

# A Vulkan Video Encoder from Mesa to GStreamer

Hyunjun Ko / Stéphane Cerveau

2024-01-06

**Vulkanised 2024**

The 6<sup>th</sup> Vulkan Developer  
Conference  
Sunnyvale, California | February  
5-7, 2024

# Implementing a Vulkan Video encoder from Mesa to GStreamer

Stéphane Cerveau, Igalia  
Hyunjun Ko, Igalia

# Agenda

1. Vulkan Video
2. Mesa - driver
3. GStreamer - application
4. Demos

# Vulkan Video

- Stateless codecs using GPU hardware acceleration
- Supported codecs: H.264, H.265, AV1
- Closer integration with Graphics and Displays.
- Cross-platform and vendor-neutral low-level HW state(-less) video codecs API
  - Each driver can operate differently depending on its capabilities with a common API.

# Vulkan Video Timeline

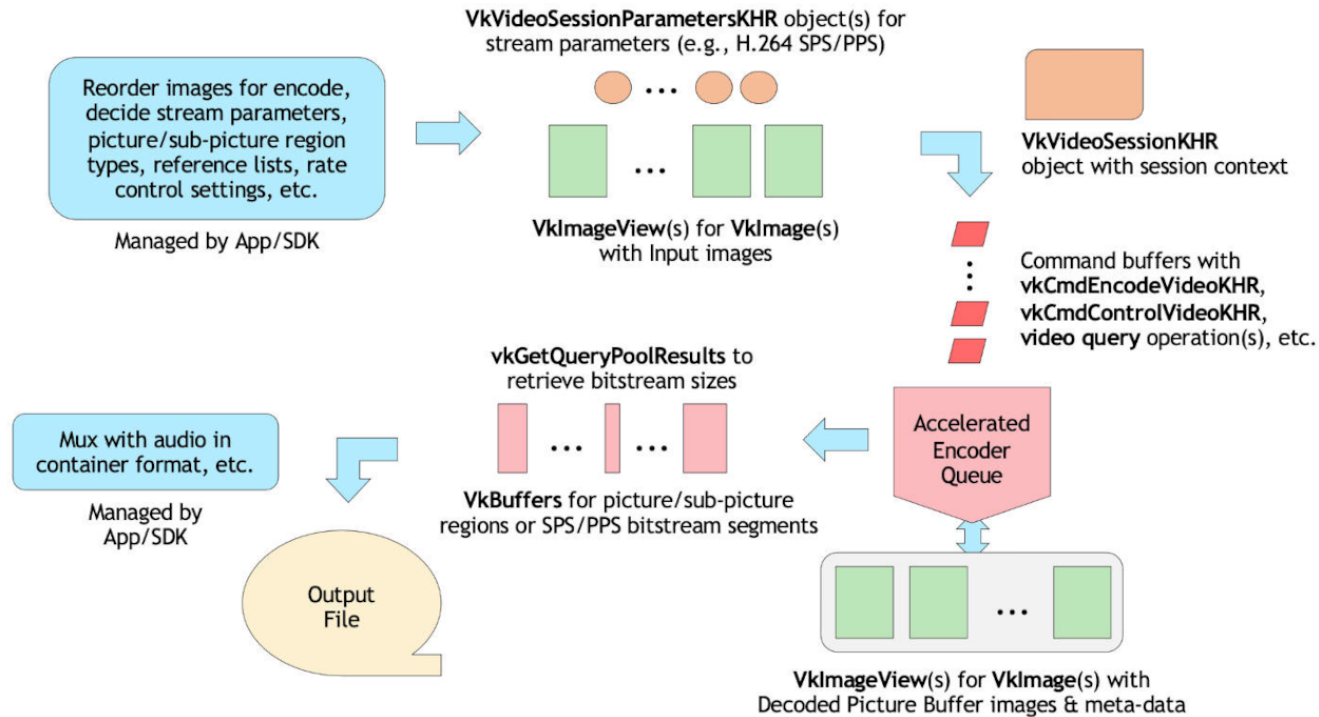

- **March 2018:** TSG was created and driven by IHVs such as AMD/Intel/Nvidia and open source operators
- **April 2021:** **Provisional extensions released** including the Video Decode and Encode extensions
- **January 2023:** Video Extensions for Accelerated H.264 and H.265 Decode **released**
- **December 2023:** Khronos **finalized** Vulkan Video Extensions for Accelerated H.264 and H.265 Encode

# Encoding basics

# Vulkan Video Encoding

# The status of Vulkan Video Encoder Support in Mesa project

# Contents

- What is Mesa?
- History of Vulkan Video development in Mesa
- Drivers supporting Vulkan Video in Mesa
- Development of Vulkan Video Encoding on Intel GPUs
- Challenges
- Plan

# What is Mesa?

- <https://mesa3d.org/>
- Began as an open source implementation of the OpenGL.
- Now actively implementing Vulkan specification on various GPUs.
  - Intel, AMD, Qualcomm Adreno(R/E), Raspberry PI, etc..
  - <https://gitlab.freedesktop.org/mesa/mesa>
- Contributors: Igalia, Intel, Google, Collabora, Mesa community.

# History of Vulkan Video development in Mesa

- Dave Airlie started in 2022 on AMD and Intel GPU(RADV and ANV)
  - [Dave's blog post](#)
  - With [Lynne](#) on FFmpeg.
  - Igalia joined on GStreamer later.
- Hyunjun joined in 2023, started working on Intel GPU(ANV)
- So Dave fully dedicated to AMD GPU(RADV).

# The status of Vulkan Video development in Mesa

- Implemented and landed decoder first for h264 and h265.
  - [ANV H264 MR #20782](#)
  - [ANV H265 MR #22202](#)
  - [RADV H264/265 MR #20388](#)
- Now MR for h264/5 encoding are almost ready.
  - [RADV MR](#)
  - [ANV Branch](#)

# Drivers supporting Vulkan Video in Mesa

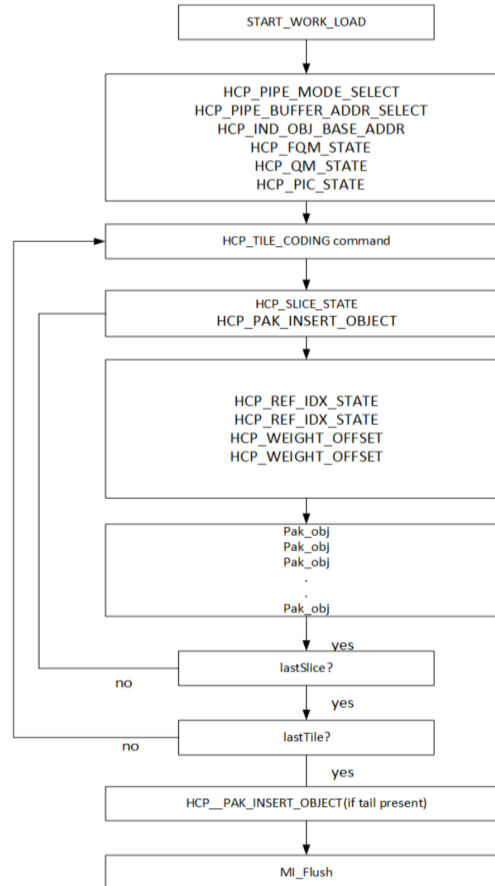

GPU	H264 dec	H265 dec	H264 enc	H265 enc
Intel(ANV)	O	O	WIP	WIP
AMD (RADV)	O	O	Ready	Ready

# Working on Intel GPUs (1)

- Dived into Intel Vulkan driver(ANV) in 2023.
  - Started working on H265 decoding first.
- Tons of documents and source code of Intel VA-API drivers.
  - Exhausted to learn lots of Video commands.
  - But better than nothing :)

# Working on Intel GPUs (2)

- H265 Encoding Sequence

# Working on Intel GPUs (3)

- Complete each command very carefully.
  - Otherwise you got a GPU hang or even whole system down.
- When you get a GPU hang and don't see any clue.
  - Dumping whole video commands encoding a frame(by VAAPI Driver) into a file.
  - Compare to commands that you created

# Working on Intel GPUs (4)

- Thanks to the existing infrastructures of ANV
  - Easy to handle memories and images.
- Thanks to ANV maintainers.
  - They actively reviewed relevant merge requests.

# Co-working with Applications

- GStreamer, VK CTS, FFMpeg...
- Each uses different parameters and makes it find bugs easily.
  - Different resolution, profile, SPS, PPS parameters.

# Challenges

- GPU hang.
  - Not enough useful tools to investigate.
- Lots of generations of Intel GPUs.
  - Different commands, parameters, memory size, alignment, etc...

# Plan 2024

- Land h264/h265 encoding support.
- AV1 support.
- Support other GPUs?

- a 20-year-old framework for streaming media applications.
- Black boxes interconnection system
- Native, multiplatform, highly-optimized framework

# GStreamer pipeline

The screenshot shows the GStreamer Pipeline Studio interface. The main workspace displays a pipeline graph with the following elements and connections:

- videotestsrc** (src\_0) is connected to **vulkanupload** (sink\_0).
- vulkanupload** (sink\_0) is connected to **vulkanh264enc** (sink\_0).
- vulkanh264enc** (sink\_0) is connected to **vulkanh264dec** (sink\_0).
- vulkanh264dec** (sink\_0) is connected to **vulkandownload** (sink\_0).
- vulkandownload** (sink\_0) is connected to **autovideosink** (sink\_0).

Additional details in the interface include:

- A play button and a timer showing 0:09:27/0:00:00.
- A right-hand sidebar with "Elements" and "Favorites" tabs, listing various GStreamer elements like 3gppmux, aacparse, ac3parse, accurip, adder, adpcmdec, and adpcmenc.
- A bottom status bar with "App", "GST", and "Messages" sections.
- A small window titled "gst-pipeline-studio" in the bottom right corner showing a test pattern.

**Messages Log:**

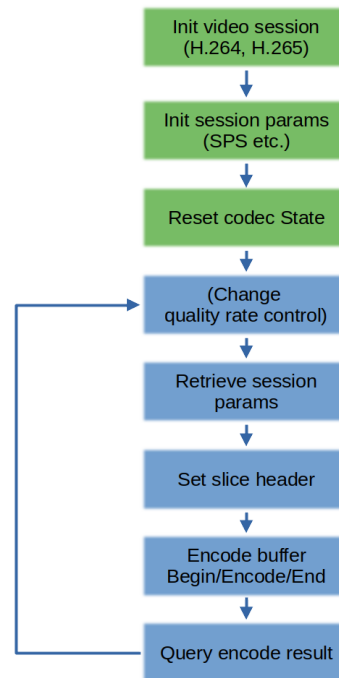

```
15:55:56 [DEBUG] (1) gst_pipeline_studio::logger:gst_pipeline_studio::graphbook::create_graphtab::((closure)) Graph updated id=0
15:47:05 [INFO] gst_pipeline_studio::gps::player::Player::create_pipeline::((closure)) Received the signal deep element added xvimagesink
15:47:05 [INFO] gst_pipeline_studio::gps::element::ElementInfo::search_for_element Found factory: videotestsrc
15:47:06 [INFO] gst_pipeline_studio::element::ElementInfo::search_for_element Found factory: vulkanupload
Playing
```

# Vulkan Video support

- Follow [Vulkan Video Status](#)
- Vulkan H.264 decoder [merged](#) in December 2023
- Vulkan H.264/H.265 encoder [under review](#).

# State machine

# Challenges

# Cross platform API

- Hardware crashes, Thanks Validation Layers!
- Exact behavior varies by hardware vendor
- Rate control and quality issues

# Synchronization

- Major issues with both decoder and encoder
  - Old memories from Vulkanised 2023, green screen...
  - Rework of GStreamer state machine with memory barriers, fences.
  - GstVulkanOperation to handle commands synchronization.

# DPB management

- Understand the correct use of Begin and Encode reference slots.
  - Need to declare the reference within *Begin* command and use it during the *Encode* command.
- Various crashes in drivers not detected by the Validation Layers when the standard H.26x parameters (SPS, slice header) were not filled properly.
- Vulkan reference slots management.

# Vulkan tooling

- Validation Layers:
  - Help validate we understand the specifications correctly
  - Do not prevent a misconfiguration of the std parameters
  - Mesa drivers helped to understand driver's pitfalls when VL was clear.
- GFXReconstruct, VK\_LAYER\_LUNARG\_api\_dump layer.
- CTS: Help with a reference design reviewed by IHVs.

# Demos
