, **Time Range** to **07:00-13:00**, and **Node Range** to **5-8**.

Click **Configure Node Range for Specific Time Range** or **Add Resource Plan** to configure multiple resource plans.

**NOTE**

- **Effective On** is set to **Daily** by default. You can also select one or multiple days from Monday to Sunday.
- If you do not set **Node Range**, its default value will be used.
- If you set both **Node Range** and **Time Range**, the node range you set will be used during the time range you set, and the default node range will be used beyond the time range you set. If the time is not within the configured time range, the default range is used.

----End

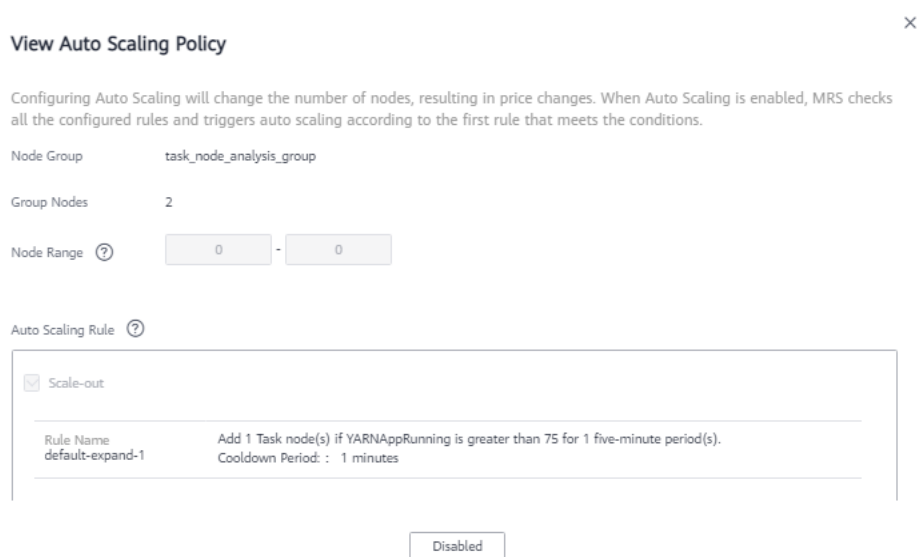

### 7.5.6.3 Managing MRS Cluster Auto Scaling Policies

You can view, modify, delete, enable, and disable an auto scaling policy on the MRS console after it is created.

## Viewing an Auto Scaling Policy

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Active Clusters**, select a running cluster, and click its name. to access its details page.
- Step 3** Click the **Auto Scaling** tab.
- Step 4** Click **View** on the right of the target auto scaling policy to view it.

**Figure 7-17** Viewing an auto scaling policy

----End

## Modifying an Auto Scaling Policy

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Active Clusters**, select a running cluster, and click its name. to access its details page.
- Step 3** Click the **Auto Scaling** tab.
- Step 4** Click **Edit** on the right of the target auto scaling policy.

**Figure 7-18** Editing an auto scaling policy

**Edit Auto Scaling Policy** ✕

Configuring Auto Scaling will change the number of nodes, resulting in price changes. When Auto Scaling is enabled, MRS checks all the configured rules and triggers auto scaling according to the first rule that meets the conditions.

# 7.6 MRS Cluster Data Backup and Restoration

## 7.6.1 Backing Up and Restoring MRS Cluster Data

### Overview

Manager can back up system and user data by components. The system can back up Manager data, component metadata, and service data.

For MRS 3.x and later, data can be backed up to local disks (LocalDir), local HDFS (LocalHDFS), remote HDFS (RemoteHDFS), NAS (NFS/CIFS), Object Storage Service (OBS), and SFTP server (SFTP). For details, see [Backing Up MRS Cluster Component Data](#).

#### NOTE

Only MRS 3.1.0 or later supports data backup to OBS.

Backup and restoration tasks are performed in the following scenarios:

- Routine backup is performed to ensure the data security of the system and components.
- If the system is faulty, the data backup can be used to recover the system.
- If the active cluster is completely faulty, a mirrored cluster identical to the active cluster needs to be created. You can use the backup data to restore the active cluster.

**Table 7-14** Metadata (MRS 2.x and earlier versions)

| Backup Type | Backup Content                                                                                                          |
|-------------|-------------------------------------------------------------------------------------------------------------------------|
| OMS         | Database data (excluding alarm data) and configuration data in the cluster management system to be backed up by default |
| LdapServer  | User information, including the username, password, key, password policy, and user group information                    |
| DBService   | Metadata of the components (Hive) managed by DBService                                                                  |
| NameNode    | HDFS metadata                                                                                                           |

**Table 7-15** Manager configuration data (MRS 3.x and later)

| Backup Type | Backup Content                                                                                          | Backup Directory Type                                                                                                                                                 |

| Hive        | Table-level user data.                                                                                          |                                                                                         |
| IoTDB       | IoTDB service data.                                                                                             | RemoteHDFS                                                                              |
| ClickHouse  | Table-level user data.                                                                                          | RemoteHDFS                                                                              |

Note that some components in MRS 3.x and later versions do not provide data backup or restoration:

- Kafka supports replicas and allows multiple replicas to be specified when a topic is created.
- CDL data is stored in DBService and Kafka. A system administrator can create DBService and Kafka backup tasks to back up data.
- MapReduce and Yarn data is stored in HDFS. Therefore, they rely on the backup and restoration provided by HDFS.
- Backup and restoration of service data in ZooKeeper are performed by their own upper-layer components.

## MRS Cluster Data Backup and Restoration Principles

### Task

Before backup or restoration, you need to create a backup or restoration task and set task parameters, such as the task name, backup data source, and type of the directory for storing backup files. Then you can execute the tasks to back up or restore data. When Manager is used to restore the data of HDFS, HBase (MRS 3.x and later), Hive, and NameNode, the cluster cannot be accessed.

Each backup task can back up data of different data sources and generate an independent backup file for each data source. All the backup files generated in a backup task form a backup file set, which can be used in restoration tasks. Backup data can be stored on Linux local disks, local cluster HDFS, and standby cluster HDFS.

- For MRS 3.x and later versions, backup tasks support full backup and incremental backup policies. Cloud data backup tasks do not support incremental backup. If the backup directory type is NFS or CIFS, incremental backup is not recommended. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.
- For MRS 2.x and earlier versions, the backup task provides the full backup or incremental backup policies. HDFS and Hive backup tasks support the incremental backup policy, while OMS, LdapServer, DBService, and NameNode backup tasks support only the full backup policy.

### NOTE

Task execution rules:

- If a task is being executed, the task cannot be executed repeatedly and other tasks cannot be started at the same time.
- The interval at which a periodic task is automatically executed must be greater than 120s. Otherwise, the task is postponed and will be executed in the next period. Manual tasks can be executed at any interval.
- When a periodic task is to be automatically executed, the current time cannot be 120s later than the task start time. Otherwise, the task is postponed and executed in the next period.
- When a periodic task is locked, it cannot be automatically executed and needs to be manually unlocked.
- The **LocalBackup** partition on the active management node must have at least 20 GB of free space to start the backup tasks for OMS, LdapServer (MRS 2.x or earlier), DBService, Kafka (MRS 3.x or later), and NameNode.
- When you are planning backup and restoration tasks, select the data to be backed up or restored strictly based on the service logic, data store structure, and database or table association.
  - For MRS 2.x and earlier versions, the system creates a default periodic backup task **default** whose execution interval is 24 hours to perform full backup of OMS, LdapServer, DBService, and NameNode data to the Linux local disk.
  - For MRS 3.x and later versions, the system creates periodic backup tasks **default-oms** and **default-cluster ID** at an interval of one hour by default. OMS metadata and cluster metadata, such as DBService and NameNode, can be fully backed up to local disks.

### Snapshot (MRS 3.x and later versions)

The system uses the snapshot technology to quickly back up data. Snapshots include HBase and HDFS snapshots.

- **HBase snapshots**

An HBase snapshot is a backup file of HBase tables at a specified time point. This backup file does not replicate service data or affect the RegionServer. The HBase snapshot replicates table metadata, including table descriptor, region info, and HFile reference information. The metadata can be used to restore data before the snapshot creation time.

- **HDFS snapshots**

An HDFS snapshot is a read-only backup of HDFS at a specified time point. The snapshot is used in data backup, misoperation protection, and disaster recovery scenarios.

The snapshot function can be enabled for any HDFS directory to create the related snapshot file. Before creating a snapshot for a directory, the system automatically enables the snapshot function for the directory. Creating a snapshot does not affect any HDFS operation. A maximum of 65,536 snapshots can be created for each HDFS directory.

When a snapshot is being created for an HDFS directory, the directory cannot be deleted or modified before the snapshot is created. Snapshots cannot be created for the upper-layer directories or subdirectories of the directory.

### **DistCp (MRS 3.x and later versions)**

Distributed copy (DistCp) is a tool used to replicate a large amount of data in HDFS in a cluster or between the HDFSs of different clusters. In a backup or restoration task of HBase, HDFS, or Hive, if you back up the data to HDFS of the standby cluster, the system invokes DistCp to perform the operation. Install the MRS software of the same version for the active and standby clusters and install the cluster.

DistCp uses MapReduce to implement data distribution, troubleshooting, restoration, and report. DistCp specifies different Map jobs for various source files and directories in the specified list. Each Map job copies the data in the partition that corresponds to the specified file in the list.

If you use DistCp to replicate data between HDFSs of two clusters, configure the cross-cluster mutual trust (mutual trust does not need to be configured for clusters managed by the same FusionInsight Manager) and cross-cluster replication for both clusters. When backing up the cluster data to HDFS in another cluster, you need to install the Yarn component. Otherwise, the backup fails.

### **Local Fast Restoration (MRS 3.x and later versions)**

After using DistCp to back up the HBase, HDFS, and Hive data of the local cluster to the HDFS of the standby cluster, the HDFS of the local cluster retains the backup data snapshots. You can create local rapid restoration tasks to restore data by using the snapshot files in the HDFS of the local cluster.

### **NAS (MRS 3.x and later versions)**

Network Attached Storage (NAS) is a dedicated data storage server which includes the storage components and embedded system software. It provides the cross-platform file sharing function. By using NFS (supporting NFSv3 and NFSv4) and CIFS (supporting SMBv2 and SMBv3), you can connect the service plane of MRS to the NAS server to back up data to the NAS or restore data from the NAS.

 NOTE

- Before data is backed up to the NAS, the system automatically mounts the NAS shared address to a local partition of the backup task execution node. After the backup is complete, the system unmounts the NAS shared partition from the backup task execution node.
- To prevent backup and restoration failures, do not access the shared address where the NAS server has been mounted to, for example, `/srv/BigData/LocalBackup/nas`, during data backup and restoration.
- When service data is backed up to the NAS, DistCp is used.

## Specifications of MRS Cluster Data Backup and Restoration

**Table 7-18** Specifications of the backup and restoration feature

| Item                                                    | Specification |
|---------------------------------------------------------|---------------|
| Maximum number of backup or restoration tasks           | 100           |
| Number of concurrent tasks in a cluster                 | 1             |
| Maximum number of waiting tasks                         | 199           |
| Maximum size (GB) of backup files on a Linux local disk | 600           |

 NOTE

If service data is stored in the ZooKeeper upper-layer components in MRS 3.x and later versions, ensure that the number of znodes in a single backup or restoration task is not too large. Otherwise, the task will fail, and the ZooKeeper service performance will be affected. To check the number of znodes in a single backup or restoration task, perform the following operations:

- Ensure that the number of znodes in a single backup or restoration task is smaller than the upper limit of OS file handles. Specifically:
  1. To check the upper limit at the system level, run the `cat /proc/sys/fs/file-max` command.
  2. To check the upper limit at the user level, run the `ulimit -n` command.
- If the number of znodes in the parent directory exceeds the upper limit, back up and restore data in its sub-directories in batches. To check the number of znodes using ZooKeeper client scripts, perform the following operations:
  1. On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, choose **Services > ZooKeeper > Instance**, and view the management IP address of each ZooKeeper role.
  2. Log in to the node where the client is installed, configure environment variables, authenticate the user (skip this step for clusters with Kerberos authentication disabled), and run the following command:

```
zkCli.sh -server ip:port
```

*ip* can be any management IP address. The default value of *port* is 2181.

3. If the following information is displayed, login to the ZooKeeper server is successful:  

```
WatchedEvent state:SyncConnected type:None path:null
[zk: ip:port(CONNECIED) 0]
```
4. Run the `getusage` command to check the number of znodes in the directory to be backed up.

```
getusage /hbase/region
```

In the command output, **Node count=xxxxxx** indicates the number of znodes stored in the **region** directory.

**Table 7-19** Specifications of the **default** task (MRS 2.x and earlier)

| Item                            | OMS                                                                                    | LdapServer | DBService | NameNode |
|---------------------------------|----------------------------------------------------------------------------------------|------------|-----------|----------|
| Backup period                   | 1 hour                                                                                 |            |           |          |
| Maximum number of backup copies | 2                                                                                      |            |           |          |
| Maximum size of a backup file   | 10 MB                                                                                  | 20 MB      | 100 MB    | 1.5 GB   |
| Maximum size of disk space used | 20 MB                                                                                  | 40 MB      | 200 MB    | 3 GB     |
| Save path of backup data        | <i>Data save path</i> / <b>LocalBackup/</b> of the active and standby management nodes |            |           |          |

**Table 7-20** Specifications of the **default** task (MRS 3.x and later)

| Item                            | OMS                                                                              | HBase   | Kafka  | DBService | NameNode                     |
|---------------------------------|----------------------------------------------------------------------------------|---------|--------|-----------|------------------------------|
| Backup period                   | 1 hour                                                                           |         |        |           |                              |
| Maximum number of backups       | 168 (7-day historical data)                                                      |         |        |           | 24 (one-day historical data) |
| Maximum size of a backup file   | 10 MB                                                                            | 10 MB   | 512 MB | 100 MB    | 20 GB                        |
| Maximum size of disk space used | 1.64 GB                                                                          | 1.64 GB | 84 GB  | 16.41 GB  | 480 GB                       |
| Storage path of backup data     | <i>Data storage path/LocalBackup/</i> of the active and standby management nodes |         |        |           |                              |

**NOTE**

- The backup data of the default backup task must be periodically transferred and saved outside the cluster based on the enterprise O&M requirements.
- In MRS 3.x and later, administrators can create DistCp backup tasks to save OMS, DBService, and NameNode data to external clusters.
- The execution time of a cluster data backup task can be calculated using the following formula: Task execution time = Volume of data to be backed up/Network bandwidth between the cluster and the backup device. In practice, you are advised to multiply the calculated duration by 1.5 to get the reference value of the task execution time.
- Executing a data backup task affects the maximum I/O performance of the cluster. Therefore, you are advised to execute a backup task during off-peak hours.

## 7.6.2 Enabling MRS Inter-Cluster Replication

DistCp is used to replicate the data stored in HDFS from a cluster to another cluster. To use DistCp, you must first enable inter-cluster replication on both nodes of the cluster where you want to copy data.

Administrators can modify parameters on Manager to enable inter-cluster replication. They then create a backup task to copy data to the remote HDFS.

### Impact on the System

Yarn needs to be restarted to enable the cross-cluster replication function and cannot be accessed during restart.

### Prerequisites

- The **hadoop.rpc.protection** parameter of HDFS in the two clusters for data replication must use the same data transmission mode. The default value is

**privacy**, indicating encrypted transmission. The value **authentication** indicates that transmission is not encrypted.

- For clusters with Kerberos authentication enabled (security mode), mutual trust between clusters needs to be configured.
- The inbound rules of the two security groups on the peer cluster have been added to the two security groups in each cluster to allow all access requests of all protocols and ports of all ECSs in the security groups.

## Enabling MRS Inter-Cluster Replication

**Step 1** Log in to the Manager of one of the two clusters.

- For MRS 2.x and earlier, choose **Services > Yarn > Service Configuration** and set **Type** to **All**.
- For MRS 3.x and later, choose **Cluster > Services > Yarn > Configurations**, and click **All Configurations**.

**Step 2** In the navigation pane on the left, choose **Yarn > Distcp** and set the following parameters:

- For MRS2.x and earlier versions, set **dfs.namenode.rpc-address.haclusterX.remotenn1** to the service IP address and RPC port of a NameNode instance in the peer cluster, in **dfs.namenode.rpc-address.haclusterX.remotenn2**, enter the service IP address and RPC port number of the other NameNode instance in the peer cluster. For example, enter **10.1.1.1:25000** and **10.1.1.2:25000**.  
**dfs.namenode.rpc-address.haclusterX.remotenn1** and **dfs.namenode.rpc-address.haclusterX.remotenn2** do not distinguish active and standby NameNode instances. The default NameNode RPC port is **25000** and cannot be modified on Manager.
- For MRS 3.x and later versions, modify **dfs.namenode.rpc-address**, set **haclusterX.remotenn1** to the service IP address and RPC port of one NameNode instance of the peer cluster, and set **haclusterX.remotenn2** to the service IP address and RPC port number of the other NameNode instance of the peer cluster. Examples of modified parameter values: **10.1.1.1:8020** and **10.1.1.2:8020**.  
**haclusterX.remotenn1** and **haclusterX.remotenn2** do not distinguish active and standby NameNodes. The default NameNode RPC port is **8020** and cannot be modified on Manager.

### NOTE

If data of the current cluster needs to be backed up to the HDFS of multiple clusters, you can configure the corresponding NameNode RPC addresses to **haclusterX1**, **haclusterX2**, **haclusterX3**, and **haclusterX4**.

**Step 3** Save the configurations and restart YARN.

- For MRS2.x and earlier versions, click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the YARN service. After the system displays "Operation succeeded", click **Finish**. The YARN service is restarted successfully.
- For MRS 3.x and later versions, click **Save**. In the displayed dialog box, click **OK**. Click **Dashboard**, choose **More > Restart Service**, and enter the password of the user to restart the YARN service.

**Step 4** Log in to Manager of the other cluster and repeat [Step 1](#) to [Step 3](#).

----End

## 7.6.3 Creating an MRS Cluster Data Backup Task

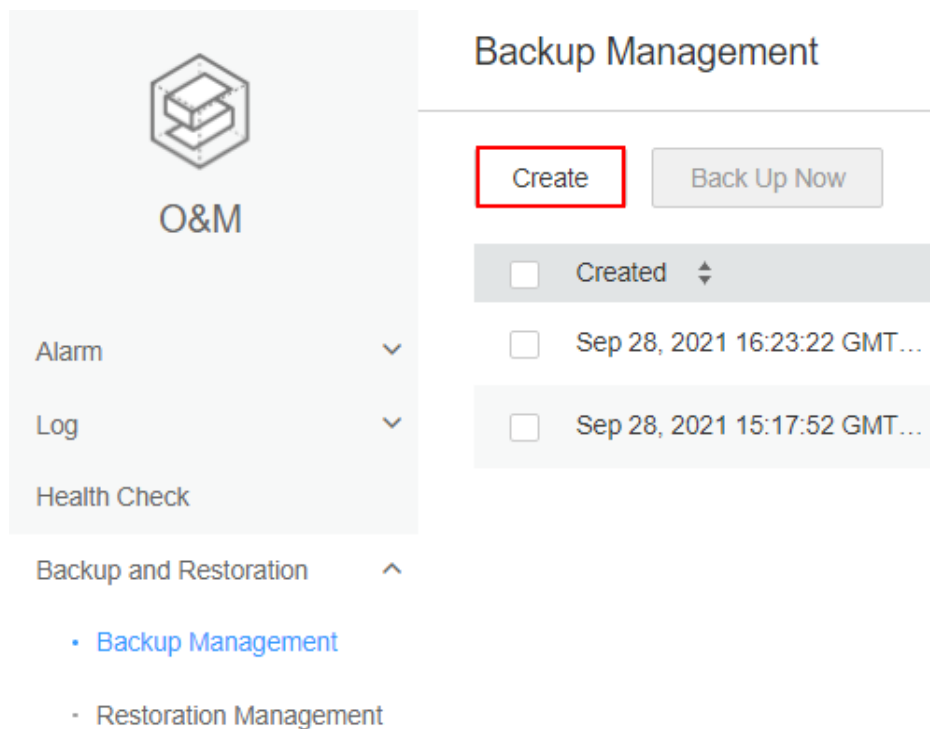

You can create backup tasks on Manager. Executing backup tasks backs up related data.

### Creating a Data Backup Task (MRS 3.x and Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Backup and Restoration > Backup Management**. On the page that is displayed, click **Create**.

**Figure 7-19** Creating a backup task.

**Step 3** Set **Backup Object** to **OMS** or the cluster whose data you want to back up.

**Step 4** Enter a task name in the **Name** text box.

**Step 5** Set **Mode** to **Periodic** or **Manual** as required.

**Table 7-21** Backup types

| Type            | Parameter  | Description                                                                   |
|-----------------|------------|-------------------------------------------------------------------------------|
| Periodic backup | Start Time | Indicates the time when a periodic backup task is started for the first time. |

| Type          | Parameter     | Description                                                                                                                                                                                                                         |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Period        | Task execution interval. Value options are <b>Hours</b> and <b>Days</b> .                                                                                                                                                           |
|               | Backup Policy | The following policies can be selected: <ul style="list-style-type: none"><li>• Full backup at the first time and subsequent incremental backup</li><li>• Full backup every time</li><li>• Full backup once every n times</li></ul> |
| Manual backup | N/A           | You need to manually execute the task to back up data.                                                                                                                                                                              |

**Step 6** Set required parameters in the **Configuration** area.

- Metadata and service data can be backed up.
- For details about how to back up data of different components, see [MRS Cluster Data Backup and Restoration](#).

**Step 7** Click **OK** to save the configurations.

**Step 8** In the backup task list, you can view the created backup task.

Locate the row that contains the target backup task, choose **More > Back Up Now** in the **Operation** column to execute the task immediately.

----End

## Creating a Metadata Backup Task (MRS 2.x and Earlier)

**Step 1** Create a backup task.

1. On MRS Manager, choose **System > Back Up Data**.
2. Click **Create Backup Task**.

**Step 2** Configure a backup policy.

1. Set **Name** to the name of the backup task.
2. Set **Backup Mode** to the type of the backup task. **Periodic** indicates that the backup task is periodically executed. **Manual** indicates that the backup task is manually executed.

To create a periodic backup task, set the following parameters:

- **Started**: indicates the time when the task is started for the first time.
- **Period**: indicates the task execution interval. The options include **Hours** and **Days**.
- **Backup Policy**: indicates the volume of data to be backed up in each task execution. The options include **Full backup at the first time and incremental backup later**, **Full backup every time**, and **Full backup once every n times**. If you select **Full backup once every n times**, you need to specify the value of *n*.

**Step 3** Select backup sources.

On the **Configuration** page, select the metadata option and set backup parameters. For details, see [Backing Up Manager Data \(MRS 2.x and Earlier\)](#).

**Step 4** Click **OK**.

**Step 5** In the **Operation** column of the created task in the backup task list, click **Back Up Now** if **Backup Mode** is set to **Periodic** or click **Start** if **Backup Mode** is set to **Manual** to execute the backup task.

----End

## 7.6.4 Creating an MRS Cluster Data Restoration Task

You can create a restoration task on Manager. After the restoration task is executed, the specified backup data is restored to the cluster.

### Creating a Data Restoration Task (MRS 3.x and Later)

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Backup and Restoration > Restoration Management**. On the page that is displayed, click **Create**.

**Step 3** Configure **Task Name**.

**Step 4** Set **Recovery Object** to **OMS** or the cluster whose data you want to restore.

**Step 5** Set the required parameters in the **Recovery Configuration** area.

- Metadata and service data can be restored.
- For details about how to restore data of different components, see [MRS Cluster Data Backup and Restoration](#).

**Step 6** Click **OK** to save the configurations.

**Step 7** In the restoration task list, you can view the created restoration tasks.

Locate the row containing the target restoration task, click **Start** in the **Operation** column to execute the restoration task immediately.

----End

### Creating a Metadata Restoration Task (MRS 2.x and Earlier)

**Step 1** On MRS Manager, choose **System > Recovery Management**.

**Step 2** On the page that is displayed, click **Create Restoration Task**.

**Step 3** Set **Task Name** to the name of the restoration task.

**Step 4** In the **Configuration** area, select the component whose metadata is to be restored and set restoration parameters. For details, see [Restoring Manager Data \(MRS2.x and Earlier\)](#).

**Step 5** Click **OK**.

**Step 6** In the restoration task list, you can view the created restoration tasks.

In the restoration task list, locate the row where the created task resides, and click **Start** in the **Operation** column.

----End

## 7.6.5 Backing Up MRS Cluster Component Data

### 7.6.5.1 Backing Up Manager Data (MRS 2.x and Earlier)

#### Scenario

To ensure the security of metadata either on a routine basis or before and after performing critical metadata operations (such as scale-out, scale-in, patch installation, upgrades, and migration), metadata must be backed up. The backup data can be used to recover the system if an exception occurs or if the operation has not achieved the expected result. This minimizes the adverse impact on services. Metadata includes data of OMS, LdapServer, DBService, and NameNode. MRS Manager data to be backed up includes OMS data and LdapServer data.

By default, metadata backup is supported by the **default** task. This section describes how to create a backup task and back up metadata on MRS Manager. Both automatic backup tasks and manual backup tasks are supported.

#### Prerequisites

- A standby cluster for backing up data has been created, and the network is connected. The inbound rules of the two security groups on the peer cluster have been added to the two security groups in each cluster to allow all access requests of all protocols and ports of all ECSs in the security groups.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.

### Backing Up Manager Data

**Step 1** Create a backup task.

1. On MRS Manager, choose **System > Back Up Data**.
2. Click **Create Backup Task**.

**Step 2** Configure a backup policy.

1. Set **Task Name** to the name of the backup task.
2. Set **Backup Mode** to the type of the backup task. **Periodic** indicates that the backup task is periodically executed. **Manual** indicates that the backup task is manually executed.

To create a periodic backup task, set the following parameters:

- **Started**: indicates the time when the task is started for the first time.
- **Period**: indicates the task execution interval. The options include **By hour** and **By day**.

- **Backup Policy:** indicates the volume of data to be backed up in each task execution. The options include **Full backup at the first time and incremental backup later**, **Full backup every time**, and **Full backup once every n times**. If you select **Full backup once every n times**, you need to specify the value of *n*.

**Step 3** Select backup sources.

In the **Configuration** area, select **OMS** and **LdapServer** under **Metadata**.

**Step 4** Set backup parameters.

1. Set **Path Type** of **OMS** and **LdapServer** to a backup directory type.

The following backup directory types are supported:

- **LocalDir:** indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path/LocalBackup/*. If you select **LocalDir**, you need to set the maximum number of copies to specify the number of backup files that can be retained in the backup directory.
- **LocalHDFS:** indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **SFTP**, set the following parameters:
  - **Target Path:** indicates the HDFS directory for storing the backup files. The save path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory.
  - **Max Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Target Instance Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.

2. Click **OK**.

**Step 5** Execute the backup task.

In the **Operation** column of the created task in the backup task list, click **Back Up Now** if **Backup Mode** is set to **Periodic** or click **Start If Backup Mode** is set to **Manual** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 7.6.5.2 Backing Up Manager Data (MRS 3.x and Later Versions)

### Scenario

To ensure data security of FusionInsight Manager routinely or before and after a critical operation (such as capacity expansion and reduction) on FusionInsight

Manager, you need to back up FusionInsight Manager data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up Manager data. Both automatic and manual backup tasks are supported.

## Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
  - Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
  - Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

## Backing Up Manager Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Figure 7-20** Creating a backup task.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Set **Backup Object** to **OMS**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.  
**Manual** indicates that the backup task is executed manually.

**Table 7-22** Periodic backup parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Started       | Indicates the time when the task is started for the first time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Period        | Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Backup Policy | <ul style="list-style-type: none"> <li>● <b>Full backup at the first time and incremental backup subsequently</b></li> <li>● <b>Full backup every time</b></li> <li>● <b>Full backup once every n times</b></li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>● Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li> <li>● If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li> </ul> |

**Step 6** In **Configuration**, select **OMS**.

**Step 7** Set **Path Type** of **OMS** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files.

The default storage directory is *Data storage path/LocalBackup/*, for example, */srv/BigData/LocalBackup/*.

If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this option, set the following parameters:

- **Target Path**: indicates the HDFS directory for storing the backup files. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as */hbase* or */user/hbase/backup*.
- **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **Cluster for Backup**: Enter the cluster name mapping to the backup directory.
- **Target NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address**: indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as */hbase* or */user/hbase/backup*.
- **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **Source Cluster**: Select the cluster of the Yarn queue used by the backup data.

- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.
  - **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
  - **Username:** indicates the username for connecting to the server using the SFTP protocol.
  - **Password:** indicates the password for connecting to the server using the SFTP protocol.

- **Server Shared Path:** indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **OBS:** indicates that backup files are stored in OBS.  
If you select this option, set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

 **NOTE**

Only MRS 3.1.0 or later supports data backup to OBS.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

### 7.6.5.3 Backing Up CDL Service Data

#### Scenario

To ensure CDL service data security routinely or before a major operation on CDL (such as upgrade or migration), you need to back up CDL data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

CDL data is stored in DBService and Kafka. You can create DBService and Kafka backup tasks on FusionInsight Manager to back up CDL data. Both automatic and manual backup tasks are supported.

#### Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
  - Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
  - Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.

- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

## Backing Up CDL Service Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 7-23** Periodic backup parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Started       | Indicates the time when the task is started for the first time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Period        | Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Backup Policy | <ul style="list-style-type: none"><li>• <b>Full backup at the first time and incremental backup subsequently</b></li><li>• <b>Full backup every time</b></li><li>• <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>• If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul> |

**Step 6** Set **Configuration** to **DBService** and **Kafka**.

**Step 7** Set **Path Type** of **DBService** to a backup directory type. For details about how to set the parameters, see [Step 7](#).

**Step 8** Set **Path Type** of **Kafka** to a backup directory type. For details about how to set the parameters, see [Step 7](#).

**Step 9** Click **OK**.

**Step 10** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 7.6.5.4 Backing Up ClickHouse Metadata

### Scenario

To ensure ClickHouse metadata security or before a major operation (such as upgrade or migration), you need to back up ClickHouse metadata. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up ClickHouse metadata. Both automatic and manual backup tasks are supported.

---

**NOTICE**

This function is supported only by MRS 3.1.0 or later.

---

### Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
  - Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
  - In active/standby mode, ensure that the value of **HADOOP\_RPC\_PROTECTION** of ClickHouse is the same as that of **hadoop.rpc.protection** of HDFS.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.

## Backing Up ClickHouse Metadata

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task. **Periodic** indicates that the backup task is periodically executed. **Manual** indicates that the backup task is manually executed.

To create a periodic backup task, set the following parameters:

- **Started:** indicates the time when the task is started for the first time.
- **Period:** indicates the task execution interval. The options include **Hours** and **Days**.
- **Backup Policy:** Only **Full backup every time** is supported.

**Step 6** In **Configuration**, select **ClickHouse** under **Metadata and other data**.

**Step 7** Set **Path Type** of **ClickHouse** to a backup directory type.

The following backup directory types are supported:

- **LocalDir:** indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files.

The default storage directory is *Data storage path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.

If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.

- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

This option is available for MRS 3.1.0 and 3.1.2 clusters only after you configure the environment by referring to [Configuring the Environment When the ClickHouse Backup Task's Path is RemoteHDFS](#).

You also need to configure the following parameters for MRS 3.2.0 or later clusters:

- **Destination NameService Name:** indicates the NameService name of the standby cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Destination Active NameNode IP Address:** indicates the service plane IP address of the active NameNode in the standby cluster.
- **Destination Standby NameNode IP Address:** indicates the service plane IP address of the standby NameNode in the standby cluster.

- **Destination NameNode RPC Port:** indicates the value of `dfs.namenode.rpc.port` in the HDFS basic configuration of the destination cluster.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as `/hbase` or `/user/hbase/backup`.

You also need to configure the following parameters for MRS 3.1.0 or 3.1.2 clusters:

- **Destination NameService Name:** indicates the NameService name of the standby cluster, for example, `hacluster`. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, `IPv4` or `IPv6`.
- **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as `/hbase` or `/user/hbase/backup`.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Data source\_Task execution time.tar.gz*.

----End

## Configuring the Environment When the ClickHouse Backup Task's Path is RemoteHDFS

This topic is available for MRS 3.1.0 and 3.1.2 only.

**Step 1** Log in to FusionInsight Manager of the standby cluster.

**Step 2** Choose **Cluster > Services > HDFS**. Click **More** and select **Download Client**. Set **Select Client Type** to **Configuration Files Only**, select **x86\_64** for x86 or **aarch64** for Arm based on the type of the node, and click **OK**.

**Step 3** After the client file package is generated, download the client to the local PC as prompted and decompress the package.

For example, if the client file package is `FusionInsight_Cluster_1_HDFS_Client.tar`, decompress it to obtain

**FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles.tar**. Then, decompress this file to the **D:\FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles** directory on the local PC. The directory name cannot contain spaces.

- Step 4** Go to the **FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles\ client** directory and obtain the **hosts** file.
- Step 5** Go to **FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles\HDFS\config** to obtain the **core-site.xml** and **hdfs-site.xml** files.
- Step 6** Log in to FusionInsight Manager of the source cluster.
- Step 7** Choose **Cluster > Services > ClickHouse**, choose **Configurations > All Configurations**, and select **backup** under **ClickHouse(Service)**.

For **remote\_connect\_core\_config\_file**, click **Upload File** and select the **core-site.xml** file prepared in [Step 5](#).

For **remote\_connect\_hdfs\_config\_file**, click **Upload File** and select the **hdfs-site.xml** file prepared in [Step 5](#).

**Figure 7-21** Configuring ClickHouse data backup parameters

- Step 8** Click **Save**, confirm the information, and click **OK** to save the configuration. After saving the configurations, click **Finish**.
- Step 9** Choose **Cluster > Services > ClickHouse**, click **Instances**, and view the instance IP address of **ClickHouseServer**.
- Step 10** Log in to the host nodes of the ClickHouseServer instances as user **root** and check whether the **/etc/hosts** file contains the host information in [Step 4](#). If not, add the host information in [Step 4](#) to the **/etc/hosts** file.

----End

## 7.6.5.5 Backing Up ClickHouse Service Data

### Scenario

To ensure ClickHouse service data security routinely or before a major operation on ClickHouse (such as upgrade or migration), you need to back up ClickHouse service data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up ClickHouse service data. Both automatic and manual backup tasks are supported.

**NOTICE**

This function is supported only by MRS 3.1.0 or later.

## Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
  - Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
  - The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.
  - In active/standby mode, ensure that the value of **HADOOP\_RPC\_PROTECTION** of ClickHouse is the same as that of **hadoop.rpc.protection** of HDFS.
- You have planned the backup type, period, object, and directory based on service requirements.

## Backing Up ClickHouse Service Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 7-24** Periodic backup parameters

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| Started   | Indicates the time when the task is started for the first time.                           |
| Period    | Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> . |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Backup Policy | <ul style="list-style-type: none"><li>● <b>Full backup at the first time and incremental backup subsequently</b></li><li>● <b>Full backup every time</b></li><li>● <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b><br/>Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</p> |

**Step 6** In **Configuration**, select **ClickHouse** under **Service Data**.

**Step 7** Set **Path Type** of **ClickHouse** to a backup directory type.

Currently, only the **RemoteHDFS** type is available.

**RemoteHDFS**: indicates that backup files are stored in HDFS of the standby cluster.

This option is available for MRS 3.1.0 and 3.1.2 clusters only after you configure the environment by referring to [Configuring the Environment When the ClickHouse Backup Task's Path is RemoteHDFS](#).

You also need to configure the following parameters for MRS 3.2.0 and later clusters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Destination Active NameNode IP Address**: indicates the service plane IP address of the active NameNode in the standby cluster.
- **Destination Standby NameNode IP Address**: indicates the service plane IP address of the standby NameNode in the standby cluster.
- **Destination NameNode RPC Port**: indicates the value of **dfs.namenode.rpc.port** in the HDFS basic configuration of the destination cluster.
- **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.

You also need to configure the following parameters for MRS 3.1.0 or 3.1.2 clusters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.

**Step 8** Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

**Step 9** Set **Backup Content** to one or multiple ClickHouse tables to be backed up.

You can select backup data using either of the following methods:

- Adding a backup data file  
Click the name of a database in the navigation pane to show all the tables in the database, and select specified tables.  
MRS 3.2.0 or later:
  - a. Click **Add**.
  - b. Select the table to be backed up under **File Directory**, and click **Add** to add the table to **Backup Content**.
  - c. Click **OK**.
- MRS 3.2.0 or later: Regular expression filtering
  - a. Click **Query Regular Expression**.
  - b. Enter the logical cluster and database to which the ClickHouse table belongs in the first text box as prompted. The logical cluster and database must match the existing logical cluster and database, for example, **/default\_cluster/database**.
  - c. Enter a regular expression in the second box. Standard regular expressions are supported. For example, to filter all tables that contain the keyword **test** in the database, enter **test.\***.
  - d. Click **Refresh** to view the displayed tables in **Directory Name**.
  - e. Click **Synchronize** to save the result.

#### NOTE

- When entering regular expressions, click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.
- Versions earlier than MRS 3.2.0: Regular expression filtering
  - a. Click **Query Regular Expression**.
  - b. Enter the database where the ClickHouse tables are located in the first text box as prompted. The database must be the same as the existing database, for example, **default**.

- c. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get all tables in the database, enter `([\s\S]*?)`. To get tables whose names consist of letters and digits, for example, `tb 1`, enter `tb\d*`.
- d. Click **Refresh** to view the displayed tables in **Directory Name**.
- e. Click **Synchronize** to save the result.

 **NOTE**

- When entering regular expressions, click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.

**Step 10** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of the verification failure are as follows:

- The target NameNode IP address is incorrect.
- The directory or table to be backed up does not exist.
- The name of the NameService is incorrect.

**Step 11** Click **OK**.

**Step 12** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Data source\_Task creation time*, and the subdirectory is used to save latest data source backup files.

----End

## Configuring the Environment When the ClickHouse Backup Task's Path is RemoteHDFS

This topic is available for MRS 3.1.0 and 3.1.2 only.

**Step 1** Log in to FusionInsight Manager of the standby cluster.

**Step 2** Choose **Cluster > Services > HDFS**. Click **More** and select **Download Client**. Set **Select Client Type** to **Configuration Files Only**, select **x86\_64** for x86 or **aarch64** for Arm based on the type of the node, and click **OK**.

**Step 3** After the client file package is generated, download the client to the local PC as prompted and decompress the package.

For example, if the client file package is **FusionInsight\_Cluster\_1\_HDFS\_Client.tar**, decompress it to obtain **FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles.tar**. Then, decompress this file to the **D:\FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles** directory on the local PC. The directory name cannot contain spaces.

**Step 4** Go to the **FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles\** client directory and obtain the **hosts** file.

**Step 5** Go to **FusionInsight\_Cluster\_1\_HDFS\_ClientConfig\_ConfigFiles\HDFS\config** to obtain the **core-site.xml** and **hdfs-site.xml** files.

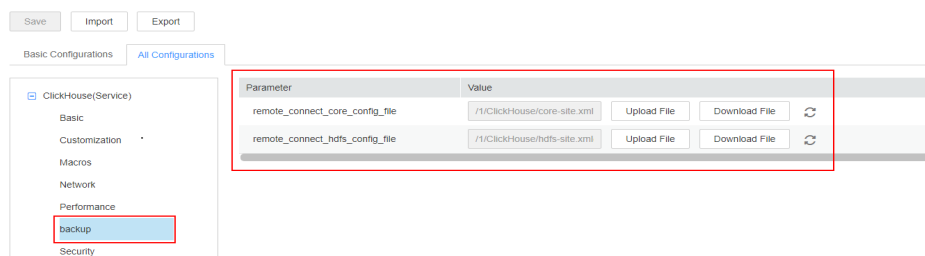

**Step 6** Log in to FusionInsight Manager of the source cluster.

**Step 7** Choose **Cluster > Services > ClickHouse**, choose **Configurations > All Configurations**, and select **backup** under **ClickHouse(Service)**.

For **remote\_connect\_core\_config\_file**, click **Upload File** and select the **core-site.xml** file prepared in **Step 5**.

For **remote\_connect\_hdfs\_config\_file**, click **Upload File** and select the **hdfs-site.xml** file prepared in **Step 5**.

**Figure 7-22** Configuring ClickHouse data backup parameters

**Step 8** Click **Save**, confirm the information, and click **OK** to save the configuration. After saving the configurations, click **Finish**.

**Step 9** Choose **Cluster > Services > ClickHouse**, click **Instances**, and view the instance IP address of **ClickHouseServer**.

**Step 10** Log in to the host nodes of the ClickHouseServer instances as user **root** and check whether the **/etc/hosts** file contains the host information in **Step 4**. If not, add the host information in **Step 4** to the **/etc/hosts** file.

----End

## 7.6.5.6 Backing Up DBService Data

### Scenario

To ensure DBService service data security routinely or before a major operation on DBService (such as upgrade or migration), you need to back up DBService data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up DBService data. Both automatic and manual backup tasks are supported.

### Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager,

mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.

- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

## Backing Up DBService Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 7-25** Periodic backup parameters

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| Started   | Indicates the time when the task is started for the first time.                           |
| Period    | Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> . |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Backup Policy | <ul style="list-style-type: none"><li>● <b>Full backup at the first time and incremental backup subsequently</b></li><li>● <b>Full backup every time</b></li><li>● <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>● Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>● If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul> |

**Step 6** In **Configuration**, select **DBService**.

**Step 7** Set **Path Type** of **DBService** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files.

The default storage directory is *Data storage path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.

If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this option, set the following parameters:

- **Target Path**: indicates the HDFS directory for storing the backup files. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **Target NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Server Shared Path:** indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **OBS:** indicates that backup files are stored in OBS.

If you select this option, set the following parameters:

- **Target Path:** indicates the OBS directory for storing backup data.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

 **NOTE**

Only MRS 3.1.0 or later supports data backup to OBS.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

## 7.6.5.7 Backing Up Flink Metadata

### Scenario

To ensure Flink metadata security or before a major operation on Flink (such as upgrade or migration), you need to back up Flink metadata. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up Flink metadata. Both automatic and manual backup tasks are supported.

## Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
  - Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
  - Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The HDFS and Yarn services have been installed if data needs to be backed up to HDFS.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.

## Backing Up Flink Metadata

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task. **Periodic** indicates that the backup task is periodically executed. **Manual** indicates that the backup task is manually executed.

To create a periodic backup task, set the following parameters:

- **Started**: indicates the time when the task is started for the first time.
- **Period**: indicates the task execution interval. The options include **Hours** and **Days**.
- **Backup Policy**: Only **Full backup every time** is supported.

**Step 6** In **Configuration**, select **Flink** under **Metadata and other data**.

**Step 7** Set **Path Type** of **Flink** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files.

The default storage directory is *Data storage path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.

If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.

- **LocalHDFS:** indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this option, set the following parameters:

- **Target Path:** indicates the HDFS directory for storing the backup files. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.

- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name:** indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Data source\_Task execution time.tar.gz*.

----End

## 7.6.5.8 Backing Up HBase Metadata

### Scenario

To ensure HBase metadata security (including tableinfo files and HFiles) or before a major operation on HBase system tables (such as upgrade or migration), you need to back up HBase metadata to prevent HBase service unavailability caused by HBase system table directory or file damages. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up HBase metadata. Both automatic and manual backup tasks are supported.

### Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
  - Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
  - Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- The **fs.defaultFS** parameter settings of HBase are the same as those of Yarn and HDFS.
- If HBase data is stored in the local HDFS, HBase metadata can be backed up to OBS. If HBase data is stored in OBS, data backup is not supported.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

### Backing Up HBase Metadata

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.
- Step 2** Click **Create**.
- Step 3** Set **Name** to the name of the backup task.
- Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.  
**Manual** indicates that the backup task is executed manually.

**Table 7-26** Periodic backup parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Started       | Indicates the time when the task is started for the first time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Period        | Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Backup Policy | <ul style="list-style-type: none"><li>• <b>Full backup at the first time and incremental backup subsequently</b></li><li>• <b>Full backup every time</b></li><li>• <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>• If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul> |

**Step 6** In **Configuration**, select **HBase** under **Metadata and other data**.

**Step 7** Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files.  
The default storage directory is *Data storage path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.  
If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.  
If you select this option, set the following parameters:
  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as `/hbase` or `/user/hbase/backup`.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol.  
If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol.  
If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.  
If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Server Shared Path:** indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **OBS:** indicates that backup files are stored in OBS.  
If you select this option, set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

 **NOTE**

Only MRS 3.1.0 or later supports data backup to OBS.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

### 7.6.5.9 Backing Up HBase Service Data

#### Scenario

For HBase service data security, you need to back up HBase service data before a major operation on HBase (such as upgrade or migration). The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up HBase service data. Both automatic and manual backup tasks are supported.

The following situations may occur during the HBase service data backup:

- When a user creates an HBase table, **KEEP\_DELETED\_CELLS** is set to **false** by default. When the user backs up this HBase table, deleted data will be backed

up and junk data may exist after data restoration. This parameter can be set to **true** manually when an HBase table is created based on service requirements.

- When a user manually specifies the timestamp when writing data into an HBase table and the specified time is earlier than the last backup time of the HBase table, new data may not be backed up in incremental backup tasks.
- The HBase backup function cannot back up the access control lists (ACLs) for reading, writing, executing, creating, and managing HBase global or namespaces. After HBase data is restored, you need to reset the role permissions on FusionInsight Manager.
- If the backup data of the standby cluster is lost in an existing HBase backup task, the next incremental backup will fail, and you need to create an HBase backup task again. However, the next full backup task will be normal.

## Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
  - Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
  - Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
  - The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.
- Backup policies, including the backup task type, period, backup object, backup directory, and Yarn queue required by the backup task are planned based on service requirements.
- On the HDFS client, you have executed the **hdfs lsSnapshottableDir** command as user **hdfs** to check the list of directories for which HDFS snapshots have been created in the current cluster and ensured that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- The **fs.defaultFS** parameter settings of HBase are the same as those of Yarn and HDFS.

## Backing Up HBase Service Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 7-27** Periodic backup parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Started       | Indicates the time when the task is started for the first time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Period        | Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Backup Policy | <ul style="list-style-type: none"> <li>• <b>Full backup at the first time and incremental backup subsequently</b></li> <li>• <b>Full backup every time</b></li> <li>• <b>Full backup once every n times</b></li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li> <li>• If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li> </ul> |

**Step 6** In **Configuration**, choose **HBase > HBase** under **Service data**.

**Step 7** Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address**: indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.

- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as `/hbase` or `/user/hbase/backup`.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory,

and the user group and owner group of the shared path must be **nobody:nobody**.)

- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Server Shared Path:** indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.

**Step 8** Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

**Step 9** Set **Backup Content** to one or multiple HBase tables to be backed up.

You can select backup data using either of the following methods:

- Adding a backup data file

Click the name of a database in the navigation pane to show all the tables in the database, and select specified tables.

MRS 3.2.0 or later:

- a. Click **Add**.

- b. Select the table to be backed up under **File Directory**, and click **Add** to add the table to **Backup Content**.
- c. Click **OK**.
- Selecting using regular expressions
  - a. Click **Query Regular Expression**.
  - b. Enter the namespace where the HBase tables are located in the first text box as prompted. The namespace must be the same as the existing namespace, for example, **default**.
  - c. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get all tables in the namespace, enter **([\s\S]\*?)**. To get tables whose names consist of letters and digits, for example, **tb 1**, enter **tb\d\***.
  - d. Click **Refresh** to view the displayed tables in **Directory Name**.
  - e. Click **Synchronize** to save the result.

 **NOTE**

- When entering regular expressions, click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.

**Step 10** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of the verification failure are as follows:

- The target NameNode IP address is incorrect.
- The queue name is incorrect.
- The parent directory or subdirectory of the HDFS directory where HBase table data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.

**Step 11** Click **OK**.

**Step 12** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *xxx/Backup task name\_Data source\_Task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are stored in the related snapshot directories.

----End

## 7.6.5.10 Backing Up HDFS NameNode Data

### Scenario

To ensure NameNode service data security routinely or before a major operation on NameNode (such as upgrade or migration), you need to back up NameNode data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up NameNode data. Both automatic and manual backup tasks are supported.

## Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
  - Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
  - Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

## Backing Up HDFS NameNode Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 7-28** Periodic backup parameters

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| Started   | Indicates the time when the task is started for the first time.                           |
| Period    | Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> . |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Backup Policy | <p>Only <b>Full backup every time</b> is supported.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul> |

**Step 6** In **Configuration**, select **NameNode**.

**Step 7** Set **Path Type** of **NameNode** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path/LocalBackup/*.
  - **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
  - **NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this option, set the following parameters:
  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address**: indicates the service plane IP address of the NameNode in the standby cluster.
  - **Target Path**: indicates the path for storing backup files.
  - **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
  - **NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS**: indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the NAS server.
- **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.
  - **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
  - **Username:** indicates the username for connecting to the server using the SFTP protocol.
  - **Password:** indicates the password for connecting to the server using the SFTP protocol.

- **Server Shared Path:** indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **OBS:** indicates that backup files are stored in OBS.  
If you select this option, set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.

 **NOTE**

Only MRS 3.1.0 or later supports data backup to OBS.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 7.6.5.11 Backing Up HDFS Service Data

### Scenario

To ensure HDFS service data security routinely or before a major operation on HDFS (such as upgrade or migration), you need to back up HDFS service data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up HDFS service data. Both automatic and manual backup tasks are supported.

 **NOTE**

Encrypted directories cannot be backed up or restored.

### Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager,

mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.

- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.
- Backup policies, including the backup task type, period, backup object, backup directory, and Yarn queue required by the backup task are planned based on service requirements.
- On the HDFS client, you have executed the `hdfs lsSnapshottableDir` command as user `hdfs` to check the list of directories for which HDFS snapshots have been created in the current cluster and ensured that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to NAS, you have deployed the NAS server in advance.

## Backing Up HDFS Service Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 7-29** Periodic backup parameters

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| Started   | Indicates the time when the task is started for the first time.                           |
| Period    | Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> . |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Backup Policy | <ul style="list-style-type: none"><li>● <b>Full backup at the first time and incremental backup subsequently</b></li><li>● <b>Full backup every time</b></li><li>● <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>● Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>● If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul> |

**Step 6** In **Configuration**, select **HDFS**.

**Step 7** Set **Path Type** of **HDFS** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address**: indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value is **100**.

- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
  - **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.

- **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value is **100**.
- **NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.
- **SFTP**: indicates that backup files are stored in the server using the SFTP protocol.

If you select this option, set the following parameters:

- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address**: indicates the IP address of the server where the backup data is stored.
- **Port**: indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username**: indicates the username for connecting to the server using the SFTP protocol.
- **Password**: indicates the password for connecting to the server using the SFTP protocol.
- **Server Shared Path**: indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value is **100**.
- **NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

**Step 8** Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

**Step 9** Set **Backup Content** to one or multiple HDFS directories to be backed up based on service requirements.

You can select backup data using either of the following methods:

- Adding a backup data file  
Click the name of a database in the navigation pane to show all the tables in the database, and select specified tables.  
MRS 3.2.0 or later:
  - Click **Add**.
  - Select the table to be backed up under **File Directory**, and click **Add** to add the table to **Backup Content**.
  - Click **OK**.
- Selecting using regular expressions

- a. Click **Query Regular Expression**.
- b. Enter the parent directory full path of the directory in the first text box as prompted. The directory must be the same as the existing directory, for example, **/tmp**.
- c. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get all files or subdirectories in the parent directory, enter **([\\s\\S]\*?)**. To get files whose names consist of letters and digits, for example, **file1**, enter **file\\d\***.
- d. Click **Refresh** to view the displayed directories in **Directory Name**.
- e. Click **Synchronize** to save the result.

 **NOTE**

- When entering regular expressions, click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.
- The backup directory cannot contain files that have been written for a long time. Otherwise, the backup task will fail. Therefore, you are not advised to perform operations on the top-level directory, such as **/user**, **/tmp**, and **/mr-history**.

**Step 10** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of the verification failure are as follows:

- The target NameNode IP address is incorrect.
- The queue name is incorrect.
- The parent directory or subdirectory of the HDFS directory where data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.
- The name of the NameService is incorrect.

**Step 11** Click **OK**.

**Step 12** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Data source\_Task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are stored in the related snapshot directories.

----End

## 7.6.5.12 Backing Up Hive Service Data

### Scenario

To ensure Hive service data security routinely or before a major operation on Hive (such as upgrade or migration), you need to back up Hive service data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up Hive service data. Both automatic and manual backup tasks are supported.

- Hive backup and restoration cannot identify the service and structure relationships of objects such as Hive tables, indexes, and views. When executing backup and restoration tasks, you need to manage unified restoration points based on service scenarios to ensure proper service running.
- Hive backup and restoration do not support Hive on RDB data tables. You need to back up and restore original data tables in external databases independently.
- If the backup data of the standby cluster is lost in an existing Hive backup task that contains Hive on HBase tables, the next incremental backup will fail, and you need to create a Hive backup task again. However, the next full backup task will be normal.
- After the backup function of FusionInsight Manager is used to back up the HDFS directories at the Hive table level, the Hive tables cannot be deleted and recreated.

## Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
  - Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
  - Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
  - The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.
- Backup policies, including the backup task type, period, backup object, backup directory, and Yarn queue required by the backup task are planned based on service requirements.
- On the HDFS client, you have executed the `hdfs lsSnapshottableDir` command as user `hdfs` to check the list of directories for which HDFS snapshots have been created in the current cluster and ensured that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to NAS, you have deployed the NAS server in advance.

## Backing Up Hive Service Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 7-30** Periodic backup parameters

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Started       | Indicates the time when the task is started for the first time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Period        | Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Backup Policy | <ul style="list-style-type: none"><li>• <b>Full backup at the first time and incremental backup subsequently</b></li><li>• <b>Full backup every time</b></li><li>• <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>• If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul> |

**Step 6** In **Configuration**, choose **Hive > Hive**.

**Step 7** Set **Path Type** of **Hive** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this option, set the following parameters:
  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address**: indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.

- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as `/hbase` or `/user/hbase/backup`.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
  - **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.

- **Password:** indicates the password set when the CIFS protocol is configured.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select this option, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Server Shared Path:** indicates the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.

**Step 8** Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

**Step 9** Set **Backup Content** to one or multiple Hive tables to be backed up.

You can select backup data using either of the following methods:

- Adding a backup data file  
Click the name of a database in the navigation pane to show all the tables in the database, and select specified tables.  
MRS 3.2.0 or later:
  - a. Click **Add**.
  - b. Select the table to be backed up under **File Directory**, and click **Add** to add the table to **Backup Content**.
  - c. Click **OK**.
- Selecting using regular expressions
  - a. Click **Query Regular Expression**.
  - b. Enter the database where the Hive tables are located in the first text box as prompted. The database must be the same as the existing database, for example, **default**.
  - c. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get all tables in the database, enter **([s\S]\*?)**. To get tables whose names consist of letters and digits, for example, **tb1**, enter **tb\d\***.
  - d. Click **Refresh** to view the displayed tables in **Directory Name**.
  - e. Click **Synchronize** to save the result.

 **NOTE**

- When entering regular expressions, click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.

**Step 10** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of the verification failure are as follows:

- The target NameNode IP address is incorrect.
- The queue name is incorrect.
- The parent directory or subdirectory of the HDFS directory where data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.
- The name of the NameService is incorrect.

**Step 11** Click **OK**.

**Step 12** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Data source\_Task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are stored in the related snapshot directories.

----End

### 7.6.5.13 Backing Up IoTDB Metadata

#### Scenario

To ensure IoTDB metadata security and prevent the IoTDB service from being unavailable due to IoTDB metadata file damages, you need to back up IoTDB metadata. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up IoTDB metadata. Both automatic and manual backup tasks are supported.

#### Prerequisites

- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- Backup policies, including the backup task type, period, backup object, backup directory, and Yarn queue required by the backup task are planned based on service requirements.
- The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.

#### Backing Up IoTDB Metadata

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.  
**Manual** indicates that the backup task is executed manually.

**Table 7-31** Periodic backup parameters

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| Started   | Indicates the time when the task is started for the first time.                   |
| Period    | The task execution interval. Value options include <b>Hours</b> and <b>Days</b> . |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Backup Policy | <p>Indicates a periodic backup policy.</p> <ul style="list-style-type: none"><li>● <b>Full backup at the first time and incremental backup subsequently</b></li><li>● <b>Full backup every time</b></li><li>● <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b><br/>Incremental backup is not supported when component metadata is backed up. Only <b>Full backup every time</b> is supported.</p> |

**Step 6** In **Configuration**, select **IoTDB** under **Metadata and other data**.

**Step 7** Set **Path Type** of **IoTDB** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path/LocalBackup/*.  
If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.
- **NFS**: indicates that backup files are stored in the NAS using the NFS protocol.  
If you select this option, set the following parameters:
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the IP address of the NAS server.
  - **Server Shared Path**: indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.  
If you select this option, set the following parameters:
  - **Destination NameService Name**: indicates the NameService name of the standby cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Destination Active NameNode IP Address**: indicates the service plane IP address of the active NameNode in the standby cluster.
  - **Destination Standby NameNode IP Address**: indicates the service plane IP address of the standby NameNode in the standby cluster.

- **Destination NameNode RPC Port:** indicates the value of `dfs.namenode.rpc.port` in the HDFS basic configuration of the standby cluster.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as `/hbase` or `/user/hbase/backup`.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol.  
If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.  
If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.
  - **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
  - **Username:** indicates the username for connecting to the server using the SFTP protocol.
  - **Password:** indicates the password for connecting to the server using the SFTP protocol.
  - **Server Shared Path:** indicates the backup path on the SFTP server.
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 7.6.5.14 Backing Up IoTDB Service Data

### Scenario

To ensure IoTDB service data security routinely or before a major operation on IoTDB (such as upgrade or migration), you need to back up IoTDB service data. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up IoTDB service data. Both automatic and manual backup tasks are supported.

### Prerequisites

To back up IoTDB service data to a remote HDFS, you need to meet the following conditions:

- A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
- The cluster where IoTDB is deployed must be in security mode.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The HDFS in the standby cluster has sufficient space. You are advised to save backup files in a custom directory.

## Backing Up IoTDB Service Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.  
**Manual** indicates that the backup task is executed manually.

**Table 7-32** Periodic backup parameters

| Parameter     | Description                                                                                                                                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Started       | Indicates the time when the task is started for the first time.                                                                                                                                                                                        |
| Period        | The task execution interval. Value options include <b>Hours</b> and <b>Days</b> .                                                                                                                                                                      |
| Backup Policy | Indicates a periodic backup policy. <ul style="list-style-type: none"><li>• <b>Full backup at the first time and incremental backup subsequently</b></li><li>• <b>Full backup every time</b></li><li>• <b>Full backup once every n times</b></li></ul> |

**Step 6** In **Configuration**, choose **IoTDB > IoTDB** under **Service data**.

**Step 7** Set **Path Type** of **IoTDB** to a backup directory type.

The following backup directory types are supported:

**RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name:** indicates the NameService name of the standby cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Destination Active NameNode IP Address:** indicates the service plane IP address of the active NameNode in the standby cluster.
- **Destination Standby NameNode IP Address:** indicates the service plane IP address of the standby NameNode in the standby cluster.
- **Destination NameNode RPC Port:** indicates the value of **dfs.namenode.rpc.port** in the HDFS basic configuration of the standby cluster.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.

**Step 8** Set **Backup Content** to one or multiple service data records to be backed up.

You can select backup data using either of the following methods:

- Adding a backup data file
  - a. Click **Add**.

- b. Select the table to be backed up under **File Directory**, and click **Add** to add the table to **Backup Content**.
- c. Click **OK**.
- Selecting using regular expressions
  - a. Click **Query Regular Expression**.
  - b. Enter the parent directory full path of the directory in the first text box as prompted. The directory must be the same as the existing directory, for example, **/root**.
  - c. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get all files or subdirectories in the parent directory, enter **([\\s\\S]\*?)**. To get files whose names consist of letters and digits, for example, **file 1**, enter **file\\d\***.
  - d. Enter a regular expression in the second text box. Standard regular expressions are supported. For example, to get objects containing **test**, enter **.\*test.\***. To get objects starting with **test**, enter **test.\***. To get objects ending with **test**, enter **.\*test**.
  - e. Click **Refresh** to view the displayed directories in **Directory Name**.
  - f. Click **Synchronize** to save the result.

**NOTE**

- When entering regular expressions, click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.
- The backup directory cannot contain files that have been written for a long time. Otherwise, the backup task will fail. Therefore, you are not advised to perform operations on the top-level directory, such as **/user**, **/tmp**, and **/mr-history**.

**Step 9** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of the verification failure are as follows:

- The target NameNode IP address is incorrect.
- The data to be backed up does not exist.

**Step 10** Click **OK**.

**Step 11** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Data source\_Task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are stored in the related snapshot directories.

----End

## 7.6.5.15 Backing Up Kafka Metadata

### Scenario

To ensure Kafka metadata security or before a major operation on ZooKeeper (such as upgrade or migration), you need to back up Kafka metadata. The backup

data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

You can create a backup task on FusionInsight Manager to back up Kafka metadata. Both automatic and manual backup tasks are supported.

## Prerequisites

- To back up data to a remote HDFS, the following conditions must be met:
  - A standby cluster for backing up data has been created. The authentication mode must be the same as that of the active cluster.
  - If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
  - Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
  - Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- If you want to back up data to NAS, you have deployed the NAS server in advance.
- If you want to back up data to OBS, you have connected the current cluster to OBS and have the permission to access OBS.

## Backing Up Kafka Metadata

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is executed by the system periodically.

**Manual** indicates that the backup task is executed manually.

**Table 7-33** Periodic backup parameters

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| Started   | Indicates the time when the task is started for the first time.                           |
| Period    | Indicates the task execution interval. The options include <b>Hours</b> and <b>Days</b> . |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Backup Policy | <ul style="list-style-type: none"><li>● <b>Full backup at the first time and incremental backup subsequently</b></li><li>● <b>Full backup every time</b></li><li>● <b>Full backup once every n times</b></li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>● Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li><li>● If <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, incremental backup cannot be used. When incremental backup is used for NFS or CIFS backup, the latest full backup data is updated each time the incremental backup is performed. Therefore, no new recovery point is generated.</li></ul> |

**Step 6** In **Configuration**, select **Kafka**.

**Step 7** Set **Path Type** of **Kafka** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path/LocalBackup/*.

If you select this option, you need to set the maximum number of replicas to specify the number of backup file sets that can be retained in the backup directory.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this option, set the following parameters:

- **Target Path**: indicates the HDFS directory for storing the backup files. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup file sets that can be retained in the backup directory.
- **Target NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The storage path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select this option, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Server Shared Path:** indicates the configured shared directory of the NAS server. (The shared path of the server cannot be set to the root directory, and the user group and owner group of the shared path must be **nobody:nobody**.)
  - **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.
- **OBS:** indicates that backup files are stored in OBS. If you select this option, set the following parameters:

- **Target Path:** indicates the OBS directory for storing backup data.
- **Maximum Number of Backup Copies:** indicates the number of backup file sets that can be retained in the backup directory.

 **NOTE**

Only MRS 3.1.0 or later supports data backup to OBS.

**Step 8** Click **OK**.

**Step 9** In the **Operation** column of the created task in the backup task list, click **More** and select **Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 7.6.6 Restoring MRS Cluster Component Data

### 7.6.6.1 Restoring Manager Data (MRS2.x and Earlier)

#### Scenario

You need to restore metadata in the following scenarios: A user modifies or deletes data unexpectedly, data needs to be retrieved, system data becomes abnormal or does not achieve the expected result, all modules are faulty, and data is migrated to a new cluster.

This section describes how to restore metadata on MRS Manager. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the data that is generated after the data backup and before the data restoration will be lost.
  - Use the OMS data and LdapServer data backed up at the same time to restore data. Otherwise, the service and operation may fail.
  - By default, MRS clusters use DBService to store Hive metadata.
- 

#### Impact on the System

- After the data is restored, the data generated between the backup time and restoration time is lost.
- After the data is restored, the configuration of the components that depend on DBService may expire and these components need to be restarted.

## Prerequisites

- The data in the OMS and LdapServer backup files has been backed up at the same time.
- The status of the OMS resources and the LdapServer instances is normal. If the status is abnormal, data restoration cannot be performed.
- The status of the cluster hosts and services is normal. If the status is abnormal, data restoration cannot be performed.
- The cluster host topologies during data restoration and data backup are the same. If the topologies are different, data restoration cannot be performed and you need to back up data again.
- The services added to the cluster during data restoration and data backup are the same. If the services are different, data restoration cannot be performed and you need to back up data again.
- The status of the active and standby DBService instances is normal. If the status is abnormal, data restoration cannot be performed.
- The upper-layer applications depending on the MRS cluster have been stopped.
- On MRS Manager, you have stopped all the NameNode role instances whose data is to be recovered. Other HDFS role instances are running properly. After data is recovered, the NameNode role instances need to be restarted and cannot be accessed before the restart.
- You have checked whether NameNode backup files have been stored in the *Data save path/LocalBackup/* directory on the active management node.

## Restoring Manager Data

**Step 1** Check the location of backup data.

1. On MRS Manager, choose **System > Back Up Data**.
2. In the row where the specified backup task resides, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task. In the window that is displayed, select a success record and click **View Backup Path** in the corresponding column to view its backup path information. Find the following information:
  - **Backup Object**: indicates the backup data source.
  - **Backup Path**: indicates the full path where backup files are stored.
3. Select the correct path, and manually copy the full path of backup files in **Backup Path**.

**Step 2** Create a restoration task.

1. On MRS Manager, choose **System > Recovery Management**.
2. On the page that is displayed, click **Create Restoration Task**.
3. Set **Task Name** to the name of the restoration task.

**Step 3** Select restoration sources.

In **Configuration**, select the metadata component whose data is to be restored.

**Step 4** Set the restoration parameters.

1. Set **Path Type** to a backup directory type.
2. The settings vary according to backup directory types:
  - **LocalDir**: indicates that the backup files are stored on the local disk of the active management node. If you select **LocalDir**, you need to set **Source Path** to specify the full path of the backup file. For example, *Data storage path/LocalBackup/Backup task name\_Task creation time/Data source\_Task execution time/Version number\_Data source\_Task execution time.tar.gz*.
  - **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **SFTP**, set the following parameters:
    - **Source Path**: indicates the full HDFS path of a backup file. for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
    - **Source Instance Name**: indicates the name of NameService corresponding to the backup directory when a restoration task is being executed. The default value is **hacluster**.
3. Click **OK**.

**Step 5** Execute the restoration task.

In the restoration task list, locate the row where the created task resides, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and try to execute the task again by clicking **Start**.

**Step 6** Determine what metadata has been restored.

- If the OMS and LdapServer metadata is restored, go to [Step 7](#).
- If DBService data is restored, no further action is required.
- Restore NameNode data. On MRS Manager, choose **Services > HDFS > More > Restart Service**. The task is complete.

**Step 7** Restarting Manager for the recovered data to take effect

1. In MRS Manager, Choose **LdapServer > More > Restart Service** and click **OK**. Wait until the LdapServer service is restarted successfully.
2. Log in to the active management node. For details, see [Checking MRS Active/Standby Management Nodes](#).
3. Run the following command to restart OMS:

```
sh ${BIGDATA_HOME}/om-0.0.1/sbin/restart-oms.sh
```

The command has been executed successfully if the following information is displayed:

```
start HA successfully.
```

4. On MRS Manager, choose **KrbServer > More > Synchronize Configuration**. Do not select Restart the services and instances whose configuration has

expired. Click **OK** and wait until the KrbServer service configuration is synchronized and restarted successfully.

5. Choose **Services > More > Synchronize Configuration**. Do not select Restart the services and instances whose configuration has expired. Click **OK** and wait until the cluster is configured and synchronized successfully.
6. Choose **Services > More > Stop Cluster**. After the cluster is stopped, choose **Services > More > Start Cluster**.

----End

## 7.6.6.2 Restoring Manager Data (MRS 3.x and Later Versions)

### Scenario

Manager data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in FusionInsight Manager, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable.

System administrators can create a restoration task in FusionInsight Manager to recover Manager data. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that of data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the Manager data that is generated after the data backup and before the data restoration will be lost.
- 

### Impact on the System

- In the restoration process, the Controller needs to be restarted and FusionInsight Manager cannot be logged in or operated during the restart.
- In the restoration process, all clusters need to be restarted and cannot be accessed during the restart.
- After data restoration, the data, such as system configuration, user information, alarm information, and audit information, that is generated after the data backup and before the data restoration will be lost. This may result in data query failure or cluster access failure.
- After the Manager data is recovered, the system forces the LdapServer of each cluster to synchronize data from the OLadp.

### Prerequisites

- To restore data from a remote HDFS, the following conditions must be met:
  - Prepare a standby cluster for restoring data, and ensure that data in this cluster has been backed up. For details, see [Backing Up Manager Data](#)

- (MRS 3.x and Later Versions)**. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, system mutual trust needs to be configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
  - Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
  - The status of the OMS resources and the LdapServer instances of each cluster is normal. If the status is abnormal, data restoration cannot be performed.
  - The status of the cluster hosts and services is normal. If the status is abnormal, data restoration cannot be performed.
  - The cluster host topologies during data restoration and data backup are the same. If the topologies are different, data restoration cannot be performed and you need to back up data again.
  - The services added to the cluster during data restoration and data backup are the same. If the topologies are different, data restoration cannot be performed and you need to back up data again.
  - The upper-layer applications that depend on the cluster are stopped.

## Restoring Manager Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view the historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restore > Restoring Management**. On the displayed page, click **Create**.

**Figure 7-23** Creating a restoration task

Restoration Management > Create Restoration Task

• Task Name:  The task name contains 3 to 128 characters, including digits, letters, and underscores (\_), and cannot be empty.

• Recovery Object:

• Restoration Configuration: Metadata and other data

- DBService
- NameNode (The NameNode instances must be stopped before the restoration.)
- Yarn
- HBase
- Kafka

Service data

- HDFS
- HBase
- Hive

**Step 4** Set **Task Name** to the name of the restoration task.

**Step 5** Set **Recovery Object** to **OMS**.

**Step 6** Select **OMS**.

**Step 7** Set **Path Type** of **OMS** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.  
If you select **LocalDir**, you also need to set **Source Path** to select the backup file to be restored, for example, *Version\_Data source\_Task execution time.tar.gz*.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.  
If you select **LocalHDFS**, set the following parameters:
  - **Source Path**: indicates the full path of the backup file in the HDFS, for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Cluster for Restoration**: Enter the name of the cluster used during restoration task execution.
  - **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when a restoration task is executed. The default value is **hacluster**.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.  
If you select **RemoteHDFS**, set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the

- remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Source Cluster**: Select the cluster of the Yarn queue used by the recovery data.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS**: indicates that backup files are stored in the NAS using the NFS protocol. If you select **NFS**, set the following parameters:
    - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address**: indicates the IP address of the NAS server.
    - **Source Path**: indicates the complete path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **CIFS**: indicates that backup files are stored in the NAS using the CIFS protocol. If you select **CIFS**, set the following parameters:
    - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address**: indicates the IP address of the NAS server.
    - **Port**: indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
    - **Username**: indicates the username set when the CIFS protocol is configured.
    - **Password**: indicates the password set when the CIFS protocol is configured.
    - **Source Path**: indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **SFTP**: indicates that backup files are stored in the server using the SFTP protocol. If you select **SFTP**, set the following parameters:
    - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **OBS:** indicates that backup files are stored in OBS.  
If you select **OBS**, set the following parameters:
  - **Source Path:** indicates the full OBS path of a backup file, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

 **NOTE**

Only MRS 3.1.0 or later supports saving backup files in OBS.

**Step 8** Click **OK**.

**Step 9** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 10** Log in to the active and standby management nodes as user **omm**.

**Step 11** Run the following command to restart OMS:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/restart-oms.sh
```

The command is run successfully if the following information is displayed:

```
start HA successfully.
```

Run `sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh` to check whether **HAAllResOK** of the management node is **Normal** and whether FusionInsight Manager can be logged in again. If yes, OMS is restarted successfully.

**Step 12** On FusionInsight Manager, click **Cluster**, click the name of the target cluster, and choose **Services > KrbServer**. On the displayed page, choose **More > Synchronize Configuration**, click **OK**, and wait for the KrbServer configuration to be synchronized and the service to be restarted.

**Step 13** Choose **Cluster**, click the name of the desired cluster, and choose **More > Synchronize Configurations**, click **OK**, and wait until the cluster configuration is synchronized successfully.

- Step 14** On FusionInsight Manager, click **Cluster**, click the name of the target cluster, and choose **More > Restart**. On the displayed page, enter the password of the current login user, click **OK**, and wait for the cluster to be restarted.

----End

### 7.6.6.3 Restoring CDL Service Data

#### Scenario

CDL data needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After an administrator performs major operations (such as upgrade and data adjustment) on CDL, an exception occurs or the expected result is not achieved. All modules are faulty and become unavailable. Data is migrated to a new cluster.

CDL metadata is stored in DBService and Kafka. A system administrator can create DBService and Kafka restoration tasks on FusionInsight Manager to restore CDL data. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the DBService and Kafka data that is generated after the data backup and before the data restoration will be lost.
  - By default, MRS clusters use DBService to store metadata of Hive, Hue, Loader, Spark, CDL, and Oozie. Restoring DBService data will restore the metadata of all these components.
- 

#### Impact on the System

- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is restored, the configurations of the components that depend on DBService may expire and these components need to be restarted.
- After the metadata is restored, the offset information stored on ZooKeeper by Kafka consumers is rolled back, resulting in repeated consumption.

#### Prerequisites

- To restore data from a remote HDFS, the following conditions must be met:
  - A standby cluster for restoring data has been created, and data in this cluster has been backed up. For details, see [Backing Up CDL Service Data](#). If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.

- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The status of the active and standby DBService instances is normal. If the status is abnormal, data restoration cannot be performed.
- The Kafka service has been stopped. After the restoration is complete, start the Kafka service.

## Restoring CDL Service Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the row where the specified backup task is located, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task.

In the window that is displayed, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:

- **Backup Object:** indicates the backup data source.
- **Backup Path:** indicates the full path where backup files are stored.  
Select the correct path, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In the **Restoration Configuration** area, select **DBService** and **Kafka**.

**Step 8** Set **Path Type** of **DBService** to a backup directory type. For details about how to configure the parameters, see [Step 8](#).

**Step 9** Set **Path Type** of **Kafka** to a backup directory type. For details about how to configure the parameters, see [Step 8](#).

**Step 10** Click **OK**.

**Step 11** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

## 7.6.6.4 Restoring ClickHouse Metadata

### Scenario

ClickHouse metadata needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After a user performs major operations (such as upgrade and migration) on ClickHouse, an exception occurs or the expected result is not achieved. The ClickHouse component is faulty and becomes unavailable. Data is migrated to a new cluster.

Users can create a ClickHouse restoration task on FusionInsight Manager. Only manual restoration tasks are supported.

---

#### NOTICE

- This function is supported only by MRS 3.1.0 or later.
  - Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore ClickHouse metadata when the service is running properly, you are advised to manually back up the latest ClickHouse metadata before restoration. Otherwise, the ClickHouse metadata that is generated after the data backup and before the data restoration will be lost.
  - ClickHouse metadata restoration and service data restoration cannot be performed at the same time. Otherwise, service data restoration fails. You are advised to restore service data after metadata restoration is complete.
- 

### Impact on the System

- After the metadata is restored, the data generated after the data backup and before the data restoration is lost.
- After the metadata is restored, the ClickHouse upper-layer applications need to be started.

### Prerequisites

- You have checked the path for storing ClickHouse metadata backup files.
- If you need to restore data from a remote HDFS, a standby cluster has been created and the data has been backed up. For details, see [Backing Up ClickHouse Metadata](#). If the active and standby clusters are deployed in security mode and they are not managed by the same FusionInsight Manager, mutual trust must be configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active and standby clusters are deployed in normal mode, no mutual trust is required.
- In an active/standby cluster, the value of `HADOOP_RPC_PROTECTION` of ClickHouse must be the same as that of `hadoop.rpc.protection` in the HDFS when you restore data from the remote HDFS to the local host.

## Restoring ClickHouse Metadata

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of the specified task in the task list, choose **More > View History**.

In the window that is displayed, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:

- **Backup Object:** indicates the backup data source.
- **Backup Path:** indicates the full path where backup files are stored.  
Select the correct path, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **ClickHouse** under **Metadata and other data**.

**Step 8** Set **Path Type** of **ClickHouse** to a restoration directory type.

The configurations vary based on backup directory types:

- **LocalDir:** indicates that data is restored from the local disk of the active management node.  
If you select this value, you also need to configure the following parameters:
  - **Source Path:** backup file to be restored, for example, *Backup task name\_Data source\_Task execution time.tar.gz*.
- **RemoteHDFS:** indicates that data is restored from the HDFS directory of the standby cluster.

If you select this option for MRS 3.2.0 or later clusters, you also need to configure the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source Active NameNode IP Address:** indicates the service plane IP address of the active NameNode in the standby cluster.
- **Source Standby NameNode IP Address:** indicates the service plane IP address of the standby NameNode in the standby cluster.
- **Source NameNode RPC Port:** indicates the value of **dfs.namenode.rpc.port** in the HDFS basic configuration of the destination cluster.
- **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Data source\_Task execution time.tar.gz*.

- **Logical Cluster** of MRS 3.2.0 or later: Enter the ClickHouse logical cluster whose data has been backed up.

If you select this option for MRS 3.1.0 or 3.1.2 clusters, you also need to configure the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Data source\_Task execution time.tar.gz*.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column. In the displayed dialog box, click **OK** to start the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 11** Choose **Cluster > Services** and start the ClickHouse service.

----End

## 7.6.6.5 Restoring ClickHouse Service Data

### Scenario

ClickHouse data needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After a user performs major operations (such as upgrade and migration) on ClickHouse, an exception occurs or the expected result is not achieved. All modules are faulty and become unavailable. Data is migrated to a new cluster.

Users can create a ClickHouse restoration task on FusionInsight Manager to restore data. Only manual restoration tasks are supported.

The ClickHouse backup and restoration functions cannot identify the service and structure relationships of objects such as ClickHouse tables, indexes, and views. When executing backup and restoration tasks, you need to manage unified restoration points based on service scenarios to ensure proper service running.

**NOTICE**

- This function is supported only by MRS 3.1.0 or later.
- Data restoration can be performed only when the system version is consistent with that during data backup.
- To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the ClickHouse data that is generated after the data backup and before the data restoration will be lost.
- ClickHouse metadata restoration and service data restoration cannot be performed at the same time. Otherwise, service data restoration fails. You are advised to restore service data after metadata restoration is complete.

## Impact on the System

- During data restoration, user authentication stops and users cannot create new connections.
- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is restored, the ClickHouse upper-layer applications need to be started.

## Prerequisites

- If you need to restore data from a remote HDFS, a standby cluster has been created and the data has been backed up. For details, see [Backing Up ClickHouse Service Data](#). If the active and standby clusters are deployed in security mode and they are not managed by the same FusionInsight Manager, mutual trust must be configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active and standby clusters are deployed in normal mode, no mutual trust is required.
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The database for storing restored data tables, the HDFS save path of data tables, and the list of users who can access restored data are planned.
- The ClickHouse backup file save path is correct.
- The ClickHouse upper-layer applications are stopped.
- In an active/standby cluster, the value of `HADOOP_RPC_PROTECTION` of ClickHouse must be the same as that of `hadoop.rpc.protection` in the HDFS when you restore data from the remote HDFS to the local host.

## Restoring ClickHouse Service Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the row where the specified backup task is located, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task.

In the window that is displayed, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:

- **Backup Object:** indicates the backup data source.
- **Backup Path:** indicates the full path where backup files are stored.  
Select the correct path, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **ClickHouse** under **Service data**.

**Step 8** Set **Path Type** of **ClickHouse** to a backup directory type.

Currently, the backup directory supports only the **RemoteHDFS** type.

- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option for MRS 3.2.0 or later clusters, you also need to configure the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source Active NameNode IP Address:** indicates the service plane IP address of the active NameNode in the standby cluster.
- **Source Standby NameNode IP Address:** indicates the service plane IP address of the standby NameNode in the standby cluster.
- **Source NameNode RPC Port:** indicates the value of **dfs.namenode.rpc.port** in the HDFS basic configuration of the destination cluster.
- **Source Path:** indicates the full path of the HDFS directory for storing backup data of the standby cluster. For details, see **Backup Path** obtained in **Step 2**. for example, *Backup path/Backup task name\_Data source\_Task creation time*.

If you select this option for MRS 3.1.0 or 3.1.2 clusters, you also need to configure the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Source NameNode IP Address:** indicates the IP address of the NameNode service plane in the standby cluster. It can be of an active or standby node.
- **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster. For details, see the **Backup Path** obtained in step [Step 2](#), for example, *Backup path/Backup task name\_Data source\_Task creation time*.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 7.6.6.6 Restoring DBService Metadata

#### Scenario

DBService data needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in DBService, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover DBService data. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the DBService data that is generated after the data backup and before the data recovery will be lost.
  - By default, MRS clusters use DBService to store metadata of Hive, Hue, Loader, Spark, CDL, and Oozie. Restoring DBService data will restore the metadata of all these components.
-

## Impact on the System

- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is restored, the configurations of the components that depend on DBService may expire and these components need to be restarted.

## Prerequisites

- If you need to restore data from a remote HDFS, a standby cluster has been created and the data has been backed up. For details, see [Backing Up DBService Data](#). If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The status of the active and standby DBService instances is normal. If the status is abnormal, data restoration cannot be performed.

## Restoring DBService Metadata

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view the historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In the **Restoration Configuration** area, select **DBService**.

**Step 8** Set **Path Type** of **DBService** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.  
If you select **LocalDir**, you also need to set **Source Path** to select the backup file to be restored, for example, *Version\_Data source\_Task execution time.tar.gz*.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.  
If you select **LocalHDFS**, set the following parameters:
  - **Source Path**: indicates the full path of the backup file in the HDFS, for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when a restoration task is executed. The default value is **hacluster**.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.  
If you select **RemoteHDFS**, set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS**: indicates that backup files are stored in the NAS using the NFS protocol.  
If you select **NFS**, set the following parameters:
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the IP address of the NAS server.
  - **Source Path**: indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **CIFS**: indicates that backup files are stored in the NAS using the CIFS protocol.  
If you select **CIFS**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the NAS server.
- **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
- **Username:** indicates the username set when the CIFS protocol is configured.
- **Password:** indicates the password set when the CIFS protocol is configured.
- **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.

If you select **SFTP**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

- **OBS:** indicates that backup files are stored in OBS.

If you select **OBS**, set the following parameters:

- **Source Path:** indicates the full OBS path of a backup file, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

#### NOTE

Only MRS 3.1.0 or later supports saving backup files in OBS.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.

- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 7.6.6.7 Restoring Flink Metadata

#### Scenario

Flink metadata needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After an administrator performs major operations (such as upgrade and data adjustment) on Flink, an exception occurs or the expected result is not achieved. The Flink component is faulty and becomes unavailable. Data is migrated to a new cluster.

System administrators can create a Flink restoration task on FusionInsight Manager. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore Flink metadata when the service is running properly, you are advised to manually back up the latest Flink metadata before restoration. Otherwise, the Flink metadata that is generated after the data backup and before the data restoration will be lost.
  - Flink metadata restoration and service data restoration cannot be performed at the same time. Otherwise, service data restoration fails. You are advised to restore service data after metadata restoration is complete.
- 

#### Impact on the System

- Before restoring the metadata, you need to stop the Flink service. During this period, all upper-layer applications are affected and cannot work properly.
- After the metadata is restored, the data generated after the data backup and before the data restoration is lost.
- After the metadata is restored, the Flink upper-layer applications of Solr need to be started.

#### Prerequisites

- You have checked the path for storing Flink metadata backup files.
- The Flink service has been stopped before its metadata is restored.
- If you need to restore data from a remote HDFS, a standby cluster has been created and the data has been backed up. For details, see [Backing Up Flink Metadata](#). If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.

- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).

## Restoring Flink Metadata

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of the specified task in the task list, choose **More > View History**.

In the displayed window, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved. Select the correct path, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **Flink** under **Metadata and other data**.

**Step 8** Set **Path Type** of **Flink** to a restoration directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that data is restored from the local disk of the active management node.  
If you select **LocalDir**, you also need to set **Source Path** to select the backup file to be restored, for example, *Backup task name\_Data source\_Task execution time.tar.gz*.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.  
If you select **LocalHDFS**, set the following parameters:
  - **Source Path**: indicates the full path of the backup file in the HDFS, for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when a restoration task is executed.
- **RemoteHDFS**: indicates that data is restored from the HDFS directory of the standby cluster.  
If you select **RemoteHDFS**, set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**,

**haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.

- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Data source\_Task execution time.tar.gz*.
- **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column. In the displayed dialog box, click **OK** to start the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 11** Choose **Cluster > Services** and start the Flink service.

----End

## 7.6.6.8 Restoring HBase Metadata

### Scenario

To ensure HBase metadata security (including tableinfo files and HFiles) or before a major operation on HBase system tables (such as upgrade or migration), you need to back up HBase metadata to prevent HBase service unavailability caused by HBase system table directory or file damages. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impacts on services.

System administrators can create a recovery task in FusionInsight Manager to recover HBase metadata. Only manual restoration tasks are supported.

**NOTICE**

- Data restoration can be performed only when the system version is consistent with that during data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HBase data that is generated after the data backup and before the data recovery will be lost.
- It is recommended that a data restoration task restore the metadata of only one component to prevent the data restoration of other components from being affected by stopping a service or instance. If data of multiple components is restored at the same time, data restoration may fail.  
HBase metadata cannot be restored at the same time as NameNode metadata. As a result, data restoration fails.

## Impact on the System

- Before restoring the metadata, you need to stop the HBase service, during which the HBase upper-layer applications are unavailable.
- After the metadata is restored, the data generated after the data backup and before the data restoration is lost.
- After the metadata is restored, the upper-layer applications of HBase need to be started.

## Prerequisites

- If you need to restore data from a remote HDFS, a standby cluster has been created and the data has been backed up. For details, see [Backing Up HBase Metadata](#). If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
- You have checked the path for storing HBase metadata backup files.
- The HBase service has been stopped before its metadata is restored.

## Restoring HBase Metadata

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view the historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.

- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **HBase** under **Metadata and other data**.

**Step 8** Set **Path Type** of **HBase** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.  
If you select **LocalDir**, you also need to set **Source Path** to select the backup file to be restored, for example, *Version\_Data source\_Task execution time.tar.gz*.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select **RemoteHDFS**, set the following parameters:

- **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS**: indicates that backup files are stored in the NAS using the NFS protocol.  
If you select **NFS**, set the following parameters:
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address**: indicates the IP address of the NAS server.

- **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **CIFS:** indicates that backup files are stored in NAS using the CIFS protocol.  
If you select **CIFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.  
If you select **SFTP**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.
  - **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
  - **Username:** indicates the username for connecting to the server using the SFTP protocol.
  - **Password:** indicates the password for connecting to the server using the SFTP protocol.
  - **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **OBS:** indicates that backup files are stored in OBS.  
If you select **OBS**, set the following parameters:
  - **Source Path:** indicates the full OBS path of a backup file, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

 **NOTE**

Only MRS 3.1.0 or later supports saving backup files in OBS.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 7.6.6.9 Restoring HBase Service Data

#### Scenario

HBase data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in HBase, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover HBase data. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HBase data that is generated after the data backup and before the data recovery will be lost.
- 

#### Impact on the System

- During the data recovery process, the system disables the HBase table to be recovered and the table cannot be accessed in this moment. The data recovery process takes several minutes, during which the HBase upper-layer applications are unavailable.
- During data restoration, user authentication stops and users cannot create new connections.
- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is recovered, the HBase upper-layer applications need to be started.

#### Prerequisites

- If you need to restore data from a remote HDFS, a standby cluster has been created and the data has been backed up. For details, see [Backing Up HBase Service Data](#). If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust](#)

**Between MRS Clusters.** If the active cluster is deployed in normal mode, no mutual trust is required.

- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The directory for saving the backup file has been checked.
- The HBase upper-layer applications have been stopped.

## Restoring HBase Service Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **HBase** under **Service Data**.

**Step 8** Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select **RemoteHDFS**, set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.

- **Source Path:** indicates the full path of the backup file in the HDFS, for example, *Backup path/xxx/Backup task name\_Data source\_Task creation time*. To obtain the backup path, locate the row that contains the target backup task in the backup management list, click **More > View History** in the **Operation** column, and click **View** in the **Backup Path** column.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select **NFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/xxx/Backup task name\_Data source\_Task creation time*. To obtain the backup path, locate the row that contains the target backup task in the backup management list, click **More > View History** in the **Operation** column, and click **View** in the **Backup Path** column.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select **CIFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/xxx/Backup task name\_Data source\_Task*

*creation time*. To obtain the backup path, locate the row that contains the target backup task in the backup management list, click **More > View History** in the **Operation** column, and click **View** in the **Backup Path** column.

- **Queue Name**: indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value is **100**.
- **SFTP**: indicates that backup files are stored in the server using the SFTP protocol.

If you select **SFTP**, set the following parameters:

- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address**: indicates the IP address of the server where the backup data is stored.
- **Port**: indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username**: indicates the username for connecting to the server using the SFTP protocol.
- **Password**: indicates the password for connecting to the server using the SFTP protocol.
- **Source Path**: indicates the full path of the backup file on the backup server, for example, *Backup path/xxx/Backup task name\_Data source\_Task creation time*. To obtain the backup path, locate the row that contains the target backup task in the backup management list, click **More > View History** in the **Operation** column, and click **View** in the **Backup Path** column.
- **Queue Name**: indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value is **100**.

**Step 9** Set **Backup Data** column in **Data Configuration** to one or multiple backup data sources to be recovered. In the **Target Namespace** column, specify the target naming space after backup data recovery.

You are advised to set **Target Namespace** to a location that is different from the backup naming space.

**Step 10** Set **Force recovery** to **true**, which indicates to forcibly recover all backup data when a data table with the same name already exists. If the data table contains

new data added after backup, the new data will be lost after the data recovery. If you set the parameter to **false**, the restoration task is not executed if a data table with the same name exists.

**Step 11** Click **Verify** to check whether the restoration task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified naming space does not exist, the verification fails.
- If the forcible overwrite conditions are not met, the verification fails.

**Step 12** Click **OK** to save the settings.

**Step 13** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 14** Check whether HBase data is restored in an environment where HBase is newly installed or reinstalled.

- If yes, the administrator needs to set new permission for roles on FusionInsight Manager based on the original service plan.
- If no, no further operation is required.

----End

### 7.6.6.10 Restoring HDFS NameNode Metadata

#### Scenario

NameNode data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in NameNode, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover NameNode data. Only manual restoration tasks are supported.

**NOTICE**

- Data restoration can be performed only when the system version is consistent with that during data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the NameNode data that is generated after the data backup and before the data recovery will be lost.
- It is recommended that a data restoration task restore the metadata of only one component to prevent the data restoration of other components from being affected by stopping a service or instance. If data of multiple components is restored at the same time, data restoration may fail.  
HBase metadata cannot be restored at the same time as NameNode metadata. As a result, data restoration fails.

## Impact on the System

- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is recovered, the NameNode needs to be restarted and is unavailable during the restart.
- After data is restored, metadata and service data may not be matched, the HDFS enters the security mode, and the HDFS service fails to be started. .

## Prerequisites

- If you need to restore data from a remote HDFS, a standby cluster has been created and the data has been backed up. For details, see [Backing Up HDFS NameNode Data](#). If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- On FusionInsight Manager, all the NameNode role instances whose data is to be recovered are stopped. Other HDFS role instances must keep running. After data is recovered, the NameNode role instances need to be restarted. The NameNode role instances cannot be accessed during the restart.
- The NameNode backup files are stored *Data path/LocalBackup/* on the active management node.

## Restoring HDFS NameNode Metadata

- Step 1** On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and choose **Services > HDFS**. On the displayed page, click **Instances** and click **NameNode** to check whether the NameNode instances of the data to be restored

are stopped. If the NameNode instances are not stopped, click **Stop Instance** in the upper right corner.

**Step 2** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 3** In the **Operation** column of a specified task in the task list, choose **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 4** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 5** Click **Create**.

**Step 6** Set **Task Name** to the name of the restoration task.

**Step 7** Select the cluster to be operated from **Recovery Object**.

**Step 8** In the **Restoration Configuration** area, select **NameNode**.

**Step 9** Set **Path Type** of **NameNode** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.  
If you select **LocalDir**, set the following parameters:
  - **Source Path**: indicates the full path of the backup file on the local disk, for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Target NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select **RemoteHDFS**, set the following parameters:

- **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.

- **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **NFS:** indicates that backup files are stored in the NAS using the NFS protocol. If you select **NFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **CIFS:** indicates that backup files are stored in the NAS using the CIFS protocol. If you select **CIFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
  - **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol. If you select **SFTP**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.
  - **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.

- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **OBS:** indicates that backup files are stored in OBS.

If you select **OBS**, set the following parameters:

- **Source Path:** indicates the full OBS path of a backup file, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.

#### NOTE

Only MRS 3.1.0 or later supports saving backup files in OBS.

**Step 10** Click **OK**.

**Step 11** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 12** On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and choose **Services > HDFS**. On the displayed page, click **Configurations** and click **All Configurations**.

On the displayed page, enter the password of the administrator who has logged in for authentication and click **OK**. After the system displays "Operation succeeded", click **Finish**. The service is started successfully.

----End

## 7.6.6.11 Restoring HDFS Service Data

### Scenario

HDFS data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in the HDFS, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover HDFS data. Only manual restoration tasks are supported.

**NOTICE**

- Data restoration can be performed only when the system version is consistent with that during data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HDFS data that is generated after the data backup and before the data recovery will be lost.
- The HDFS restoration operation cannot be performed for the directories used by running Yarn tasks, for example, `/tmp/logs`, `/tmp/archived`, and `/tmp/hadoop-yarn/staging`. Otherwise, data restoration using Distcp tasks fails due to file loss.

## Impact on the System

- During data restoration, user authentication stops and users cannot create new connections.
- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is recovered, the HDFS upper-layer applications need to be started.

## Prerequisites

- If you need to restore data from a remote HDFS, a standby cluster has been created and the data has been backed up. For details, see [Backing Up HDFS Service Data](#). If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The HDFS backup file save path is correct.
- The HDFS upper-layer applications are stopped.

## Restoring HDFS Service Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.

- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **HDFS** under **Service Data**.

**Step 8** Set **Path Type** of **HDFS** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select **RemoteHDFS**, set the following parameters:

- **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value is **100**.
- **NFS**: indicates that backup files are stored in NAS using the NFS protocol. If you select **NFS**, set the following parameters:
    - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Server IP Address:** indicates the IP address of the NAS server.
- **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **CIFS:** indicates that backup files are stored in NAS using the CIFS protocol. If you select **CIFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.  
If you select **SFTP**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.

- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.

**Step 9** In the **Backup Data** column of the **Data Configuration** page, select one or more pieces of backup data that needs to be restored based on service requirements. In the **Target Path** column, specify the target location after backup data restoration.

You are advised to set **Target Path** to a new path that is different from the backup path.

**Step 10** Click **Verify** to check whether the restoration task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified directory to be restored does not exist, the verification fails.

**Step 11** Click **OK**.

**Step 12** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

## 7.6.6.12 Restoring Hive Service Data

### Scenario

Hive data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in the Hive, an exception occurs or the operation has not

achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover Hive data. Only manual restoration tasks are supported.

Hive backup and restoration cannot identify the service and structure relationships of objects such as Hive tables, indexes, and views. When executing backup and restoration tasks, you need to manage unified restoration points based on service scenarios to ensure proper service running.

---

**NOTICE**

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the Hive data that is generated after the data backup and before the data recovery will be lost.
- 

## Impact on the System

- During data restoration, user authentication stops and users cannot create new connections.
- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is recovered, the Hive upper-layer applications need to be started.

## Prerequisites

- If you need to restore data from a remote HDFS, a standby cluster has been created and the data has been backed up. For details, see [Backing Up Hive Service Data](#). If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The database for storing restored data tables, the HDFS save path of data tables, and the list of users who can access restored data are planned.
- The Hive backup file save path is correct.
- The Hive upper-layer applications are stopped.

## Restoring Hive Service Data

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In the **Restoration Configuration** area, select **Hive**.

**Step 8** Set **Path Type** of **Hive** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select **RemoteHDFS**, set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
  - **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
  - **Queue Name**: indicates the name of the Yarn queue used for backup task execution.
  - **Recovery Point List**: Click **Refresh** and select a Hive backup file set that has been backed up in the standby cluster.
  - **Target NameService Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.
  - **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value is **100**.

- **NFS:** indicates that backup files are stored in NAS using the NFS protocol. If you select **NFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select a Hive backup file set that has been backed up in the standby cluster.
  - **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **CIFS:** indicates that backup files are stored in NAS using the CIFS protocol. If you select **CIFS**, set the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
  - **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select a Hive backup file set that has been backed up in the standby cluster.
  - **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **100**.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.  
If you select **SFTP**, set the following parameters:

- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the IP address of the server where the backup data is stored.
- **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
- **Username:** indicates the username for connecting to the server using the SFTP protocol.
- **Password:** indicates the password for connecting to the server using the SFTP protocol.
- **Source Path:** indicates the full path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time*.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Target NameService Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value is **1**.

**Step 9** Set **Backup Data** in the **Data Configuration** to one or multiple backup data sources to be recovered based on service requirements. In the **Target Database** and **Target Path** columns, specify the target database and file save path after backup data recovery.

Configuration restrictions:

- Data can be restored to the original database, but data tables must be stored in a new path that is different from the backup path.
- To restore Hive index tables, select the Hive data tables that correspond to the Hive index tables to be restored.
- If a new restoration directory is selected to avoid affecting the current data, HDFS permission must be manually granted so that users who have permission of backup tables can access this directory.
- Data can be restored to other databases. In this case, HDFS permission must be manually granted so that users who have permission of backup tables can access the HDFS directory that corresponds to the database.

**Step 10** Set **Force recovery** to **true**, which indicates to forcibly recover all backup data when a data table with the same name already exists. If the data table contains new data added after backup, the new data will be lost after the data recovery. If you set the parameter to **false**, the restoration task is not executed if a data table with the same name exists.

**Step 11** Click **Verify** to check whether the restoration task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified directory to be restored does not exist, the verification fails.
- If the forcible overwrite conditions are not met, the verification fails.

**Step 12** Click **OK**.

**Step 13** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 7.6.6.13 Restoring IoTDB Metadata

#### Scenario

To ensure IoTDB metadata security and prevent the IoTDB service from being unavailable due to IoTDB file damage, IoTDB metadata needs to be backed up. In this way, the system can restore data timely when an exception is reported or an operation does not achieve the expected result, minimizing the impact on services.

System administrators can create an IoTDB restoration task on FusionInsight Manager. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the IoTDB data that is generated after the data backup and before the data restoration will be lost.
  - You are advised to restore the metadata of only one component in a restoration task to prevent the stop of a service or instance from affecting the data restoration of other components. If data of multiple components is restored at the same time, data restoration may fail.
- 

#### Impact on the System

After the metadata is restored, the data generated after the data backup and before the data restoration is lost.

#### Restoring IoTDB Metadata

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the row where the specified backup task is located, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task.

In the window that is displayed, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:

- **Backup Object:** indicates the backup data source.
- **Backup Path:** indicates the full path where backup files are stored.  
Select the correct path, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **IoTDB** under **Metadata and other data**.

**Step 8** Select a backup directory type for **Path Type**.

The configurations vary based on backup directory types:

- **LocalDir:** indicates that the backup files are stored on the local disk of the active management node.  
If you select this option, you also need to set **Source Path**, which indicates the backup file to be restored, for example, *Version\_Data source\_Task execution time.tar.gz*.
- **NFS:** indicates that backup files are stored in NAS using the NFS protocol.  
If you select this option, configure the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Source Path:** indicates the complete path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.  
If you select this option, configure the following parameters:
  - **Source NameService Name:** indicates the NameService name of the backup data cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source Active NameNode IP Address:** indicates the service plane IP address of the active NameNode in the standby cluster.

- **Source Standby NameNode IP Address:** indicates the service plane IP address of the standby NameNode in the standby cluster.
- **Source NameNode RPC Port:** indicates the value of **dfs.namenode.rpc.port** in the HDFS basic configuration of the standby cluster.
- **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **CIFS:** indicates that backup files are stored in NAS using the CIFS protocol.  
If you select this option, configure the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the NAS server.
  - **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
  - **Username:** indicates the username set when the CIFS protocol is configured.
  - **Password:** indicates the password set when the CIFS protocol is configured.
  - **Source Path:** indicates the complete path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **SFTP:** indicates that backup files are stored in the server using the SFTP protocol.  
If you select this option, configure the following parameters:
  - **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the IP address of the server where the backup data is stored.
  - **Port:** indicates the port number used to connect to the backup server over the SFTP protocol. The default value is **22**.
  - **Username:** indicates the username for connecting to the server using the SFTP protocol.
  - **Password:** indicates the password for connecting to the server using the SFTP protocol.
  - **Source Path:** indicates the complete path of the backup file on the backup server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.

- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 11** Choose **Cluster > Services** and start the IoTDB service.

----End

## 7.6.6.14 Restoring IoTDB Service Data

### Scenario

IoTDB service data needs to be restored in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored. After an administrator performs major operations (such as upgrade and data adjustment) on IoTDB, an exception occurs or the expected result is not achieved. All modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create an IoTDB restoration task on FusionInsight Manager. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the IoTDB data that is generated after the data backup and before the data restoration will be lost.
- 

### Impact on the System

- During data restoration, user authentication stops and users cannot create new connections.
- After the data is restored, the data generated after the data backup and before the data restoration is lost.
- After the data is restored, the IoTDB upper-layer applications need to be started.

### Prerequisites

- If you need to restore data from a remote HDFS, a standby cluster has been created and the data has been backed up. For details, see [Backing Up IoTDB Service Data](#). If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust must be configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.

- The IoTDB backup file save path is correct.
- The IoTDB upper-layer applications are stopped.

## Restoring IoTDB Service Data

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the row where the specified backup task is located, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task.

In the window that is displayed, select a success record and click **View** in the **Backup Path** column to view its backup path information and find the following information:

- **Backup Object:** indicates the backup data source.
- **Backup Path:** indicates the full path where backup files are stored.  
Select the correct path, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, choose **IoTDB > IoTDB** under **Service Data**.

**Step 8** Set **Path Type** of **IoTDB** to a backup directory type.

The following backup directory types are supported:

**RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this option, configure the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster, for example, **hacluster**. You can obtain it from the **NameService Management** page of HDFS of the standby cluster.
- **IP Mode:** indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source Active NameNode IP Address:** indicates the service plane IP address of the active NameNode in the standby cluster.
- **Source Standby NameNode IP Address:** indicates the service plane IP address of the standby NameNode in the standby cluster.
- **Source NameNode RPC Port:** indicates the value of **dfs.namenode.rpc.port** in the HDFS basic configuration of the standby cluster.
- **Source Path:** indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time*.

- **Recovery Point List:** Click **Refresh** and select an IoTDB directory that has been backed up in the standby cluster.

**Step 9** In the **Backup Data** column of the **Data Configuration** page, select one or more pieces of backup data that needs to be restored based on service requirements. In the **Target Path** column, specify the target location after backup data restoration.

You are advised to set **Target Path** to a new path that is different from the backup path.

**Step 10** Set **Force recovery** to **true**, which indicates that all backup data is forcibly restored when a data table with the same name already exists. If the data table contains new data added after backup, the new data will be lost after the data restoration. If you set the parameter to **false**, the restoration task is not executed if a data table with the same name exists.

**Step 11** Click **Verify** to check whether the restoration task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified directory to be restored does not exist, the verification fails.

**Step 12** Click **OK**.

**Step 13** In the restoration task list, locate the row where the created task is located, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 7.6.6.15 Restoring Kafka Metadata

#### Scenario

Kafka data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After an administrator performs critical data adjustment in ZooKeeper, an exception occurs or the operation has not achieved the expected result. All Kafka modules are faulty and become unavailable. Data is migrated to a new cluster.

System administrators can create a recovery task in FusionInsight Manager to recover Kafka data. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore Kafka metadata when the service is running properly, you are advised to manually back up the latest Kafka metadata before restoration. Otherwise, the Kafka metadata that is generated after the data backup and before the data restoration will be lost.
-

## Impact on the System

- After the metadata is restored, the data generated after the data backup and before the data restoration is lost.
- After the metadata is restored, the offset information stored on ZooKeeper by Kafka consumers is rolled back, resulting in repeated consumption.

## Prerequisites

- If you need to restore data from a remote HDFS, a standby cluster has been created and the data has been backed up. For details, see [Backing Up Kafka Metadata](#). If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, mutual trust has been configured. For details, see [Configuring Mutual Trust Between MRS Clusters](#). If the active cluster is deployed in normal mode, no mutual trust is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling MRS Inter-Cluster Replication](#).
- Time is consistent between the active and standby clusters and the NTP services on the active and standby clusters use the same time source.
- The Kafka service is disabled first, and then enabled upon data restoration.

## Restoring Kafka Metadata

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, choose **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the restoration task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In the **Restoration Configuration** area, select **Kafka**.

**Step 8** Set **Path Type** of **Kafka** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.

If you select **LocalDir**, you also need to set **Source Path** to select the backup file to be restored, for example, *Version\_Data source\_Task execution time.tar.gz*.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select **LocalHDFS**, set the following parameters:

- **Source Path**: indicates the full path of the backup file in the HDFS, for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when a restoration task is executed. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select **RemoteHDFS**, set the following parameters:

- **Source NameService Name**: indicates the NameService name of the backup data cluster. You can enter the built-in NameService name of the remote cluster, for example, **haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**. You can also enter a configured NameService name of the remote cluster.
- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path**: indicates the full path of HDFS directory for storing backup data of the standby cluster, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.

- **NFS**: indicates that backup files are stored in NAS using the NFS protocol.

If you select **NFS**, set the following parameters:

- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address**: indicates the IP address of the NAS server.
- **Source Path**: indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

- **CIFS**: indicates that backup files are stored in NAS using the CIFS protocol.

If you select **CIFS**, set the following parameters:

- **IP Mode**: indicates the mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Server IP Address:** indicates the IP address of the NAS server.
- **Port:** indicates the port number used to connect to the NAS server over the CIFS protocol. The default value is **445**.
- **Username:** indicates the username set when the CIFS protocol is configured.
- **Password:** indicates the password set when the CIFS protocol is configured.
- **Source Path:** indicates the full path of the backup file on the NAS server, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
- **OBS:** indicates that backup files are stored in OBS.  
If you select **OBS**, set the following parameters:
  - **Source Path:** indicates the full OBS path of a backup file, for example, *Backup path/Backup task name\_Data source\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.

 **NOTE**

Only MRS 3.1.0 or later supports saving backup files in OBS.

**Step 9** Click **OK**.

**Step 10** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**NOTICE**

- If the Kafka service is reinstalled and metadata is restored after data backup, or metadata is migrated to a new cluster, the Kafka broker cannot be restarted. View the error in the `/var/log/Bigdata/kafka/broker/server.log` file. An example is as follows:  
ERROR Fatal error during KafkaServer startup. Prepare to shutdown  
(kafka.server.KafkaServer)kafka.common.InconsistentClusterIdException: The Cluster ID kVSgfuUQFGGpHMTBqBPiw doesn't match stored clusterId Some(0Qftv9yBTAmf2iDPSllk7g) in meta.properties. The broker is trying to join the wrong cluster. Configured zookeeper.connect may be wrong. at kafka.server.KafkaServer.startup(KafkaServer.scala:220) at kafka.server.KafkaServerStartable.startup(KafkaServerStartable.scala:44) at kafka.Kafka\$.main(Kafka.scala:84) at kafka.Kafka.main(Kafka.scala)  
Check the value of `log.dirs` in the Kafka Broker configuration file `${BIGDATA_HOME}/FusionInsight_Current/*Broker/etc/server.properties`. The value is the Kafka data directory. Go to the Kafka data directory and change the value `0Qftv9yBTAmf2iDPSllk7g` of `cluster.id` in `meta.properties` to `kVSgfuUQFGGpHMTBqBPiw` (the latest value in the error log).
- The preceding modification must be performed on each node where Broker is located. After the modification, restart the Kafka service.

----End

## 7.6.7 Managing MRS Cluster Backup and Restoration Tasks

This topic describes how to modify the parameters of a created backup task on Manager to meet changing service requirements. The parameters of restoration tasks can be viewed but not modified.

### Impact on the System

After a backup task is modified, the new parameters take effect when the task is executed next time.

### Prerequisites

- A backup task has been created.
- A new backup task policy has been planned based on the actual situation.

### Modifying a Backup Task (MRS 3.x and Later)

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the task list, locate a specified task, click **Configure** in the **Operation** column to go to the configuration modification page.

On the displayed page, modify the following parameters:

- Started
- Period
- Destination NameService Name

- Target NameNode IP Address
- Target Path
- Max Number of Backup Copies
- Maximum Number of Recovery Points
- Maximum Number of Maps
- Maximum Bandwidth of a Map

 **NOTE**

After the **Target Path** parameter of a backup task is modified, this task will be performed as a full backup task for the first time by default.

**Step 3** Click **OK** to save the settings.

----End

## Modifying a Backup Task (MRS 2.x and Earlier)

**Step 1** On MRS Manager, choose **System > Back Up Data**.

**Step 2** In the task list, locate a specified task, click **Modify** in the **Operation** column to go to the configuration modification page.

**Step 3** Modify the following parameters on the displayed page:

- Manual backup:
  - Target Path
  - Max Number of Backup Copies
- Periodic backup:
  - Started
  - Period
  - Target Path
  - Max Number of Backup Copies

 **NOTE**

- When **Path Type** is set to **LocalHDFS**, **Target Path** is valid for modifying a backup task.
- After the **Target Path** parameter of a backup task is modified, this task will be performed as a full backup task for the first time by default.

**Step 4** Click **OK** to save the settings.

----End

## Viewing Backup and Restoration Tasks (MRS 3.x and Later)

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration**.

**Step 2** Click **Backup Management** or **Restoration Management**.

**Step 3** In the task list, obtain the previous execution result in the **Task Status** and **Task Progress** column. Green indicates that the task is executed successfully, and red indicates that the execution fails.

**Step 4** In the **Operation** column of a specified task in the task list, choose **More > View History** or click **View History** to view the historical record of backup and restoration task execution.

In the displayed window, click  before a specified record to display log information about the execution.

You can also perform more maintenance operations listed in [Table 7-34](#) in the **Operation** column of a specified task.

**Table 7-34** Maintenance and management operations

| Operation Entry                                      | Description                                                                                                                                                                                                                                                                              |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>More &gt; Back Up Now</b> or <b>Start</b>         | Start a backup or restoration task that is ready or fails to be executed. Executed restoration tasks cannot be repeatedly executed.                                                                                                                                                      |
| <b>Configure</b>                                     | Modify parameters for a backup task.                                                                                                                                                                                                                                                     |
| <b>Restore</b>                                       | After data backup, click <b>Restore</b> to quickly restore data.                                                                                                                                                                                                                         |
| <b>More &gt; Back Up Now</b>                         | Execute a backup task immediately.                                                                                                                                                                                                                                                       |
| <b>More &gt; Stop</b> or <b>Stop</b>                 | Stop a running backup or restoration task. After the task is stopped, its <b>Task Status</b> changes to <b>Stopped</b> .                                                                                                                                                                 |
| <b>More &gt; Delete</b> or <b>Delete</b>             | Delete a backup or restoration task. After a task is deleted, the backup data is retained by default.                                                                                                                                                                                    |
| <b>More &gt; Suspend</b>                             | Suspend a backup task. Only periodic backup tasks can be suspended. Suspended backup tasks are no longer executed automatically. If you suspend a backup task that is being executed, the task execution stops. To unlock the task and run it again, choose <b>More &gt; Run Again</b> . |
| <b>More &gt; Resume</b>                              | Enable automatic backup.                                                                                                                                                                                                                                                                 |
| <b>More &gt; View History</b> or <b>View History</b> | Switch to the task run log page to view the task running details and backup path.                                                                                                                                                                                                        |
| <b>View</b>                                          | Check the parameter settings of a restoration task.                                                                                                                                                                                                                                      |
| <b>Start</b>                                         | Run a restoration task.                                                                                                                                                                                                                                                                  |

----End

## Viewing Backup and Restoration Tasks (MRS 2.x and Earlier)

**Step 1** On MRS Manager, click **System**.

**Step 2** Click **Backup Management** or **Restoration Management**.

**Step 3** In the task list, obtain the previous execution result in the **Task Progress** column. Green indicates that the task is executed successfully, and red indicates that the execution fails.

**Step 4** In the **Operation** column of a specified task in the task list, choose **More > View History** to view the historical record of backup and restoration execution.

In the displayed window, click **View** in the **Details** column. The task execution logs and paths are displayed.

#### NOTE

Other related operations are as follows:

- Viewing a restoration task

In the **Operation** column of the specified task in the task list, click **View Details** to view the restoration task. You can only view but cannot modify the parameters of a restoration task.

- Executing a backup or restoration task

In the task list, locate a specified task and click **Start** in the **Operation** column to start a backup or restoration task that is ready or fails to be executed. Executed restoration tasks cannot be repeatedly executed.

- Stopping a backup task

In the task list, locate a specified task and choose **More > Stop** in the **Operation** column to stop a backup task that is running.

- Deleting a backup or restoration task

In the **Operation** column of the specified task in the task list, choose **More > Delete** to delete the backup or restoration task. After a task is deleted, the backup data is retained by default.

- Suspending a backup task

In the task list, locate a specified task and choose **More > Suspend** in the **Operation** column to suspend the backup task. Only periodic backup tasks can be suspended. Suspended backup tasks are no longer executed automatically. When you suspend a backup task that is being executed, the task execution stops. To cancel the suspension status of a task, choose **More > Resume**.

----End

## 7.6.8 Using HDFS Snapshots to Quickly Restore Component Service Data

### Scenario

When DistCp is used to back up data, the backup snapshot is saved to HDFS of the active cluster. FusionInsight Manager supports using the local snapshot for quick data restoration, requiring less time than restoring data from the standby cluster.

Use FusionInsight Manager and the snapshots on HDFS of the active cluster to create a local quick restoration task and execute the task.

#### NOTE

This topic is available for MRS 3.x or later.

## Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.
- Step 2** In the backup task list, locate a created task and click **Restore** in the **Operation** column.
- Step 3** Check whether the system displays "No data is available for quick restoration. Create a task on the restoration management page to restore data."
- If yes, click **OK** to close the dialog box. No backup data snapshot is created in the active cluster, and no further action is required.
  - If no, go to **Step 4** to create a local quick restoration task.

 **NOTE**

Metadata does not support quick restoration.

- Step 4** Set **Name** to the name of the local quick restoration task.
- Step 5** Set **Configuration** to a data source.
- Step 6** Set **Recovery Point List** to a recovery point that contains the backup data.
- Step 7** Set **Queue Name** to the name of the Yarn queue used in the task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- Step 8** Set **Data Configuration** to the object to be recovered.
- Step 9** Click **Verify**, and wait for the system to display "The restoration task configuration is verified successfully."
- Step 10** Click **OK**.
- Step 11** In the restoration task list, locate a created task and click **Start** in the **Operation** column to execute the restoration task.

After the task is complete, **Task Status** of the task is displayed as **Successful**.

----End

## 7.7 MRS Cluster Patching

### 7.7.1 Viewing Patch Information for an MRS Cluster

View patch information for cluster components. If a cluster component, such as Hadoop or Spark, is abnormal, download the patch version to rectify the fault.

- Step 1** Log in to the MRS management console.
- Step 2** On the **Active Clusters** page, click the name of your desired cluster.
- Step 3** Click **Patches**. On the displayed page, view patch information for the MRS cluster.
- Patch Name: name of the patch package
  - Published: time when the patch package is released

- Status: patch status
- Patch Description: patch version description
- Operation: patch installation or uninstallation

----End

## 7.7.2 Patching an MRS Cluster

Install the cluster version patch as required if you obtain patch information from:

- The message center service
- On a cluster details page of the MRS console, choose **Patches > Cluster Component Patches** to view the patches that can be installed.

### Preparing for Patch Installation

---

#### CAUTION

- For details about how to check the cluster status, see section [Performing a Health Check for an MRS Cluster](#). Exceptions such as cluster node faults and hard disk faults may cause patch installation and uninstallation failures. Before you install or uninstall the patch, ensure that the cluster is healthy.
  - Click **Patches** then **Cluster Component Patches**, view the **Patch Description** column of the target patch, and read the patch description carefully to understand the patch installation procedure and impact. For details, see [MRS Cluster Patch Description](#).
  - MRS 2.x and earlier versions, MRS 3.1.5 and later versions, and MRS 3.2.0-LTS and later versions support online patch installation.
- 

### Installing a Patch

- Step 1** Log in to the MRS management console.
- Step 2** On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.
- Step 3** In the **Patches** tab, click **Cluster Component Patches**. In the operation list, click **Install** next to the patch you want to install.

#### NOTE

[MRS Cluster Patch Description](#) describes the patching procedure and impact.

- Step 4** In the displayed dialog box, select **I have read Patch Description and understood that this operation may restart services**. Click **Yes** and wait until the patch is successfully installed.
- Step 5** Check the patch status. Restart the components and install the client patch according to the patch description.

 NOTE

If there is an isolated host in the cluster, the patch will not be installed on the isolated host. In this case, when the installation completes, the patch is partially installed. After an isolated node is restored and the isolation is canceled, you can install the patch again. In this case, the patch is installed only on the node where isolation is canceled. For versions earlier than MRS 3.x, perform operations by referring to [Patching Hosts Isolated in an MRS Cluster](#).

----End

## Uninstalling a Patch

- Step 1** Log in to the MRS management console.
- Step 2** On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.
- Step 3** In the **Patches** tab, click **Cluster Component Patches**. In the operation list, click **Uninstall** next to the patch you want to uninstall.
- Step 4** In the displayed dialog box, select the confirmation check box and click **Yes**. Wait until the patch is successfully uninstalled.
- Step 5** Restart the component and uninstall the client patch according to the patch description.

 NOTE

If there is an isolated host in the cluster, the patch will not be uninstalled on the isolated host. In this case, when the uninstallation completes, the patch is partially uninstalled. After the isolated node is restored and the isolation is canceled, you can uninstall the patch again. In this case, the patch is uninstalled only on the node whose isolation is canceled. For versions earlier than MRS 3.x, perform operations by referring to [Patching Hosts Isolated in an MRS Cluster](#).

----End

## 7.7.3 Applying Rolling Patches for an MRS Cluster

The rolling patch function indicates that patches are installed or uninstalled for one or more services in a cluster by performing a rolling service restart (restarting services or instances in batches), without interrupting the services or within a minimized service interruption interval. Services in a cluster are divided into the following three types based on whether they support rolling patch:

- Services supporting rolling patch installation or uninstallation: All businesses or part of them (varying depending on different services) of the services are not interrupted during patch installation or uninstallation.
- Services not supporting rolling patch installation or uninstallation: Businesses of the services are interrupted during patch installation or uninstallation.
- Services with some roles supporting rolling patch installation or uninstallation: Some businesses of the services are not interrupted during patch installation or uninstallation.

 NOTE

In **MRS 3.x**, you cannot perform operations in this section on the management console.

**Table 7-35** provides services and instances that support or do not support rolling restart in the MRS cluster.

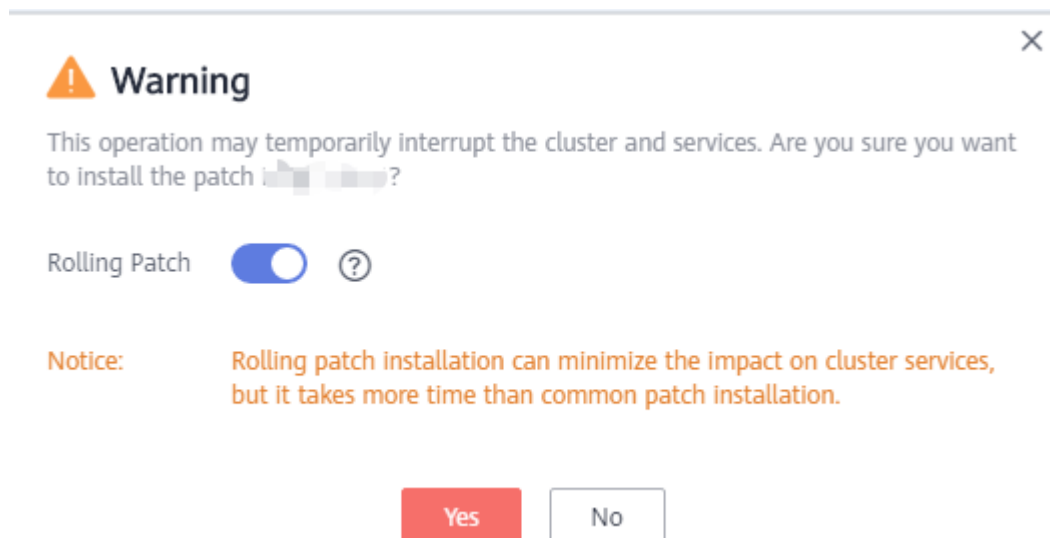

**Table 7-35** Support for rolling restarts on services and instances

| Service | Instance         | Support for Rolling Restart |
|---------|------------------|-----------------------------|
| Alluxio | AlluxioJobMaster | Yes                         |
|         | AlluxioMaster    |                             |
| Flink   | FlinkResource    | No                          |
|         | FlinkServer      |                             |
| Flume   | Flume            | Yes                         |
|         | MonitorServer    |                             |
| HBase   | HMaster          | Yes                         |
|         | RegionServer     |                             |
|         | ThriftServer     |                             |
|         | RETSerServer     |                             |
| HDFS    | NameNode         | Yes                         |
|         | Zkfc             |                             |
|         | JournalNode      |                             |
|         | HttpFS           |                             |
|         | DataNode         |                             |
| Hive    | MetaStore        | Yes                         |
|         | WebHCat          |                             |
|         | HiveServer       |                             |
| Hue     | Hue              | No                          |
| Impala  | Impalad          | No                          |
|         | StateStore       |                             |
|         | Catalog          |                             |
| Kafka   | Broker           | Yes                         |
|         | KafkaUI          | No                          |
| Kudu    | KuduTserver      | Yes                         |
|         | KuduMaster       |                             |
| Loader  | Sqoop            | No                          |

| Service   | Instance         | Support for Rolling Restart |
|-----------|------------------|-----------------------------|
| Mapreduce | JobHistoryServer | Yes                         |
| Oozie     | oozie            | No                          |
| Presto    | Coordinator      | Yes                         |
|           | Worker           |                             |
| Spark     | JobHistory       | Yes                         |
|           | JDBCServer       |                             |
|           | SparkResource    |                             |
| Storm     | Nimbus           | Yes                         |
|           | UI               |                             |
|           | Supervisor       |                             |
|           | Logviewer        |                             |
| Tez       | TezUI            | No                          |
| Yarn      | ResourceManager  | Yes                         |
|           | NodeManager      |                             |
| Zookeeper | Quorumpeer       | Yes                         |

## Installing a Rolling Patch

- Step 1** Log in to the MRS console.
- Step 2** On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.
- Step 3** On the **Patches** page, click **Install** in the **Operation** column.
- Step 4** On the **Warning** page, enable or disable **Rolling Patch**.

**Figure 7-24** Rolling patch installation**NOTE**

- Enabling the rolling patch installation function: Services are not stopped before patch installation, and rolling service restart is performed after the patch installation. This minimizes the impact on cluster services but takes more time than common patch installation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch installation function is not available in clusters with less than two Master nodes and three Core nodes.

**Step 5** Click **Yes** to install the target patch.

**Step 6** View the patch installation progress.

1. Access MRS Manager. For details, see [Accessing MRS Manager](#).
2. Choose **System > Manage Patch**. On the **Manage Patch** page, you can view the patch installation progress.

**NOTE**

For the isolated host nodes in the cluster, follow instructions in [Patching Hosts Isolated in an MRS Cluster](#) to restore the patch.

----End

## Uninstalling a Rolling Patch

**Step 1** Log in to the MRS console.

**Step 2** On the **Active Clusters** page displayed by default, click the name of the target cluster to enter the cluster details page.

**Step 3** On the **Patches** page, click **Uninstall** in the **Operation** column.

**Step 4** On the **Warning** page, enable or disable **Rolling Patch**.

**Figure 7-25** Rolling patch uninstallation

**NOTE**

- Enabling the rolling patch uninstallation function: Services are not stopped before patch uninstallation, and rolling service restart is performed after the patch uninstallation. This minimizes the impact on cluster services but takes more time than common patch uninstallation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- Only patches that are installed in rolling mode can be uninstalled in the same mode.

**Step 5** Click **Yes** to uninstall the target patch.

**Step 6** View the patch uninstallation progress.

1. Access MRS Manager. For details, see [Accessing MRS Manager](#).
2. Choose **System** > **Manage Patch**. On the **Manage Patch** page, you can view the patch uninstallation progress.

**NOTE**

For the isolated host nodes in the cluster, follow instructions in [Patching Hosts Isolated in an MRS Cluster](#) to restore the patch.

----End

## 7.7.4 Patching Hosts Isolated in an MRS Cluster

If some hosts are isolated in a cluster, perform the following operations to restore patches for these isolated hosts after patch installation on other hosts in the cluster. After patch restoration, versions of the isolated host nodes are consistent with those are not isolated.

**NOTE**

Operations in this section cannot be performed on the management console of MRS 3.x. This section applies only to versions earlier than 3.x.

- Step 1** Access MRS Manager. For details, see [Accessing MRS Manager](#).
- Step 2** Choose **System > Manage Patch**. The **Manage Patch** page is displayed.
- Step 3** In the **Operation** column, click **View Details**.
- Step 4** On the patch details page, select host nodes whose **Status** is **Isolated**.
- Step 5** Click **Select and Restore** to restore the isolated host nodes.

**Figure 7-26** Restoring patches for the isolated hosts

----End

## 7.8 MRS Cluster Patch Description

### 7.8.1 MRS 3.0.5.1 Patch Description

#### Basic Information

**Table 7-36** Basic information

|                      |             |
|----------------------|-------------|
| <b>Patch Version</b> | MRS 3.0.5.1 |
| <b>Release Date</b>  | 2021-08-14  |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Resolved Issues</b></p> | <p><b>List of resolved issues in MRS 3.0.5.1:</b></p> <p><b>MRS Manager</b></p> <ul style="list-style-type: none"> <li>● Resolved the failure to submit SparkSQL jobs on the job management page due to long SQL statements.</li> <li>● Resolved the failure to execute SQL statements with comments.</li> </ul> <p><b>Big data components</b></p> <ul style="list-style-type: none"> <li>● Resolved the failure to synchronize IAM users with ClickHouse clusters.</li> <li>● Resolved the issue that the Flume client in the cluster cannot use an agency to access OBS.</li> <li>● Resolved the issue that the value of <b>% of Queue</b> is not displayed for a specified job on the native Yarn web UI.</li> <li>● Resolved the issue that job logs are incompletely displayed on the native Yarn web UI.</li> <li>● Resolved the issue that temporary files reside in HDFS after execution of Hive jobs.</li> <li>● Resolved the incompatibility in the interconnection between open-source Sqoop 1.4.7 and MRS Hive.</li> <li>● Resolved the failure to query Avro tables through Hive on MR.</li> <li>● Resolved the memory leak issue caused when HiveServer loads user-defined functions (UDFs).</li> <li>● Resolved the issue that the execution results of Hive and SparkSQL time functions are inconsistent.</li> <li>● Resolved the issue (HIVE-20187) that the result is incorrect when Hive on Tez uses MapJoin to achieve performance tuning.</li> <li>● Resolved the issue that an error occurs when the <b>beeline -p</b> command is executed.</li> <li>● Resolved the issue that Hue fails to format SQL statements.</li> <li>● Resolved the failure to submit Oozie jobs due to the incompatibility between Hue and Oozie time zones.</li> <li>● Resolved the unavailability of the variable drop-down list when a variable-declared Hive SQL statement is executed on the Hue web UI.</li> <li>● Resolved the query failure caused by incorrectly closed sessions when Hue connects to Hive for queries.</li> <li>● Resolved slow responses to Kunpeng servers' queries of Kudu tables using Impala.</li> <li>● Resolved the failure to install the Kudu client.</li> <li>● Resolved the unexpected restarts of KuduMaster instance on Kunpeng servers.</li> <li>● Resolved the search exceptions on the Ranger web UI.</li> <li>● Resolved the failure to redirect users to the login page after the logout from the Ranger web UI.</li> </ul> |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                                         |                                                                         |
|-----------------------------------------|-------------------------------------------------------------------------|
| <b>Compatibility with Other Patches</b> | The MRS 3.0.5.1 patch can resolve all the issues detected in MRS 3.0.5. |
|-----------------------------------------|-------------------------------------------------------------------------|

## Impact of Patch Installation

- During the installation of MRS 3.0.5.1, the executor and controller processes are automatically restarted and cluster functions on the management plane, such as job submission and cluster scaling, will be affected. Therefore, install the patch at an appropriate time.
- After you install the patch, restart the Spark2x, Hive, Yarn, Impala, Kudu, and Hue components on FusionInsight Manager for the patch to take effect. During the restart, some services may be unavailable for a short period of time. To minimize the impact on service continuity, perform the restart at a proper time.
- To install the MRS 3.0.5.1 patch, you need to manually download the patch file and install it on any master node in the cluster. For details, see the **README.md** file in the patch package.
- This patch must be also installed for any new node subsequently added to the cluster. To install the patch for this new node, install the patch on the master node and restart the corresponding service.

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.11 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, YARN, MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are

temporarily unavailable but services are not interrupted during the rolling restart.

- After the MRS 2.1.0.11 patch is installed, log in to the **standby Master node** (Log in to MRS Manager. The Master node with a hollow pentagon on the **Host Management** page is the standby Master node), switch to user **omm**, and run the **sh /opt/knox/bin/restart-knox.sh** command to restart the Knox process. This operation is not required for a cluster with only one Master node.

You can run the **ps -ef |grep knox** command to check whether the knox process is started. If the knox process ID is displayed, the knox process is started successfully.

- (Optional) After installing the MRS 2.1.0.11 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For how to fully update the original client of the active and standby master nodes, see [Updating Client Configurations \(Version 2.x or Earlier\)](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(MRS 2.x or Earlier\)](#).

#### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.  
Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}"` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.
  - c. Restart the Tomcat service on the active Master node.
    - i. On the active Master node, run the `netstat -anp |grep 28443 |grep LISTEN` command as user **omm** to query the Tomcat process ID.
    - ii. Run the `kill -9 {pid}` command, in which `{pid}` indicates the process ID obtained in the previous step.

- iii. Wait for the process to automatically restart. You can run the **netstat -anp |grep 28443 |grep LISTEN** command to check whether the process is started. If the command output is displayed, the process is started successfully.
- d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.
  - HDFS/MapReduce/YARN: Add the custom configuration item **http.server.session.timeout.secs**.
  - Spark: Change the value of **spark.session.maxAge**.
  - Hive: Add the customized configuration item **http.server.session.timeout.secs**.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

## 7.8.3 MRS 2.1.0.10 Patch Description

### Basic Information

Table 7-38 Basic information

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.10 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, YARN, MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are

temporarily unavailable but services are not interrupted during the rolling restart.

- After installing the MRS 2.1.0.10 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For how to fully update the original client of the active and standby master nodes, see [Updating Client Configurations \(Version 2.x or Earlier\)](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(MRS 2.x or Earlier\)](#).

#### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.

Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}"` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.
  - c. Restart the Tomcat service on the active Master node.
    - i. On the active Master node, run the `netstat -anp |grep 28443 |grep LISTEN` command as user `omm` to query the Tomcat process ID.
    - ii. Run the `kill -9 {pid}` command, in which `{pid}` indicates the process ID obtained in the previous step.
    - iii. Wait for the process to automatically restart. You can run the `netstat -anp |grep 28443 |grep LISTEN` command to check whether the process is started. If the command output is displayed, the process is started successfully.
  - d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.
    - HDFS/MapReduce/YARN: Add the custom configuration item `http.server.session.timeout.secs`.

- Spark: Change the value of **spark.session.maxAge**.
- Hive: Add the customized configuration item **http.server.session.timeout.secs**.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

## 7.8.4 MRS 2.1.0.9 Patch Description

### Basic Information

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.9 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, YARN, MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are

temporarily unavailable but services are not interrupted during the rolling restart.

- After installing the MRS 2.1.0.9 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For how to fully update the original client of the active and standby master nodes, see [Updating Client Configurations \(Version 2.x or Earlier\)](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(MRS 2.x or Earlier\)](#).

#### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.

Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}`" in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.
  - c. Restart the Tomcat service on the active Master node.
    - i. On the active Master node, run the `netstat -anp |grep 28443 |grep LISTEN` command as user `omm` to query the Tomcat process ID.
    - ii. Run the `kill -9 {pid}` command, in which `{pid}` indicates the process ID obtained in the previous step.
    - iii. Wait for the process to automatically restart. You can run the `netstat -anp |grep 28443 |grep LISTEN` command to check whether the process is started. If the command output is displayed, the process is started successfully.
  - d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.
    - HDFS/MapReduce/YARN: Add the custom configuration item `http.server.session.timeout.secs`.

- Spark: Change the value of **spark.session.maxAge**.
- Hive: Add the customized configuration item **http.server.session.timeout.secs**.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

## 7.8.5 MRS 2.1.0.8 Patch Description

### Basic Information

Table 7-40 Basic information

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <p><b>Vulnerab<br/>ility<br/>Disclosur<br/>e</b></p>            | <p>The remote code execution vulnerability of the Spark has been fixed. For details about the vulnerability, see <a href="#">CVE-2020-9480</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.8 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, YARN, MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are

temporarily unavailable but services are not interrupted during the rolling restart.

- After installing the MRS 2.1.0.8 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For how to fully update the original client of the active and standby master nodes, see [Updating Client Configurations \(Version 2.x or Earlier\)](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(MRS 2.x or Earlier\)](#).

#### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.  
Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}"` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.
  - c. Restart the Tomcat service on the active Master node.
    - i. On the active Master node, run the `netstat -anp |grep 28443 |grep LISTEN` command as user `omm` to query the Tomcat process ID.
    - ii. Run the `kill -9 {pid}` command, in which `{pid}` indicates the process ID obtained in the previous step.
    - iii. Wait for the process to automatically restart. You can run the `netstat -anp |grep 28443 |grep LISTEN` command to check whether the process is started. If the command output is displayed, the process is started successfully.
  - d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.
    - HDFS/MapReduce/YARN: Add the custom configuration item `http.server.session.timeout.secs`.

- Spark: Change the value of **spark.session.maxAge**.
- Hive: Add the customized configuration item **http.server.session.timeout.secs**.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

## 7.8.6 MRS 2.1.0.7 Patch Description

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.7 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, YARN,

MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.

- After installing the MRS 2.1.0.7 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For how to fully update the original client of the active and standby master nodes, see [Updating Client Configurations \(Version 2.x or Earlier\)](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(MRS 2.x or Earlier\)](#).

#### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.  
Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}"` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.
  - c. Restart the Tomcat service on the active Master node.
    - i. On the active Master node, run the `netstat -anp |grep 28443 |grep LISTEN` command as user `omm` to query the Tomcat process ID.
    - ii. Run the `kill -9 {pid}` command, in which `{pid}` indicates the process ID obtained in the previous step.
    - iii. Wait for the process to automatically restart. You can run the `netstat -anp |grep 28443 |grep LISTEN` command to check whether the process is started. If the command output is displayed, the process is started successfully.
  - d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.
    - HDFS/MapReduce/YARN: Add the custom configuration item `http.server.session.timeout.secs`.

- Spark: Change the value of **spark.session.maxAge**.
- Hive: Add the customized configuration item **http.server.session.timeout.secs**.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

## 7.8.7 MRS 2.1.0.6 Patch Description

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.6 patch, MRS Manager will be restarted, and the components such as Hive, Impala, Spark, HDFS, YARN, MapReduce, Presto, HBase, Tez, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After installing the MRS 2.1.0.6 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).

- For how to fully update the original client of the active and standby master nodes, see [Updating Client Configurations \(Version 2.x or Earlier\)](#).
- For details about how to fully install the clients you set up, see [Installing a Client \(MRS 2.x or Earlier\)](#).

**NOTE**

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.
- (Optional) The timeout interval of the MRS Manager page and the native page of the component can be configured. You need to manually modify the following configuration:
  - a. Change the session timeout interval of the web and CAS services on all Master nodes.
    - i. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/web.xml`. The unit is minute.
    - ii. Change the value of `<session-timeout>20</session-timeout>` in `/opt/Bigdata/tomcat/webapps/web/WEB-INF/web.xml`. The unit is minute.
  - b. Change the TGT validity period of the CAS on all Master nodes.  
Change `1200` in `p:maxTimeToLiveInSeconds="$ {tgt.maxTimeToLiveInSeconds:1200}` and `p:timeToKillInSeconds="$ {tgt.timeToKillInSeconds:1200}"` in `/opt/Bigdata/tomcat/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml` to the corresponding timeout interval, in seconds.
  - c. Restart the Tomcat service on the active Master node.
    - i. On the active Master node, run the `netstat -anp |grep 28443 |grep LISTEN` command as user `omm` to query the Tomcat process ID.
    - ii. Run the `kill -9 {pid}` command, in which `{pid}` indicates the process ID obtained in the previous step.
    - iii. Wait for the process to automatically restart. You can run the `netstat -anp |grep 28443 |grep LISTEN` command to check whether the process is started. If the command output is displayed, the process is started successfully.
  - d. Add or modify configuration items for each component. The values of the configuration items are the same as the timeout interval, in seconds.
    - HDFS/MapReduce/YARN: Add the custom configuration item `http.server.session.timeout.secs`.
    - Spark: Change the value of `spark.session.maxAge`.
    - Hive: Add the customized configuration item `http.server.session.timeout.secs`.

When saving the configuration items, you can choose not to restart the affected services or instances. Restart the services or instances when the service is not busy.

## 7.8.8 MRS 2.1.0.3 Patch Description

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.3 patch, MRS Manager will be restarted, and the components such as Hive, Spark, HDFS, YARN, MapReduce, Presto, HBase, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After installing the MRS 2.1.0.3 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For how to fully update the original client of the active and standby master nodes, see [Updating Client Configurations \(Version 2.x or Earlier\)](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(MRS 2.x or Earlier\)](#).

### NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.

## Impact of Patch Installation

- During the installation of the MRS 2.1.0.2 patch, MRS Manager will be restarted, and the components such as Hive, Spark, HDFS, YARN, MapReduce, Presto, HBase, and related dependent services will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable, and services are not interrupted during the rolling restart.
- After installing the MRS 2.1.0.2 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).

- For how to fully update the original client of the active and standby master nodes, see [Updating Client Configurations \(Version 2.x or Earlier\)](#).
- For details about how to fully install the clients you set up, see [Installing a Client \(MRS 2.x or Earlier\)](#).

 **NOTE**

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.

| <b>Compatibility with Other Patches</b> | None                                                                                                                                                                                                                                                                                                                                                                                                       |

### Impact of Patch Installation

During the installation of MRS 2.1.0.1 patches, MRS Manager and Hive are restarted. During the restart, the services are temporarily unavailable.

After MRS 2.1.0.1 patches are installed, log in to the Master1 node of the MRS cluster and delete the job directory in HDFS.

- For a cluster with Kerberos authentication disabled, run the following command to delete the job directory in HDFS:

```
hdfs dfs -rm -r /mrs/mrsjob/hive
```

- For a cluster with Kerberos authentication enabled, perform the following operations to delete the job directory in HDFS:
  - a. Run the following command and enter the password to perform authentication.  
**kinit hdfs**
  - b. Run the following command to delete the job directory in HDFS:  
**hdfs dfs -rm -r /mrs/mrsjob/hive**

 **NOTE**

This step is not required for a new MRS cluster because the directory does not exist in HDFS.

## 7.8.11 MRS 2.0.6.1 Patch Description

### Impact of Patch Installation

During the installation of the MRS 2.0.6.1 patch, MRS Manager will be restarted, and the components such as Hive and services with dependency will be restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable, and services are not interrupted during the rolling restart.

| <b>Compatibility with Other Patches</b> | The MRS 1.9.3.3 patch package contains all patches released for MRS 1.9.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Impact of Patch Installation

- During the installation of the MRS 1.9.3.3 patch, MRS Manager is restarted, and Hadoop, HDFS, Hive, Spark, and related dependent services are restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After installing the MRS 1.9.3.3 patch, you need to download and install all clients again, including the original clients of Master nodes and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For how to fully update the original client of the active and standby master nodes, see [Updating Client Configurations \(Version 2.x or Earlier\)](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(MRS 2.x or Earlier\)](#).

 NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.

## 7.8.16 MRS 1.9.3.1 Patch Description

| <b>Release Date</b>                     | 2020-09-04                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Resolved Issues</b>                  | <p><b>MRS Manager</b><br/>Solved the problem that Task nodes fail to be removed from a custom cluster.</p> <p><b>MRS big data components</b><br/>Solved the problem that the version of the <b>adapter-hadoop-wrapper-file-system</b> package in the Hive and Spark paths is incorrect.</p> <p>Solved the problem that multiple namespaces saved on FusionInsight Manager of HBase do not take effect in the background.</p> <p>Added HDFSWrapper to support AbstractFileSystem.</p> |
| <b>Compatibility with Other Patches</b> | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Impact of Patch Installation

- During the installation of the MRS 1.9.3.1 patch, MRS Manager is restarted, and Hadoop, HDFS, Hive, Spark, and related dependent services are restarted in rolling mode. During the restart of MRS Manager, services are temporarily unavailable but services are not interrupted during the rolling restart.
- After installing the MRS 1.9.3.1 patch, you need to download and install all clients again, including the original clients of the Master node and the clients used by other nodes of VPC (that is, the clients that you set up).
  - For how to fully update the original client of the active and standby master nodes, see [Updating Client Configurations \(Version 2.x or Earlier\)](#).
  - For details about how to fully install the clients you set up, see [Installing a Client \(MRS 2.x or Earlier\)](#).

 NOTE

- You are advised to back up the old clients before reinstalling the new ones.
- If you have modified client configurations based on the service scenario, modify them again after reinstalling the clients.

## 7.8.17 MRS 1.9.2.2 Patch Description
