6

Network Controller Sideband Interface (NC-SI) Specification

7
8
9
10

Supersedes: 1.1.1

Document Class: Normative

Document Status: DMTF Standard

Document Language: en-US

11 Copyright Notice

12 Copyright © 2009, 2013, 2015, 2019–2023 DMTF. All rights reserved.

13 DMTF is a not-for-profit association of industry members dedicated to promoting enterprise and systems
14 management and interoperability. Members and non-members may reproduce DMTF specifications and
15 documents, provided that correct attribution is given. As DMTF specifications may be revised from time to
16 time, the particular version and release date should always be noted.

17 Implementation of certain elements of this standard or proposed standard may be subject to third-party
18 patent rights, including provisional patent rights (herein “patent rights”). DMTF makes no representations
19 to users of the standard as to the existence of such rights and is not responsible to recognize, disclose, or
20 identify any or all such third-party patent right owners or claimants nor for any incomplete or inaccurate
21 identification or disclosure of such rights, owners, or claimants. DMTF shall have no liability to any party,
22 in any manner or circumstance, under any legal theory whatsoever, for failure to recognize, disclose, or
23 identify any such third-party patent rights, or for such party’s reliance on the standard or incorporation
24 thereof in its product, protocols or testing procedures. DMTF shall have no liability to any party
25 implementing such standard, whether such implementation is foreseeable or not, nor to any patent owner
26 or claimant, and shall have no liability or responsibility for costs or losses incurred if a standard is
27 withdrawn or modified after publication, and shall be indemnified and held harmless by any party
28 implementing the standard from any and all claims of infringement by a patent owner for such
29 implementations.

30 For information about patents held by third-parties which have notified the DMTF that, in their opinion,
31 such patents may relate to or impact implementations of DMTF standards, visit
32 <https://www.dmtf.org/about/policies/disclosures.php>.

CONTENTS

36	Foreword	16
37	Introduction.....	17
38	1 Scope	18
39	2 Normative references	18
40	3 Terms and definitions	19
41	3.1 Wording Interpretation	19
42	3.2 Requirement term definitions	19
43	3.3 NC-SI term definitions.....	21
44	3.4 Numbers and number bases	24
45	3.5 Network Addresses.....	24
46	3.6 Reserved fields	24
47	4 Acronyms and abbreviations.....	24
48	5 NC-SI overview	27
49	5.1 General	27
50	5.2 Defined topologies	28
51	5.3 Single and integrated Network Controller implementations.....	29
52	5.4 Transport stack	31
53	5.5 Transport protocol.....	32
54	5.6 Byte and bit ordering for transmission	32
55	6 Operational behaviors	33
56	6.1 Typical operational model.....	33
57	6.1.1 State definitions and defined states.....	33
58	6.1.2 NC-SI RBT pre-operational states	34
59	6.1.3 Package Ready state.....	34
60	6.1.4 Initial State	35
61	6.1.5 NC-SI Initial State recovery	35
62	6.1.6 State transition diagram	36
63	6.1.7 State diagram for NC-SI operation with hardware arbitration.....	38
64	6.1.8 Resets.....	39
65	6.1.9 Network Controller Channel ID	39
66	6.1.10 Configuration-related settings.....	40
67	6.1.11 Transmitting Pass-through packets from the Management Controller	41
68	6.1.12 Receiving Pass-through packets for the Management Controller	41
69	6.1.13 Pass-through operation in multiple medium implementations	42
70	6.1.14 Startup sequence examples	42
71	6.2 NC-SI traffic types.....	47
72	6.2.1 Overview	47
73	6.2.2 Command protocol.....	47
74	6.3 Link configuration and control.....	50
75	6.3.1 Link Configuration.....	50
76	6.3.2 Link Status	50
77	6.4 Frame filtering for Pass-through mode	50
78	6.4.1 Overview	50
79	6.4.2 Multicast filtering	50
80	6.4.3 Broadcast filtering	50
81	6.4.4 VLAN filtering	50
82	6.5 Output buffering behavior	52
83	6.6 NC-SI flow control.....	52
84	6.7 Asynchronous Event Notification	52
85	6.7.1 Overview	52
86	6.7.2 AEN handling in multiple medium implementations	53

87	6.8	Error handling	53
88	6.8.1	Overview	53
89	6.8.2	Transport errors	53
90	6.8.3	Missing responses	54
91	6.8.4	Detecting Pass-through traffic interruption	54
92	6.9	Support for additional network fabrics	55
93	6.9.1	FC support	55
94	6.9.2	InfiniBand Support	55
95	6.10	PLDM and SPDM transport	55
96	7	Arbitration in configurations with multiple Network Controller packages	58
97	7.1	Overview	58
98	7.2	Multi-controller RBT	58
99	7.3	Hardware arbitration	59
100	7.3.1	General	59
101	7.3.2	Hardware arbitration opcodes	60
102	7.3.3	Opcode operations	62
103	7.3.4	Bypass mode	64
104	7.3.5	Hardware arbitration startup	64
105	7.3.6	ARB_MSTR assignment	64
106	7.3.7	Token timeout mechanism	64
107	7.3.8	Timing considerations	65
108	7.3.9	Example hardware arbitration state machine	66
109	7.4	Command-based arbitration	68
110	8	Packet definitions	69
111	8.1	NC-SI packet encapsulation	69
112	8.1.1	Ethernet frame header	69
113	8.1.2	Frame Check Sequence	70
114	8.1.3	Data length	70
115	8.2	Control Packet data structure	70
116	8.2.1	Control Packet header	70
117	8.2.2	Control Packet payload	72
118	8.2.3	Command packet payload	73
119	8.2.4	Response packet payload	73
120	8.2.5	Response codes and reason codes	74
121	8.2.6	AEN packet format	77
122	8.2.7	Single OEM AEN packet format	78
123	8.2.8	Multiple OEMs AEN packet format	78
124	8.3	Control Packet type definitions	79
125	8.4	Command and response packet formats	84
126	8.4.1	NC-SI command frame format	84
127	8.4.2	NC-SI response packet format	84
128	8.4.3	Clear Initial State command (0x00)	85
129	8.4.4	Clear Initial State response (0x80)	85
130	8.4.5	Select Package command (0x01)	86
131	8.4.6	Select Package response (0x81)	88
132	8.4.7	Deselect Package command (0x02)	88
133	8.4.8	Deselect Package response (0x82)	89
134	8.4.9	Enable Channel command (0x03)	89
135	8.4.10	Enable Channel response (0x83)	89
136	8.4.11	Disable Channel command (0x04)	90
137	8.4.12	Disable Channel response (0x84)	91
138	8.4.13	Reset Channel command (0x05)	91
139	8.4.14	Reset Channel response (0x85)	91
140	8.4.15	Enable Channel Network TX command (0x06)	92

141	8.4.16	Enable Channel Network TX response (0x86)	92
142	8.4.17	Disable Channel Network TX command (0x07).....	92
143	8.4.18	Disable Channel Network TX response (0x87).....	93
144	8.4.19	AEN Enable command (0x08)	93
145	8.4.20	AEN Enable response (0x88)	94
146	8.4.21	Set Link command (0x09).....	95
147	8.4.22	Set Link Response (0x89).....	98
148	8.4.23	Get Link Status command (0x0A)	99
149	8.4.24	Get Link Status response (0x8A)	99
150	8.4.25	Set VLAN Filter command (0x0B).....	104
151	8.4.26	Set VLAN Filter response (0x8B).....	106
152	8.4.27	Enable VLAN command (0x0C)	106
153	8.4.28	Enable VLAN response (0x8C)	108
154	8.4.29	Disable VLAN command (0x0D).....	108
155	8.4.30	Disable VLAN response (0x8D).....	109
156	8.4.31	Set MAC Address command (0x0E)	109
157	8.4.32	Set MAC Address response (0x8E)	111
158	8.4.33	Enable Broadcast Filter command (0x10)	112
159	8.4.34	Enable Broadcast Filter response (0x90)	113
160	8.4.35	Disable Broadcast Filter command (0x11).....	114
161	8.4.36	Disable Broadcast Filter response (0x91).....	114
162	8.4.37	Enable Global Multicast Filter command (0x12).....	114
163	8.4.38	Enable Global Multicast Filter response (0x92).....	119
164	8.4.39	Disable Global Multicast Filter command (0x13).....	120
165	8.4.40	Disable Global Multicast Filter response (0x93).....	120
166	8.4.41	Set NC-SI Flow Control command (0x14)	121
167	8.4.42	Set NC-SI Flow Control response (0x94)	122
168	8.4.43	Get Version ID command (0x15)	122
169	8.4.44	Get Version ID Response (0x95).....	123
170	8.4.45	Get Capabilities command (0x16)	125
171	8.4.46	Get Capabilities response (0x96).....	125
172	8.4.47	Get Parameters command (0x17).....	128
173	8.4.48	Get Parameters response (0x97).....	128
174	8.4.49	Get Controller Packet Statistics command (0x18).....	132
175	8.4.50	Get Controller Packet Statistics response (0x98).....	132
176	8.4.51	Get NC-SI Statistics command (0x19).....	136
177	8.4.52	Get NC-SI Statistics response (0x99).....	137
178	8.4.53	Get NC-SI Pass-through Statistics command (0x1A)	138
179	8.4.54	Get NC-SI Pass-through Statistics response (0x9A)	139
180	8.4.55	Get Package Status command (0x1B).....	140
181	8.4.56	Get Package Status response (0x9B).....	141
182	8.4.57	Get NC Capabilities and Settings command (0x25)	141
183	8.4.58	Get NC Capabilities and Settings response (0xA5)	142
184	8.4.59	Set NC Configuration command (0x26).....	144
185	8.4.60	Set NC Configuration response (0xA6)	145
186	8.4.61	Get PF Assignment command (0x27)	145
187	8.4.62	Get PF Assignment Response (0xA7)	146
188	8.4.63	Set PF Assignment command (0x28)	148
189	8.4.64	Set PF Assignment Response (0xA8)	150
190	8.4.65	Get Channel Configuration command (0x29)	151
191	8.4.66	Get Channel Configuration response (0xA9)	151
192	8.4.67	Set Channel Configuration command (0x2A).....	153

193	8.4.68	Set Channel Configuration response (0xAA).....	155
194	8.4.69	Get Partition Configuration command (0x2B)	155
195	8.4.70	Get Partition Configuration response (0xAB)	156
196	8.4.71	Set Partition Configuration command (0x2C)	160
197	8.4.72	Set Partition Configuration response (0xAC)	163
198	8.4.73	Get Boot Config Command (0x2D)	163
199	8.4.74	Get Boot Config Response (0xAD).....	164
200	8.4.75	Set Boot Config command (0x2E).....	168
201	8.4.76	Set Boot Config Response (0xAE)	169
202	8.4.77	Get Partition Statistics command (0x2F)	170
203	8.4.78	Get Partition Statistics response for Ethernet (0xAF)	171
204	8.4.79	Get Partition Statistics response for FCoE (0xAF)	174
205	8.4.80	Get Partition Statistics response for iSCSI (0xAF)	175
206	8.4.81	Get Partition Statistics response for InfiniBand (0xAF).....	176
207	8.4.82	Get Partition Statistics response for RDMA (0xAF)	178
208	8.4.83	Get Partition Statistics Response for Fibre Channel (0xAF)	180
209	8.4.84	Set Module Management Data command (0x30)	181
210	8.4.85	Set Module Management Data response (0xB0)	182
211	8.4.86	Get FC Link Status command (0x31)	183
212	8.4.87	Get FC Link Status Response (0xB1)	184
213	8.4.88	Get Module Management Data command (0x32)	186
214	8.4.89	Get Module Management Data response (0xB2)	187
215	8.4.90	Set Pass-through Mode Control Command (0x33)	189
216	8.4.91	Set Pass-through Mode Control Response (0xB3).....	190
217	8.4.92	Get Pass-through Mode Command (0x34).....	190
218	8.4.93	Get Pass-through Mode Response (0xB4)	191
219	8.4.94	Get VF Allocation command (0x35)	192
220	8.4.95	Get VF Allocation Response (0xB5)	192
221	8.4.96	Set VF Allocation command (0x36)	193
222	8.4.97	Set VF Allocation Response (0xB6)	194
223	8.4.98	Get InfiniBand Link Status command (0x38)	194
224	8.4.99	Get InfiniBand Link Status Response (0xB8)	195
225	8.4.100	Get InfiniBand Statistics command (0x39)	197
226	8.4.101	Get InfiniBand Statistics Response (0xB9)	197
227	8.4.102	Settings Commit command (0x47)	199
228	8.4.103	Settings Commit response (0xC7)	200
229	8.4.104	Get ASIC Temperature (0x48).....	200
230	8.4.105	Get ASIC Temperature Response (0xC8)	201
231	8.4.106	Get Ambient Temperature (0x49)	201
232	8.4.107	Get Ambient Temperature Response (0xC9)	202
233	8.4.108	Get Transceiver Temperature (0x4A)	202
234	8.4.109	Get Transceiver Temperature Response (0xCA).....	203
235	8.4.110	Thermal Shutdown Control Command (0x4B)	203
236	8.4.111	Thermal Shutdown Control Response (0xCB).....	204
237	8.4.112	Transmit Data to NC command (0x4C).....	205
238	8.4.113	Transmit Data to NC response (0xCC).....	206
239	8.4.114	Receive Data from NC command (0x4D).....	207
240	8.4.115	Receive Data from NC response (0xCD).....	208
241	8.4.116	Get Inventory Information command (0x4E)	210
242	8.4.117	Get Inventory Information response (0xCE)	210
243	8.4.118	OEM command (0x50)	211
244	8.4.119	OEM response (0xD0)	212

245	8.4.120 PLDM Request (0x51)	212
246	8.4.121 PLDM Response (0xD1)	213
247	8.4.122 Get Package UUID command (0x52)	213
248	8.4.123 Get Package UUID response (0xD2)	214
249	8.4.124 Query and Set OEM AEN command (0x53)	215
250	8.4.125 Query and Set OEM AEN Response (0xD3).....	215
251	8.4.126 Transport-specific AEN Enable command (0x55).....	216
252	8.4.127 Transport-specific AENs Enable Response (0xD5)	217
253	8.4.128 Query Pending NC PLDM Request (0x56).....	217
254	8.4.129 Query Pending NC PLDM Request Response (0xD6).....	218
255	8.4.130 Send NC PLDM Reply (0x57).....	218
256	8.4.131 Send NC PLDM Reply Response (0xD7).....	219
257	8.4.132 Get MC MAC Address command (0x58)	220
258	8.4.133 Get MC MAC Address response (0xD8).....	220
259	8.4.134 SPDM command (0x60).....	221
260	8.4.135 SPDM Response (0xE0).....	221
261	8.4.136 Query Pending NC SPDM Request (0x61)	222
262	8.4.137 Query Pending NC SPDM Request Response (0xE1)	222
263	8.4.138 Send NC SPDM Reply (0x62).....	223
264	8.4.139 Send NC SPDM Reply Response (0xE2).....	223
265	8.5 AEN packet formats	224
266	8.5.1 Link Status Change AEN	224
267	8.5.2 Configuration Required AEN	225
268	8.5.3 Host Network Controller Driver Status Change AEN.....	225
269	8.5.4 Delayed Response Ready AEN.....	226
270	8.5.5 InfiniBand Link Status Change AEN	226
271	8.5.6 Fibre Channel Link Status Change AEN	227
272	8.5.7 Transceiver Event AEN	227
273	8.5.8 Request Data Transfer AEN	229
274	8.5.9 Partition Link Status Change AEN.....	229
275	8.5.10 Thermal Shutdown Event AEN	230
276	8.5.11 Pending PLDM Request AEN.....	231
277	8.5.12 Pending SPDM Request AEN	231
278	9 Packet-based and opcode timing.....	233
279	10 RBT Electrical specification.....	235
280	10.1 Topologies	235
281	10.2 Electrical and signal characteristics and requirements.....	236
282	10.2.1 Companion specifications.....	236
283	10.2.2 Full-duplex operation	236
284	10.2.3 Signals	236
285	10.2.4 High-impedance control.....	237
286	10.2.5 Hardware Implementations.....	237
287	10.2.6 DC characteristics.....	238
288	10.2.7 AC characteristics.....	239
289	10.2.8 Interface power-up.....	243
290	10.2.9 REF_CLK startup.....	244
291	10.3 RBT Implementation guidance	244
292	ANNEX A (normative) Extending the model	245
293	A.1 Commands extension	245
294	A.2 Design considerations.....	245
295	A.2.1 PHY support.....	245
296	A.2.2 Multiple Management Controllers support.....	245
297	ANNEX B (informative) Relationship to RMI Specification	246
298	B.1 Differences from the <i>RMI Specification</i>	246

299 ANNEX C (informative) Change log..... 248
300 Bibliography 249
301

302 **Figures**

303 Figure 1 – NC-SI functional block diagram 27

304 Figure 2 – NC-SI RBT traffic flow diagram..... 28

305 Figure 3 – Example topologies supported by the NC-SI..... 29

306 Figure 4 – Network Controller integration options..... 30

307 Figure 5 – NC-SI transport stack 32

308 Figure 6 – NC-SI package/channel operational state diagram 37

309 Figure 7 – NC-SI operational state diagram for hardware arbitration operation..... 38

310 Figure 8 – MC steps when the MC does not have prior knowledge of hardware arbitration..... 46

311 Figure 9 – NC-SI packet filtering flowchart 51

312 Figure 10 – Basic multi-drop block diagram..... 58

313 Figure 11 – Multiple Network Controllers in a ring format..... 60

314 Figure 12 – Opcode to RXD relationship 61

315 Figure 13 – Example TOKEN to transmit relationship 65

316 Figure 14 – Hardware arbitration state machine..... 66

317 Figure 15 – Ethernet frame encapsulation of NC-SI packet data without VLAN tag 69

318 Figure 16 – Example NC-SI RBT signal interconnect topology 235

319 Figure 17 – DC measurements 238

320 Figure 18 – AC measurements 240

321 Figure 19 – Overshoot measurement 242

322 Figure 20 – Undershoot measurement 243

323

324 **Tables**

325 Table 1 – NC-SI operating state descriptions 33

326 Table 2 – Channel ID format 40

327 Table 3 – Channel Ready state configuration settings 41

328 Table 4 – Commands for RBT binding..... 55

329 Table 5 – Hardware arbitration di-bit encoding..... 60

330 Table 6 – Hardware arbitration opcode format 61

331 Table 7 – Hardware arbitration states 67

332 Table 8 – Hardware arbitration events..... 67

333 Table 9 – Ethernet Header Format 69

334 Table 10 – Control Packet header format 71

335 Table 11 – Generic example of Control Packet payload 72

336 Table 12 – Generic example of Response packet payload 74

337 Table 13 – Generic example of Delayed Response packet payload..... 74

338 Table 14 – Reason code ranges 75

339 Table 15 – Standard response code values 75

340 Table 16 – Standard Reason Code Values 77

341 Table 17 – AEN packet format..... 78

342 Table 18 – AEN Type Ranges 78

343 Table 19 – OEM AEN packet format..... 78

344 Table 20 – Multiple OEMs AEN packet format 79

345 Table 21 – Command and Response types..... 79

Foreword

610 The *Network Controller Sideband Interface (NC-SI) Specification* (DSP0222) was prepared by the PMCI
611 Working Group.

612 This version supersedes version 1.1.1. For a list of changes, see the Change Log in ANNEX C.

613 DMTF is a not-for-profit association of industry members dedicated to promoting enterprise and systems
614 management and interoperability.

633

634

Introduction

635 In out-of-band management environments, the interface between the out-of-band Management Controller
636 and the Network Controller is critical. This interface is responsible for supporting communication between
637 the Management Controller and external management applications.

638 The goal of this specification is to define an interoperable sideband communication interface standard to
639 enable the exchange of management data between the Management Controller and Network Controller.
640 The Sideband Interface is intended to provide network access for the Management Controller, and the
641 Management Controller is expected to perform all the required network functions.

642 This specification defines the protocol and commands necessary for the operation of the sideband
643 communication interface. This specification also defines physical and electrical characteristics of a
644 sideband binding interface that is a variant of RMII targeted specifically for sideband communication
645 traffic.

646 The specification is primarily intended for architects and engineers involved in the development of
647 Network and Management Controllers that will be used in providing out-of-band management
648 functionality.

649 1 Scope

650 This specification defines the functionality and behavior of the Sideband Interface responsible for
651 connecting the Network Controller (including Ethernet, Fibre Channel, and InfiniBand controllers) to the
652 Management Controller. It also outlines the behavioral model of the network traffic destined for the
653 Management Controller from the Network Controller.

654 This specification defines the following two aspects of the Network Controller Sideband Interface (NC-SI):

- 655 • behavior of the interface, which includes its operational states as well as the states of the
656 associated components.
- 657 • the payloads and commands of the communication protocol supported over the interface.

658 The scope of this specification is limited to addressing only a single Management Controller
659 communicating with one or more Network Controllers.

660 This specification also defines the following aspects of a 3.3 V RMIIBased Transport (RBT) based
661 physical medium:

- 662 • transport binding for NC-SI over RBT
- 663 • electrical and timing requirements for the RBT
- 664 • an optional hardware arbitration mechanism for RBT

665 Only the topics that may affect the behavior of the Network Controller or Management Controller, as it
666 pertains to the Sideband Interface operations, are discussed in this specification.

705 **3 Terms and definitions**

706 **3.1 Wording Interpretation**

707 In this document, some terms have a specific meaning beyond the normal English meaning. Those terms
708 are defined in this clause.

709 The terms "shall" ("required"), "shall not", "should" ("recommended"), "should not" ("not recommended"),
710 "may", "need not" ("not required"), and "can" in this document are to be interpreted as described in
711 [ISO/IEC Directives, Part 2](#), Clause 7. The terms in parentheses are alternatives for the preceding term,
712 for use in exceptional cases when the preceding term cannot be used for linguistic reasons. Note that
713 [ISO/IEC Directives, Part 2](#), Clause 7 specifies additional alternatives. Occurrences of such additional
714 alternatives shall be interpreted in their normal English meaning.

715 The terms "clause", "subclause", "paragraph", and "annex" in this document are to be interpreted as
716 described in [ISO/IEC Directives, Part 2](#), Clause 6.

717 The terms "normative" and "informative" in this document are to be interpreted as described in [ISO/IEC](#)
718 [Directives, Part 2](#), Clause 3. In this document, clauses, subclauses, or annexes labeled "(informative)" do
719 not contain normative content. Notes and examples are always informative elements.

720 The terms defined in [DSP0004](#), [DSP0223](#), and [DSP1001](#) apply to this document. The following additional
721 terms are used in this document.

722 **3.2 Requirement term definitions**

723 This clause defines key phrases and words that denote requirement levels in this specification.

- 724 **3.2.1**
725 **can**
726 indicates an ability or capability expressed by the specification or of the possibility of some outcome in the
727 context of the specification
- 728 **3.2.2**
729 **cannot**
730 indicates the inability or denial of the possibility of a certain outcome in the context of the specification
- 731 **3.2.3**
732 **conditional**

766 indicates that the item is an absolute requirement of the specification

767 **3.2.14**

768 **shall not**

769 indicates that the item is an absolute prohibition of the specification

770 **3.2.15**

771 **should**

772 indicates a recommendation of the specification, but the full implications should be understood and
773 carefully weighed before choosing a different course

774 **3.2.16**

775 **should not**

776 indicates a recommendation against, but the full implications should be understood and carefully weighed
777 before implementing any behavior described with this label

778 **3.3 NC-SI term definitions**

779 For the purposes of this document, the following terms and definitions apply.

780 **3.3.1**

781 **frame**

782 a data packet of fixed or variable length that has been encoded for digital transmission over a node-to-
783 node link

784 *Frame* is used in references to [IEEE 802.3 Frames](#). *Packet* is used in all other references.

785 **3.3.2**

786 **packet**

787 a formatted block of information carried by a computer network

788 *Frame* is used in references to [IEEE 802.3 Frames](#). *Packet* is used in all other references.

789 **3.3.3**

790 **external network interface**

791 the interface of the Network Controller that provides connectivity to the external network infrastructure;
792 also known as *port*

793 **3.3.4**

794 **internal host interface**

795 the interface of the Network Controller that provides connectivity to the host operating system running on
796 the platform

797 **3.3.5**

798 **Management Controller**

799 an intelligent entity composed of hardware/firmware/software that resides within a platform and is
800 responsible for some or all of the management functions associated with the platform; also known as
801 BMC and Service Processor

802 **3.3.6**803 **Network Controller**

804 the component within a system that is responsible for providing connectivity to an external Ethernet, Fibre
805 Channel, or InfiniBand network

806 **3.3.7**807 **remote media**

808 a manageability feature that enables remote media devices to appear as if they are attached locally to the
809 host

810 **3.3.8**811 **Network Controller Sideband Interface**812 **NC-SI**

813 The RBT interface of the Network Controller that provides network connectivity to a Management
814 Controller; also shown as *Sideband Interface*, *RBT*, or *NC-SI* as appropriate in the context

815 **3.3.9**816 **integrated controller**

817 a Network Controller device that supports two or more channels for the NC-SI that share a common
818 NC-SI physical interface (for example, a Network Controller that has two or more physical network ports
819 and a single NC-SI bus connection)

820 **3.3.10**821 **multi-drop**

822 refers to the situation in which multiple physical communication devices share an electrically common bus
823 and a single device acts as the controller of the bus and communicates with multiple “worker” or “target”
824 devices

825 Related to NC-SI, a Management Controller serves the role of the controller, and the Network Controllers
826 are the worker/target devices

827 **3.3.11**828 **point-to-point**

829 refers to the situation in which only a single Management Controller and single Network Controller
830 package are used on the bus in a controller/worker relationship, where the Management Controller is the
831 controller

832 **3.3.12**833 **Channel**

834 refers to the logical representation of a network port in a Network Controller that supports Control traffic
835 and may support Pass-through traffic

836 A Network Controller may have a 1:1 relationship of NC-SI channels to physical network ports, or Network
837 Controllers that support partitioning can have multiple channels on a given network port

838 **3.3.13**839 **Partition**

840 one or more NC-SI channels in a Network Controller that share a common network port

841 **3.3.14**842 **Package**

843 one or more NC-SI channels in a Network Controller that share a common set of electrical buffers and
844 common electrical buffer controls for the NC-SI bus

845 Typically, a single, logical NC-SI package exists for a single physical Network Controller package (chip or
846 module). However, this specification allows a single physical chip or module to hold multiple NC-SI logical
847 packages

848 **3.3.15**

849 **control traffic**

850 **Control Packets**

851 **control packets**

852 command, response, and asynchronous event notification packets transmitted between the Management
853 Controller and Network Controllers for the purpose of managing the NC and NC-SI

854 **3.3.16**

855 **Command**

856 Control Packet sent by the Management Controller to the Network Controller to request the Network
857 Controller to perform an action and/or return data

858 **3.3.17**

859 **Response**

860 Control Packet sent by the Network Controller to the Management Controller as a positive
861 acknowledgment of a command received from the Management Controller, and to provide the execution
862 outcome of the command, as well as to return any required data

863 **3.3.18**

864 **Asynchronous Event Notification**

865 Control Packet sent by the Network Controller to the Management Controller as an explicit notification of
866 the occurrence of an event of interest to the Management Controller

867 **3.3.19**

868 **pass-through traffic**

869 **pass-through packets**

870 network packets passed between the external network and the Management Controller through the
871 Network Controller

872 **3.3.20**

873 **RBT**

874 **RMII-Based Transport**

875 Electrical and timing specification for a 3.3 V-signaling physical medium that is derived from [RMII](#)

876 **3.3.21**

877 **PCIe Endpoint**

878 Also PCIe Port, physically the collection of Transmitters and Receivers located on the same chip that
879 define a Link, logically the interface between a component and a PCI Express Link. For the purposes of
880 this specification, it is a PCIe upstream port on the NC that is assigned a PCI Bus number when
881 connecting to a PCIe Switch or Root Complex

882 **3.3.22**

883 **PCIe Link**

884 The collection of two Ports and their interconnecting Lanes. A Link is a dual-simplex communications path
885 between two components.

886 **3.4 Numbers and number bases**

887 Numbers in this specification are written as follows:

- 888 • Hexadecimal numbers are written with a “0x” prefix (for example, 0xFF and 0x80).
- 889 • Binary numbers are written with a lowercase “b” suffix (for example, 1001b and 10b).
- 890 • Hexadecimal and binary numbers are formatted in the Courier New font.
- 891 • “uint8” describes an unsigned 8-bit integer value.

892 **3.5 Network Addresses**

893 Network addresses in this specification are written as follows:

- 894 • IPv4 addresses are written as decimal numbers with period (.) separators.
- 895 • IPv6 addresses are written as hexadecimal numbers with colon (:) separators.
- 896 • MAC addresses are written as 6 hexadecimal number pairs with colon (:) separators.
- 897 • InfiniBand GUIDs are written as hexadecimal numbers with no separators.
- 898 • Fibre Channel WWNs are written as hexadecimal numbers with no separators.

899 **3.6 Reserved fields**

900 Unless otherwise specified, reserved fields (bytes, bits, etc.) are reserved for future use and should be
901 written as zeros and ignored when read.

902 **4 Acronyms and abbreviations**

903 The following symbols and abbreviations are used in this document.

904 **4.1**

905 **AC**

906 Alternating Current

907 **4.2**

908 **AEN**

909 Asynchronous Event Notification

910 **4.3**

911 **BMC**

912 Baseboard Management Controller (often used interchangeably with MC)

913 **4.4**

914 **CMIS**

915 Common Management Interface Specification

916 **4.5**

917 **CRC**

918 Cyclic Redundancy Check

919 **4.6**

920 **CRS_DV**

921 a physical NC-SI signal used to indicate Carrier Sense/Received Data Valid

984 **5 NC-SI overview**

985 **5.1 General**

986 This specification enables a common interface definition between different Management Controller and
 987 Network Controller vendors. This specification addresses not only the electrical and protocol
 988 specifications, but also the system-level behaviors for the Network Controller and the Management
 989 Controller related to the NC-SI.

990 The NC-SI is defined as the interface (protocol, messages, and medium) between a Management
 991 Controller and one or more Network Controllers. This interface, referred to as a Sideband Interface in
 992 Figure 1, is responsible for providing external network connectivity for the Management Controller while
 993 also allowing the external network interface to be shared with traffic to and from the host.

994 The specification of how the NC-SI protocol and messages are implemented over a particular physical
 995 medium is referred to as a transport binding. This document, DSP0222, includes the definition of the
 996 transport binding, electrical, framing, and timing specifications for a physical interface called RBT (RMII-
 997 based Transport). Electrically, RBT, as described in clause 10, is similar to the Reduced Media
 998 Independent Interface™ (RMII)—see ANNEX B. Transport bindings for NC-SI over other media and
 999 transport protocols are defined through external transport binding specifications, such as [DSP0261](#), the
 1000 *NC-SI over MCTP Transport Binding Specification*. That specification defines the Get Supported Media
 1001 command (0x54) which is used to discover support for operations over multiple media types. This
 1002 command may be issued on any NC-SI transport including RBT.

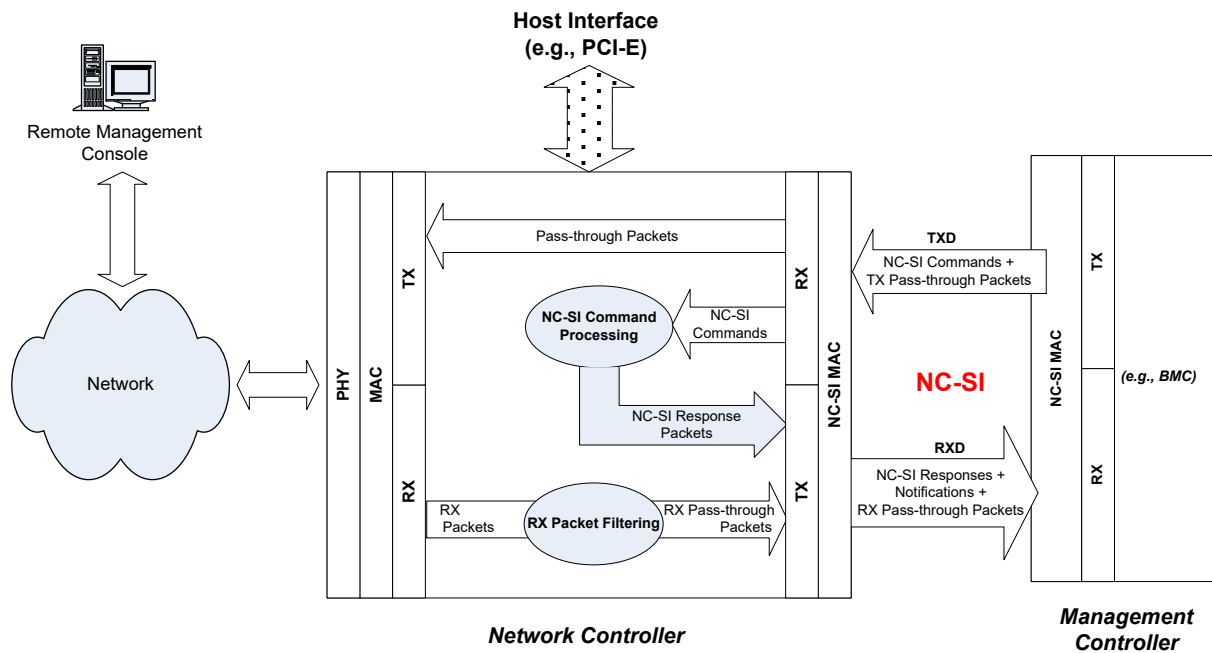

1003

1004

Figure 1 – NC-SI functional block diagram

1005 NC-SI traffic flow is illustrated in Figure 2. Two classes of packet data can be delivered over the Sideband Interface:
 1006 Interface:

- 1007 • “Pass-through” packets that are transferred between the Management Controller and the
 1008 external network and/or an internal host.
- 1009 • “Control” packets that are transferred between the Management Controller and Network
 1010 Controllers for control or configuration functionality. This specification defines NC-SI commands
 1011 and responses as well as a mechanism to customize and extend functionality via OEM
 1012 command extensions—see ANNEX A.

1013

1014

Figure 2 – NC-SI RBT traffic flow diagram

1015 NC-SI is intended to operate independently from the in-band activities of the Network Controller. As such,
 1016 the Sideband Interface is not specified to be visible through the host interface of the Network Controller.
 1017 From the external world, this interface should behave and operate like a standard Ethernet Interface.

1018 **5.2 Defined topologies**

1019 The topologies supported under this specification apply to the case in which a single Management
 1020 Controller is actively communicating with one or more Network Controller on the Sideband Interface over
 1021 RBT. The RBT electrical specification is targeted to directly support up to four physical Network Controller
 1022 packages. The protocol specification allows up to eight Network Controller packages, with up to
 1023 31 channels per package.

1024 Figure 3 illustrates some examples of Network Controller configurations supported by the NC-SI in the
 1025 current release:

- 1026 • Configuration 1 shows a Management Controller connecting to a single Network Controller with
 1027 a single external network connection.
- 1028 • Configuration 2 shows a Management Controller connecting to a Network Controller package
 1029 that supports two NC-SI channel connections.
- 1030 • Configuration 3 shows a Management Controller connecting to four discrete Network
 1031 Controllers.

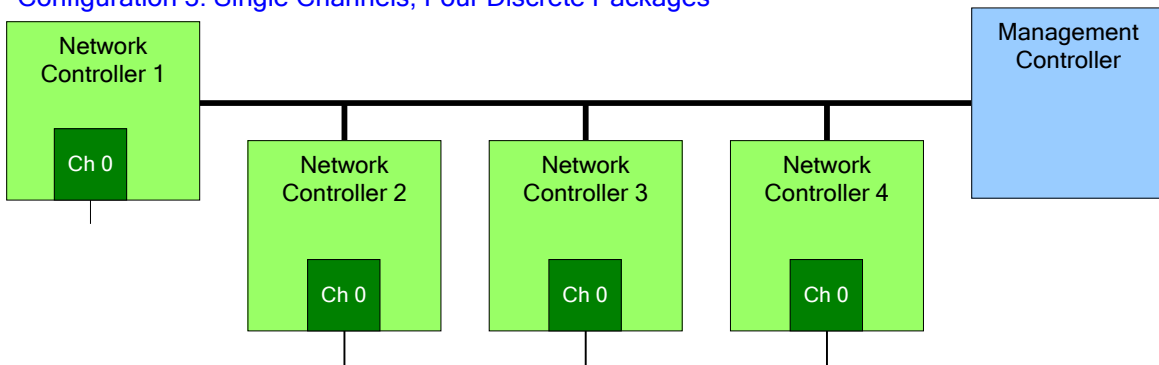

Configuration 1: Single Channel, Single Package

Configuration 2: Integrated Dual Channel, Single Package

Configuration 3: Single Channels, Four Discrete Packages

1032

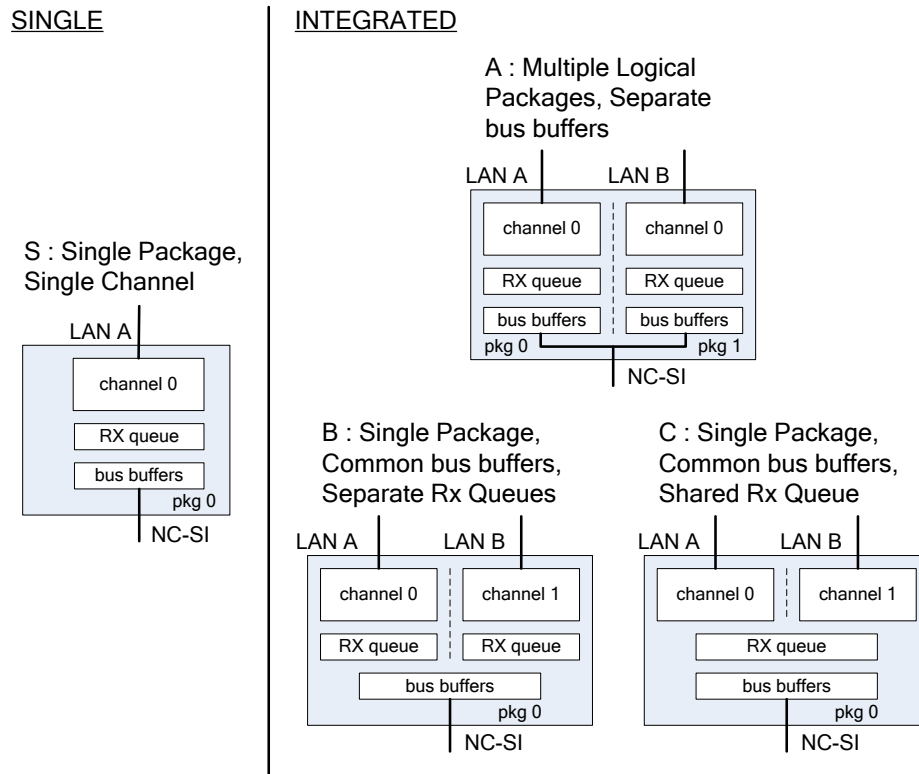

1033 **Figure 3 – Example topologies supported by the NC-SI**

1034 **5.3 Single and integrated Network Controller implementations**

1035 This clause illustrates the general relationship between channels, packages, receive buffers, and bus
 1036 buffers for different controller implementations.

1037 An integrated controller is a Network Controller that connects to the NC-SI RBT (or other physical
 1038 interfaces that support NC-SI) interface and provides NC-SI support for two or more network connections.
 1039 A single controller is a controller that supports only a single NC-SI channel.

1040 For the *NC-SI Specification*, an integrated controller can be logically implemented in one of three basic
 1041 ways, as illustrated in Figure 4. Although only two channels are shown in the illustration, an integrated
 1042 controller implementation can provide more than two channels. The example channel and package
 1043 numbers (for example, channel 0, package 0) refer to the Internal Channel and Package ID subfields of
 1044 the Channel ID. For more information, see clause 6.1.9.

1045

1046 **Figure 4 – Network Controller integration options**

1047 Packages that include multiple channels are required to handle internal arbitration between those
 1048 channels and the Sideband Interface. The mechanism by which this occurs is vendor-specific and not
 1049 specified in this document. This internal arbitration is always active by default. No NC-SI commands are
 1050 defined for enabling or disabling internal arbitration between channels.

1051 The following classifications refer to a logical definition. The different implementations are distinguished
 1052 by their behavior with respect to the NC-SI bus and command operation. The actual physical and internal
 1053 implementation can vary from the simple diagrams. For example, an implementation can act as if it has
 1054 separate RX queues without having physically separate memory blocks for implementing those queues.

1055 **• S: Single Package, Single Channel**

1056 This implementation has a single NC-SI interface providing NC-SI support for a single LAN port,
 1057 all contained within a package or module that has a single connection to the NC-SI physical

1058 bus. Note that FC Bonding is supported in this specification and thus multiple physical ports
1059 may be aggregated into one logical port.

1060 • **A: Multiple Logical Packages, Separate Bus Buffers**

1061 This implementation acts like two physically separate Network Controllers that happen to share
1062 a common overall physical container. Electrically, they behave as if they have separate
1063 electrical buffers connecting to the NC-SI bus. This behavior might be accomplished by means
1064 of a passive internal bus or by separate physical pins coming from the overall package. From
1065 the point of view of the Management Controller and the NC-SI command operation, this
1066 implementation behaves as if the logical controllers were implemented as physically separate
1067 controllers.

1068 This type of implementation could include internal hardware arbitration between the two logical
1069 Network Controller packages. If hardware arbitration is provided external to the package, it shall
1070 meet the requirements for hardware arbitration described later in this specification. (For more
1071 information, see clause 7.3.)

1072 • **B: Single Package, Common Bus Buffers, Separate RX Queues**

1073 In this implementation, the two internal NC-SI channels share a common set of electrical bus
1074 buffers. A single Deselect Package command will deselect the entire package. The Channel
1075 Enable and Channel Disable commands to each channel control whether the channel can
1076 transmit Pass-through and AEN packets through the NC-SI interface. The Channel Enable
1077 command also determines whether the packets to be transmitted through the NC-SI interface
1078 will be queued up in an RX Queue for the channel while the channel is disabled or while the
1079 package is deselected. Because each channel has its own RX Queue, this queuing can be
1080 configured for each channel independently.

1081 • **C: Single Package, Common Bus Buffers, Shared RX Queue**

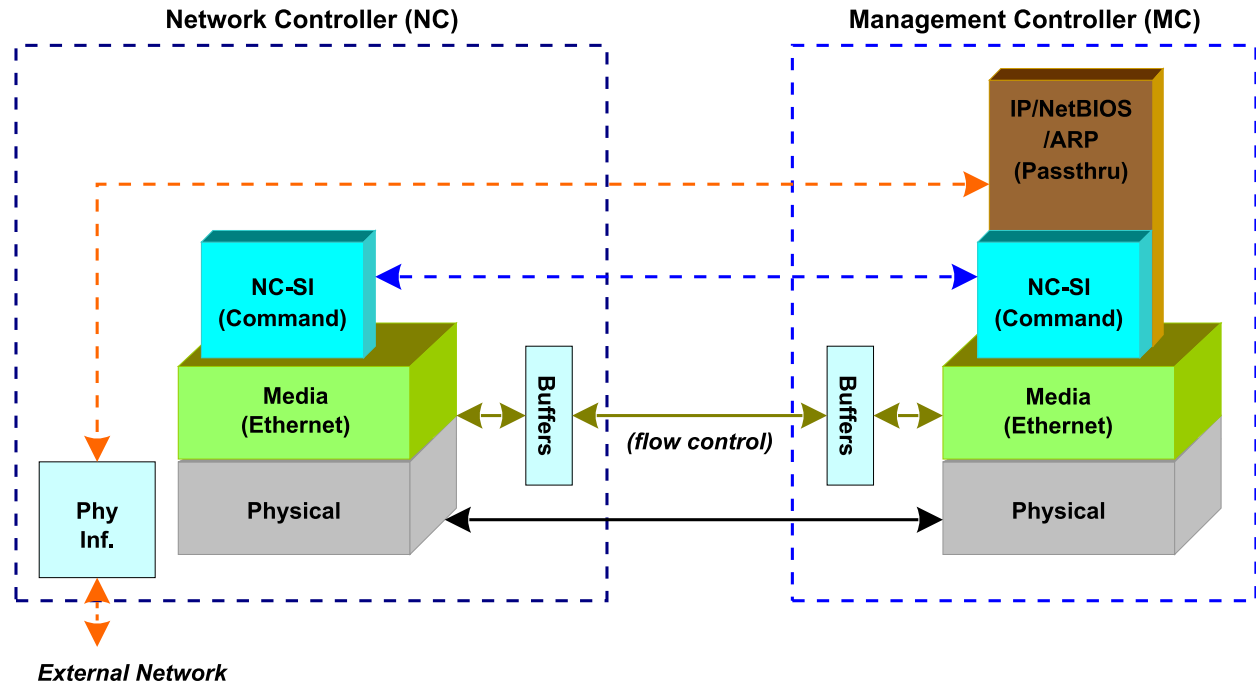

1082 This implementation is the same as described in the preceding implementation, except that the
1083 channels share a common RX Queue for holding Pass-through packets to be transmitted
1084 through the NC-SI interface. This queue could also queue up AEN or Response packets.

1085 In addition to the general purpose architectures listed above, some Network Controllers support more
1086 advanced architectures that provide for multiple host interfaces that share a single channel/physical port
1087 (commonly called “partitions”), a single host interface that sends and receives traffic over multiple physical
1088 ports but is modeled as a single channel, and lastly an internally terminated channel that can be used to
1089 control some other functionality in the NC that requires a communication and control path to the MC.

1090 **5.4 Transport stack**

1091 The overall transport stack of the NC-SI is illustrated in Figure 5. The lowest level is the physical-level
1092 interface (for example, RBT), and the media-level interface is based on Ethernet. Above these interfaces
1093 are the two data-level protocols that are supported by the *NC-SI Specification*: NC-SI Command Protocol
1094 and the Network Data Protocol (for example, ARP, IP, DHCP, and NetBIOS) associated with Pass-
1095 through traffic for NCs. Both protocols are independent from binding to the underlying physical interface.
1096 This specification only defines the binding for NC-SI over RBT.

1097 This document defines the necessary NC-SI command set and interface specification that allows the
1098 appropriate configuration of the Network Controller parameters and operation to enable network traffic to
1099 flow to and from external networks to the Management Controller for those devices that support it. As
1100 shown in Figure 5, the scope of the NC-SI Command Protocol is limited to the interface between the
1101 Network Controller and the Management Controller.

1102 External Network

1103 Figure 5 – NC-SI transport stack

1104 **5.5 Transport protocol**

1105 A simple transport protocol is used to track the reliable reception of command packets. The transport
 1106 protocol is based upon a command/response paradigm and involves the use of unique Instance IDs (IIDs)
 1107 in the packet headers to allow responses received to be matched to previously transmitted commands.
 1108 The Management Controller is the generator of command packets sent to the Sideband Interface of one
 1109 or more Network Controllers in the system, and it receives response packets from them. A response
 1110 packet is expected to be received for every command packet successfully sent.

1111 The transport protocol described here shall apply only to command and response packets sent between
 1112 the Management Controller and the Network Controller.

1113 **5.6 Byte and bit ordering for transmission**

1114 Unless otherwise specified, the bytes for a multi-byte numeric field are transmitted most significant byte
 1115 first and bits within a byte are transmitted most significant bit first.
 1116

1117 **6 Operational behaviors**

1118 **6.1 Typical operational model**

1119 This clause describes the typical system-level operation of the NC-SI components.

1120 The following tasks are associated with Management Controller use of the NC-SI:

1121 **• Initial configuration**

1122 When the NC-SI interface is first powered up, the Management Controller needs to discover
 1123 and configure NC-SI devices as well as to enable pass-through operation. This task includes
 1124 setting parameters such as MAC addresses, configuring Layer 2 filtering, setting Channel
 1125 enables, and so on.

1126 **• General Controller configuration and monitoring**

1127 The Management Controller may also configure and monitor aspects of Controller operation.

1128 **• Pass-through**

1129 The Management Controller handles transmitting and receiving Pass-through packets using the
 1130 NC-SI. Pass-through packets can be delivered to and received from the network through the
 1131 NC-SI based on the Network Controller’s NC-SI configuration.

1132 **• Asynchronous event handling**

1133 In certain situations, a status change in the Network Controller, such as a Link State change,
 1134 can generate an asynchronous event on the Sideband Interface. These event notifications are
 1135 sent to the Management Controller where they are processed as appropriate.

1136 **• Error handling**

1137 The Management Controller handles errors that could occur during operation or configuration.
 1138 For example, a Network Controller might have an internal state change that causes it to enter a
 1139 state in which it requires a level of reconfiguration (this condition is called the “Initial State” and
 1140 is described in more detail in 6.1.4); or a data glitch on the NC-SI could have caused an NC-SI
 1141 command to be dropped by the Network Controller, requiring the Management Controller to
 1142 retry the command.

1143 **6.1.1 State definitions and defined states**

1144 Table 1 describes states related to whether and when the Network Controller is ready to handle NC-SI
 1145 command packets, when it is allowed to transmit packets through the NC-SI interface, and when it has
 1146 entered a state where it is expecting configuration by the Management Controller.

1147 **Table 1 – NC-SI operating state descriptions**

State	Applies to	Description
Interface Power Down	Package	The NC-SI is in the power down state.
Interface Power Up	Package	The NC-SI is in the power up state, as defined in clause 10.
Package Selected (also referred to as the Selected state)	Package	A Selected package is allowed to turn on its electrical buffers and transmit through the NC-SI interface.
Package Deselected (also referred to as the Deselected state)	Package	A Deselected package is not allowed to turn on its electrical buffers and transmit through the NC-SI interface.

State	Applies to	Description
Hardware Arbitration Enabled	Package	When hardware arbitration is enabled, the package is allowed to transmit through the NC-SI interface only when it is Selected and has the TOKEN opcode.
Hardware Arbitration Disabled	Package	When hardware arbitration is disabled, the package is allowed to transmit through the NC-SI interface anytime that it is Selected, regardless of whether it has the TOKEN opcode.
Package Ready	Package	In the Package Ready state, the package is able to accept and respond to NC-SI commands for the package and be Selected.
Package Not Ready	Package	The Package Not Ready state is a transient state in which the package does not accept package-specific commands.
Channel Ready	Channel	In the Channel Ready state, a channel within the package is able to accept channel-specific NC-SI commands that are addressed to its Channel ID (Package ID + Internal Channel ID).
Channel Not Ready	Channel	The Channel Not Ready state is a transient state in which the channel does not accept channel-specific commands.
Initial State	Channel	In the Initial State, the channel is able to accept and respond to NC-SI commands, and one or more configuration settings for the channel need to be set or restored by the Management Controller (that is, the channel has not yet been initialized, or has encountered a condition where one or more settings have been lost and shall be restored). Refer to 6.1.4 for more information.
Channel Enabled	Channel	This is a sub-state of the Channel Ready state. When a channel is enabled, the channel is allowed to transmit unrequested packets (that is, packets that are not command responses—for example, AEN and Pass-through packets) through the NC-SI interface whenever the package is Selected.
Channel Disabled	Channel	This is a sub-state of the Channel Ready state. When a channel is disabled, the channel is not allowed to transmit unrequested packets (that is, packets that are not command responses—for example, AEN and Pass-through packets) through the NC-SI interface.

1148 6.1.2 NC-SI RBT pre-operational states

1149 There are two states defined on RBT before it becomes operational:

- 1150 • NC-SI Interface Power Down state

1151 In this state, the NC-SI Physical interface and the associated receive and transmit buffers in all
 1152 devices on the NC-SI RBT (that is, the NC-SI interfaces on the Network Controllers and
 1153 Management Controller) are not powered up.

- 1154 • NC-SI Power Up state

1155 In this state, the NC-SI Physical interface and the associated receive and transmit buffers in all
 1156 devices on the NC-SI RBT (that is, the Network Controller and Management Controller) are
 1157 powered up.

1158 NOTE: NC transmit I/O buffers should not be enabled in this state. The Network Controller is expected to
 1159 transition to the Initial State within T4 seconds after the Power Up state is entered.

1160 6.1.3 Package Ready state

1161 A Network Controller in the Package Ready state shall be able to respond to any NC-SI commands that
 1162 are directed to the ID for the overall package (versus being directed to a particular channel within the

1163 package). Package-specific commands are identified by a particular set of Channel ID values delivered in
 1164 the command header (see clause 6.1.9).

1165 **6.1.4 Initial State**

1166 The Initial State for a channel corresponds to a condition in which the Sideband Interface is powered up
 1167 and is able to accept NC-SI commands, and the channel has one or more configuration settings that need
 1168 to be set or restored by the Management Controller. Unless default configuration settings are explicitly
 1169 defined in this specification, the default values are implementation specific. The MC should not make any
 1170 assumptions on any configuration settings that are not defined in this specification. Because this state
 1171 may be entered at any time, the Initial State shall be acknowledged with a Clear Initial State command for
 1172 the Initial State to be exited. This requirement helps to ensure that the Management Controller does not
 1173 continue operating the interface unaware that the NC-SI configuration had autonomously changed in the
 1174 Network Controller.

1175 An NC-SI channel in the Initial State shall:

- 1176 • be able to respond to NC-SI commands that are directed to the Channel ID for the particular
 1177 channel (see clause 6.1.9)
- 1178 • respond to all non-OEM NC-SI command packets that are directed to the channel or partitions
 1179 on the channel with a Response Packet that contains a Response Code of “Command Failed”
 1180 and a Reason Code of “Initialization Required”
- 1181 • place the channel into the Disabled state
- 1182 • set hardware arbitration (if supported) to “enabled” on Interface Power Up only; otherwise, the
 1183 setting that was in effect before entry into the Initial State shall be preserved (that is, the
 1184 hardware arbitration enable/disable configuration is preserved across entries into the Initial
 1185 State)
- 1186 • set the enabled/disabled settings for the individual MAC and VLAN filters (typically set using the
 1187 Set MAC Address, Set VLAN Filter, and Enable VLAN commands) to “disabled”
 1188 NOTE It is recommended that global multicast and broadcast filters are also set to “disabled”.
- 1189 • reset all counters defined in the various channel and partition level statistics commands, and set
 1190 the Get NC-SI Pass-Through Statistics command to 0x0
- 1191 • disable the Channel Network TX setting and transmission of Pass-through packets onto the
 1192 network
- 1193 • clear any record of prior command instances received upon entry into the Initial State (that is,
 1194 assume that the first command received after entering the Initial State is a new command and
 1195 not a retried command, regardless of any Instance ID that it may have received before entering
 1196 the Initial State)
- 1197 • disable transmission of AENs and reset any enabled AENs

1198 Otherwise, there is no requirement that other NC-SI configuration settings be set, retained, or restored to
 1199 particular values in the Initial State unless otherwise specified. Controller configuration settings that are
 1200 identified as persistent and saved to NVRAM are one example of retained settings.

1201 The Initial State is an NC-SI configuration state and therefore places no requirements on the NC’s
 1202 network link state.

1203 **6.1.5 NC-SI Initial State recovery**

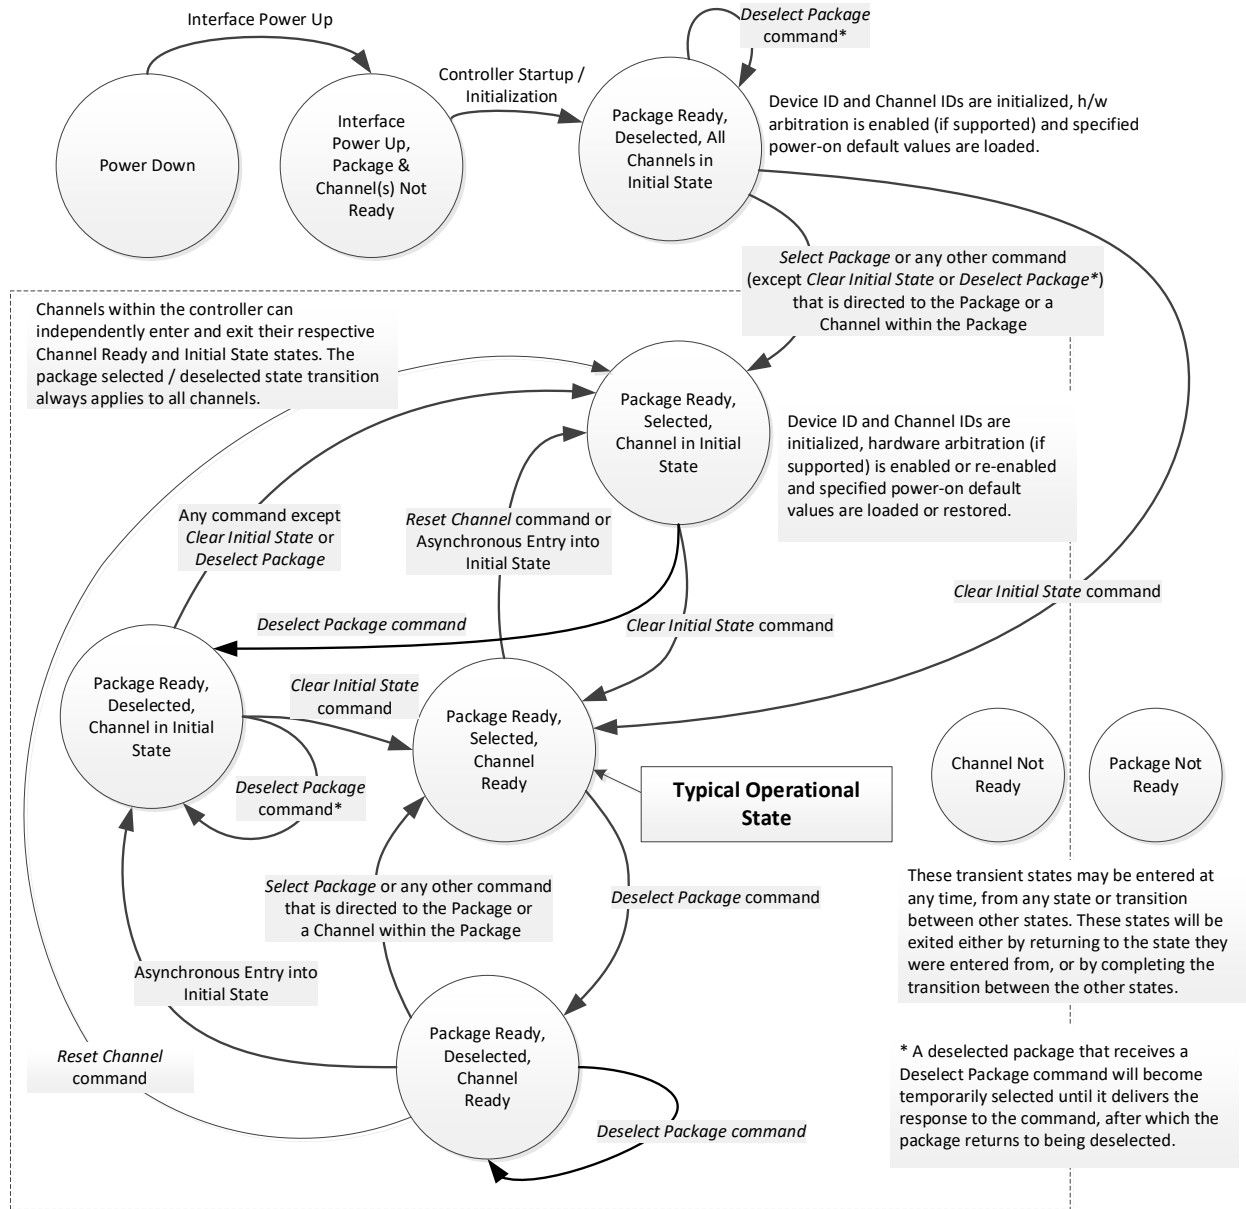

1204 As described in clause 6.1.4, a channel in the Initial State shall receive the Clear Initial State command
 1205 before other commands can be executed. This requirement ensures that if the Initial State is entered
 1206 asynchronously, the Management Controller is made aware that one or more NC-SI settings may have

1207 changed without its involvement and the Management Controller is blocked from issuing additional
1208 commands under that condition. Until the channel receives the Clear Initial State command, the Network
1209 Controller shall respond to any other received command directed to the channel or partitions on the
1210 channel with a Command Failed response code and Interface Initialization Required reason code to
1211 indicate that the Clear Initial State command shall be sent. See response and reason code definitions in
1212 clause 8.2.5.2.

1213 If the Management Controller, at any time, receives the response indicating that the Clear Initial State
1214 command is expected, it should interpret this response to mean that default settings have been restored
1215 for the channel (per the Initial State specification), and that one or more package/channel settings need to
1216 be restored by the Management Controller.

1217 **6.1.6 State transition diagram**

1218 Figure 6 illustrates the general relationship between the package- and channel-related states described in
1219 Table 1 and the actions that cause transitions between the states. Each bubble in Figure 6 represents a
1220 particular combination of states as defined in Table 1.

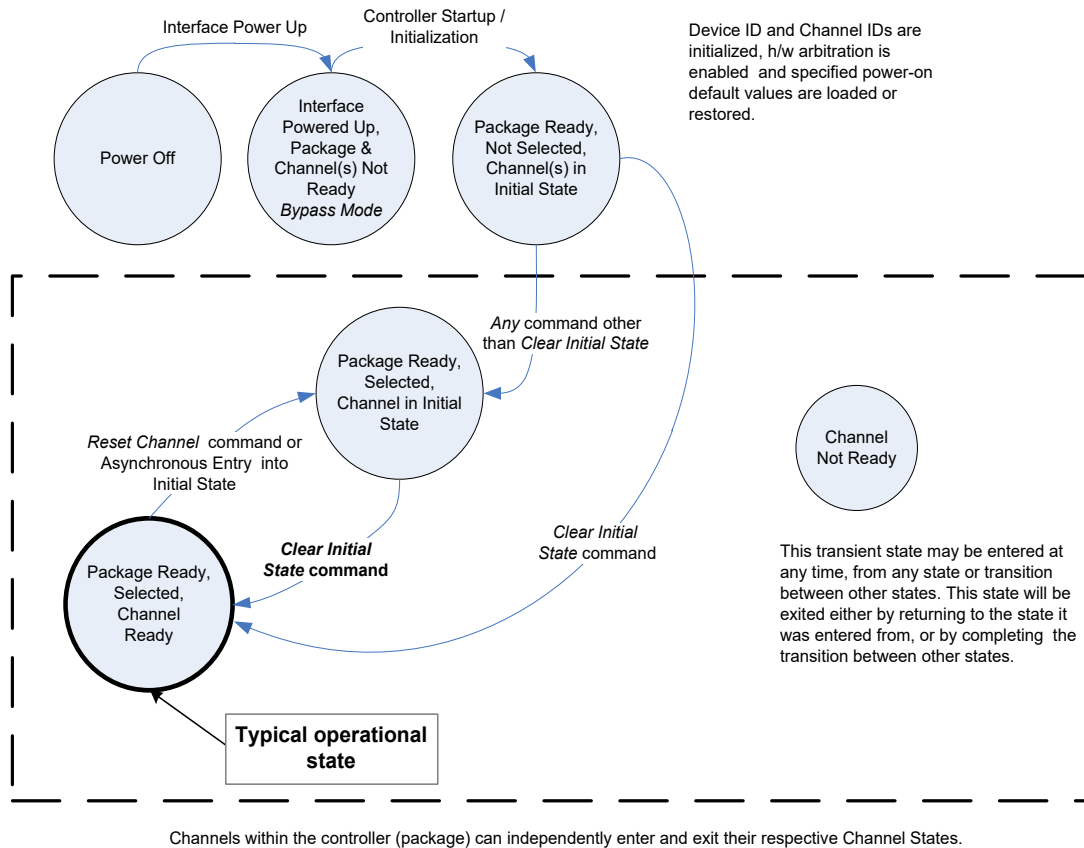

1221

1222

Figure 6 – NC-SI package/channel operational state diagram

1223 **6.1.7 State diagram for NC-SI operation with hardware arbitration**

1224 Figure 7 shows NC-SI operation in the hardware arbitration mode of operation. This is a sub-set of the
 1225 general NC-SI operational state diagram (Figure 6) and has been included to illustrate the simplified
 1226 sequence of package selection when this optional capability is used.

1227

1228 **Figure 7 – NC-SI operational state diagram for hardware arbitration operation**

1229 While Select and Deselect package commands are not shown in Figure 7, these commands can be used
 1230 with HW arbitration and will behave as specified in this specification.

1231 Select and Deselect package commands can work together with HW arbitration. If HW arbitration is
 1232 enabled, a package needs both the HW arbitration token and to be selected in order to transmit on the
 1233 NC-SI RBT. If either the package is deselected, or the package does not have HW arbitration token, then
 1234 the package is not allowed to transmit on the NC-SI RBT.

1235 **6.1.8 Resets**

1236 **6.1.8.1 Asynchronous entry into Initial State**

1237 An Asynchronous Reset event is defined as an event that results in a Channel asynchronously entering
1238 the Initial State. This event could occur as a consequence of powering up, a System Reset, a Driver
1239 Reset, an internal firmware error, loss of configuration errors, internal hardware errors, and so on.
1240 Additionally, it is recommended that any event in the NC that causes a total or partial loss of configuration
1241 should be interpreted as an Asynchronous Reset event.

1242 Unless otherwise specified, NC-SI configuration settings beyond those required by the Initial State may or
1243 may not be preserved following asynchronous entry into the Initial State, depending on the Network
1244 Controller implementation.

1245 There is no explicit definition of a Reset for an entire package. However, it is possible that an
1246 Asynchronous Reset condition may cause an asynchronous entry into the Initial State for all Channels in
1247 a package simultaneously.

1248 **6.1.8.2 Synchronous Reset**

1249 A Synchronous Reset event on the NC-SI is defined as a Reset Channel command issued by a
1250 Management Controller to a Channel. Upon the receipt of this command, the Network Controller shall
1251 place the Channel into the Initial State.

1252 Unless otherwise specified, NC-SI configuration settings beyond those required by the Initial State may or
1253 may not be preserved following a Synchronous Reset, depending on the Network Controller
1254 implementation.

1255 **6.1.8.3 Other Resets**

1256 Resets that do not affect NC-SI operation are outside the scope of this specification.

1257 **6.1.9 Network Controller Channel ID**

1258 Each channel in the Network Controller shall be physically assigned a Network Controller Channel ID that
1259 will be used by the Management Controller to specify which Network Controller channel, out of possibly
1260 many channels, it is trying to communicate with. The Network Controller Channel ID shall be physically
1261 assignable (configured) at system-integration time based on the following specification.

1262 It is the system integrator's or system designer's responsibility to correctly assign and provide these
1263 identifier values in single- and multi-port Network Controller configurations, and to ensure that Channel
1264 IDs do not conflict between devices sharing a common NC-SI RBT interconnect.

1265 The Channel ID field is composed of the two subfields Package ID and Internal Channel ID, as described
1266 in Table 2.

1267

Table 2 – Channel ID format

Bits	Field Name	Description
[7..5]	Package ID	<p>The Package ID is required to be common across all channels within a single Network Controller that share a common NC-SI physical interconnect.</p> <p>The system integrator will typically configure the Package IDs starting from 0 and increasing sequentially for each physical Network Controller.</p> <p>The Network Controller shall allow the least significant two bits of this field to be configurable by the system integrator, with the most significant bit of this field = 0b. An implementation is allowed to have all 3 bits configurable.</p>
[4..0]	Internal Channel ID	<p>The Network Controller shall support Internal Channel IDs that are numbered starting from 0 and increasing sequentially for each channel supported by the Network Controller that is accessible by the Management Controller through the NC-SI using NC-SI commands.</p> <p>An implementation is allowed to support additional configuration options for the Internal Channel ID as long as the required numbering can be configured.</p> <p>An Internal Channel ID value of 0x1F applies to the entire Package.</p>

1268 Channel IDs shall be completely decoded. Aliasing between values is not allowed (that is, the Network
1269 Controller is not allowed to have multiple IDs select the same channel on a given Sideband Interface).

1270 Once configured, the settings of the Package ID and Internal Channel ID values shall be retained in a
1271 non-volatile manner. That is, they shall be retained across power-downs of the Sideband Interface and
1272 shall not be required to be restored by the Management Controller for NC-SI operation. This specification
1273 does not define the mechanism for configuring or retaining the Package ID or the Internal Channel ID (if
1274 configurable). Some implementations may use pins on the Network Controller for configuring the IDs,
1275 whereas other implementations may use non-volatile storage logic such as electrically erasable memory
1276 or FLASH, while others may use a combination of pins and non-volatile storage logic.

1277 6.1.10 Configuration-related settings

1278 6.1.10.1 Package-specific operation

1279 There are some NC-SI configuration settings that are package-specific:

- 1280 • the enable/disable settings for hardware arbitration
- 1281 • NC-SI flow control
- 1282 • Package-related AENs

1283 There may also be NC configuration settings that are controlled by NC-SI Commands addressed to the
1284 package. These commands specify this requirement in their command description.

1285 Hardware arbitration is enabled or disabled through a parameter that is delivered using the Select
1286 Package command. If hardware arbitration is enabled on all Network Controller packages on the NC-SI
1287 RBT, more than one package can be in the Selected state simultaneously. Otherwise, only one package
1288 is allowed to be in the Selected state at a time to prevent electrical buffer conflicts (“buffer fights”) that can
1289 occur from more than one package being allowed to drive the bus.

1290 NC-SI flow control is enabled or disabled using the Set NC-SI Flow Control command. The flow control
1291 setting applies to all channels in the package.

1292 Package-specific commands should only be allowed and executed when the Internal Channel ID field is
1293 set to 0x1F.

1294 There are some package-level AENs to allow the NC to alert the MC of controller-level events.

1295 **6.1.10.2 Channel-specific operation**

1296 Channel-specific commands should only be allowed to be executed when the Internal Channel ID field is
 1297 set to a value other than 0x1F. Channel-specific commands with Invalid Channel IDs are not allowed
 1298 (see clause 6.8.2.1).

1299 Table 3 shows the major categories of configuration settings that control channel operation when a
 1300 channel is in the Channel Ready state. Channels that are not operating in Pass-through mode may not
 1301 support Pass-through-related settings.

Table 3 – Channel Ready state configuration settings

Setting/Configuration Category	Description
“Channel Enable” settings	The Enable Channel and Disable Channel commands are used to control whether the channel is allowed to asynchronously transmit unrequested packets (AEN and Pass-through packets) through the NC-SI interface whenever the package is Selected. Note that channels are always allowed to transmit responses to commands sent to the channel.
“Channel Configuration” settings	Version 1.2 adds a number of commands for configuration setting of channels and their partitions (if supported) See Table 21.
Pass-through Transmit Enable settings	The Enable Channel Network TX command is used to enable the channel to transmit any Pass-through packets that it receives through the NC-SI onto the network, provided that the source MAC address in those packets matches the Network Controller settings. Correspondingly, the Disable Channel Network TX command is used to direct the controller not to transmit Pass-through packets that it receives onto the network.
AEN Enable settings	The AEN Enable command is used to enable and disable the generation of the different AENs supported by the Network Controller.
MAC Address Filter settings and control	The Set MAC Address, Enable Broadcast Filter, and Enable Global Multicast Filter commands are used to configure the filters for unicast, broadcast, and multicast addresses that the controller uses in conjunction with the VLAN Filter settings for filtering incoming Pass-through packets.
VLAN Filter settings and control	The Set VLAN Filter command is used to configure VLAN Filters that the controller uses in conjunction with the MAC Address Filters for filtering incoming Pass-through packets. The Enable VLAN and Disable VLAN commands are used to configure VLAN filtering modes and enable or disable whether VLAN filtering is used.

1303 **6.1.11 Transmitting Pass-through packets from the Management Controller**

1304 Packets not recognized as command packets (that is, packets without the NC-SI EtherType) that are
 1305 received on the Network Controller’s NC-SI interface shall be assumed to be Pass-through packets
 1306 provided that the source MAC Address matches one of the unicast MAC addresses settings (as
 1307 configured by the Set MAC Address command) for the channel in the Network Controller, and will be
 1308 forwarded for transmission to the corresponding external network interface if Channel Network TX is
 1309 enabled.

1310 **6.1.12 Receiving Pass-through packets for the Management Controller**

1311 The Management Controller has control over and responsibility for configuring packet-filtering options,
 1312 such as whether broadcast, multicast, or VLAN-tagged packets are accepted. Depending on the filter

1313 configurations, after the channel has been enabled, any packet that the Network Controller receives for
1314 the Management Controller shall be forwarded to the Management Controller through the NC-SI
1315 interface.

1316 **6.1.13 Pass-through operation in multiple medium implementations**

1317 Pass-through operation is not restricted to certain physical interfaces, but an NC-SI channel shall support
1318 Pass-through on at most one physical interface at a time.

1319 **6.1.14 Startup sequence examples**

1320 **6.1.14.1 Overview**

1321 The following clauses show possible startup sequences that may be used by the Management Controller
1322 to start NC-SI operation. Depending upon the specific configuration of each system, there are many
1323 possible variations of startup sequences that may be used, and these examples are intended for
1324 reference only.

1325 **6.1.14.2 Typical non-hardware arbitration specific startup sequence**

1326 The following sequence is provided as an example of one way a Management Controller can start up
1327 NC-SI operation. This sequence assumes that the Management Controller has no prior knowledge of how
1328 many Network Controllers are present on RBT or what capabilities those controllers support. Note that
1329 this is not the only possible startup sequence. Alternative sequences can also be used to start up NC-SI
1330 operation. Some steps may be skipped if the Management Controller has prior knowledge of the Network
1331 Controller capabilities, such as whether Network Controllers are already connected and enabled for
1332 hardware arbitration.

1333 1) Power up

1334 The NC-SI is powered up (refer to clause 10.2.8 for the specification of this condition). The
1335 Network Controller packages are provided a Network Controller Power Up Ready Interval
1336 during which they can perform internal firmware startup and initialization to prepare their NC-SI
1337 to accept commands. The Management Controller first waits for the maximum Network
1338 Controller Power Up Ready Interval to expire (refer to Table 280). At this point, all the Network
1339 Controller packages and channels should be ready to accept commands through the NC-SI.
1340 (The Management Controller may also start sending commands before the Network Controller
1341 Power Up Ready Interval expires but will have to handle the case that Network Controller
1342 devices may be in a state in which they are unable to accept or respond to commands.)

1343 2) Discover package

1344 The Management Controller issues a Select Package command starting with the lowest
1345 Package ID (see clause 8.4.5 for more information). Because the Management Controller is
1346 assumed to have no prior knowledge of whether the Network Controller is enabled for hardware
1347 arbitration, the Select Package command is issued with the Hardware Arbitration parameter set
1348 to 'disable'.

1349 If the Management Controller receives a response within the specified response time, it can
1350 record that it detected a package at that ID. If the Management Controller does not receive a
1351 response, it is recommended that the Management Controller retry sending the command.
1352 Three total tries are typical. (This same retry process should be used when sending all
1353 commands to the Network Controller and will be left out of the descriptions in the following
1354 steps.) If the retries fail, the Management Controller can assume that no Network Controller is at
1355 that Package ID and can immediately repeat this step 2) for the next Package ID in the
1356 sequence.

1357 3) Discover and get capabilities for each channel in the package

1358 The Management Controller can now discover how many channels are supported in the
 1359 Network Controller package and their capabilities. To do this, the Management Controller issues
 1360 the Clear Initial State command starting from the lowest Internal Channel ID (which selects a
 1361 given channel within a package). If it receives a response, the Management Controller can then
 1362 use the Get Version ID command to determine NC-SI specification compatibility, and the Get
 1363 Capabilities command to collect information about the capabilities of the channel. The
 1364 Management Controller can then repeat this step until the full number of internal channels has
 1365 been discovered. (The Get Capabilities command includes a value that indicates the number of
 1366 channels supported within the given package.)

1367 NOTE The *NC-SI Specification* requires Network Controllers to be configurable to have their Internal
 1368 Channel IDs be sequential starting from 0. If it is known that the Network Controller is configured this way,
 1369 the Management Controller needs only to iterate sequentially starting from Internal Channel
 1370 ID = 0 up to the number of channels reported in the first Get Capabilities response.

1371 The Management Controller should temporarily retain the information from the Get Capabilities
 1372 command, including the information that reports whether the overall package supports hardware
 1373 arbitration. This information is used in later steps.

1374 4) Repeat steps 2 and 3 for remaining packages

1375 The Management Controller repeats steps 2) and 3) until it has gone through all the Package
 1376 IDs.

1377 IMPORTANT: Because hardware arbitration has not been enabled yet, the Management
 1378 Controller shall issue a Deselect Package command to the present Package ID before issuing
 1379 the Select Package command to the next Package ID. If hardware arbitration is not being used,
 1380 only one package can be in the Selected state at a time. Otherwise, hardware electrical buffer
 1381 conflicts (“buffer fights”) will occur between packages.

1382 5) Initialize each channel in the package

1383 Based on the number of packages and channels that were discovered, their capabilities, and
 1384 the desired use of Pass-through communication, the Management Controller can initialize the
 1385 settings for each channel. This process includes the following general steps for each package:

1386 a) Issue the Select Package command.

1387 b) For each channel in the package, depending on controller capabilities, perform the
 1388 following actions. Refer to individual command descriptions for more information.

- 1389 • Use the Set MAC Address command to configure which unicast and multicast
 1390 addresses are used for routing Pass-through packets to and from the Management
 1391 Controller.

- 1392 • Use the Enable Broadcast Filter command to configure whether incoming broadcast
 1393 Pass-through packets are accepted or rejected.

- 1394 • Use the Enable Global Multicast Filter command to configure how incoming multicast
 1395 Pass-through packets are handled based on settings from the Set MAC Address
 1396 command.

- 1397 • Use the Set VLAN Filter and Enable VLAN Filters commands to configure how
 1398 incoming Pass-through packets with VLAN Tags are handled.

- 1399 • Use the Set NC-SI Flow Control command (if supported) to configure how Ethernet
 1400 Pause Frames are used for flow control on RBT. Set NC-SI Flow Control is a package
 1401 command and only needs to be issued once.

- 1402 • Use the AEN Enable command to configure what types of AEN packets the channel
 1403 should send out on the NC-SI.

1404 • Use the Enable Channel Network TX command to configure whether the channel is
1405 enabled to deliver Pass-through packets from the NC-SI to the network (based on the
1406 MAC address settings) or is disabled from delivering any Pass-through packets to the
1407 network.

1408 c) Issue the Deselect Package command.

1409 6) Start Pass-through packet and AEN operation on the channels

1410 The channels should now have been initialized with the appropriate parameters for Pass-
1411 through packet reception and AEN operation. Pass-through operation can be started by issuing
1412 the Enable Channel command to each channel that is to be enabled for delivering Pass-through
1413 packets or generating AENs through the NC-SI interface.

1414 NOTE: If hardware arbitration is not operational and it is necessary to switch operation over to another package, a
1415 Deselect Package command shall be issued to the presently selected package before a different package can be
1416 selected. Deselecting a package blocks all output from the package. Therefore, it is not necessary to issue Disable
1417 Channel commands before selecting another package. There is no restriction on enabling multiple channels within a
1418 package.

1419 6.1.14.3 Hardware arbitration-specific startup sequence

1420 This clause applies when multiple NCs are used by the MC. This clause applies only to the NC-SI over
1421 RBT binding.

1422 The following is an example of the steps that a Management Controller may perform to start up NC-SI
1423 operation when Hardware Arbitration is specifically known to be used, present, and enabled on all
1424 Network Controllers. This example startup sequence assumes a high level of integration where the
1425 Management Controller knows the Network Controllers support and default to the use of Hardware
1426 Arbitration on startup but does not have prior knowledge of how many Network Controllers are present on
1427 RBT or the full set of capabilities those controllers support, so discovery is still required.

1428 Although other startup examples may show a specific ordering of steps for the process of discovering,
1429 configuring, and enabling channels, the Management Controller has almost total flexibility in choosing
1430 how these steps are performed once a channel in a package is discovered. In the end, it would be just as
1431 valid for a Management Controller to follow a breadth-first approach to discovery steps as it would be to
1432 follow a depth-first approach where each channel that is discovered is fully initialized and enabled before
1433 moving to the next.

1434 1) Power up

1435 No change from other startup scenarios.

1436 2) Discovery

1437 The process of discovery consists of identifying the number of packages that are available, the
1438 number of channels that are available in each package and, for each channel, the capabilities
1439 that are provided for Management Controller use. Because in this startup scenario the
1440 Management Controller knows Hardware Arbitration is used, it is not required to use the **Select**
1441 **Package** and **Deselect Package** commands for discovery but may elect to use just the **Clear**
1442 **Initial State** command for this purpose instead.

1443 In this startup scenario, Packages and Channels are discovered by sending the **Clear Initial**
1444 **State** command starting with the lowest Package ID and Internal Channel ID, and then waiting
1445 for and recording the response event as previously described. Internal channel IDs are required
1446 to be numbered sequentially starting with 0, so when the Management Controller does not
1447 receive a response to repeated attempts at discovery, it knows this means no additional
1448 channels exist in the current package. If this happens when the internal channel ID is 0, the
1449 Management Controller knows a package is not available at the current package ID, and it

1450 continues with the next package ID in sequence. If the Management Controller receives a
 1451 response to the **Clear Initial State** command, it records that the channel and package are
 1452 available and continues discovery.

1453 During discovery, the Management Controller should interrogate the capabilities of each
 1454 channel found to be available in each package by sending the **Get Capabilities** command
 1455 appropriate package and Internal channel ID values. However, it does not matter whether this is
 1456 done as the very next step in the discovery process or performed for each channel after all
 1457 packages and channels have been discovered, just as long as the Management Controller does
 1458 interrogate each channel.

1459 3) Configure each channel and enable pass-through

1460 Once the existence of all packages and channels and the capabilities of each channel have
 1461 been discovered and recorded, the Management Controller shall initialize and enable each
 1462 channel as needed for use. The details of these steps remain essentially the same as have
 1463 been previously stated, except to note that there are no restrictions on how they are performed.
 1464 What this means is that the MC may perform these steps in any order across the channels in
 1465 each package as it sees fit. The MC may fully initialize and enable each channel in each
 1466 package one at a time or perform the same step on each channel in sequence before moving
 1467 on to the next, or in a different order. The specific order of steps is not dictated by this
 1468 specification.

1469 6.1.14.4 Summary of scheme for the MC without prior knowledge of hardware arbitration

1470 The following scheme describes the case when the MC does not have a priori knowledge of the hardware
 1471 arbitration support across multiple NCs.

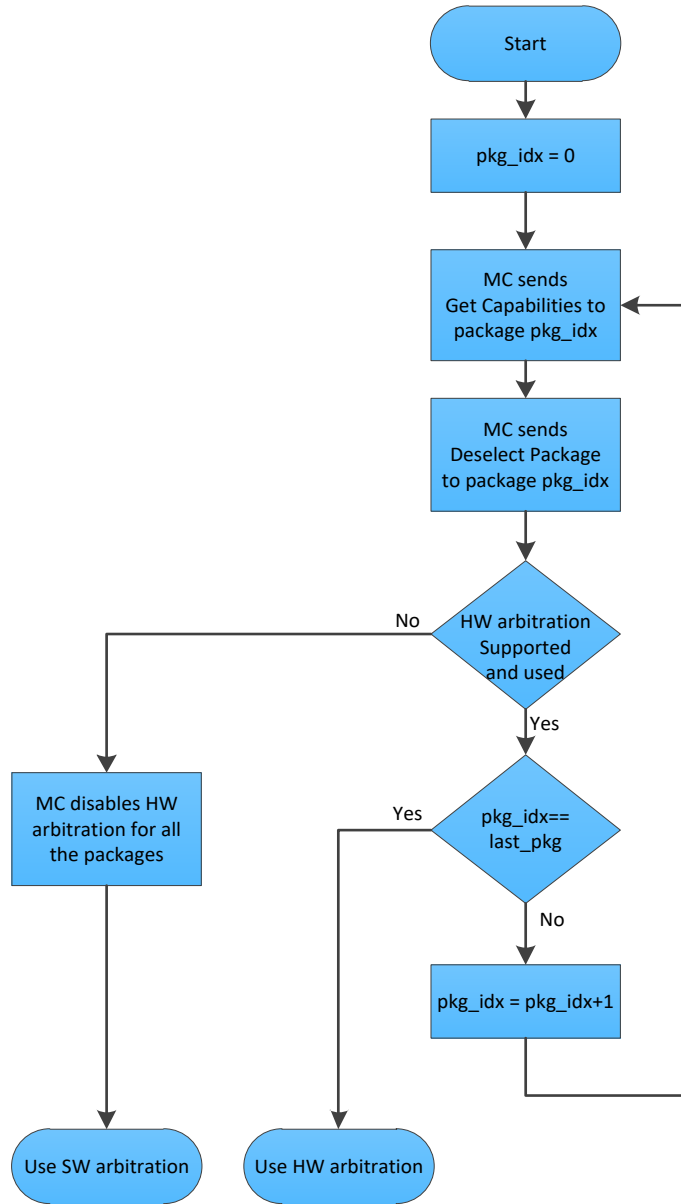

- 1472 1. For each available NC:
 - 1473 a. The MC checks whether a device supports the HW arbitration, using the **Get**
 1474 **Capabilities** command (this implicitly selects the package).
 - 1475 b. The MC issues "Deselect Package" for the NC (necessary since at this stage we do not
 1476 know whether all the devices support HW arbitration).
- 1477 2. If all NCs support HW arbitration and if HW arbitration is used by all NCs, then:

1478 the MC assumes that HW arbitration is active because according to clause 6.2.4 "set
 1479 hardware arbitration (if supported) to *enabled* on Interface Power Up only", and the MC can
 1480 "Select" any number of packages at the same time.

1481 Otherwise (i.e, if at least one NC reports that HW arbitration is not supported, or if at least one
 1482 NC reports that HW arbitration is not used, or if at least one NC cannot report its support level),
 1483 then:

1484 HW arbitration is **not** active, and the MC can "Select" only single package at the any time.

1485 The MC configures every NC to disable HW arbitration, using the **Select Package**
 1486 command.

1487

1488

Figure 8 – MC steps when the MC does not have prior knowledge of hardware arbitration

1489 6.2 NC-SI traffic types

1490 6.2.1 Overview

1491 Two types of traffic are defined by NC-SI, based on the network fabric type: Pass-through traffic and
1492 Control traffic.

- 1493 • Pass-through traffic consists of packets that are transferred between the external network
1494 interface and the Management Controller using the Sideband Interface.
- 1495 • Control traffic consists of commands (requests) and responses that support the inventory,
1496 configuration and control of the Network Controller, the Sideband Interface and Pass-through
1497 operation of the Network Controller, and AENs that support reporting various events to the
1498 Management Controller.

1499 6.2.2 Command protocol

1500 6.2.2.1 Overview

1501 Commands are provided to allow a Management Controller to initialize, control, and regulate
1502 Management Controller packet flow across the sideband interface, configure channel filtering, and
1503 interrogate the operational status of the Network Controller. As interface master, the Management
1504 Controller is the initiator of all commands, and the Network Controller responds to commands but may
1505 also generate AENs if enabled.

1506 6.2.2.2 Instance IDs

1507 The command protocol uses a packet field called the Instance ID (IID). IID numbers are 8-bit values that
1508 shall range from 0x01 to 0xFF. IIDs are used to uniquely identify instances of a command, to improve the
1509 robustness of matching responses to commands, and to differentiate between new and retried
1510 commands. The Network Controller that receives a command handles the IID in the following ways:

- 1511 • It returns the IID value from the command in the corresponding response.
- 1512 • If the IID is the same as the IID for the previous command, it recognizes the command as a
1513 'retried' command rather than as a new instance of the command. It is expected that the 'retried'
1514 command contains the same command type value in the Control Packet Type field. The NC
1515 behavior when a 'retried' command type does not match the original command type is outside
1516 the scope of this specification.
- 1517 • If a retried command is received, the Network Controller shall return the previous response.
1518 Depending on the command, the Network Controller can accomplish this either by holding the
1519 previous response data so that it can be returned or, if re-executing the command has no side
1520 effects (that is, the command is idempotent), by re-executing the command operation and
1521 returning that response.
- 1522 • If the command IID is the same as the IID for the previous command, and the Poll Indication is
1523 set, the NC recognizes the command as a 'polling' command rather than as a new instance of
1524 the command.
 - 1525 • When polling, the MC is expected to use the command type value of the original command
1526 in the Control Packet Type field. If there was no command in progress, the NC shall fail the
1527 'polling' command and respond with an error. When the NC fails the 'polling' command, the
1528 outcome of the original command is indeterminate and is outside the scope of this
1529 specification.
 - 1530 • If a command with Poll Indication set is received and the original command has been
1531 completed, then the Network Controller shall return the response of the completed
1532 command.

- 1533 • If it is still processing the command, it shall return a “Delayed Response” reason code and
1534 optionally recommend a next polling time interval.
- 1535 • When an IID value is received that is different from the one for the previous command, the
1536 Network Controller executes the command as a new command.
- 1537 • When the NC-SI Channel first enters the Initial State, it shall clear any record of any prior
1538 requests. That is, it assumes that the first command after entering the Initial State is a new
1539 command and not a retried command, regardless of any IID that it may have received before
1540 entering the Initial State.

1541 Thus, for single-threaded operation with idempotent commands, a responding Network Controller can
1542 simply execute the command and return the IID that it received in the command in the response. If it is
1543 necessary to not execute a retried command, the responding controller can use the IID to identify the
1544 retried command and return the response that was delivered for the original command.

1545 The Management Controller that generates a command handles the IID in the following ways:

- 1546 • The IID changes for each new instance of a command.
- 1547 • If a command needs to be retried, the Management Controller uses the same value for the IID
1548 that it used for the initial command.
- 1549 • The Management Controller can optionally elect to use the IID to provide additional confirmation
1550 that the response is being returned for a particular command.

1551 Because an AEN is not a response, an AEN always uses a value of 0x00 for its IID.

1552 NOTE: The Instance ID mechanism can be readily extended in the future to support multiple controllers and multiple
1553 outstanding commands. This extension would require having the responder track the IID on a per command and per
1554 requesting controller basis. For example, a retried command would be identified if the IID and command matched the
1555 IID and command for a prior command for the given originating controller’s ID. That is, a match is made with the
1556 command, originating controller, and IID fields rather than on the IID field alone. A requester that generates multiple
1557 outstanding commands would correspondingly need to track responses based on both command and IID to match a
1558 given response with a given command. IIDs need to be unique for the number of different commands that can be
1559 concurrently outstanding.

1560 6.2.2.3 Single-threaded operation

1561 The Network Controller is required to support NC-SI commands only in a single-threaded manner. That is,
1562 the Network Controller is required to support processing only one command at a time and is not required
1563 to accept additional commands until after it has sent the response to the previous one.

1564 Therefore, the Management Controller should issue NC-SI commands in a single-threaded manner. That
1565 is, the Management Controller should have only one command outstanding to a given Network Controller
1566 package at a time. Upon sending an NC-SI command packet, and before sending a subsequent
1567 command, the Management Controller should wait for the corresponding response packet to be received
1568 or a command timeout event to occur before attempting to send another command. For the full
1569 descriptions of command timeout, see clause 6.8.3.2.

1570 NOTE: While NC implementations are only required to support single-threaded operations, they may choose to
1571 support more than one outstanding command. The use of unique IIDs is essential to properly match multiple
1572 outstanding commands and responses in such implementations.

1573 6.2.2.4 Responses

1574 The Network Controller shall process and acknowledge each validly formatted command received at the
1575 NC-SI interface by formatting and sending a valid response packet to the Management Controller through
1576 the NC-SI interface.

1577 To allow the Management Controller to match responses to commands, the Network Controller shall copy
1578 the IID number of the Command into the Instance ID field of the corresponding response packet.

1579 To allow for retransmission and error recovery, the Network Controller may re-execute the last command
1580 or maintain a copy of the response packet most recently transmitted to the Management Controller
1581 through its sideband interface. This “previous” response packet shall be updated every time a new
1582 response packet is transmitted to the Management Controller by replacing it with the one just sent.

1583 The Network Controller shall return a “Command Unsupported” response code with an “Unknown
1584 Command Type” reason code for any command (standard or OEM) that the Network Controller does not
1585 support or recognize. If a command cannot be executed due to the processing of other commands, the
1586 response code Command Unavailable shall be returned.

1587 **6.2.2.5 Response and post-response processing**

1588 Typically, a Network Controller completes a requested operation before sending the response. In some
1589 situations, however, it may be useful for the controller to be allowed to queue up the requested operation
1590 and send the response assuming that the operation will complete correctly (for example, when the
1591 controller is requested to change link configuration). The following provisions support this process:

- 1592 • A Network Controller is allowed to send a response before performing the requested action if
1593 the command is expected to complete normally and all parameters that are required to be
1594 returned with the response are provided.
- 1595 • Temporal ordering of requested operations shall be preserved. For example, if one command
1596 updates a configuration parameter value and a following command reads back that parameter,
1597 the operation requested first shall complete so that the following operation returns the updated
1598 parameter.
- 1599 • Under typical operation of the Network Controller, responses should be delivered within the
1600 Normal Execution Interval (T5) (see Table 280).
- 1601 • Unless otherwise specified, all requested operations shall complete within the Asynchronous
1602 Reset/Asynchronous Not Ready interval (T6) following the response.
- 1603 • If the Network Controller channel determines that the requested operation or configuration
1604 change has not been completed correctly after sending the response, the channel shall enter
1605 the Initial State.
- 1606 • If the command response is dependent on the execution of the command and the command
1607 response cannot be provided within Normal Execution Interval (T5), then a “Delayed Response”
1608 response code may be returned. In this case, the MC can poll the command later with the “Poll
1609 Indication” set to retrieve the response. The decision on when the MC polls again can be based
1610 on one of the following criteria:
 - 1611 • A fixed delay. In this case a delay greater than T5 is recommended.
 - 1612 • If provided, based on the “recommended next polling time” in the original response
 - 1613 • If the AEN is enabled, based on reception of a “Delayed Response Ready AEN”.

1614 When using delayed responses, the NC shall complete the command processing within T14 seconds.

1615 **6.2.2.6 NC-SI traffic ordering**

1616 This specification does not require any ordering between AENs, NC-SI responses, and NC-SI Pass-
1617 through packets. Specific transport binding specifications may require ordering between AENs, NC-SI
1618 responses, and NC-SI Pass-through packets.

1619 **6.3 Link configuration and control**

1620 **6.3.1 Link Configuration**

1621 The Network Controller provides commands to allow the Management Controller to specify the
1622 auto-negotiation, link speed, duplex settings, FEC algorithm, link training, SerDes lane configuration, etc.
1623 to be used on the network interface. For more information, see clause 8.4.21.

1624 The Management Controller should make link configuration changes only when the host network driver is
1625 absent or non-operational.

1626 **6.3.2 Link Status**

1627 The Network Controller provides a Get Link Status command to allow the Management Controller to
1628 interrogate the configuration and operational status of the primary links. The Management Controller may
1629 issue the Get Link Status command regardless of OS operational status.

1630 **6.4 Frame filtering for Pass-through mode**

1631 **6.4.1 Overview**

1632 The Network Controller provides the option of configuring various types of filtering mechanisms for the
1633 purpose of controlling the delivery of received Ethernet frames to the Management Controller. These
1634 options include VLAN Tag filter, L2 address filters, MAC address support, and limited frame filtering using
1635 L3, L4 protocol header fields. All frames that pass frame filtering are forwarded to the Management
1636 Controller over the Sideband Interface. Refer to [RFC2373](#), [RFC2461](#), and [RFC3315](#) for IPv6-related
1637 definitions.

1638 **6.4.2 Multicast filtering**

1639 The Network Controller may provide commands to allow the Management Controller to enable and
1640 disable global filtering of all multicast packets. The Network Controller may optionally provide one or more
1641 individual multicast filters, as well as DHCP v6, IPv6 Neighbor Advertisement, IPv6 Router Advertisement,
1642 IPv6 Neighbor Solicitation, IPv6 MLD, mDNSv4, mDNSv6, and LLDP filters.

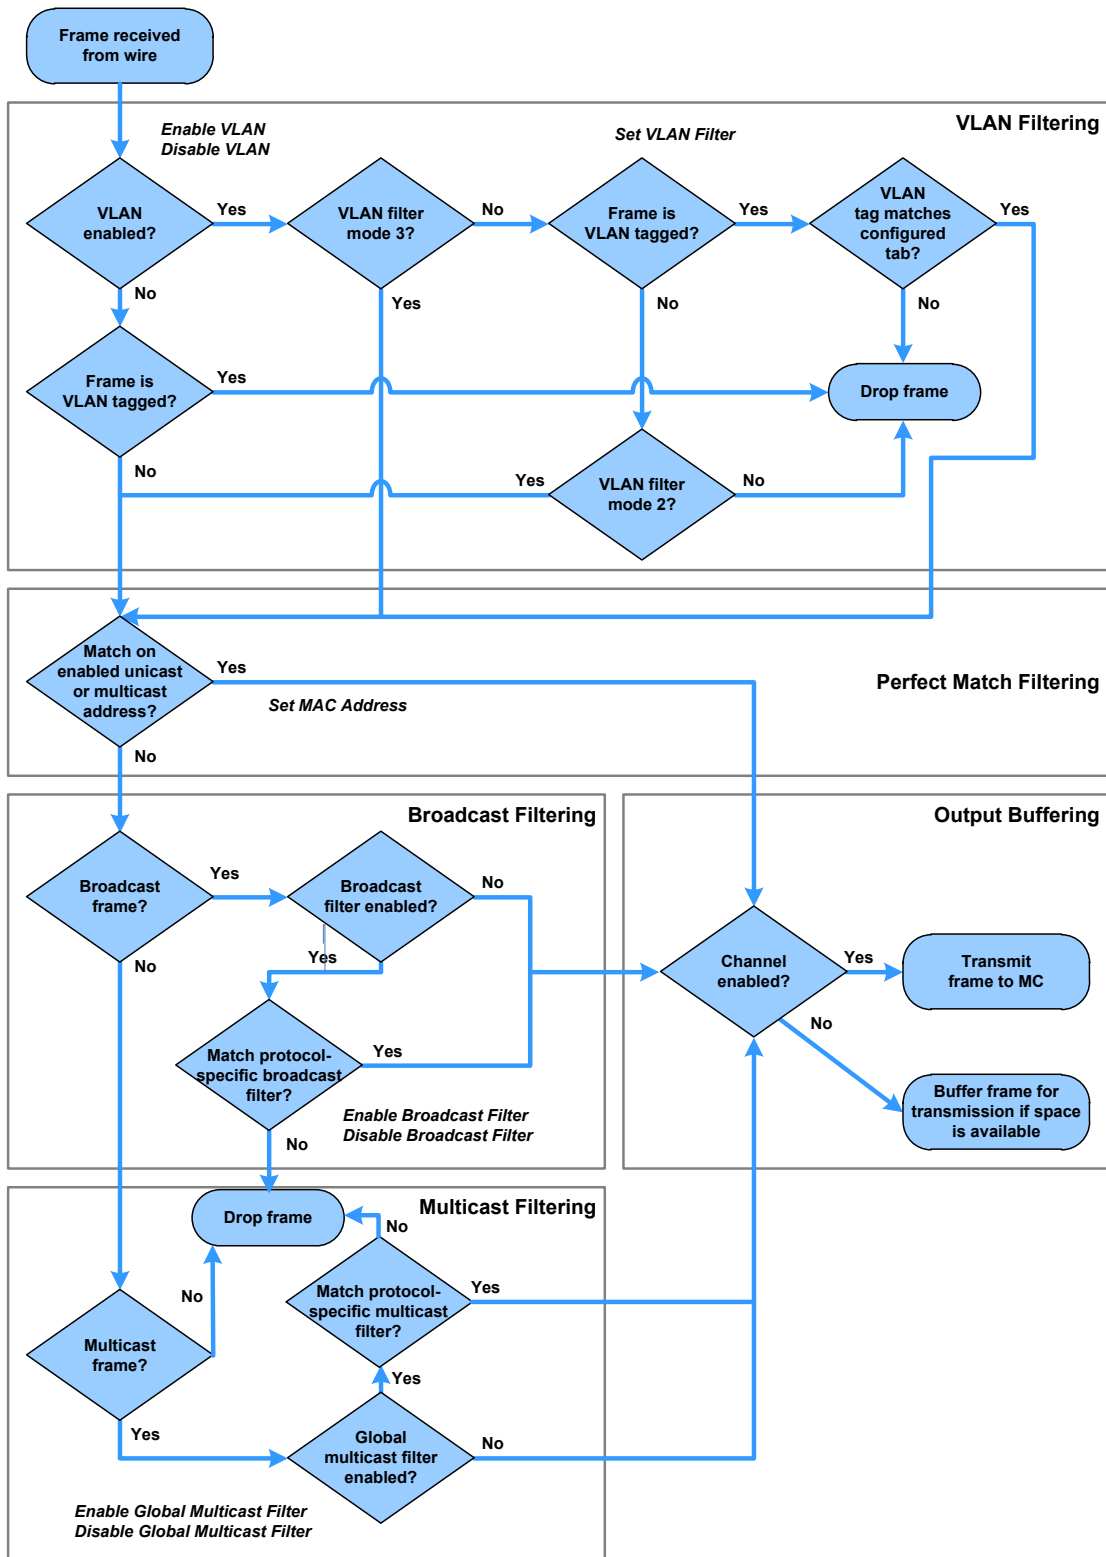

1643 **6.4.3 Broadcast filtering**

1644 The Network Controller provides commands to allow the Management Controller to enable and disable
1645 forwarding of Broadcast and ARP packets. The Network Controller may optionally support selective
1646 forwarding of broadcast packets for specific protocols, such as DHCP (see [RFC2131](#)) and NetBIOS.

1647 **6.4.4 VLAN filtering**

1648 The Network Controller provides commands to allow the Management Controller to enable and disable
1649 VLAN filtering, configure one or more VLAN Filters, and configure VLAN filtering modes.

1650 Figure 9 illustrates the flow of frame filtering. Italicized text in the figure is used to identify NC-SI
1651 command names.

1652

1653

Figure 9 – NC-SI packet filtering flowchart

1654 **6.5 Output buffering behavior**

1655 There are times when the NC is not allowed to transmit Pass-through, AEN, or Control Packets onto the
1656 Sideband Interface.

1657 The NC should buffer Pass-through frames to be transmitted to the MC under any of the following
1658 conditions:

- 1659 • The package is deselected.
- 1660 • For a channel within a package while that channel is disabled.
- 1661 • When the hardware arbitration is enabled and the NC does not have the token to transmit
1662 frames to the MC.

1663 The NC may buffer AENs to the MC under any of the above conditions.

1664 Control Packets (responses) are buffered when hardware arbitration is enabled and the NC does not
1665 have the token to transmit frames to the MC.

1666 Additionally, while an NC-SI channel is in the initial state, previously received Pass-through frames and
1667 AENs may or may not be buffered. This behavior is outside the scope of this specification.

1668 **6.6 NC-SI flow control**

1669 The Network Controller may provide commands to enable flow control on the RBT interface between the
1670 Network Controller and the Management Controller. The NC-SI flow control behavior follows the PAUSE
1671 frame behavior as defined in [IEEE 802.3](#). Flow control is configured using the Set NC-SI Flow command
1672 (see clause 8.4.41).

1673 When enabled for flow control, a channel may direct the package to generate and renew 802.3x (XOFF)
1674 PAUSE Frames for a maximum interval of T12 for a single congestion condition. If the congestion
1675 condition remains in place after a second T12 interval expires, the congested channel shall enter the
1676 Initial State and remove its XOFF request to the package. Note that some implementations may have
1677 shared buffering arrangements where all channels within the package become congested simultaneously.
1678 Also note that if channels become congested independently, the package may not immediately go into
1679 the XON state after T12 if other channels within the package are still requesting XOFF.

1680 **6.7 Asynchronous Event Notification**

1681 **6.7.1 Overview**

1682 Asynchronous Event Notification (AEN) packets enable the Network Controller to deliver unsolicited
1683 notifications to the Management Controller when certain status changes that could impact interface
1684 operation occur in the Network Controller. Because the NC-SI is a small part of the larger Network
1685 Controller, its operation can be affected by a variety of events that occur in the Network Controller. These
1686 events include link status changes, OS driver loads and unloads, and chip resets. This feature defines a
1687 set of notification packets that operate outside of the established command-response mechanism.

1688 Control over the generation of the AEN packets is achieved by control bits in the AEN Enable command.
1689 Each type of notification is optional and can be independently enabled by the Management Controller.

1690 AENs are not acknowledged, and there is no protection against the possible loss of an AEN packet. Each
1691 defined event has its own AEN packet. Because the AEN packets are generated asynchronously by the
1692 Network Controller, they cannot implement some of the features of the other Control Packets. AEN
1693 packets leverage the general packet format of Control Packets.

- 1694 • The originating Network Controller shall fill in the Channel ID (Ch. ID) field as defined in clause
1695 6.1.9 in the AEN header to identify the source of notification.

- 1696 • The IID field in an AEN shall be set to 0x00 to differentiate it from a response or command
1697 packet.
- 1698 • The Network Controller shall copy the AEN MC ID field from the AEN Enable command into the
1699 MC ID field in every AEN sent to the Management Controller.

1700 **6.7.2 AEN handling in multiple medium implementations**

1701 Implementations that use NC-SI over physical interfaces other than RBT and enable Asynchronous Event
1702 Notifications (AEN) on those other media used for MCTP shall comply with the requirements in [DSP0261](#).

1703 AENs that are enabled via RBT are specific to RBT-active operation and any AEN that is subsequently
1704 generated is delivered only over RBT and even then only when RBT is active (maintained or restored
1705 operation).

1706 AEN generation is suppressed and not cached when the media on which it was enabled is not active.

1707 **6.8 Error handling**

1708 **6.8.1 Overview**

1709 This clause describes the error-handling methods that are supported over NC-SI. Two types of error-
1710 handling methods are defined:

- 1711 • Synchronous Error Handling
- 1712 • Errors that trigger Asynchronous Entry into the Initial State

1713 Synchronous Error Handling occurs when an Error (non-zero) Response/Reason Code is received in
1714 response to a command issued by the Management Controller. For information about response and
1715 reason codes, see clause 8.2.4.1.

1716 Asynchronous Entry into the Initial State Error Handling occurs when the Network Controller
1717 asynchronously enters the Initial State because of an error condition that affects NC-SI configuration or a
1718 failure of a command that was already responded to. For more information, see clause 6.1.8.1.

1719 **6.8.2 Transport errors**

1720 **6.8.2.1 Dropped Control Packets**

1721 A Network Controller with an active interface shall drop Control Packets received on the NC-SI interface
1722 under the following conditions:

- 1723 • The packet has an invalid Frame Check Sequence (FCS) value.
- 1724 • Frame length does not meet [IEEE 802.3](#) requirements (except for OEM commands, where
1725 accepting larger packets may be allowed as a vendor-specific option).
- 1726 • The packet checksum (if provided) is invalid.
- 1727 • The NC-SI Channel ID value in the packet does not match the expected value.
- 1728 • The Network Controller does not have resources available to accept the packet.
- 1729 • The Network Controller receives a command packet with an incorrect header revision.
- 1730 • Control Packets may also be dropped if an event that triggers Asynchronous Entry into the
1731 Initial State causes packets to be dropped during the transition.

1732 6.8.2.2 Pass-through packet errors

1733 Handling of Pass-through packet errors, other than logging statistics, is out of scope of this specification.

1734 6.8.3 Missing responses**1735 6.8.3.1 Overview**

1736 There are typical scenarios in which the Management Controller does not receive the response to a
1737 command:

- 1738 • The Network Controller dropped the command and thus never sent the response.
- 1739 • The response was dropped by the Management Controller (for example, because of a CRC
1740 error in the response packet).
- 1741 • The Network Controller is in the process of being reset or is disabled.

1742 The Management Controller can detect a missing response packet as the occurrence of an NC-SI
1743 command timeout event.

1744 6.8.3.2 Command timeout

1745 The Management Controller may detect missing responses by implementing a command timeout interval.
1746 The timeout value chosen by the Management Controller shall not be less than the Normal Execution
1747 Interval, T5. Upon detecting a timeout condition, the Management Controller should not make
1748 assumptions on the state of the unacknowledged command (for example, the command was dropped, or
1749 the response was dropped), but should retransmit (retry) the previous command using the same IID it
1750 used in the initial command.

1751 The Management Controller should try a command at least three times before assuming an error
1752 condition in the Network Controller.

1753 It is possible that a Network Controller could send a response to the original command at the same time a
1754 retried command is being delivered. Under this condition, the Management Controller could get more than
1755 one response to the same command. Thus, the Management Controller should be capable of determining
1756 that it has received a second instance of a previous response packet. Dropped commands may be
1757 detected by the Management Controller as a timeout event waiting for the response.

1758 6.8.3.3 Handling dropped commands or missing responses

1759 To recover from dropped commands or missing responses, the Management Controller can retransmit
1760 the unacknowledged command packet using the same IID that it used for the initial command.

1761 The Network Controller shall be capable of reprocessing retransmitted (retried) commands without error
1762 or undesirable side effects. The Network Controller can determine that the command has been
1763 retransmitted by verifying that the IID is unchanged from the previous command.

1764 6.8.4 Detecting Pass-through traffic interruption

1765 The Network Controller might asynchronously enter the Initial State because of a reset or other event. In
1766 this case, the Network Controller stops transmitting Pass-through traffic on the RXD lines. Similarly, Pass-
1767 through traffic sent to the Network Controller may be dropped. If the Management Controller is not in the
1768 state of sending or receiving Pass-through traffic, it may not notice this condition. Thus, the Management
1769 Controller should periodically issue a command to the Network Controller to test whether the Network
1770 Controller has entered the Initial State. How often this testing should be done is a choice of the
1771 Management Controller.

1772 **6.9 Support for additional network fabrics**

1773 **6.9.1 FC support**

1774 NCs that support Fibre Channel connectivity can be inventoried, configured, and monitored. Fibre
 1775 Channel-specific link speed, link status, boot configuration, and statistics commands are provided. Fibre
 1776 Channel over Ethernet (FCoE) support is also defined for Ethernet NCs that support it.

1777 **6.9.2 InfiniBand Support**

1778 NCs that support InfiniBand connectivity can be inventoried, configured, and monitored. InfiniBand-
 1779 specific link speed, link status and statistics commands, and Pass-through mode support are provided.

1780 **6.10 PLDM and SPDM transport**

1781 NC-SI over RBT can be used to transport SPDM or PLDM messages. This transport supports the
 1782 following modes:

- 1783 • MC sends PLDM and/or SPDM commands to the NC.
- 1784 • MC polls the NC for PLDM and/or SPDM commands originating at the NC.
- 1785 • The NC indicates through an AEN that a PLDM/SPDM command is available for retrieval.

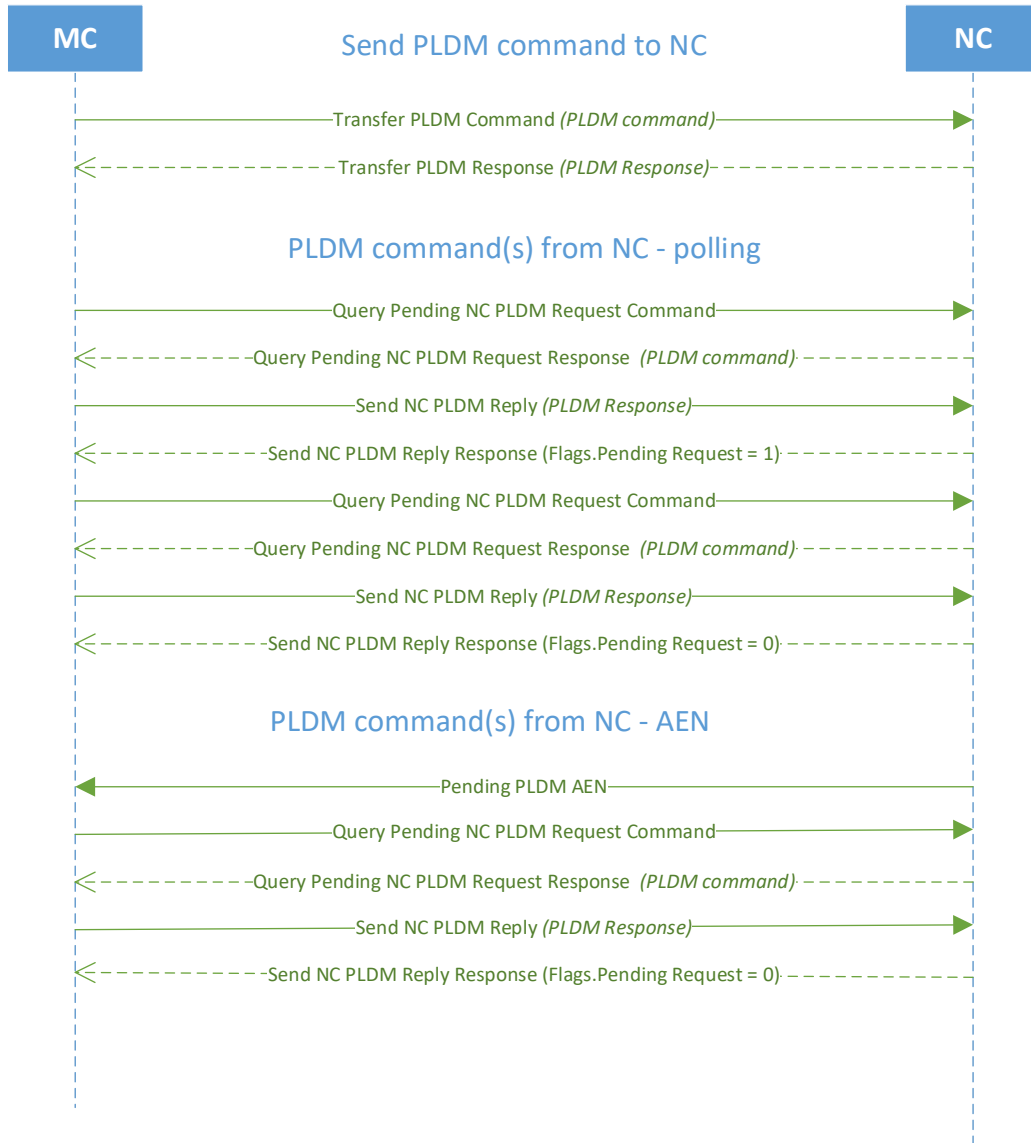

1786 The following commands are used to implement an RBT binding for these messages:

1787 **Table 4 – Commands for RBT binding**

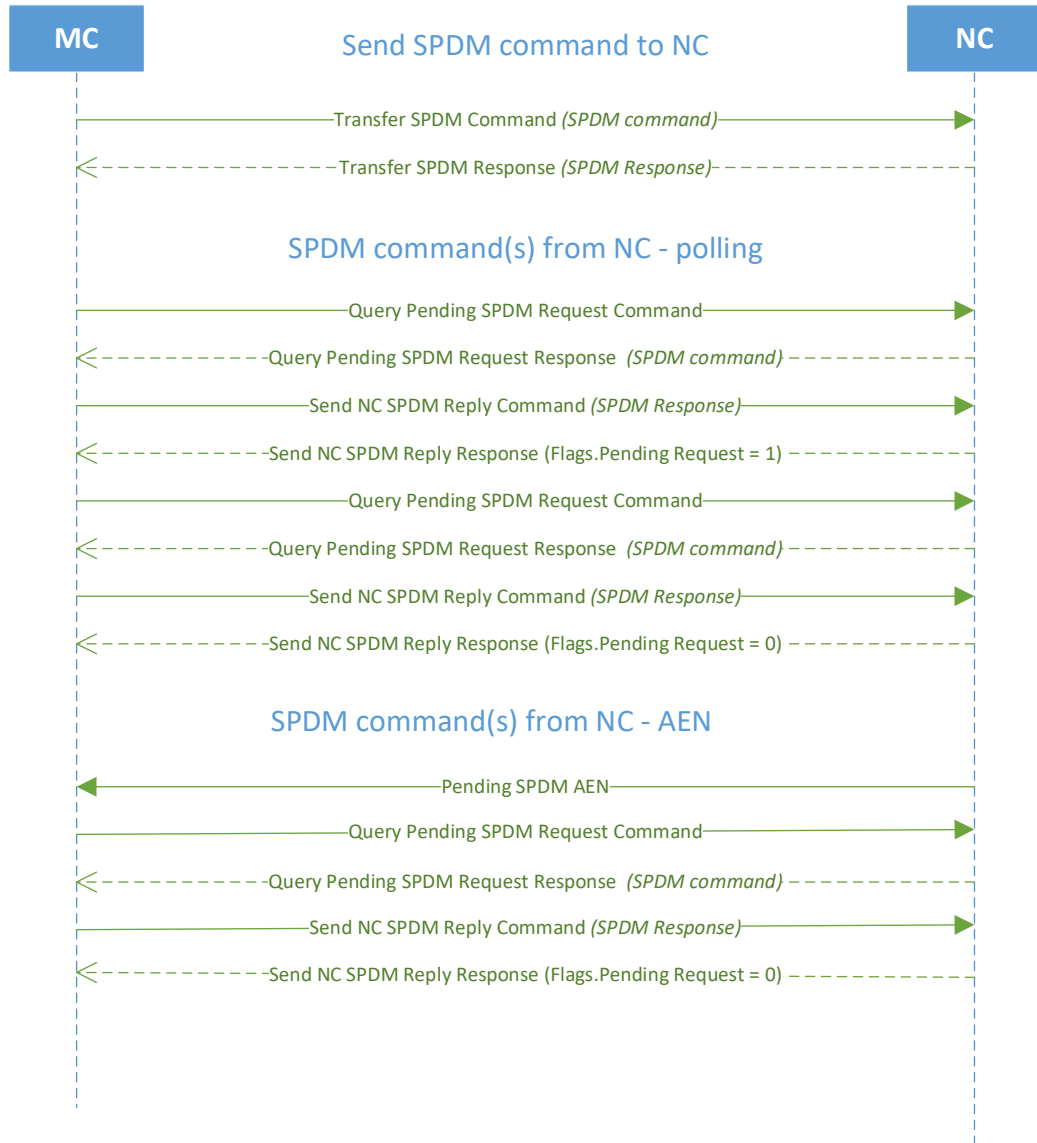

Command Description	PLDM Commands over RBT	SPDM Commands over RBT
Send command from MC	PLDM	SPDM
Poll for NC command	Query Pending NC PLDM Request	Query Pending SPDM Request
Respond to NC command	Send NC PLDM Reply	Send NC SPDM Reply

1788

1789 The PLDM and SPDM command flows are described in the UML diagrams below.

1790

1791
1792

1793 7 Arbitration in configurations with multiple Network Controller 1794 packages

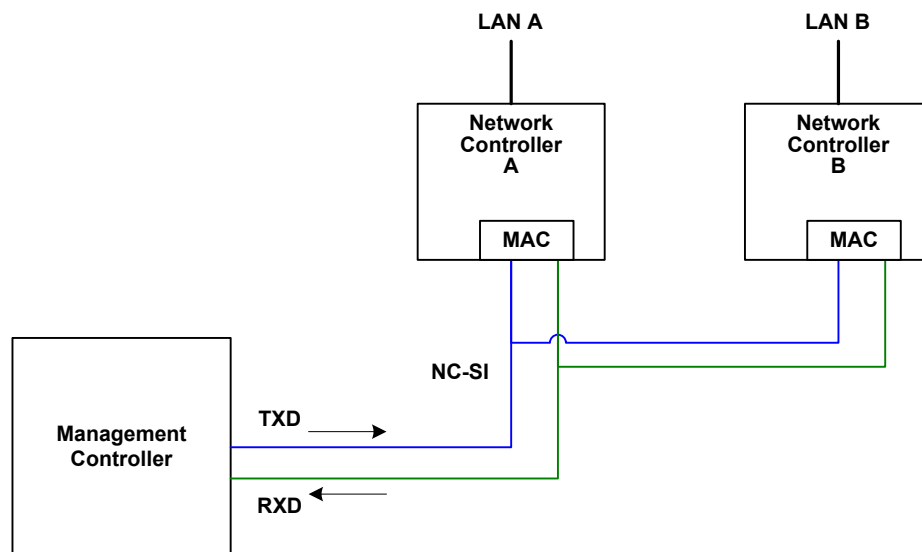

1795 7.1 Overview

1796 This clause applies to NC-SI over RBT only.

1797 More than one Network Controller package on an RBT interface can be enabled for transmitting packets
1798 to the Management Controller. This specification defines two mechanisms to accomplish Network
1799 Controller package arbitration operations. One mechanism uses software commands provided by the
1800 Network Controller for the Management Controller to control whose turn it is to transmit traffic. The other
1801 mechanism uses hardware arbitration to share the single RBT bus. Implementations are required to
1802 support command-based Device Selection operation; the hardware arbitration method is typically desired
1803 but is optional.

1804 7.2 Multi-controller RBT

1805 Figure 10 is a simplified block diagram of the Sideband Interface being used in a multi-drop configuration.
1806 The RMII (upon which NC-SI RBT is based) was originally designed for use as a point-to-point
1807 interconnect. Accordingly, only one party can transmit data onto the bus at any given time. There is no
1808 arbitration protocol intrinsic in the RMII specification to support managing multiple transmitters.

1809

1810 **Figure 10 – Basic multi-drop block diagram**

1811 However, it is possible for multiple Network Controllers on the interface to be able to simultaneously
1812 receive traffic from the Management Controller that is being transmitted on the RBT TXD lines. The
1813 Network Controllers can receive commands from the Management Controller without having to arbitrate
1814 for the bus. This facilitates the Management Controller in delivering commands for setup and
1815 configuration of arbitration.

1816 Arbitration allows multiple Network Controller packages that are attached to the interface to be enabled to
1817 share the RXD lines to deliver packets to the Management Controller.

1818 This operation is summarized as follows:

- 1819 • Only one Network Controller at a time can transmit packets on the RXD lines of the interface.
- 1820 • Network Controllers can accept commands for configuring and controlling arbitration for the
- 1821 RXD lines.

1822 **7.3 Hardware arbitration**

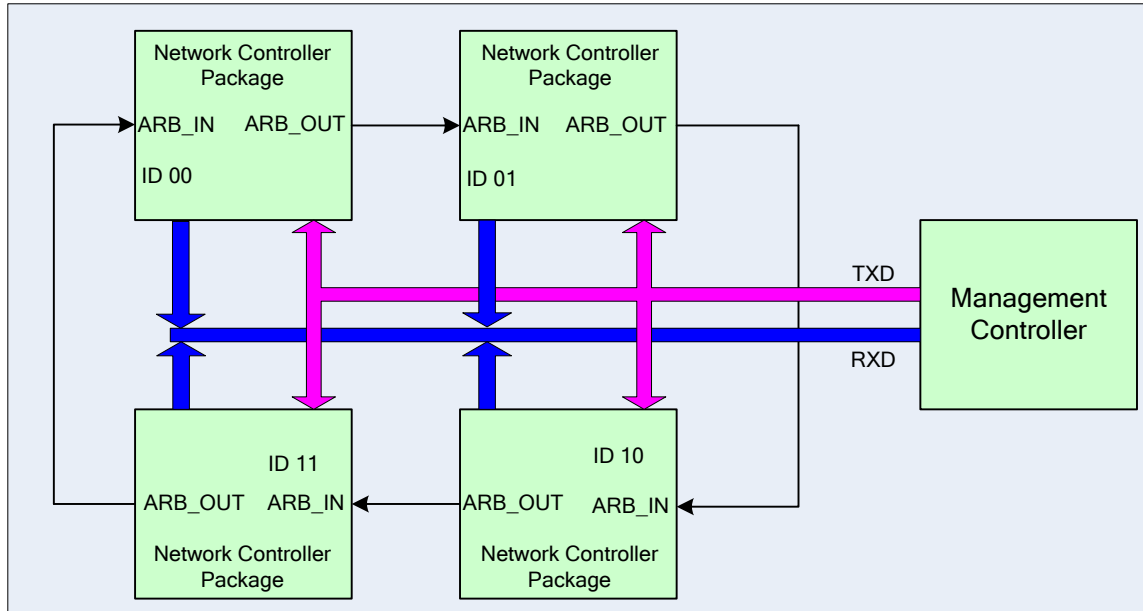

1823 To prevent two or more NC-SI packages from transmitting at the same time, a hardware-based arbitration
1824 scheme was devised to allow only one Network Controller package to drive the RX lines of the shared
1825 interface at any given time. This scheme uses a mechanism of passing messages (opcodes) between
1826 Network Controller packages to coordinate when a controller is allowed to transmit through the RBT
1827 interface.

1828 **7.3.1 General**

1829 Three conceptual modes of hardware arbitration exist: arbitration master assignment, normal operation,
1830 and bypass. After a package is initialized and has its Channel IDs assigned, it enters the arbitration
1831 master assignment mode. This mode assigns one package the role of an Arbitration Master
1832 (ARB_Master) that is responsible for initially generating a TOKEN opcode that is required for the normal
1833 operating mode. In the normal operating mode, the TOKEN opcode is passed from one package to the
1834 next in the ring. The package is allowed to use the shared RXD signals and transmit if the package has
1835 received the TOKEN opcode and has a packet to send.

1836 Bypass mode allows hardware arbitration opcodes to pass through a Network Controller package before
1837 it is initialized. Bypass mode shall be in effect while hardware arbitration is disabled. Bypass mode shall
1838 be exited, and arbitration master assignment mode shall be entered when the hardware arbitration
1839 becomes enabled or re-enabled.

1840 Hardware-based arbitration requires two additional pins (ARB_IN and ARB_OUT) on the Network
1841 Controller. The ARB_OUT pin of one package is connected to the ARB_IN pin of the next package to
1842 form a ring configuration, as illustrated in Figure 11. The timing requirements for hardware arbitration are
1843 designed to accommodate a maximum of four Network Controller packages. If the implementation
1844 consists of a single Network Controller package, the ARB_OUT pin may be connected to the ARB_IN pin
1845 on the same package, or may be left disconnected, in which case hardware arbitration should be disabled
1846 by using the Select Package command. This specification optionally supports reporting of Hardware
1847 arbitration implementation status and hardware arbitration status using the Get Capabilities command.

1848

1849

Figure 11 – Multiple Network Controllers in a ring format

1850

Each Network Controller package sends out pulses on the ARB_OUT pin to create a series of symbols that form opcodes (commands) between Network Controllers. Each pulse is one clock wide and synchronized to REF_CLK. The hardware arbitration data bits follow the same timing specifications used for the TXD and RXD data bits (see clause 10.2.7). The pulses are di-bit encoded to ensure that symbols are correctly decoded. The symbols have the values shown in Table 5.

1851

1852

1853

1854

1855

While clause 7.3.2.1 allows for opcodes to be truncated, it is recommended that the transmission of the current opcode on ARB_OUT be completed if the HW arbitration mode is changed in the middle of an opcode transfer (or in the middle of a symbol).

1856

1858

Table 5 – Hardware arbitration di-bit encoding

Symbol Name	Encoded Value
E _{sync}	11b
E _{zero}	00b
E _{one}	01b
Illegal symbol	10b

1859

7.3.2 Hardware arbitration opcodes

1860

The hardware-based arbitration feature defines five opcodes: IDLE, TOKEN, FLUSH, XON, and XOFF. Each opcode starts with an E_{sync} symbol and is followed by either E_{one} or E_{zero} symbols. The legal opcodes are listed in Table 6.

1861

1862

1863

Table 6 – Hardware arbitration opcode format

Opcode	Format
IDLE	E _{sync} E _{zero} E _{zero} (110000b)
TOKEN	E _{sync} E _{one} E _{zero} (110100b)
FLUSH	E _{sync} E _{one} E _{one} E _{zero} E(Package_ID[2:0]) E _{zero} (11010100xxxxxx00b)
XOFF	E _{sync} E _{zero} E _{one} E _{zero} E _{zero} E _{zero} (1100010000000b)
XON	E _{sync} E _{zero} E _{one} E _{one} E _{zero} E(Package_ID[2:0]) E _{zero} (1100010100uuuuuu00b)

1864 7.3.2.1 Detecting truncated opcodes

1865 A truncated opcode is detected when the number of clocks between successive E_{sync} symbols is less than
 1866 the number of bits required for the opcode. Note that any additional bits clocked in after a legitimate
 1867 opcode is detected do not indicate an error condition and are ignored until the next E_{sync}.

1868 7.3.2.2 Handling truncated or illegal opcodes

1869 When a Network Controller receives a truncated or illegal opcode, it should discard it.

1870 7.3.2.3 Relationship of opcodes processing and driving the RX data lines

1871 A Network Controller package shall take no more than T9 REF_CLK times after receiving the last bit of
 1872 the opcode to decode the incoming opcode and start generating the outgoing opcode. This time limit
 1873 allows for decoding and processing of the incoming opcode under the condition that an outgoing opcode
 1874 transmission is already in progress.

1875 A package that has received a TOKEN and has packet data to transmit shall turn on its buffer and begin
 1876 transmitting the packet data within T11 REF_CLK times of receiving the TOKEN, as illustrated in
 1877 Figure 12. The package shall disable the RXD buffers before the last clock of the transmitted TOKEN.

1878

Figure 12 – Opcode to RXD relationship

1879

1880 7.3.3 Opcode operations

1881 7.3.3.1 TOKEN opcode

1882 When a TOKEN opcode is received, the Network Controller package may drive the RXD signals to send
1883 only one of the following items: a Pass-through packet, a command response, or an AEN. One [IEEE](#)
1884 [802.3](#) PAUSE frame (XON or XOFF) may also be sent either before or after one of the previous packets,
1885 or on its own. While the Network Controller package is transmitting the data on the RXD signals of the
1886 interface, it shall generate IDLE opcodes on its ARB_OUT pin. Once a package completes its
1887 transmission, if any, it shall generate and send the TOKEN on its ARB_OUT pin.

1888 7.3.3.2 IDLE opcode

1889 A package that has no other opcode to send shall continuously generate IDLE opcodes. Typically, a
1890 received IDLE opcode indicates that the TOKEN is currently at another package in the ring. This opcode
1891 is also used in the ARB_Master assignment process (for details, see clause 7.3.5). An Idle opcode
1892 typically will also be generated when the package is transmitting on RBT

1893 7.3.3.3 FLUSH opcode

1894 A FLUSH opcode is used to establish an Arbitration Master for the ring when the package enters the
1895 Package Ready state or when the TOKEN is not received within the specified timeout, T8. This opcode is
1896 further explained in clause 7.3.5.

1897 If the package receives a FLUSH opcode while it is in the middle of transmitting a packet onto NC-SI, it
1898 shall generate IDLE opcodes until the transmission is complete and then process the FLUSH opcode as
1899 described.

1900 7.3.3.4 Flow Control opcodes

1901 The XON and XOFF opcodes are used to manage the generation of [IEEE 802.3](#) PAUSE frames on the
1902 RBT interface. If the Network Controller supports flow control and flow control is enabled, the XOFF and
1903 XON opcodes behave as described in this clause. If the Network Controller does not support flow control
1904 or if flow control is not enabled, the Network Controller shall pass the opcodes to the next package.

1905 There may be a configuration where some NCs support flow control and others do not. In this
1906 configuration, an NC sending an XOFF opcode may see the XOFF packet emission delayed by two or
1907 more full-size Pass-through packets, one for each package not supporting XOFF when it gets the token,
1908 and one for the next package supporting XOFF before sending the XOFF packet. The NC is not required
1909 to provide buffering to prevent packet loss in this configuration. If all NCs have flow control enabled, no
1910 drop behavior should be expected by an MC.

1911 NOTE: There is a maximum amount of time that the Network Controller is allowed to maintain a PAUSE. For more
1912 information, see clause 8.4.41.

1913 7.3.3.4.1 XOFF opcode

1914 A Network Controller package that becomes congested while receiving packets from the NC-SI shall
1915 perform the following actions:

- 1916 • If it does not have a TOKEN, it sends the XOFF opcode to the next package.

1917 NOTE: If it has the TOKEN and has not previously sent an XOFF frame for this instance of congestion, it
1918 shall send a single XOFF frame (PAUSE frame with a pause time of 0xFFFF) and will not generate an
1919 XOFF opcode.

- 1920 • A package may also regenerate an XOFF frame or opcode if it is still congested and determines
1921 that the present PAUSE frame is about to expire.

1922 When a package on the ring receives an XOFF opcode, it shall perform one of the following actions:

- 1923 • If it does not have a TOKEN opcode, it passes the XOFF opcode to the next package in the
1924 ring.
- 1925 • If it has the TOKEN, it shall send an XOFF frame (PAUSE frame with a pause time of 0xFFFF)
1926 and will not regenerate the XOFF opcode. If it receives another XOFF opcode while sending the
1927 XOFF frame or a regular network packet, it discards the received XOFF opcode.

1928 7.3.3.4.2 XON opcode

1929 XON frames (PAUSE frame with a pause time of 0x0000) are used to signal to the Management
1930 Controller that the Network Controller packages are no longer congested and that normal traffic flow can
1931 resume. XON opcodes are used between the packages to coordinate XON frame generation. The
1932 package ID is included in this opcode to provide a mechanism to verify that no package is congested
1933 before sending an XON frame to the Management Controller.

1934 The XON opcode behaves as follows:

- 1935 • When a package is no longer congested, it generates an XON opcode with its own Package ID.
1936 This puts the package into the 'waiting for its own XON' state.
- 1937 • A package that receives the XON opcode takes one of the following actions:
 - 1938 – If it is congested, it replaces the received XON opcode with the IDLE opcode. This action
1939 causes the XON opcode to be discarded. Eventually, the congested package generates its
1940 own XON opcode when it exits the congested state.
 - 1941 – If the package is not congested and is not waiting for the XON opcode with its own
1942 Package ID, it forwards the received XON opcode to the next package in the ring.
 - 1943 – If the received XON opcode contains the package's own Package ID, the opcode should
1944 be discarded.
 - 1945 – If the package is not congested and is waiting for its own XON opcode, it performs one of
1946 the following actions:
 - 1947 • If it receives an XON opcode with a Package ID that is higher than its own, it replaces
1948 the XON opcode with its own Package ID.
 - 1949 • If it receives an XON opcode with a Package ID lower than its own, it passes that
1950 XON opcode to the next package and it exits the 'waiting for its own XON' state.
 - 1951 • If it receives an XON opcode with the Package ID equal to its own, it sends an XON
1952 frame on the NC-SI when it receives the TOKEN opcode and exits the 'waiting for its
1953 own XON' state.

1954 NOTE: More than one XON opcode with the same Package ID can be received while
1955 waiting for the TOKEN and while sending the XON frame. These additional XON
1956 opcodes should be discarded.

- 1957 • If a package originates an XON opcode but receives an XOFF opcode, it terminates its XON
1958 request so that it does not output an XON frame when it receives the TOKEN.

1959 NOTE: This behavior is not likely to occur because the Management Controller will be in the
1960 Pause state at this point.

- 1961 • A package that generated an XON opcode may receive its own XON opcode back while it has
1962 the TOKEN opcode. In this case, it may send a regular packet (Pass-through, command
1963 response, or AEN) to the Management Controller (if it has one to send), an XON frame, or both.

1964 **7.3.4 Bypass mode**

1965 When the Network Controller package is in bypass mode, data received on the ARB_IN pin is redirected
1966 to the ARB_OUT pin within the specified clock delay. This way, arbitration can continue between other
1967 devices in the ring.

1968 A package in bypass mode shall take no more than T10 REF_CLK times to forward data from the
1969 ARB_IN pin to the ARB_OUT pin. The transition in and out of bypass mode may result in a truncated
1970 opcode.

1971 A Network Controller package enters bypass mode immediately upon power up and transitions out of this
1972 mode after the Network Controller completes its startup/initialization sequence.

1973 **7.3.5 Hardware arbitration startup**

1974 Hardware arbitration startup works as follows:

- 1975 1) All the packages shall be in bypass mode within T_{pwz} seconds of NC-SI power up.
- 1976 2) As each package is initialized, it shall continuously generate FLUSH opcodes with its own
1977 Package ID.
- 1978 3) The package then participates in the ARB_MSTR assignment process described in the
1979 following clause.

1980 **7.3.6 ARB_MSTR assignment**

1981 ARB_MSTR assignment works as follows:

- 1982 1) When a package receives a FLUSH opcode with a Package ID numerically smaller than its
1983 own, it shall forward on the received FLUSH opcode. If the received FLUSH opcode's
1984 Package ID is numerically larger than the local Package ID, the package shall continue to
1985 send its FLUSH opcode with its own Package ID. When a package receives a FLUSH
1986 opcode with its own Package ID, it becomes the master of the ring (ARB_MSTR).
- 1987 2) The ARB_MSTR shall then send out IDLE opcodes until it receives an IDLE opcode.
- 1988 3) Upon receiving the IDLE opcode, the ARB_MSTR shall be considered to be in possession of
1989 the TOKEN opcode (see clause 7.3.3.1).
- 1990 4) If the package receives a FLUSH opcode while it is in the middle of transmitting a packet onto
1991 NC-SI, it shall generate IDLE opcodes until the transmission is complete and then process
1992 the FLUSH opcode as described.

1993 **7.3.7 Token timeout mechanism**

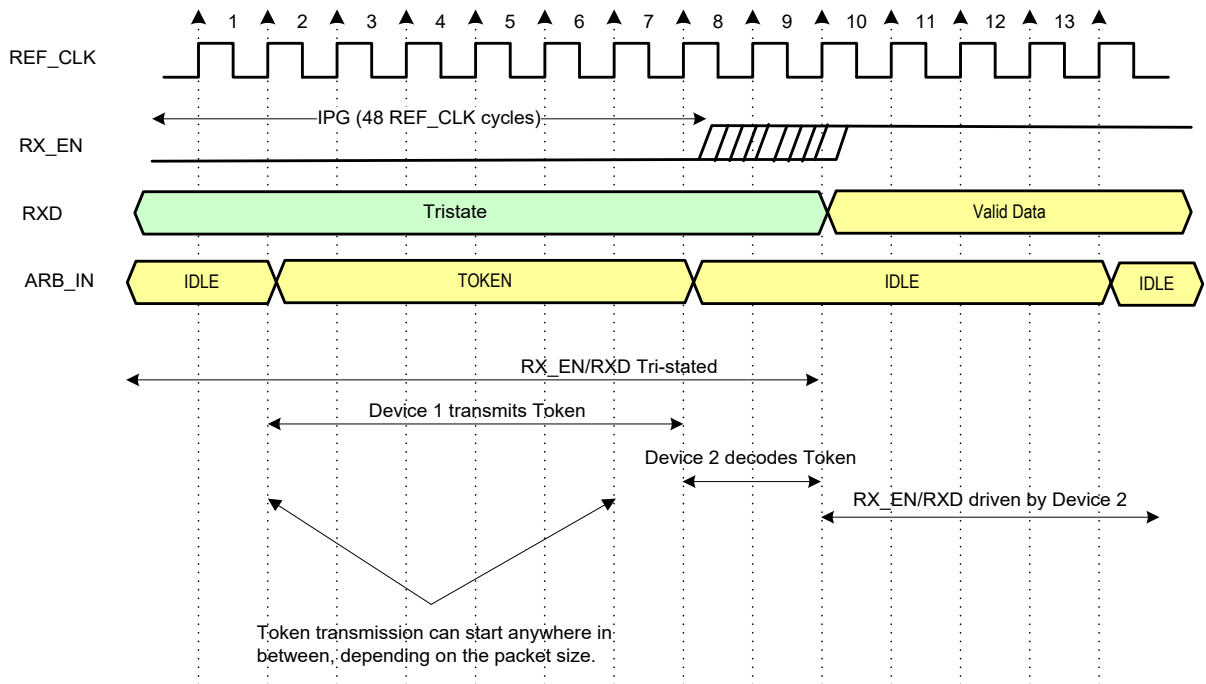

1994 Each Network Controller package that supports hardware-based arbitration control shall implement a
1995 timeout mechanism in case the TOKEN opcode is not received. When a package has a packet to send, it
1996 starts its timer. If it does not receive a TOKEN prior to the TOKEN timeout, the package shall send a
1997 FLUSH opcode. This restarts the arbitration process.

1998 The timer may be programmable depending on the number of packages in the ring. The timeout value is
1999 designed to accommodate up to four packages, each sending the largest packet (1536 bytes) plus
2000 possible XON or XOFF frame transmission and opcode processing time. The timeout shall be no fewer
2001 than T8 cycles of the REF_CLK.

2002 **7.3.8 Timing considerations**

2003 The ARB_OUT and ARB_IN pins shall follow the timing specifications outlined in clause 10.

2004 To improve the efficiency of the multi-drop NC-SI, TOKEN opcode generation may overlap the Inter
 2005 Packet Gap (IPG) defined by the [IEEE 802.3](#) specification, as shown in Figure 13. The TOKEN opcode
 2006 shall be sent no earlier than the last T13 REF_CLK cycles of the IPG.

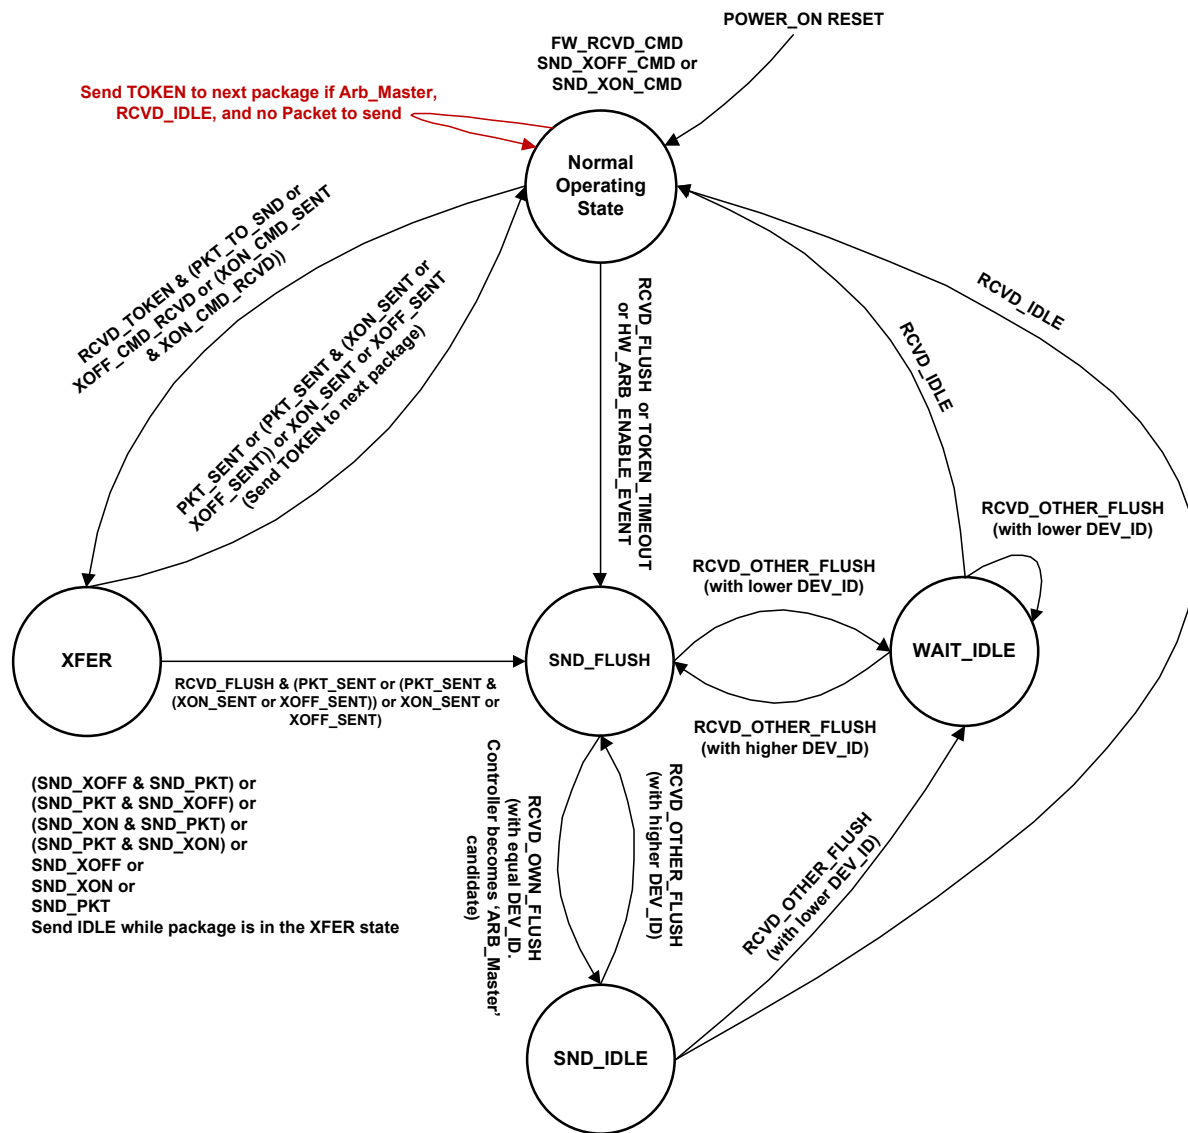

2007

2008

Figure 13 – Example TOKEN to transmit relationship

2009 **7.3.9 Example hardware arbitration state machine**

2010 The state machine diagram shown in Figure 14 is provided as a guideline to help illustrate the startup
 2011 process and opcode operations described in the preceding clauses.

2012
 2013 **Figure 14 – Hardware arbitration state machine**

2014 The states and events shown in Figure 14 are described in Table 7 and Table 8, respectively.

2015

Table 7 – Hardware arbitration states

State	Action
Normal Operating State	<p>This state is the normal operating state for hardware arbitration. The following actions happen in this state:</p> <ul style="list-style-type: none"> • FW_RCVD_CMD: Forward received command. As opcodes are received and acted upon, the resulting opcode is sent to the next package. For example, the TOKEN opcode is received, and no packet data is available to send, so the TOKEN opcode is sent to the next package in the ring. • SND_XOFF_CMD: Send the XOFF opcode to the next package. This action happens when the specific conditions are met as described in clause 7.3.3. • SND_XON_CMD: Send the XON opcode to the next package. This action happens when the specific conditions are met as described in clause 7.3.3. • If the Network Controller is ARB_Master, it generates the TOKEN opcode upon receiving an IDLE opcode at the end of the FLUSH process. • The RXD lines will be in a high-impedance condition in this state.
XFER	<p>In this state, data is sent on the RXD lines. This data will be a Pass-through packet, response packet, XON (Pause Off) packet, XOFF (Pause On) packet, or AEN. (An XON or XOFF packet can be sent in addition to a Pass-through packet, response packet, or AEN.) IDLE opcodes are sent to the next package while the device is in the XFER state.</p> <p>The following actions happen in this state:</p> <ul style="list-style-type: none"> • SND_XON: Transmit an XON frame (Pause Off) to the Management Controller. • SND_XOFF: Transmit an XOFF frame (Pause On) to the Management Controller. • SND_PKT: Transmit a Pass-through packet, response packet, or AEN to the Management Controller. • The TOKEN opcode is sent to the next package upon completion of the transfer.
SND_FLUSH	<p>This state is the entry point for determining the ARB_Master among the packages. In this state, the FLUSH opcode is continuously sent. This state is exited upon receiving a FLUSH opcode that has a DEV_ID that is equal to or lower than the package's own DEV_ID.</p>
SND_IDLE	<p>This is the final state for determining the ARB_Master, entered when a device's own FLUSH opcode is received. In this state, the IDLE opcode is continuously sent.</p>
WAIT_IDLE	<p>This state is entered when a FLUSH command is received from another package with a lower Device ID. When an IDLE opcode is received, the ARB_Master has been determined and the device transitions to the Normal Operating State.</p>

2016

Table 8 – Hardware arbitration events

Event	Description
RCVD_TOKEN	A TOKEN opcode was received, or the arbitration was just completed and won by this package.
RCVD_IDLE	An IDLE opcode was received.
XOFF_SENT	The Pause On frame was sent on the RXD interface.
XON_SENT	The Pause Off frame was sent on the RXD interface.
PKT_TO_SND	The Network Controller package has a Pass-through packet, command response packet, XON (Pause Off) frame, XOFF (Pause On) frame, or AEN to send.
XON_CMD_RCVD	A package received an XON opcode with its own Package ID.
XOFF_CMD_RCVD	An XOFF opcode was received.
XON_CMD_SENT	A package sent an XON opcode with its own Package ID.
RCVD_FLUSH	A FLUSH opcode was received.
TOKEN_TIMEOUT	The timeout limit expired while waiting for a TOKEN opcode.
HW_ARB_ENABLE_EVENT	This event begins ARB_MSTR assignment. This event occurs just after the Network Controller package initializes or when hardware arbitration is re-enabled through the Select Package command.
RCVD_OTHER_FLUSH	A package received a FLUSH opcode with a Package ID other than its own.
RCVD_OWN_FLUSH	A package received a FLUSH opcode with a Package ID equal to its own.

2017 7.4 Command-based arbitration

2018 If hardware arbitration is not being used, the **Select Package** and **Deselect Package** commands shall be
 2019 used to control which Network Controller package can transmit on the RXD lines. Because only one
 2020 Network Controller package is allowed to transmit on the RXD lines, the Management Controller shall
 2021 only have one package in the selected state at any given time. For more information, see clauses 8.4.5
 2022 and 8.4.7.
 2023

2024 **8 Packet definitions**

2025 **8.1 NC-SI packet encapsulation**

2026 The RBT interface is an Ethernet interface adhering to the standard [IEEE 802.3](#) Ethernet frame format.
 2027 Whether or not the Network Controller accepts runt packets is unspecified.

2028 As shown in Figure 15, this L2, or data link layer, frame format encapsulates all NC-SI packets, including
 2029 Pass-through, command, and response packets, as the L2 frame payload data by adding a 14-byte
 2030 header to the front of the data and appending a 4-byte Frame Check Sequence (FCS) to the end.

2031 NC-SI Control Packets shall not include any VLAN tags. NC-SI Pass-through packets may include an
 2032 802.1Q VLAN tag.

2033

2034 **Figure 15 – Ethernet frame encapsulation of NC-SI packet data without VLAN tag**

2035 **8.1.1 Ethernet frame header**

2036 The Management Controller shall format the 14-byte Ethernet frame header so that when it is received, it
 2037 shall be formatted in the big-endian byte order shown in Table 9.

2038 Channels shall accept Pass-through packets that meet the [IEEE 802.3](#) frame requirements.

2039

Table 9 – Ethernet Header Format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..03	DA ₅ = 0xFF	DA ₄ = 0xFF	DA ₃ = 0xFF	DA ₂ = 0xFF
04..07	DA ₁ = 0xFF	DA ₀ = 0xFF	SA ₅	SA ₄
08..11	SA ₃	SA ₂	SA ₁	SA ₀
12..13	EtherType = 0x88F8 (DMTF NC-SI)			

2040 **8.1.1.1 Destination Address (DA)**

2041 Bytes 0–5 of the header represent bytes 5–0 of the Ethernet Destination Address field of an L2 header.

2042 The channel is not assigned a specific MAC address and the contents of this field are not interpreted as a
 2043 MAC address by the Management Controller or the Network Controller. However, the DA field in all NC-SI
 2044 Control Packets shall be set to the broadcast address (FF:FF:FF:FF:FF:FF) for consistency.

2045 If the Network Controller receives a Control Packet with a Destination Address other than
2046 FF:FF:FF:FF:FF:FF, the Network Controller may elect to accept the packet, drop it, or return a
2047 response packet with an error response/reason code.

2048 8.1.1.2 Source Address (SA)

2049 Bytes 6–11 of the header represent bytes 5–0 of the Ethernet Source MAC Address field of the Ethernet
2050 header. The contents of this field may be set to any value. The Network Controller should use
2051 FF:FF:FF:FF:FF:FF as the source address for NC-SI Control Packets that it generates.

2052 8.1.1.3 EtherType

2053 The final two bytes of the header, bytes 12..13, represent bytes 1..0 of the EtherType field of the Ethernet
2054 header. For NC-SI Control Packets, this field shall be set to a fixed value of 0x88F8 as assigned to NC-SI
2055 by the IEEE. This value allows NC-SI Control Packets to be differentiated from other packets in the
2056 overall packet stream.

2057 8.1.2 Frame Check Sequence

2058 The Frame Check Sequence (FCS) shall be added at the end of the frame to provide detection of
2059 corruption of the frame. Any frame with an invalid FCS shall be discarded.

2060 8.1.3 Data length

2061
2062 NC-SI Commands, Responses, and AENs do not carry any VLAN tag. NC-SI Commands, Responses
2063 and AENs shall have a payload data length between 46 and 1500 octets (bytes). This complies with the
2064 802.3 specification. This means that the length of Ethernet frame shown in Figure 15 is between 64 octets
2065 (for a payload of 46 octets) and 1518 octets (for a payload with 1500 octets).
2066

2067 Pass-through packets also follow the 802.3 specification. The maximum payload size is 1500 octets; the
2068 minimum payload size shall be 42 octets when the 802.1Q (VLAN) tag is present and 46 octets when the
2069 802.1Q tag is not present. The Layer-2 Ethernet frame for an 802.1Q tagged frame shall be between 64
2070 octets (for a payload of 42 octets) and 1522 octets (for a payload with 1500 octets). For Pass-through
2071 packets that are not 802.1Q tagged, the minimum Layer-2 Ethernet frame size is 64 octets (for a payload
2072 of 46 octets) and the maximum Layer-2 Ethernet frame size is 1518 octets (for a payload of 1500 octets).

2073 8.2 Control Packet data structure

2074 Each NC-SI Control Packet is made up of a 16-byte packet header and a payload section whose length is
2075 specific to the packet type.

2076 8.2.1 Control Packet header

2077 The 16-byte Control Packet header is used in command, response, and AEN packets, and contains data
2078 values intended to allow the packet to be identified, validated, and processed. The packet header is in
2079 big-endian byte order, as shown in Table 10.

2080

Table 10 – Control Packet header format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..03	MC ID	Header Revision	Reserved	
04..07	Control Packet Type	Channel ID	Flags	Payload Length
08..11	Reserved			
12..15	Reserved			

2081 **8.2.1.1 Management Controller ID (MC ID)**

2082 In Control Packets, this 1-byte field identifies the Management Controller issuing the packet. For this
 2083 version of the specification, Management Controllers should set this field to 0x00 (zero). This implies that
 2084 only one management controller is supported for accessing the NC via NC-SI at any given time, Network
 2085 Controllers responding to command packets should copy the Management Controller ID field from the
 2086 command packet header into the response packet header. For AEN packets, this field should be copied
 2087 from the parameter that was set using the AEN Enable command.

2088 **8.2.1.2 Header revision**

2089 This 1-byte field identifies the version of the Control Packet header in use by the sender. For this version
 2090 of the specification, the header revision is 0x01.

2091 **8.2.1.3 Instance ID (IID)**

2092 This 1-byte field contains the IID of the command and associated response. The Network Controller can
 2093 use it to differentiate retried commands from new instances of commands. The Management Controller
 2094 can use this value to match a received response to the previously sent command. For more information,
 2095 see clause 6.2.2.2.

2096 **8.2.1.4 Control Packet type**

2097 This 1-byte field contains the Identifier that is used to identify specific commands and responses and to
 2098 differentiate AENs from responses. Each NC-SI command is assigned a unique 7-bit command type
 2099 value in the range 0x00 . . 0x60. The proper response type for each command type is formed by setting
 2100 the most significant bit (bit 7) in the original 1-byte command value. This allows for a one-to-one
 2101 correspondence between 96 unique response types and 96 unique command types.

2102 **8.2.1.5 Channel ID**

2103 This 1-byte field contains the Network Controller Channel Identifier. The Management Controller shall set
 2104 this value to specify the package and internal channel ID for which the command is intended.

2105 In a multi-drop configuration, all commands are received by all NC-SI Network Controllers present in the
 2106 configuration. The Channel ID is used by each receiving Network Controller to determine if it is the
 2107 intended recipient of the command. In Responses and AENs, this field carries the Channel ID from which
 2108 the response or AEN was issued.

2109 **8.2.1.6 Flags**

2110 Bit 0: Poll Indication: If this bit is set, it indicates that this command instance is polling on a previously sent
 2111 command that received a “Delayed Response” response code. This bit is relevant only for commands and
 2112 not for responses or AENs.

2113 Bits 3:1: Reserved

2114 **8.2.1.7 Payload length**

2115 This 12-bit field contains the length, in bytes, of any payload data present in the command or response
 2116 frame following the NC-SI packet header. This value does not include the length of the NC-SI Control
 2117 Packet Header, the checksum value, or any padding that might be present.

2118 **8.2.1.8 Reserved**

2119 These fields are reserved for future use and should be written as zeros and ignored when read.

2120 **8.2.2 Control Packet payload**

2121 The NC-SI packet payload may contain zero or more defined data values depending on whether the
 2122 packet is a command or response packet, and on the specific type. The NC-SI packet payload is always
 2123 formatted in big-endian byte order, as shown in Table 11.

2124 **Table 11 – Generic example of Control Packet payload**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..03	Data0 ₃	Data0 ₂	Data0 ₁	Data0 ₀
04..07	Data1 ₇	Data1 ₆	Data1 ₅	Data1 ₄
08..11	Data1 ₃	Data1 ₂	Data1 ₁	Data1 ₀
..				
...	DataN-1 ₄	DataN-1 ₃	DataN-1 ₂	DataN-1 ₁
...	DataN-1 ₀	Payload Pad (as required)		
...	Checksum			
...	Ethernet Packet Pad (as required)			

2125 **8.2.2.1 Data**

2126 As shown in Table 11, the bytes following the NC-SI packet header may contain payload data fields of
 2127 varying sizes, and which may be aligned or require padding. In the case where data is defined in the
 2128 payload, all data-field byte layouts (Data0–DataN-1) shall use big-endian byte ordering with the most
 2129 significant byte of the field in the lowest addressed byte position (that is, coming first).

2130 **8.2.2.2 Payload pad**

2131 If the payload is present and does not end on a 32-bit boundary, one to three padding bytes equal to
 2132 0x00 shall be present to align the checksum field to a 32-bit boundary.

2133 **8.2.2.3 Checksum**

2134 This 4-byte field contains the 32-bit checksum compensation value that may be included in each
 2135 command and response packet by the sender of the packet. When it is implemented, the checksum
 2136 compensation shall be computed as the 2’s complement of the checksum, which shall be computed as
 2137 the 32-bit unsigned sum of the NC-SI packet header and NC-SI packet payload interpreted as a series of
 2138 16-bit unsigned integer values. A packet receiver supporting packet checksum verification shall use the

2139 checksum compensation value to verify packet data integrity by computing the 32-bit checksum described
2140 above, adding to it the checksum compensation value from the packet, and verifying that the result is 0.

2141 Verification of non-zero NC-SI packet checksum values is optional. An implementation may elect to
2142 generate the checksums and may elect to verify checksums that it receives. The checksum field is
2143 generated and handled according to the following rules:

- 2144 • A checksum field value of all zeros specifies that a header checksum is not being provided for
2145 the NC-SI Control Packet and that the checksum field value shall be ignored when processing
2146 the packet.
- 2147 • If the originator of an NC-SI Control Packet is not generating a checksum, the originator shall
2148 use a value of all zeros for the header checksum field.
- 2149 • If a non-zero checksum field is generated for an NC-SI Control Packet, that header checksum
2150 field value shall be calculated using the specified algorithm.
- 2151 • All receivers of NC-SI Control Packets shall accept packets with all zeros as the checksum
2152 value (provided that other fields and the CRC are correct).
- 2153 • The receiver of an NC-SI Control Packet may reject (silently discard) a packet that has an
2154 incorrect non-zero checksum.
- 2155 • The receiver of an NC-SI Control Packet may ignore any non-zero checksums that it receives
2156 and accept the packet, even if the checksum value is incorrect (that is, an implementation is not
2157 required to verify the checksum field).
- 2158 • A controller that generates checksums is not required to verify checksums that it receives.
- 2159 • A controller that verifies checksums is not required to generate checksums for NC-SI Control
2160 Packets that it originates.

2161 **8.2.2.4 Ethernet packet pad**

2162 Per [IEEE 802.3](#), all Ethernet frames shall be at least 64 bytes in length, from the DA through and
2163 including FCS. For NC-SI packets, this requirement applies to the Ethernet header and payload, which
2164 includes the NC-SI Control Packet header and payload. Most NC-SI Control Packets are less than the
2165 minimum Ethernet frame payload size of 46 bytes in length and require padding to comply with
2166 [IEEE 802.3](#).

2167 **8.2.3 Command packet payload**

2168 Command packets have no common fixed payload format.

2169 **8.2.4 Response packet payload**

2170 Unlike command packets that do not necessarily contain payload data, all response packets carry at least
2171 a 4-byte payload. This default payload carries the response codes and reason codes (described in clause
2172 8.2.4.1) that provide status on the outcome of processing the originating command packet and is present
2173 in all response packet payload definitions.

2174 The default payload occupies bytes 00 . . 03 of the response packet payload, with any additional
2175 response-packet-specific payload defined to follow starting on the next word. All response packet payload
2176 fields are defined with big-endian byte ordering, as shown in Table 12.

2177

Table 12 – Generic example of Response packet payload format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..03	Response Code		Reason Code	
...
...	DataN-1 ₄	DataN-1 ₃	DataN-1 ₂	DataN-1 ₁
...	DataN-1 ₀	Word Pad (as required)		
...	Checksum			
...	Ethernet Packet Pad (as required)			

2178 8.2.4.1 Response Packet in case of Delayed Response Code

2179 If a response includes a “Delayed Response” Code, then the response does not contain the payload of
 2180 the original response, The Delayed Response shall contain a payload of a single word (uint16) including
 2181 the recommended next polling time in milliseconds. If no polling time estimate is available, then the
 2182 recommended next polling time shall be set to 0x0000.

2183

Table 13 – Generic example of Delayed Response packet payload

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..03	Response Code = 0x0004		Reason Code = 0x0000	
04..07	Reserved		Next Polling time	
08..11	Checksum			
...	Ethernet Packet Pad (as required)			

2184 8.2.5 Response codes and reason codes

2185 8.2.5.1 General

2186 Response codes and reason codes are status values that are returned in the responses to NC-SI
 2187 commands. The response code values provide a general categorization of the status being returned. The
 2188 reason code values provide additional detail related to a particular response code.

2189 Response codes and reason codes are divided into numeric ranges that distinguish whether the values
 2190 represent standard codes that are defined in this specification or are vendor/OEM-specific values that are
 2191 defined by the vendor of the controller.

2192 The response code is a 2-byte field where values from 0x00 through 0x7F are reserved for definition by
 2193 this specification. Values from 0x80 through 0xFF are vendor/OEM-specific codes that are defined by the
 2194 vendor of the controller.

2195 The reason code is a 2-byte field. The ranges of values are defined in Table 14.

2196

Table 14 – Reason code ranges

MS byte	LS byte	Description
0x00	0x00–0x7F	Standard generic reason codes This range of values for the lower byte is used for reason codes that are not specific to a particular command but can be used as reason codes in responses for any command. The values in this range are reserved for definition by this specification.
	0x80–0xFF	Vendor/OEM generic reason codes This range of values for the lower byte is used for reason codes that are not specific to a particular command but can be used as reason codes in responses for any command. Values in this range are defined by the vendor of the controller.
Command Number NOTE: This means that Command Number 00 cannot have any command-specific reason codes.	0x00–0x7F	Standard command-specific reason codes This range of values for the lower byte is used for reason codes that are specific to a particular command. The upper byte holds the value of the command for which the reason code is defined. The values in this range are reserved for definition by this specification.
	0x80–0xFF	Vendor/OEM command-specific reason codes This range of values for the lower byte is used for reason codes that are specific to a particular command. The upper byte holds the value of the command for which the reason code is defined. Values in this range are defined by the vendor of the controller.

2197 **8.2.5.2 Response code and reason code values**

2198 The standard response code values are defined in Table 15, and the standard reason code values are
 2199 defined in Table 16. Command-specific values, if any, are defined in the clauses that describe the
 2200 response data for the command. Unless otherwise specified, the standard reason codes may be used in
 2201 combination with any response code. There are scenarios where multiple combinations of response and
 2202 reason code values are valid. Unless otherwise specified, an implementation may return any valid
 2203 combination of response and reason code values for the condition.

2204

Table 15 – Standard response code values

Value	Description	Comment
0x0000	Command Completed	Returned for a successful command completion. When this response code is returned, the reason code shall be 0x0000 as described in Table 16
0x0001	Command Failed	Returned to report that a valid command could not be processed or failed to complete correctly
0x0002	Command Unavailable	Returned to report that a command is temporarily unavailable for execution because the controller is in a transient state, busy condition, or in need of external intervention.
0x0003	Command Unsupported	Returned to report that a command is not supported by the implementation. The reason code “Unknown/Unsupported Command Type” should be returned along with this response code for all unsupported commands.

Value	Description	Comment
0x0004	Delayed Response	Returned to report that the command was accepted and the NC started to handle it, but it cannot respond within T5 seconds with a final answer. When this response code is provided, the reason code shall be 0x0000.
0x8000-0xFFFF	Vendor/OEM-specific	Response codes defined by the vendor of the controller

2205

Table 16 – Standard Reason Code Values

Value	Description	Comment
0x0000	No Error/No Reason Code	When used with the Command Completed response code, indicates that the command completed normally. Otherwise this value indicates that no additional reason code information is being provided.
0x0001	Interface Initialization Required	Returned for all commands except Select/Deselect Package commands when the channel is in the Initial State, until the channel receives a Clear Initial State command
0x0002	Parameter Is Invalid, Unsupported, or Out-of-Range	Returned when a received parameter value is outside of the acceptable values for that parameter
0x0003	Channel Not Ready	Returned when the channel is in a transient state in which it is unable to process commands normally
0x0004	Package Not Ready	Returned when the package and channels within the package are in a transient state in which normal command processing cannot be done
0x0005	Invalid payload length	Returned when the payload length in the command is incorrect for the given command
0x0006	Information not available	Returned when the channel is unable to provide response data to a valid supported command.
0x0007	Intervention Required	May be returned for all commands, except for Select and Deselect Package, when the Package is not ready and requires intervention to restore its operational state. When this code is returned, the NC does not check if the command is otherwise valid and the defined response is not returned.
0x0008	Link Command Failed-Hardware Access Error	Returned when PHY R/W access fails on Link commands
0x0009	Command Timeout	Command execution has exceeded the allocated T5 time
0x000A	Secondary Device Not Powered	A device that communicates with the NC is not powered up and cannot respond to the request
0x000B-0x7FFE	Reserved	
0x7FFF	Unknown/Unsupported Command Type	Returned when the command type is unknown or unsupported. This reason code shall be used only when the response code is 0x0003 (Command Unsupported) as described in Table 15.
0x8000-0xFFFF	OEM Reason Code	Vendor-specific reason code defined by the vendor of the controller

2206 **8.2.6 AEN packet format**

2207 AEN packets shall follow the general packet format of Control Packets with the IID field set to 0 because,
 2208 by definition, the Management Controller does not send a response packet to acknowledge an AEN
 2209 packet. The Control Packet Type field shall have the value 0xFF. The originating Network Controller shall
 2210 fill in the Channel ID field with its own ID to identify itself as the source of notification. The AEN Type field
 2211 contains the identifier of what condition caused the generation of the AEN packet.

2212 Table 17 represents the AEN packet format to be used for AENs defined in this specification.

2213

Table 17 – AEN packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..03	MC ID = 0x0	0x01	Reserved	IID = 0x0
04..07	Control Packet Type = 0xFF	Originating Channel ID	Reserved	Payload Length
08..11	Reserved			
12..15	Reserved			
16..19	Reserved			AEN Type

2214 Table 18 represents the AEN type ranges to be used for AENs defined in this specification.

2215

Table 18 – AEN Type Ranges

Values	AEN Type Allocation
0x00 . . 0x6F	Specification-defined AENs (see clause 8.4.134); all others are Reserved
0x70 . . 0x7F	Transport-specific AENs
0x80 . . 0xFF	OEM-specific AENs

2216 **8.2.7 Single OEM AEN packet format**

2217 OEM AEN packets shall conform to the format shown in Table 19 below for NCs that only support AENs
 2218 using a single OEM identifier including NCs that implement spec version 1.1 and lower.

2219

Table 19 – OEM AEN packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..03	MC ID = 0x0	0x01	Reserved	IID = 0x0
04..07	Control Packet Type = 0xFF	Originating Channel ID	Reserved	Payload Length
08..11	Reserved			
12..15	Reserved			
16..19	Reserved			AEN Type
20..23	Optional AEN Data			
24..27	Checksum			

2220 **8.2.8 Multiple OEMs AEN packet format**

2221 OEM AEN packets shall conform to the format shown in Table 20 below for NCs that support multiple
 2222 OEM AENs and implement the Query and Set OEM AEN command.

2223

Table 20 – Multiple OEMs AEN packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..03	MC ID = 0x0	0x01	Reserved	IID = 0x0
04..07	Control Packet Type = 0xFF	Originating Channel ID	Reserved	Payload Length
08..11	Reserved			
12..15	Reserved			
16..19	Reserved		Multi field	AEN Type
20..23	Manufacturer ID (IANA)			
24..27	Optional AEN Data			
28..31	Checksum			

2224 **8.2.8.1 Multi field**

2225 This field has a value of 0x01 to indicate the AEN contains a Manufacturer ID (IANA).

2226 **8.3 Control Packet type definitions**

2227 Command packet types are in the range of 0x00 to 0x7F. Table 21 describes each command, its
 2228 corresponding response, and the type value for each. Table 21 includes commands addressed to either a
 2229 package or a channel. PLDM and OEM-specific commands carried over NC-SI may be package specific
 2230 or channel specific or both. Commands specific to the NC-SI over RBT binding are called out in the table.
 2231 The rest of the commands are general and apply to all NC-SI transport bindings.

2232 Ethernet (E), Fibre Channel (FC), and InfiniBand (IB) columns under the Fabric Implementation heading
 2233 refer to the specific requirements of the NC implementing the network fabric type configured on the
 2234 channel. Mandatory (M), Optional (O), and Conditional (C) in these columns refer to command support
 2235 requirements for the Network Controller, and “n/a” means not applicable. Channel (Ch), Package (Pkg),
 2236 and Channel/Package (ChPkg) in the Control Packet Type column indicates that the given command is
 2237 defined as a Channel, Package, or Channel/Package command respectively.

2238

Table 21 – Command and Response types

Control Packet Type	Command Name	Description	Response Packet Type	Fabric Implementation		
				E	FC	IB
0x00 (Ch)	Clear Initial State	Used by the Management Controller to acknowledge that the Network Controller is in the Initial State	0x80	M	M	M
0x01 (Pkg)	Select Package	Used to explicitly select a controller package to transmit packets through the NC-SI interface	0x81	M	M	M
0x02 (Pkg)	Deselect Package	Used to explicitly instruct the controller package to stop transmitting packets through the NC-SI interface	0x82	M	M	M
0x03	Enable Channel	Used to enable the NC-SI channel and to cause the forwarding of	0x83	M	M	M

Control Packet Type	Command Name	Description	Response Packet Type	Fabric Implementation		
				E	FC	IB
(Ch)		bidirectional Management Controller packets to start				
0x04 (Ch)	Disable Channel	Used to disable the NC-SI channel and to cause the forwarding of bidirectional Management Controller packets to cease	0x84	M	M	M
0x05 (Ch)	Reset Channel	Used to synchronously put the Network Controller back to the Initial State	0x85	M	M	M
0x06 (Ch)	Enable Channel Network TX	Used to explicitly enable the channel to transmit Pass-through packets onto the network	0x86	M	n/a	C
0x07 (Ch)	Disable Channel Network TX	Used to explicitly disable the channel from transmitting Pass-through packets onto the network	0x87	M	n/a	C
0x08 (ChPkg)	AEN Enable	Used to control generating AENs	0x88	C	C	C
0x09 (Ch)	Set Link	Used during OS absence to force link settings, or to return to auto-negotiation mode	0x89	M	n/a	C
0x0A (Ch)	Get Link Status	Used to get current link status information	0x8A	M	n/a	C
0x0B (Ch)	Set VLAN Filter	Used to program VLAN IDs for VLAN filtering	0x8B	M	n/a	C
0x0C (Ch)	Enable VLAN	Used to enable VLAN filtering of Management Controller RX packets	0x8C	M	n/a	C
0x0D (Ch)	Disable VLAN	Used to disable VLAN filtering	0x8D	M	n/a	C
0x0E (Ch)	Set MAC Address	Used to configure and enable unicast and multicast MAC address filters	0x8E	M	n/a	C
0x10 (Ch)	Enable Broadcast Filter	Used to enable selective broadcast packet filtering	0x90	M	n/a	C
0x11 (Ch)	Disable Broadcast Filter	Used to disable all broadcast packet filtering, and to enable the forwarding of all broadcast packets	0x91	M	n/a	C
0x12 (Ch)	Enable Global Multicast Filter	Used to enable selective multicast packet filtering	0x92	C	n/a	C
0x13 (Ch)	Disable Global Multicast Filter	Used to disable all multicast packet filtering, and to enable forwarding of all multicast packets	0x93	C	n/a	C
0x14 (Pkg)	Set NC-SI Flow Control	Used to configure IEEE 802.3 flow control on RBT (RBT specific)	0x94	O	n/a	O

Control Packet Type	Command Name	Description	Response Packet Type	Fabric Implementation		
				E	FC	IB
0x15 (Ch)	Get Version ID	Used to get controller-related version information	0x95	M	M	M
0x16 (Ch)	Get Capabilities	Used to get optional functions supported by the NC-SI	0x96	M	M	M
0x17 (Ch)	Get Parameters	Used to get configuration parameter values currently in effect on the controller	0x97	M	M	M
0x18 (Ch)	Get Controller Packet Statistics	Used to get current packet statistics for the Ethernet Controller	0x98	O	n/a	n/a
0x19 (Ch)	Get NC-SI Statistics	Used to request the packet statistics specific to the NC-SI	0x99	O	O	O
0x1A (Ch)	Get NC-SI Pass-through Statistics	Used to request NC-SI Pass-through packet statistics	0x9A	O	n/a	O
0x1B (Pkg)	Get Package Status	Used to get current status of the package.	0x9B	O	O	O
0x25 (Pkg)	Get NC Capabilities and Settings	Used to request device configuration information and capabilities	0xA5	O	O	O
0x26 (Pkg)	Set NC Configuration	Used to configure device interfaces	0xA6	O	O	O
0x27 (Pkg)	Get PF Assignment	Used to request Function assignment information	0xA7	O	O	O
0x28 (Pkg)	Set PF Assignment	Used to configure and enable Functions	0xA8	O	O	O
0x29 (Ch)	Get Channel Configuration	Used to request Channel configuration information	0xA9	O	O	O
0x2A (Ch)	Set Channel Configuration	Used to configure operational characteristics of the Channel	0xAA	O	O	O
0x2B (Ch)	Get Partition Configuration	Used to request partition configuration information	0xAB	O	O	O
0x2C (Ch)	Set Partition Configuration	Used to configure partition operational characteristics	0xAC	O	O	O
0x2D (Ch)	Get Boot Config	Used to request boot protocol configuration information	0xAD	O	O	O
0x2E (Ch)	Set Boot Config	Used to configure boot protocol attributes	0xAE	O	O	O
0x2F	Get Partition Statistics	Used to request network link statistics for the partition	0xAF	O	O	O

Control Packet Type	Command Name	Description	Response Packet Type	Fabric Implementation		
				E	FC	IB
(Ch)						
0x30 (Ch)	Set Module Management Data	Used to configure management data of module	0xB0	O	O	O
0x31 (Ch)	Get FC Link Status	Used to request link and trunk status and speed for Fibre Channel ports	0xB1	n/a	M	n/a
0x32 (Ch)	Get Module Management Data	Used to retrieve management and inventory data of module	0xB2	O	O	O
0x33 (Ch)	Set Pass-through Mode Control	Used to enable/disable pass-through data paths of the NC	0xB3	O	O	O
0x34 (Ch)	Get Pass-through Mode Control	Used to retrieve states of pass-through data paths of the NC	0xB4	O	O	O
0x35 (Pkg)	Get VF Allocation	Used to retrieve allocated VFs for PFs	0xB5	O	O	O
0x36 (Pkg)	Set VF Allocation	Used to allocate VFs across PFs	0xB6	O	O	O
0x38 (Ch)	Get InfiniBand Link Status	Used to request link status for InfiniBand ports	0xB8	n/a	n/a	M
0x39 (Ch)	Get InfiniBand Statistics	Used to request port-level statistics for InfiniBand ports	0xB9	n/a	n/a	M
0x47 (Pkg)	Settings Commit	Used to request the commit of certain settings to NVRAM	0xC7	O	O	O
0x48 (Pkg)	Get ASIC Temperature	Used to request current NC ASIC temperatures	0xC8	O	O	O
0x49 (Pkg)	Get Ambient Temperature	Used to request the current ambient temperature from the NC adapter	0xC9	O	O	O
0x4A (Ch)	Get Transceiver Temperature	Used to request the current optical module temperature and thresholds	0xCA	O	O	O
0x4B (Pkg)	Thermal Shutdown Control	Used to control and query the state of the thermal-based self-shutdown feature	0xCB	C	C	C
0x4C (Pkg)	Transmit Data to NC	Used by the MC to transfer a block of data to the NC	0xCC	O	O	O
0x4D (Pkg)	Retrieve Data from NC	Used by the MC to transfer a block of data from the NC	0xCD	O	O	O
0x4E (Pkg)	Get Inventory Information	Used by the MC to get inventory data from the NC	0xCE	O	O	O

Control Packet Type	Command Name	Description	Response Packet Type	Fabric Implementation		
				E	FC	IB
0x50 (ChPkg)	OEM Command	Used to request vendor-specific data	0xD0	O	O	O
0x51- 0x60	Reserved for Transport Protocol Oriented Commands	Used to define transport protocol-oriented commands (e.g., PLDM over NC-SI/RBT)	0xD1- 0xE0	O	O	O
0x51 (Pkg)	PLDM	Used by the MC to transfer a PLDM command (response) to (from) the NC (RBT specific)	0xD1	O	O	O
0x52 (Pkg)	Get Package UUID	Returns a universally unique identifier (UUID) for the package This command may be used on any transport	0xD2	O	O	O
0x53 (ChPkg)	Query and Set OEM AEN	Used by the MC to query and set OEM IANA and AEN settings	0xD3	O	O	O
0x54 (Pkg)	Get Supported Media	See MCTP DSP0261 for full definition This command may be used on any transport	0xD4	O	O	O
0x55 (Pkg)	Transport-specific AEN Enable	Used to control generating Transport specific AENs	0xD5	O	O	O
0x56 (Pkg)	Query Pending NC PLDM Request	Used by the MC to see if the NC has any pending PLDM requests to be retrieved (RBT specific)	0xD6	O	O	O
0x57 (Pkg)	Send NC PLDM Reply	Used by the MC to provide a response to a previous SPDM request by the NC (RBT specific)	0xD7	O	O	O
0x58 (Ch)	Get MC MAC Address	Used by the MC to retrieve MAC addresses provisioned for its use This command may be used on any transport	0xD8	O	n/a	O
0x60 (Pkg)	SPDM	Used by the MC to transfer a SPDM command (response) to (from) the NC (RBT specific)	0xE0	O	O	O
0x61 (Pkg)	Query Pending NC SPDM Request	Used by the MC to see if the NC has any pending SPDM command to be retrieved (RBT specific)	0xE1	O	O	O
0x62 (Pkg)	Send NC SPDM Reply	Used by the MC to respond to a previously read SPDM command from the NC (RBT specific)	0xE2	O	O	O

2239 **8.4 Command and response packet formats**

2240 This clause describes the format for each of the NC-SI commands and corresponding responses.

2241 The corresponding response packet format shall be mandatory when a given command is supported.

2242 **8.4.1 NC-SI command frame format**

2243 Table 22 illustrates the NC-SI frame format that shall be accepted by the Network Controller.

2244 **Table 22 – Example of complete minimum-sized NC-SI command packet**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..03	0xFF	0xFF	0xFF	0xFF
04..07	0xFF	0xFF	0xFF	0xFF
08..11	0xFF	0xFF	0xFF	0xFF
12..15	0x88F8		MC ID	Header Revision
16..19	Reserved	IID	Command Type	Channel ID

44..47	Pad			
48..51	Pad			
52..55	Pad			
56..59	Pad			
60..63	FCS			

2248 **8.4.3 Clear Initial State command (0x00)**

2249 The Clear Initial State command provides the mechanism for the Management Controller to acknowledge
 2250 that it considers a channel to be in the Initial State (typically because the Management Controller received
 2251 an “Interface Initialization Required” reason code) and to direct the Network Controller to start accepting
 2252 commands for initializing or recovering the NC-SI operation. When in the Initial State, the Network
 2253 Controller shall return the “Interface Initialization Required” reason code for all channel commands until it
 2254 receives the Clear Initial State command.

2255 If the channel is in the Initial State when it receives the Clear Initial State command, the command shall
 2256 cause the Network Controller to stop returning the “Interface Initialization Required” reason code. The
 2257 channel shall also treat any subsequently received instance ID numbers as IIDs for new command
 2258 instances, not retries.

2259 If the channel is not in the Initial State when it receives this command, it shall treat any subsequently
 2260 received instance ID numbers as IIDs for new command instances, not retries.

2261 Table 24 illustrates the packet format of the Clear Initial State command.

2262 **Table 24 – Clear Initial State command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2263 **8.4.4 Clear Initial State response (0x80)**

2264 Currently no command-specific reason code is identified for this response (see Table 25).

2265

Table 25 – Clear Initial State response packet format

2266 8.4.5 Select Package command (0x01)

2267 A package is considered to be “selected” when its NC-SI output buffers are allowed to transmit packets
 2268 through the NC-SI interface. Conversely, a package is “deselected” when it is not allowed to transmit
 2269 packets through the NC-SI interface.

2270 The Select Package command provides a way for a Management Controller to explicitly take a package
 2271 out of the deselected state and to control whether hardware arbitration is enabled for the package.
 2272 (Similarly, the Deselect Package command allows a Management Controller to explicitly deselect a
 2273 package.)

2274 The NC-SI package in the Network Controller shall also become selected if the package receives any NC-
 2275 SI command (other than Deselect Package) that is directed to the package or to a channel within the
 2276 package.

2277 The Select Package command is addressed to the package, rather than to a channel (that is, the
 2278 command is sent with a Channel ID where the Package ID subfield matches the ID of the intended
 2279 package and the Internal Channel ID subfield is set to 0x1F).

2280 More than one package can be in the selected state simultaneously if hardware arbitration is used
 2281 between the selected packages and is active. The hardware arbitration logic ensures that buffer conflicts
 2282 will not occur between selected packages.

2283 If hardware arbitration is not active or is not used for a given package, only one package shall be selected
 2284 at a time. To switch between packages, the Deselect Package command is used by the Management
 2285 Controller to put the presently selected package into the deselected state before another package is
 2286 selected.

2287 A package shall stay in the selected state until it receives a Deselect Package command unless an
 2288 internal condition causes all internal channels to enter the Initial State.

2289 A package that is not using hardware arbitration may leave its output buffers enabled for the time that it is
 2290 selected, or it may place its output buffers into the high-impedance state between transmitting packets
 2291 through the NC-SI interface. (Temporarily placing the output buffers into the high-impedance state is not
 2292 the same as entering the deselected state.)

2293 For Type A integrated controllers: Because the RBT bus buffers are separately controlled, a separate
 2294 Select Package command needs to be sent to each Package ID in the controller that is to be enabled to
 2295 transmit through the NC-SI interface. If the internal packages do not support hardware arbitration, only
 2296 one package shall be selected at a time; otherwise, a bus conflict will occur.

2297 For Type S single-channel and Types B and C integrated controllers: A single set of RBT bus buffers
 2298 exists for the package. Sending a Select Package command selects the entire package and enables all
 2299 channels within the package to transmit through the NC-SI interface. (Whether a particular channel in a
 2300 selected package starts transmitting Pass-through and AEN packets depends on whether that channel

2301 was enabled or disabled using the Enable or Disable Channel commands and whether the package may
 2302 have had packets queued up for transmission.)

2303 Implementation Note: The features control settings are only configurable via this command and are not
 2304 altered by 'implicit' selection as described in clause 6.1.14.4.

2305 Table 26 illustrates the packet format of the Select Package command.

2306 Table 27 illustrates the disable byte for hardware arbitration.

2307 **Table 26 – Select Package command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Reserved			Features Control
20..23	Checksum			
24..45	Pad			

2308

2309

Table 27 – Features Control byte

Bits	Description
0	0b = Hardware arbitration between packages is enabled. 1b = Disable hardware arbitration. Disabling hardware arbitration causes the package's arbitration logic to enter or remain in bypass mode. In the case that the Network Controller does not support hardware arbitration, this bit is ignored; the Network Controller shall not return an error if the Select Package command can otherwise be successfully processed.
1	Delayed Response Enable: 0b = NC is not allowed to use the "Delayed Response" response code (default) 1b = NC is allowed to use the "Delayed Response" response code
7..2	Reserved

2310 **8.4.6 Select Package response (0x81)**

2311 Currently no command-specific reason code is identified for this response (see Table 28).

2312

Table 28 – Select package response packet format

00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

2313 **8.4.7 Deselect Package command (0x02)**2314 The Deselect Package command directs the controller package to stop transmitting packets through the
2315 NC-SI interface and to place the output buffers for the package into the high-impedance state.2316 The Deselect Package command is addressed to the package rather than to a particular channel (that is,
2317 the command is sent with a Channel ID where the Package ID subfield matches the ID of the intended
2318 package and the Internal Channel ID subfield is set to 0x1F).2319 The controller package enters the deselected state after it has transmitted the response to the Deselect
2320 Package command and placed its buffers into the high-impedance state. The controller shall place its
2321 outputs into the high-impedance state within the Package Deselect to Hi-Z Interval (T1). (This interval
2322 gives the controller being deselected time to turn off its electrical output buffers after sending the
2323 response to the Deselect Package command.)2324 If hardware arbitration is not supported or used, the Management Controller should wait for the Package
2325 Deselect to Hi-Z Interval (T1) to expire before selecting another controller.2326 For Type A integrated controllers: Because the bus buffers are separately controlled, putting the overall
2327 controller package into the high-impedance state requires sending separate Deselect Package
2328 commands to each Package ID in the overall package.2329 For Type S single-channel and Types B and C integrated controllers: A single set of bus buffers exists for
2330 the package. Sending a Deselect Package command deselects the entire NC-SI package and prevents
2331 all channels within the package from transmitting through the NC-SI interface.

2332 Table 29 illustrates the packet format of the Deselect Package command.

2333 **Table 29 – Deselect Package command packet format**

20..45	Pad			

2334 **8.4.8 Deselect Package response (0x82)**

2335 The Network Controller shall always put the package into the deselected state after sending a Deselect
2336 Package Response.

2337 No command-specific reason code is identified for this response (see Table 30).

2338 **Table 30 – Deselect Package response packet format**

20..23	Checksum			
24..45	Pad			

2347 **8.4.11 Disable Channel command (0x04)**

2348 The Disable Channel command allows the Management Controller to disable the flow of packets,
2349 including Pass-through and AEN, to the Management Controller.

2350 A Network Controller implementation is not required to flush pending packets from its RX Queues when a
2351 channel becomes disabled. If queuing is subsequently disabled for a channel, it is possible that a number
2352 of packets from the disabled channel could still be pending in the RX Queues. These packets may
2353 continue to be transmitted through the NC-SI interface until the RX Queues are emptied of those packets.
2354 The Management Controller should be aware that it may receive a number of packets from the channel
2355 before receiving the response to the Disable Channel command.

2356 The 1-bit Allow Link Down (ALD) field can be used by the Management Controller to indicate that the link
2357 corresponding to the specified channel is not required after the channel is disabled. The Network
2358 Controller is allowed to take down the external network physical link if no other functionality (for example,
2359 host OS or WoL [Wake-on-LAN]) is active.

2360 Possible values for the 1-bit ALD field are as follows:

- 2361 • 0b = Keep link up (establish and/or keep a link established) while channel is disabled
- 2362 • 1b = Allow link to be taken down while channel is disabled

2363 Table 33 illustrates the packet format of the Disable Channel command.

2364

Table 33 – Disable Channel command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00

16..19	Reserved			ALD
20..23	Checksum			
24..45	Pad			

2365 NOTE: It is currently unspecified whether this command will cause the Network Controller to cease the passing
2366 through of traffic from the Management Controller to the network, or if this can only be done using the Disable
2367 Channel Network TX command.

2368 **8.4.12 Disable Channel response (0x84)**

2369 No command-specific reason code is identified for this response (see Table 34).

2370 **Table 34 – Disable Channel response packet format**

24..45	Pad			

2371 **8.4.13 Reset Channel command (0x05)**

2372 The Reset Channel command allows the Management Controller to put the channel into the Initial State.
 2373 Packet transmission is not required to stop until the Reset Channel response has been sent. Thus, the
 2374 Management Controller should be aware that it may receive a number of packets from the channel before
 2375 receiving the response to the Reset Channel command.

2376 Table 35 illustrates the packet format of the Reset Channel command.

2377 **Table 35 – Reset Channel command packet format**

20..23	Checksum			
24..45	Pad			

2381 **8.4.15 Enable Channel Network TX command (0x06)**

2382 The Enable Channel Network TX command shall enable the channel to transmit Pass-through packets
 2383 onto the network. After network transmission is enabled, this setting shall remain enabled until a Disable
 2384 Channel Network TX command is received, or the channel enters the Initial State.

2385 The intention of this command is to control which Network Controller ports are allowed to transmit to the
 2386 external network. The Network Controller compares the source MAC address in outgoing Pass-through
 2387 packets to the unicast MAC address(es) configured using the Set MAC Address command. If a match
 2388 exists, the packet is transmitted to the network.

2389 Table 37 illustrates the packet format of the Enable Channel Network TX command.

2390

Table 37 – Enable Channel Network TX command packet format

20..23	Checksum			
24..45	Pad			

2394 **8.4.17 Disable Channel Network TX command (0x07)**

2395 The Disable Channel Network TX command disables the channel from transmitting Pass-through packets
 2396 onto the network. After network transmission is disabled, it shall remain disabled until an Enable Channel
 2397 Network TX command is received.

2398 Table 39 illustrates the packet format of the Disable Channel Network TX command.

2399 **Table 39 – Disable Channel Network TX command packet format**

	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..23	Pad			

2400 **8.4.18 Disable Channel Network TX response (0x87)**

2401 The NC-SI shall, in the absence of a checksum error or identifier mismatch, always accept the Disable
2402 Channel Network TX command and send a response.

2403 Currently no command-specific reason code is identified for this response (see Table 40).

2404 **Table 40 – Disable Channel Network TX response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

2405 **8.4.19 AEN Enable command (0x08)**

2406 Network Controller implementations shall support this command on the condition that the Network
2407 Controller generates one or more standard AENs. The AEN Enable command enables and disables the
2408 different standard AENs supported by the Network Controller. The Network Controller shall copy the AEN
2409 MC ID field from the AEN Enable command into the MC ID field in every subsequent AEN sent to the
2410 Management Controller.

2411 The AEN Enable command is defined as both a package command and a channel command. This means
2412 the command can be either addressed to the package (that is, the command is sent with the Internal
2413 Channel ID set to 0x1F) for configuring package-level AENs or addressed to a specific channel in the
2414 package to configure AENs on that channel.

2415 For more information on AEN, see clauses 8.5 (AEN packet formats) and 8.2.1.1 (Management Controller
2416 ID).

2417 Control of transport-specific AENs is outside the scope of this specification and should be defined by the
2418 transport-binding specifications.

2419 Table 41 illustrates the packet format of the AEN Enable command.

2420 **Table 41 – AEN Enable command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00

16..19	Reserved			AEN MC ID
20..23	AEN Control			
24..27	Checksum			
28..45	Pad			

2421 The AEN Control field has the format shown in Table 42.

2422 **Table 42 – Format of AEN control**

Bit Position	Field Description	Value Description
0	Link Status Change AEN control	0b = Disable Link Status Change AEN 1b = Enable Link Status Change AEN
1	Configuration Required AEN control	0b = Disable Configuration Required AEN 1b = Enable Configuration Required AEN
2	Host NC Driver Status Change AEN control	0b = Disable Host NC Driver Status Change AEN 1b = Enable Host NC Driver Status Change AEN
3	Delayed Response Ready AEN control	0b = Disable Delayed Response Ready AEN 1b = Enable Delayed Response Ready AEN
4	InfiniBand Link Status Change AEN control	0b = Disable IB Link Status Change AEN 1b = Enable IB Link Status Change AEN
5	Fibre Channel Link Status Change AEN control	0b = Disable FC Link Status Change AEN 1b = Enable FC Link Status Change AEN
6	Transceiver Event AEN Control	0b = Disable Transceiver Event AEN 1b = Enable Transceiver Event AEN
7	Request Data Transfer AEN control	0b = Disable Request Data Transfer AEN 1b = Enable Request Data Transfer AEN
8	Partition Link Status Change AEN control	0b = Disable Partition Link Status Change AEN 1b = Enable Partition Link Status Change AEN
9	Thermal Shutdown Event AEN control	0b = Disable Thermal Shutdown Event AEN 1b = Enable Thermal Shutdown Event AEN
15..10	Reserved	Reserved
31..16	OEM-specific AEN control	OEM-specific control

2423 8.4.20 AEN Enable response (0x88)

2424 Currently no command-specific reason code is identified for this response (see Table 43). If the MC
2425 attempts to set an AEN type that is not supported, the NC shall reject the entire command even if it also

2426 includes valid AENs and shall respond with the “Command Failed” response and “Parameter Is Invalid...”
 2427 reason codes.

2428 **Table 43 – AEN Enable response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

2429 **8.4.21 Set Link command (0x09)**

2430 The Set Link command may be used by the Management Controller to configure the external network
 2431 interface associated with the channel by using the provided settings. Upon receiving this command, while
 2432 the host NC driver is not operational, the channel shall attempt to set the link to the configuration
 2433 specified by the parameters. Upon successful completion of this command, link settings specified in the
 2434 command should be used by the network controller as long as the host NC driver does not overwrite the
 2435 link settings.

2436 In the absence of an operational host NC driver, the NC should attempt to make the requested link state
 2437 change even if it requires the NC to drop the current link. The channel shall send a response packet to
 2438 the Management Controller within the required response time. However, this specification does not
 2439 specify the amount of time the requested link state changes may take to complete.

2440 The actual link settings are controlled by the host NC driver when it is operational. When the host NC
 2441 driver is operational, link settings specified by the MC using the Set Link command may be overwritten by
 2442 the host NC driver. The link settings are not restored by the NC if the host NC driver becomes non-
 2443 operational.

2444 Table 44 illustrates the packet format of the Set Link command.

2445 **Table 44 – Set Link command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Link Settings

20..21	Reserved	Reserved
22..23	Modulation Scheme	Bit 22: 1b = NRZ (optional for NC-SI 1.2, Reserved for NC-SI 1.1/1.0) Bit 23: 1b = PAM-4 (optional for NC-SI 1.2, Reserved for NC-SI 1.1/1.0) Bits 23-22 Values: 00 – Use default 01 – Enable NRZ 10 – Enable PAM-4 11 – Enable NRZ and PAM-4
24..27	Forward Error Correction (FEC) Algorithm	Bit 24: 1b = BASE-R FEC (Firecode) (optional for NC-SI 1.2, Reserved for NC-SI 1.1/1.0) Bit 25: 1b = RS-FEC (Reed Solomon) (optional for NC-SI 1.2, Reserved for NC-SI 1.1/1.0) Bits 26..27 Reserved If all bits are set to 0, then no FEC algorithm shall be selected.
28	Energy Efficient Ethernet (EEE)	1b = enable 0b = disable
29	Link Training (LT)	1b = enable 0b = disable
30	Parallel Detect An auto-negotiation link partner's mechanism to establish links with non-negotiation, fixed-speed linked partners.	1b = enable 0b = disable
31	Reserved	Reserved

2451

Table 46 – OEM Set Link bit definitions

Bit Position	Field Description	Value Description
00..31	OEM Link Settings	Vendor specified

2452

8.4.22 Set Link Response (0x89)

2453 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Set Link
 2454 command and send a response (see Table 47). In the presence of an operational Host NC driver, the NC
 2455 should not attempt to make link state changes and should send a response with reason code 0x1 (Set
 2456 Link Host OS/ Driver Conflict).

2457 If the Auto Negotiation field is set, the NC should ignore Link Speed Selection and Duplex Setting fields
 2458 that are not supported by the NC.

2459

Table 47 – Set Link response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

2460 Table 48 describes the reason codes that are specific to the Set Link command. Returning the following
 2461 command-specific codes is recommended, conditional upon Network Controller support for the related
 2462 capabilities.

2463

Table 48 – Set Link command-specific reason codes

Value	Description	Comment
0x0901	Set Link Host OS/Driver Conflict	Returned when the Set Link command is received when the Host NC driver is operational
0x0902	Set Link Media Conflict	Returned when Set Link command parameters conflict with the media type (for example, Fiber Media)
0x0903	Set Link Parameter Conflict	Returned when Set Link parameters conflict with each other (for example, 1000 Mbps HD with copper media)
0x0904	Set Link Power Mode Conflict	Returned when Set Link parameters conflict with current low-power levels by exceeding capability
0x0905	Set Link Speed Conflict	Returned when Set Link parameters attempt to force more than one speed at the same time when Auto Negotiation is disabled
0x0906	Link Command Failed/Hardware Access Error	Returned when PHY R/W access fails to complete normally while executing the Set Link or Get Link Status command
0x0907	Set Link SerDes Conflict	Returned when Set Link parameters attempt to force an unsupported SerDes configuration
0x0908	Set Link FEC Conflict	Returned when Set Link parameters attempt to force an unsupported FEC algorithm

Value	Description	Comment
0x0909	Set Link EEE Conflict	Returned when Set Link parameters attempt to force an unsupported EEE configuration
0x090A	Set Link LT Conflict	Returned when Set Link parameters attempt to force an unsupported link training configuration
0x090B	Set Link Parallel Detection Conflict	Returned when Set Link parameters attempt to force an unsupported parallel detection configuration

2464 **8.4.23 Get Link Status command (0x0A)**

2465 The Get Link Status command allows the Management Controller to query the channel for potential link
 2466 status and error conditions (see Table 49).

2467 **Table 49 – Get Link Status command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2468 **8.4.24 Get Link Status response (0x8A)**

2469 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Get Link
 2470 Status command and send a response (see Table 50).

2471 **Table 50 – Get Link Status response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00

23..22	Modulation Scheme	<p>00b = Reserved or this is not an Ethernet link 01b = NRZ is used. 10b = PAM-4 is used. 11b = Reserved</p> <p>NOTE: This field is optional for NC-SI 1.2, reserved for NC-SI 1.1/1.0.</p>

Bit Position	Field Description	Value Description
31..24	Extended Speed and duplex	<p>Optional for NC-SI 1.2/1.1, Reserved for NC-SI 1.0</p> <p>0x0 = Auto-negotiation not complete (per IEEE 802.3), or SerDes Flag = 1b, or no highest common denominator speed from the following options (0x01 through 0x13) was found:</p> <p>0x01 = 10BASE-T half-duplex 0x02 = 10BASE-T full-duplex 0x03 = 100BASE-TX half-duplex 0x04 = 100BASE-T4 0x05 = 100BASE-TX full-duplex 0x06 = 1000BASE-T half-duplex 0x07 = 1000BASE-T full-duplex 0x08 = 10G-BASE-T support or 10 Gbps 0x09 = 20 Gbps 0x0A = 25 Gbps 0x0B = 40 Gbps 0x0C = 50 Gbps 0x0D = 100 Gbps 0x0E = 2.5 Gbps 0x0F = 5 Gbps 0x10 = 1 Gbps (for non Base-T) 0x11 = 200 Gbps 0x12 = 400 Gbps 0x13 = 800 Gbps 0x14-0xFF = Reserved</p> <p>When SerDes Flag = 0b, the value may reflect forced link setting.</p> <p>NOTE: For the physical medium and/or speed/duplex not listed above, the closest speed and duplex option can be reported by the NC. This field does not infer any media type information.</p>

2475 Table 52 describes the Other Indications field bit definitions.

2476 **Table 52 – Other Indications field bit definitions**

Bits	Description	Values
00	Host NC Driver Status Indication	<p>0b = The Network Controller driver for the host external network interface associated with this channel is not operational (not running), unknown, or not supported.</p> <p>1b = The Network Controller driver for the host external network interface associated with this channel (or when partitioned, at least one partition driver) is being reported as operational (running).</p> <p>This bit always returns 0b if the Host NC Driver Status Indication is not supported.</p>
01	Energy Efficient Ethernet (EEE)	<p>1b = enabled 0b = disabled or this is not an Ethernet link</p>
02	Link Training (LT)	<p>1b = enabled 0b = disabled or this is not an Ethernet link</p>

Bits	Description	Values
03	Parallel Detect	1b = enabled 0b = disabled or this is not an Ethernet link
04	OEM Link Status Field	1b = enabled 0b = disabled
05..31	Reserved	Reserved

2477 Table 53 describes the OEM Link Status field bit definitions.

2478 **Table 53 – OEM Link Status field bit definitions (optional)**

Bits	Description	Values
00..31	OEM Link Status	OEM specific

2479 Table 54 describes the reason code that is specific to the Get Link Status command.

2480 **Table 54 – Get Link Status command-specific reason code**

Value	Description	Comment
0x0A06	Link Command Failed/ Hardware Access Error	Returned when PHY R/W access fails to complete normally while executing the Set Link or Get Link Status command

2481 **8.4.25 Set VLAN Filter command (0x0B)**

2482 The Set VLAN Filter command is used by the Management Controller to program one or more VLAN IDs
2483 that are used for VLAN filtering.

2484 Incoming packets that match both a VLAN ID filter and a MAC address filter are forwarded to the
2485 Management Controller. Other packets may be dropped based on the VLAN filtering mode per the Enable
2486 VLAN command.

2487 The quantity of each filter type that is supported by the channel can be discovered by means of the Get
2488 Capabilities command. Up to 15 filters can be supported per channel. A Network Controller
2489 implementation shall support at least one VLAN filter per channel.

2490 To configure a VLAN filter, the Management Controller issues a Set VLAN Filter command with the Filter
2491 Selector field indicating which filter is to be configured, the VLAN ID field set to the VLAN TAG values to
2492 be used by the filter, and the Enable field set to either enable or disable the selected filter.

2493 The VLAN-related fields are specified by [IEEE 802.1q](#). When VLAN Tagging is used, the packet includes
2494 a Tag Protocol Identifier (TPID) field and VLAN Tag fields, as shown in Table 55.

2495

Table 55 – IEEE 802.1q VLAN Fields

Field	Size	Description
TPI	2 bytes	Tag Protocol Identifier = 0x8100
VLAN TAG – user priority	3 bits	User Priority (typical value = 000b)
VLAN TAG – CFI	1 bit	Canonical Format Indicator = 0b
VLAN TAG – VLAN ID	12 bits	zeros = no VLAN

2496 When checking VLAN field values, the Network Controller shall match against the enabled VLAN Tag
 2497 Filter values that were configured with the Set VLAN Filter command. The Network Controller shall also
 2498 match on the TPI value of 0x8100, as specified by [IEEE 802.1q](#). Matching against the User Priority/CFI
 2499 bits is optional. An implementation may elect to ignore the setting of those fields.

2500 Table 56 illustrates the packet format of the Set VLAN Filter command.

2501

Table 56 – Set VLAN Filter command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00

2511

Table 60 – Set VLAN Filter command-specific reason code

Value	Description	Comment
0x0B07	VLAN Tag Is Invalid	Returned when the VLAN ID is invalid (VLAN ID = 0)

2512

8.4.27 Enable VLAN command (0x0C)

2513

The Enable VLAN command may be used by the Management Controller to enable the channel to accept VLAN-tagged packets from the network for NC-SI Pass-through operation (see Table 61).

2514

2515

Table 61 – Enable VLAN command packet format

		Bits			
Bytes	31..24	23..16	15..08	07..00	
00..15	NC-SI Control Packet Header				
16..19	Reserved			Mode #	
20..23	Checksum				
24..45	Pad				

2516 Table 62 describes the modes for the Enable VLAN command.

2517

Table 62 – VLAN Enable modes

Mode	#	O/M	Description
Reserved	0x00	n/a	Reserved
VLAN only	0x01	M	Only VLAN-tagged packets that match the enabled VLAN Filter settings and also match the MAC Address Filtering configuration are accepted. Non-VLAN-tagged packets are not accepted.
VLAN + non-VLAN	0x02	O	VLAN-tagged packets that match the enabled VLAN Filter settings and also match the MAC Address Filtering configuration are accepted. Non-VLAN-tagged packets that match the MAC Address Filtering configuration are also accepted.
Any VLAN + non-VLAN	0x03	O	Any VLAN-tagged packets that also match the MAC Address Filtering configuration are accepted, regardless of the VLAN Filter settings. Non-VLAN-tagged packets that match the MAC Address Filtering configuration are also accepted.
Reserved	0x04-0xFF	n/a	Reserved

2518 **8.4.28 Enable VLAN response (0x8C)**

2519 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Enable
2520 VLAN command and send a response.

2521 Currently no command-specific reason code is identified for this response (see Table 63).

2522

Table 63 – Enable VLAN response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

2523 **8.4.29 Disable VLAN command (0x0D)**

2524 The Disable VLAN command may be used by the Management Controller to disable VLAN filtering. In the
2525 disabled state, only non-VLAN-tagged packets (that also match the MAC Address Filtering configuration)
2526 are accepted. VLAN-tagged packets are not accepted.

2527 Table 64 illustrates the packet format of the Disable VLAN command.

2528

Table 64 – Disable VLAN command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2529 **8.4.30 Disable VLAN response (0x8D)**

2530 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Disable
2531 VLAN command and send a response.

2532 Currently no command-specific reason code is identified for this response (see Table 65).

2533

Table 65 – Disable VLAN response packet format

00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

2534 **8.4.31 Set MAC Address command (0x0E)**

2535 The Set MAC Address command is used by the Management Controller to program the channel’s unicast
2536 or multicast MAC address filters.

2537 The channel supports one or more “perfect match” MAC address filters that are used to selectively
2538 forward inbound frames to the Management Controller. Assuming that a packet passes any VLAN filtering
2539 that may be active, it will be forwarded to the Management Controller if its 48-bit destination MAC address
2540 exactly matches an active MAC address filter.

2541 MAC address filters may be configured as unicast or multicast addresses, depending on the capability of
2542 the channel. The channel may implement three distinct types of filters:

- 2543 • Unicast filters support exact matching on 48-bit unicast MAC addresses (AT = 0x0 only).
- 2544 • Multicast filters support exact matching on 48-bit multicast MAC addresses (AT = 0x1 only).
- 2545 • Mixed filters support matching on both unicast and multicast MAC addresses. (AT = 0x0 or
2546 AT = 0x1)

2547 The number of filters of each type that are supported by the channel can be discovered by means of the
2548 Get Capabilities command. The channel shall support at least one unicast address filter or one mixed
2549 filter, so that at least one unicast MAC address filter may be configured on the channel. Support for any
2550 combination of unicast, multicast, or mixed filters beyond this basic requirement is vendor specific. The
2551 total number of all filters shall be less than or equal to 8.

2552 To configure an address filter, the Management Controller issues a Set MAC Address command with the
2553 Address Type field indicating the type of address to be programmed (unicast or multicast) and the MAC
2554 Address Num field indicating the specific filter to be programmed.

2555 Filters are addressed using a 1-based index ordered over the unicast, multicast, and mixed filters
 2556 reported by means of the Get Capabilities command. For example, if the interface reports four unicast
 2557 filters, two multicast filters, and two mixed filters, then MAC address numbers 1 through 4 refer to the
 2558 interface's unicast filters, 5 and 6 refer to the multicast filters, and 7 and 8 refer to the mixed filters.
 2559 Similarly, if the interface reports two unicast filters, no multicast filters, and six mixed filters, then MAC
 2560 address numbers 1 and 2 refer to the unicast filters, and 3 through 8 refer to the mixed filters.

2561 The filter type of the filter to be programmed (unicast, multicast, or mixed) shall be compatible with the
 2562 Address Type being programmed. For example, programming a mixed filter to a unicast address is
 2563 allowed, but programming a multicast filter to a unicast address is an error.

2564 The Enable field determines whether the indicated filter is to be enabled or disabled. When a filter is
 2565 programmed to be enabled, the filter is loaded with the 48-bit MAC address in the MAC Address field of
 2566 the command, and the channel enables forwarding of frames that match the configured address. If the
 2567 specified filter was already enabled, it is updated with the new address provided.

2568 When a filter is programmed to be disabled, the contents of the MAC Address field are ignored. Any
 2569 previous MAC address programmed in the filter is discarded and the channel no longer uses this filter in
 2570 its packet-forwarding function.

2571 Only unicast MAC addresses, specified with AT set to 0x0, should be used in source MAC address
 2572 checking and for determining the NC-SI channel for Pass-through transmit traffic.

2573 Table 66 illustrates the packet format of the Set MAC Address command.

2574 **Table 66 – Set MAC Address command packet format**

Bytes	Bits					
	31..24	23..16	15..08	07..00		
00..15	NC-SI Control Packet Header					
16..19	MAC Address byte 5	MAC Address byte 4	MAC Address byte 3	MAC Address byte 2		
20..23	MAC Address byte 1	MAC Address byte 0	MAC Address Num	AT	Reserved	E

2584 Table 71 describes the reason code that is specific to the Set MAC Address command.

2585 **Table 71 – Set MAC Address command-specific reason code**

Value	Description	Comment
0x0E08	MAC Address Is Zero	Returned when the Set MAC Address command is received with the MAC address set to 0

2586 8.4.33 Enable Broadcast Filter command (0x10)

2587 The Enable Broadcast Filter command allows the Management Controller to control the forwarding of
 2588 broadcast frames to the Management Controller. The channel, upon receiving and processing this
 2589 command, shall filter all received broadcast frames based on the broadcast packet filtering settings
 2590 specified in the payload. If no broadcast packet types are specified for forwarding, all broadcast packets
 2591 shall be filtered out.

2592 The Broadcast Packet Filter Settings field is used to specify those protocol-specific broadcast filters that
 2593 should be activated. The channel indicates which broadcast filters it supports in the Broadcast Filter
 2594 Capabilities field of the Get Capabilities Response frame defined in clause 8.4.46.

2595 Table 72 illustrates the packet format of the Enable Broadcast Filter command.

2596 **Table 72 – Enable Broadcast Filter command packet format**

Bytes	Bits

2597 Table 73 describes the Broadcast Packet Filter Settings field bit definitions.

2598 **Table 73 – Broadcast Packet Filter Settings field**

Bit Position	Field Description	Value Description
0	ARP Packets	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this specification, an ARP broadcast packet is defined to be any packet that meets all of the following requirements:</p> <ul style="list-style-type: none"> The destination MAC address field is set to the layer 2 broadcast address (FF:FF:FF:FF:FF:FF). The EtherType field is set to 0x0806. <p>This field is mandatory.</p>

Bit Position	Field Description	Value Description
1	DHCP Client Packets	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this filter, a DHCP client broadcast packet is defined to be any packet that meets all of the following requirements:</p> <ul style="list-style-type: none"> The destination MAC address field is set to the layer 2 broadcast address (FF:FF:FF:FF:FF:FF). The EtherType field is set to 0x0800 (IPv4). The IP header's Protocol field is set to 17 (UDP). The UDP destination port number is set to 68. <p>This field is optional. If unsupported, broadcast DHCP client packets will be blocked when broadcast filtering is enabled. The value shall be set to 0b if unsupported.</p>
2	DHCP Server Packets	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this filter, a DHCP server broadcast packet is defined to be any packet that meets all of the following requirements:</p> <ul style="list-style-type: none"> The destination MAC address field is set to the layer 2 broadcast address (FF:FF:FF:FF:FF:FF). The EtherType field is set to 0x0800 (IPv4). The IP header's Protocol field is set to 17 (UDP). The UDP destination port number is set to 67. <p>This field is optional. If unsupported, broadcast DHCP packets will be blocked when broadcast filtering is enabled. The value shall be set to 0b if unsupported.</p>
3	NetBIOS Packets	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this filter, NetBIOS broadcast packets are defined to be any packet that meets all of the following requirements:</p> <ul style="list-style-type: none"> The destination MAC address field is set to the layer 2 broadcast address (FF:FF:FF:FF:FF:FF). The EtherType field is set to 0x0800 (IPv4). The IP header's Protocol field is set to 17 (UDP). The UDP destination port number is set to 137 for NetBIOS Name Service or 138 for NetBIOS Datagram Service, per the assignment of IANA well-known ports. <p>This field is optional. If unsupported, broadcast NetBIOS packets will be blocked when broadcast filtering is enabled. The value shall be set to 0b if unsupported.</p>
4..31	Reserved	Reserved

2599 **8.4.34 Enable Broadcast Filter response (0x90)**

2600 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Enable
2601 Broadcast Filter command and send a response.

2602 Currently no command-specific reason code is identified for this response (see Table 74).

2603 **Table 74 – Enable Broadcast Filter response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

2604 8.4.35 Disable Broadcast Filter command (0x11)

2605 The Disable Broadcast Filter command may be used by the Management Controller to disable the
2606 broadcast filter feature and enable the reception of all broadcast frames. Upon processing this command,
2607 the channel shall discontinue the filtering of received broadcast frames.

2608 Table 75 illustrates the packet format of the Disable Broadcast Filter command.

2609 **Table 75 – Disable Broadcast Filter command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2610 8.4.36 Disable Broadcast Filter response (0x91)

2611 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Disable
2612 Broadcast Filter command and send a response.

2613 Currently no command-specific reason code is identified for this response (see Table 76).

2614 **Table 76 – Disable Broadcast Filter response packet format**

20..23	Checksum			
24..45	Pad			

2615 8.4.37 Enable Global Multicast Filter command (0x12)

2616 The Enable Global Multicast Filter command is used to activate global filtering of multicast frames with
2617 optional filtering of specific multicast protocols. Upon receiving and processing this command, the

2618 channel shall deliver only multicast frames that match specific multicast MAC addresses enabled for
 2619 Pass-through using this command or the Set MAC Address command.

2620 The Multicast Packet Filter Settings field is used to specify optional, protocol-specific multicast filters that
 2621 should be activated. The channel indicates which optional multicast filters it supports in the Multicast Filter
 2622 Capabilities field of the Get Capabilities Response frame defined in clause 8.4.46. The Management
 2623 Controller should not set bits in the Multicast Packet Filter Settings field that are not indicated as
 2624 supported in the Multicast Filter Capabilities field.

2625 Neighbor Solicitation messages are sent to a Solicited Node multicast address that is derived from the
 2626 target node's IPv6 address. This command may be used to enable forwarding of solicited node
 2627 multicasts.

2628 The IPv6 neighbor solicitation filter, as defined in this command, may not be supported by the Network
 2629 Controller. In this case, the Management Controller may configure a multicast or mixed MAC address
 2630 filter for the specific Solicited Node multicast address using the Set MAC Address command to enable
 2631 forwarding of Solicited Node multicasts.

2632 This command shall be implemented if the channel implementation supports accepting all multicast
 2633 addresses. An implementation that does not support accepting all multicast addresses shall not
 2634 implement these commands. Pass-through packets with multicast addresses can still be accepted
 2635 depending on multicast address filter support provided by the Set MAC Address command. Multicast filter
 2636 entries that are set to be enabled in the Set MAC Address command are accepted; all others are rejected.
 2637 Table 77 illustrates the packet format of the Enable Global Multicast Filter command. Unsupported fields
 2638 should be treated as reserved fields unless otherwise specified.

2639 **Table 77 – Enable Global Multicast Filter command packet format**

2640 Table 78 describes the bit definitions for the Multicast Packet Filter Settings field.

2641

Table 78 – Bit Definitions for Multicast Packet Filter Settings field

Bit Position	Field Description	Value Description
0	IPv6 Neighbor Advertisement	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this specification, an IPv6 Neighbor Advertisement multicast packet is defined to be any packet that meets all of the following requirements:</p> <ul style="list-style-type: none"> The destination MAC address field is set to a layer 2 multicast address of the form 33:33:00:00:00:01. This address corresponds to the all-nodes multicast address (FF02::1). The EtherType field is set to 0x86DD (IPv6). The IPv6 header's Next Header field is set to 58 (ICMPv6). The ICMPv6 header's Message Type field is set to the following value: 136 – Neighbor Advertisement. <p>This field is optional.</p>
1	IPv6 Router Advertisement	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this specification, an IPv6 Router Advertisement multicast packet is defined to be any packet that meets all of the following requirements:</p> <ul style="list-style-type: none"> The destination MAC address field is set to a layer 2 multicast address of the form 33:33:00:00:00:01. This corresponds to the all-nodes multicast address (FF02::1). The EtherType field is set to 0x86DD (IPv6). The IPv6 header's Next Header field is set to 58 (ICMPv6). The ICMPv6 header's Message Type field is set to 134. <p>This field is optional.</p>
2	DHCPv6 relay and server multicast	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this filter, a DHCPv6 multicast packet is defined to be any packet that meets all of the following requirements:</p> <ul style="list-style-type: none"> The destination MAC address field is set to the layer 2 multicast address 33:33:00:01:00:02 or 33:33:00:01:00:03. These correspond to the IPv6 multicast addresses FF02::1:2 (All_DHCP_Relay_Agents_and_Servers) and FF05::1:3 (All_DHCP_Servers). The EtherType field is set to 0x86DD (IPv6). The IPv6 header's Next Header field is set to 17 (UDP). The UDP destination port number is set to 547. <p>This field is optional.</p>

Bit Position	Field Description	Value Description
3	DHCPv6 multicasts from server to clients listening on well-known UDP ports	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this filter, a DHCPv6 multicast packet is defined to be any packet that meets all of the following requirements:</p> <ul style="list-style-type: none"> • The destination MAC address field is set to the layer 2 multicast address 33:33:00:01:00:02. These correspond to the IPv6 multicast addresses FF02::1:2 (All_DHCP_Relay_Agents_and_Servers). • The EtherType field is set to 0x86DD (IPv6). • The IPv6 header's Next Header field is set to 17 (UDP). • The UDP destination port number is set to 546. <p>This field is optional.</p>
4	IPv6 MLD	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this specification, an IPv6 MLD packet is defined to be any packet that meets all of the following requirements:</p> <ul style="list-style-type: none"> • The destination MAC address field is set to a layer 2 multicast address of the form 33:33:00:00:00:01. This address corresponds to the All_Nodes (FF02::1) multicast address. • The EtherType field is set to 0x86DD (IPv6). • The IPv6 header's Next Header field is set to 58 (ICMPv6). • The ICMPv6 header's Message Type field is set to one of the following values: 130 (Multicast Listener Query), 131 (Multicast Listener Report), 132 (Multicast Listener Done) <p>This field is optional.</p>

Bit Position	Field Description	Value Description
5	IPv6 Neighbor Solicitation	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this specification, an IPv6 MLD packet is defined to be any packet that meets all of the following requirements:</p> <ul style="list-style-type: none"> • The destination MAC address field is set to a layer 2 multicast address of the form <code>33:33:FF:XX:XX:XX</code>. This address corresponds to the Solicited Node multicast address where the last three bytes of the destination MAC address are ignored for this filter. • The EtherType field is set to <code>0x86DD</code> (IPv6). • The IPv6 header's Next Header field is set to 58 (ICMPv6). • The ICMPv6 header's Message Type field is set to 135 <p>This field is optional.</p> <p>Implementation Note: Enabling of this filter results in receiving all IPv6 neighbor solicitation traffic on this channel. If IPv6 neighbor solicitation traffic for a specific multicast address is of interest, then it is recommended that the MC uses a multicast address filter (configured for the multicast address using the Set MAC Address command) instead of this filter.</p>
6	LLDP	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this specification, an LLDP packet is defined to be any packet that meets all of the following requirements:</p> <ul style="list-style-type: none"> • The destination MAC address field is set to a layer 2 multicast address of the form <code>01:80:C2:00:00:00</code>, or <code>01:80:C2:00:00:03</code>, or <code>01:80:C2:00:00:0E</code>. • The EtherType field is set to <code>0x88CC</code>. <p>The intent of this filter is to allow the MC to snoop the received LLDP frame by the port, not to achieve ownership of any contained protocols.</p> <p>This field is optional.</p> <p>Implementation Note: Enabling of this filter results in receiving a copy of all LLDP traffic on this channel. If LLDP traffic for a specific LLDP multicast address is of interest, then it is recommended that the MC uses a multicast address filter (configured for the multicast address using the Set MAC Address command) instead of this filter.</p>

Bit Position	Field Description	Value Description
7	mDNSv4	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this specification, an mDNS/IPv4 packet is defined to be any packet that meets all the following requirements:</p> <ul style="list-style-type: none"> • The destination MAC address field is set to a layer 2 multicast address of the form 01:00:5E:00:00:FB. • The EtherType field is set to 0x0800. • The IPv4 address is 224.0.0.251. • The IPv4 header's Protocol field is set to 17 (UDP). • The UDP destination port number is set to 5353. <p>This field is optional.</p>
8	mDNSv6	<p>1b = Forward this packet type to the Management Controller. 0b = Filter out this packet type.</p> <p>For the purposes of this specification, an mDNS/IPv6 packet is defined to be any packet that meets all the following requirements:</p> <ul style="list-style-type: none"> • The destination MAC address field is set to a layer 2 multicast address of the form 33:33:00:00:00:FB. This corresponds to the All Nodes IPv6 multicast address, FF02::FB. • The EtherType field is set to 0x086DD. • The IPv6 header's Next Header field is set to 17 (UDP). • The UDP destination port number is set to 5353. <p>This field is optional.</p>
31..9	Reserved	Reserved

2642 **8.4.38 Enable Global Multicast Filter response (0x92)**

2643 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Enable
 2644 Global Multicast Filter command and send a response.

2645 Currently no command-specific reason code is identified for this response (see Table 79).

2646

Table 79 – Enable Global Multicast Filter response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

2647 **8.4.39 Disable Global Multicast Filter command (0x13)**

2648 The Disable Global Multicast Filter command is used to disable global filtering of multicast frames. Upon
 2649 receiving and processing this command, and regardless of the current state of multicast filtering, the
 2650 channel shall forward all multicast frames to the Management Controller.

2651 This command shall be implemented on the condition that the channel implementation supports accepting
 2652 all multicast addresses. An implementation that does not support accepting all multicast addresses shall
 2653 not implement these commands. Pass-through packets with multicast addresses can still be accepted
 2654 depending on multicast address filter support provided by the Set MAC Address command. Packets with
 2655 destination addresses matching multicast filter entries that are set to enabled in the Set MAC Address
 2656 command are accepted; all others are rejected.

2657 Table 80 illustrates the packet format of the Disable Global Multicast Filter command.

2658

Table 80 – Disable Global Multicast Filter command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2659 **8.4.40 Disable Global Multicast Filter response (0x93)**

2660 In the absence of any errors, the channel shall process and respond to the Disable Global Multicast Filter
 2661 command by sending the response packet shown in Table 81.

2662 Currently no command-specific reason code is identified for this response.

2663

Table 81 – Disable Global Multicast Filter response packet format

20..23	Checksum			
24..45	Pad			

2664 **8.4.41 Set NC-SI Flow Control command (0x14)**

2665 The Set NC-SI Flow Control command allows the Management Controller to configure [IEEE 802.3](#) pause
 2666 packet flow control on the NC-SI RBT.

2667 The Set NC-SI Flow Control command is addressed to the package, rather than to a particular channel; in
 2668 other words, the command is sent with a Channel ID where the Package ID subfield matches the ID of
 2669 the intended package and the Internal Channel ID subfield is set to 0x1F.

2670 The setting of [IEEE 802.3](#) Pause packet flow control on RBT is independent from any arbitration scheme,
 2671 if any is used.

2672 Table 82 illustrates the packet format of the Set NC-SI Flow Control command.

2673

Table 82 – Set NC-SI Flow Control command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Reserved			Flow Control Enable

48..51	PCI SSID		PCI SVID	
52..55	Manufacturer ID (IANA)			
56..59	Checksum			

2694 **8.4.44.1 NC-SI Version encoding**

2695 The NC-SI Version field holds the version number of the NC-SI specification with which the controller is
 2696 compatible. The version field shall be encoded as follows:

- 2697 • The ‘major’, ‘minor’, and ‘update’ bytes are BCD-encoded, and each byte holds two BCD digits.
- 2698 • The ‘alpha’ byte holds an optional alphanumeric character extension that is encoded using the
 2699 ISO/IEC 8859-1 Character Set.
- 2700 • The semantics of these fields follow the semantics specified in [DSP4014](#).

- 2701 • The value 0x00 in the Alpha1 or Alpha2 fields means that the corresponding alpha field is not
2702 used. The Alpha1 field shall be used first.
 - 2703 • The value 0xF in the most-significant (MS) nibble of a BCD-encoded value indicates that the
2704 most-significant nibble should be ignored and the overall field treated as a single digit value.
 - 2705 • A value of 0xFF in the update field indicates that the entire field is not present. 0xFF is not
2706 allowed as a value for the major or minor fields.
- 2707 EXAMPLE: Version 3.7.10a → 0xF3F7106100
 2708 Version 10.01.7 → 0x1001F70000
 2709 Version 3.1 → 0xF3F1FF0000
 2710 Version 1.0a → 0xF1F0FF4100
 2711 Version 1.0ab → 0xF1F0FF4142 (Alpha1 = 0x41, Alpha2 = 0x42)
 2712

2713 NC-SI implementations that follow this particular specification shall return the following version
 2714 information in the response.

2715 The Major field shall be set to 0xF1 to indicate compatibility with Version 1.0 of the NC-SI specification.

2716 The Minor field shall be set to 0xF2 to indicate compatibility with Version 1.2 of the NC-SI specification.

2717 The Update field shall be set to 0xF0 to indicate compatibility with Version 1.2.0 of the NC-SI
 2718 specification.

2719 The Alpha1 field shall be set to 0x00.

2720 The Alpha2 field shall be set to 0x00.

2721 The reported NC-SI version using the encoding shall be: 0xF1F2F00000 (1.2.0).

2722 8.4.44.2 Firmware Name encoding

2723 The Firmware Name String shall be encoded using the ISO/IEC 8859-1 Character Set. Strings are left-
 2724 justified where the leftmost character of the string occupies the most-significant byte position of the
 2725 Firmware Name String field, and characters are populated starting from that byte position. The string is
 2726 null terminated if the string is smaller than the field size. That is, the delimiter value 0x00 follows the last
 2727 character of the string if the string occupies fewer bytes than the size of the field allows. A delimiter is not
 2728 required if the string occupies the full size of the field. Bytes following the delimiter (if any) should be
 2729 ignored and can be any value.

2730 8.4.44.3 Firmware Version encoding

2731 To facilitate a common way of representing and displaying firmware version numbers across different
 2732 vendors, each byte is hexadecimal encoded where each byte in the field holds two hexadecimal digits.
 2733 The Firmware Version field shall be encoded as follows. The bytes are collected into a single 32-bit field
 2734 where each byte represents a different 'point number' of the overall version. The selection of values that
 2735 represent a particular version of firmware is specific to the Network Controller vendor.

2736 Software displaying these numbers should not suppress leading zeros, which should help avoid user
 2737 confusion in interpreting the numbers. For example, consider the two values 0x05 and 0x31. Numerically
 2738 the byte 0x31 is greater than 0x05, but if leading zeros were incorrectly suppressed, the two displayed
 2739 values would be ".5" and ".31", respectively, and a user would generally interpret 0.5 as representing a
 2740 greater value than 0.31 instead of 0.05 being smaller than 0.31. Similarly, if leading zeros were incorrectly
 2741 suppressed, the values 0x01 and 0x10 would be displayed as 0.1 and 0.10, which could potentially be
 2742 misinterpreted as representing the same version instead of distinct 0.01 and 0.10 versions.

2743 EXAMPLE: 0x00030217 → Version 00.03.02.17
 2744 0x010100A0 → Version 01.01.00.A0

2745 **8.4.44.4 PCI ID fields**

2746 These fields (PCI DID, PCI VID, PCI SSID, PCI SVID) hold the PCI ID information for the Network
 2747 Controller when the Network Controller incorporates a PCI or PCI Express™ interface that provides a
 2748 host network interface connection that is shared with the NC-SI connection to the network.

2749 If this field is not used, the values shall be set to all zeros (0x0000). Otherwise, the fields shall hold the
 2750 PCI ID information for the host interface as defined by the version of the PCI/PCI Express™ specification
 2751 to which the device’s interface was designed.

2752 If multiple partitions are enabled on the channel, the values should represent the PCI ID of the lowest
 2753 Function number assigned to the channel by the Set PF Assignment command (0x28).

2754 **8.4.44.5 Manufacturer ID (IANA) field**

2755 The Manufacturer ID holds the [IANA Enterprise Number](#) for the manufacturer of the Network Controller as
 2756 a 32-bit binary number. If the field is unused, the value shall be set to 0xFFFFFFFF.

2757 **8.4.45 Get Capabilities command (0x16)**

2758 The Get Capabilities command is used to discover additional optional functions supported by the channel,
 2759 such as the number of unicast/multicast addresses supported, the amount of buffering in bytes available
 2760 for packets bound for the Management Controller, and so on.

2761 Table 88 illustrates the packet format for the Get Capabilities command.

2762 **Table 88 – Get Capabilities command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2763 **8.4.46 Get Capabilities response (0x96)**

2764 In the absence of any errors, the channel shall process and respond to the Get Capabilities Command
 2765 and send the response packet shown in Table 89. Currently no command-specific reason code is
 2766 identified for this response.

2767 **Table 89 – Get Capabilities response packet format**

2768 **8.4.46.1 Capabilities Flags field**

2769 The Capabilities Flags field indicates which optional features of this specification the channel supports, as
 2770 described in Table 90.

2771

Table 90 – Capabilities Flags bit definitions

Bit Position	Field Description	Value Description
0	Hardware Arbitration Capability	0b = Hardware arbitration capability is not supported by the package. 1b = Hardware arbitration capability is supported by the package.
1	Host NC Driver Status	0b = Host NC Driver Indication status is not supported. 1b = Host NC Driver Indication status is supported. See Table 52 for the definition of Host NC Driver Indication Status.
2	Network Controller to Management Controller Flow Control Support	0b = Network Controller to Management Controller flow control is not supported. 1b = Network Controller to Management Controller flow control is supported.
3	Management Controller to Network Controller Flow Control Support	0b = Management Controller to Network Controller flow control is not supported. 1b = Management Controller to Network Controller flow control is supported.
4	All multicast addresses support	0b = The channel cannot accept all multicast addresses. The channel does not support enable/disable global multicast commands. 1b = The channel can accept all multicast addresses. The channel supports enable/disable global multicast commands.
6..5	Hardware Arbitration Implementation Status	00b = Unknown 01b = Hardware arbitration capability is not implemented for the package on the given system. 10b = Hardware arbitration capability is implemented for the package on the given system. 11b = Reserved.

Bit Position	Field Description	Value Description
7	Thermal shutdown Implementation Status	0b = The thermal self-shutdown capability is not supported by the channel (package). 1b = The thermal self-shutdown capability is supported by the channel (package).
8	Delayed Response Support	0b = Delayed response operation and signaling is not supported by the channel (package). 1b = Delayed response operation and signaling is supported by the channel (package).
9..31	Reserved	Reserved

2772 8.4.46.2 Broadcast Packet Filter Capabilities field

2773 The Broadcast Packet Filter Capabilities field defines the optional broadcast packet filtering capabilities
2774 that the channel supports. The bit definitions for this field correspond directly with the bit definitions for the
2775 Broadcast Packet Filter Settings field defined for the Enable Broadcast Filter command in Table 73. A bit
2776 set to 1b indicates that the channel supports the filter associated with that bit position; otherwise, the
2777 channel does not support that filter.

2778 8.4.46.3 Multicast Packet Filter Capabilities field

2779 The Multicast Packet Filter Capabilities field defines the optional multicast packet filtering capabilities that
2780 the channel supports. The bit definitions for this field correspond directly with the bit definitions for the
2781 Multicast Packet Filter Settings field defined for the Enable Global Multicast Filter command in Table 78.
2782 A bit set to 1b indicates that the channel supports the filter associated with that bit position; otherwise, the
2783 channel does not support that filter.

2784 8.4.46.4 Buffering Capability field

2785 The Buffering Capability field defines the amount of buffering in bytes that the channel provides for
2786 inbound packets destined for the Management Controller. The Management Controller may make use of
2787 this value in software-based Device Selection implementations to determine the relative time for which a
2788 specific channel may be disabled before it is likely to start dropping packets. A value of 0 indicates that
2789 the amount of buffering is unspecified.

2790 8.4.46.5 AEN Control Support field

2791 The AEN Control Support field indicates various standard AENs supported by the implementation. The
2792 format of the field is shown in Table 42.

2793 8.4.46.6 VLAN Filter Count field

2794 The VLAN Filter Count field indicates the number of VLAN filters, up to 15, that the channel supports, as
2795 defined by the Set VLAN Filter command.

2796 8.4.46.7 Mixed, Multicast, and Unicast Filter Count fields

2797 The Mixed Filter Count field indicates the number of mixed address filters that the channel supports. A
2798 mixed address filter can be used to filter on specific unicast or multicast MAC addresses.

2799 The Multicast Filter Count field indicates the number of multicast MAC address filters that the channel
2800 supports.

2801 The Unicast Filter Count field indicates the number of unicast MAC address filters that the channel
2802 supports.

2803 The channel is required to support at least one unicast or mixed filter, such that at least one unicast MAC
 2804 address can be configured on the interface. The total number of unicast, multicast, and mixed filters shall
 2805 not exceed 8.

2806 8.4.46.8 VLAN Mode Support field

2807 The VLAN Mode Support field indicates various modes supported by the implementation. The format of
 2808 field is defined in Table 91.

2809 **Table 91 – VLAN Mode Support bit definitions**

Bit Position	Field Description	Value Description
0	VLAN only	1b = VLAN shall be supported in the implementation.
1	VLAN + non-VLAN	0b = Filtering 'VLAN + non-VLAN' traffic is not supported in the implementation. 1b = Filtering 'VLAN + non-VLAN' traffic is supported in the implementation.
2	Any VLAN + non-VLAN	0b = Filtering 'Any VLAN + non-VLAN' traffic is not supported in the implementation. 1b = Filtering 'Any VLAN + non-VLAN' traffic is supported in the implementation.
3..7	Reserved	Reserved

2810 8.4.46.9 Channel Count field

2811 The Channel Count field indicates the number of channels supported by the Network Controller.

2812 8.4.47 Get Parameters command (0x17)

2813 The Get Parameters command can be used by the Management Controller to request that the channel
 2814 send the Management Controller a copy of all of the currently stored parameter settings that have been
 2815 put into effect by the Management Controller, plus "other" Host/Channel parameter values that may be
 2816 added to the Get Parameters Response Payload.

2817 Table 92 illustrates the packet format for the Get Parameters command.

2818 **Table 92 – Get Parameters command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2819 8.4.48 Get Parameters response (0x97)

2820 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Get
 2821 Parameters command and send a response. As shown in Table 93, each parameter shall return the value
 2822 that was set by the Management Controller. If the parameter is not supported, 0 is returned. Currently no
 2823 command-specific reason code is identified for this response.

2824 The payload length of this response packet will vary according to how many MAC address filters or VLAN
2825 filters the channel supports. All supported MAC addresses are returned at the end of the packet, without
2826 any intervening padding between MAC addresses.

2827 MAC addresses are returned in the following order: unicast filtered addresses first, followed by multicast
2828 filtered addresses, followed by mixed filtered addresses, with the number of each corresponding to those
2829 reported through the Get Capabilities command. For example, if the interface reports four unicast filters,
2830 two multicast filters, and two mixed filters, then MAC addresses 1 through 4 are those currently
2831 configured through the interface's unicast filters, MAC addresses 5 and 6 are those configured through
2832 the multicast filters, and MAC addresses 7 and 8 are those configured through the mixed filters. Similarly,
2833 if the interface reports two unicast filters, no multicast filters, and six mixed filters, then MAC addresses 1
2834 and 2 are those currently configured through the unicast filters, and MAC addresses 3 through 8 are
2835 those configured through the mixed filters.

2836

Table 93 – Get Parameters response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	MAC Address Count	Reserved		MAC Address Flags
24..27	VLAN Tag Count	Reserved	VLAN Tag Flags	
28..31	Link Settings			
32..35	Broadcast Packet Filter Settings			
36..39	Configuration Flags			
40..43	VLAN Mode	Flow Control Enable	Reserved	
44..47	AEN Control			
48..51	MAC Address 1 byte 5	MAC Address 1 byte 4	MAC Address 1 byte 3	MAC Address 1 byte 2
52..55 ^a	MAC Address 1 byte 1	MAC Address 1 byte 0	MAC Address 2 byte 5	MAC Address 2 byte 4
56..59	MAC Address 2 byte 3	MAC Address 2 byte 2	MAC Address 2 byte 1	MAC Address 2 byte 0
variable	...			
	VLAN Tag 1		VLAN Tag 2	
	...			
	...		Pad (if needed)	
	Checksum			

^a Variable fields can start at this byte offset.

2837 Table 94 lists the parameters for which values are returned in this response packet.

2838

Table 94 – Get Parameters data definition

Parameter Field Name	Description
MAC Address Count	The number of MAC addresses supported by the channel
MAC Address Flags	The enable/disable state for each supported MAC address See Table 95.
VLAN Tag Count	The number of VLAN Tags supported by the channel
VLAN Tag Flags	The enable/disable state for each supported VLAN Tag See Table 96.
Link Settings	The 32-bit Link Settings value as defined in the Set Link command See Table 45.
Broadcast Packet Filter Settings	The current 32-bit Broadcast Packet Filter Settings value
Configuration Flags	See Table 97.

Parameter Field Name	Description
VLAN Mode	See Table 62.
Flow Control Enable	See Table 83.
AEN Control	See Table 42.
MAC Address 1..8	The current contents of up to eight 6-byte MAC address filter values
VLAN Tag 1..15	The current contents of up to 15 16-bit VLAN Tag filter values

2839 The format of the MAC Address Flags field is defined in Table 95.

2840 **Table 95 – MAC Address Flags bit definitions**

Bit Position	Field Description	Value Description
0	MAC address 1 status	0b = Default or unsupported or disabled 1b = Enabled
1	MAC address 2 status, or Reserved	0b = Default or unsupported or disabled 1b = Enabled
2	MAC address 3 status, or Reserved	0b = Default or unsupported or disabled 1b = Enabled
...
7	MAC address 8 status, or Reserved	0b = Default or unsupported or disabled 1b = Enabled

2841 The format of the VLAN Tag Flags field is defined in Table 96.

2842 **Table 96 – VLAN Tag Flags bit definitions**

Bit Position	Field Description	Value Description
0	VLAN Tag 1 status	0b = Default or unsupported or disabled 1b = Enabled
1	VLAN Tag 2 status, or Reserved	0b = Default or unsupported or disabled 1b = Enabled
2	VLAN Tag 3 status, or Reserved	0b = Default or unsupported or disabled 1b = Enabled
...
15	VLAN Tag 16 status, or Reserved	0b = Default or unsupported or disabled 1b = Enabled

2843 The format of the Configuration Flags field is defined in Table 97.

2844

Table 97 – Configuration Flags bit definitions

Bit Position	Field Description	Value Description
0	Broadcast Packet Filter status	0b = Disabled 1b = Enabled
1	Channel Enabled	0b = Disabled 1b = Enabled
2	Channel Network TX Enabled	0b = Disabled 1b = Enabled
3	Global Multicast Packet Filter Status	0b = Disabled 1b = Enabled
4..31	Reserved	Reserved

2845 **8.4.49 Get Controller Packet Statistics command (0x18)**

2846 The Get Controller Packet Statistics command may be used by the Management Controller to request a
 2847 copy of the aggregated Ethernet packet statistics that the channel maintains for its external interface to
 2848 the LAN network. The statistics are an aggregation of statistics for both the host-side traffic and the NC-SI
 2849 Pass-through traffic.

2850

Table 98 – Get Controller Packet Statistics command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2851 **8.4.50 Get Controller Packet Statistics response (0x98)**

2852 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Get
 2853 Controller Packet Statistics command and send the response packet shown in Table 99.

2854 The Get Controller Packet Statistics Response frame contains a set of Ethernet statistics counters that
 2855 monitor the LAN traffic in the Network Controller. Implementation of the counters listed in Table 100 is
 2856 optional. The Network Controller shall return any unsupported counter with a value of 0xFFFFFFFF for
 2857 32-bit counters and 0xFFFFFFFFFFFFFFFF for 64-bit counters.

2858

Table 99 – Get Controller Packet Statistics response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Counters Cleared from Last Read (MS bits)			
24..27	Counters Cleared from Last Read (LS bits)			
28..35	Total Bytes Received			
36..43	Total Bytes Transmitted			
44..51	Total Unicast Packets Received			
52..59	Total Multicast Packets Received			
60..67	Total Broadcast Packets Received			
68..75	Total Unicast Packets Transmitted			
76..83	Total Multicast Packets Transmitted			
84..91	Total Broadcast Packets Transmitted			
92..95	FCS Receive Errors			
96..99	Alignment Errors			
100..103	False Carrier Detections			
104..107	Runt Packets Received			
108..111	Jabber Packets Received			
112..115	Pause XON Frames Received			
116..119	Pause XOFF Frames Received			
120..123	Pause XON Frames Transmitted			
124..127	Pause XOFF Frames Transmitted			
128..131	Single Collision Transmit Frames			
132..135	Multiple Collision Transmit Frames			
136..139	Late Collision Frames			
140..143	Excessive Collision Frames			
144..147	Control Frames Received For version 1.2, this counter may include Priority flow control packets			
148..151	64-Byte Frames Received			
152..155	65–127 Byte Frames Received			
156..159	128–255 Byte Frames Received			
160..163	256–511 Byte Frames Received			
164..167	512–1023 Byte Frames Received			
168..171	1024–1522 Byte Frames Received			
172..175	1523–9022 Byte Frames Received			
176..179	64-Byte Frames Transmitted			

Bytes	Bits			
	31..24	23..16	15..08	07..00
180..183	65–127 Byte Frames Transmitted			
184..187	128–255 Byte Frames Transmitted			
188..191	256–511 Byte Frames Transmitted			
192..195	512–1023 Byte Frames Transmitted			
196..199	1024–1522 Byte Frames Transmitted			
200..203	1523–9022 Byte Frames Transmitted			
204..211	Valid Bytes Received			
212..215	Error Runt Packets Received			
216..219	Error Jabber Packets Received			
220..223	Checksum			

2859

Table 100 – Get Controller Packet Statistics counters

Counter Number	Name	Meaning
0	Total Bytes Received	Counts the number of bytes received
1	Total Bytes Transmitted	Counts the number of bytes transmitted
2	Total Unicast Packets Received	Counts the number of good (FCS valid) packets received that passed L2 filtering by a specific MAC address
3	Total Multicast Packets Received	Counts the number of good (FCS valid) multicast packets received
4	Total Broadcast Packets Received	Counts the number of good (FCS valid) broadcast packets received
5	Total Unicast Packets Transmitted	Counts the number of good (FCS valid) packets transmitted that passed L2 filtering by a specific MAC address
6	Total Multicast Packets Transmitted	Counts the number of good (FCS valid) multicast packets transmitted
7	Total Broadcast Packets Transmitted	Counts the number of good (FCS valid) broadcast packets transmitted
8	FCS Receive Errors	Counts the number of receive packets with FCS errors
9	Alignment Errors	Counts the number of receive packets with alignment errors
10	False Carrier Detections	Counts the false carrier errors reported by the PHY
11	Runt Packets Received	Counts the number of received frames that passed address filtering, were less than minimum size (64 bytes from <Destination Address> through <FCS>, inclusively), and had a valid FCS
12	Jabber Packets Received	Counts the number of received frames that passed address filtering, were greater than the maximum size, and had a valid FCS

Counter Number	Name	Meaning
13	Pause XON Frames Received	Counts the number of XON packets received from the network
14	Pause XOFF Frames Received	Counts the number of XOFF packets received from the network
15	Pause XOFF Frames Transmitted	Counts the number of XON packets transmitted to the network
16	Pause XOFF Frames Transmitted	Counts the number of XOFF packets transmitted to the network
17	Single Collision Transmit Frames	Counts the number of times that a successfully transmitted packet encountered a single collision
18	Multiple Collision Transmit Frames	Counts the number of times that a transmitted packet encountered more than one collision but fewer than 16
19	Late Collision Frames	Counts the number of collisions that occurred after one slot time (as defined by IEEE 802.3)
20	Excessive Collision Frames	Counts the number of times that 16 or more collisions occurred on a single transmit packet
21	Control Frames Received	Counts the number of MAC control frames received that are <i>not</i> XON or XOFF flow control frames
22	64-Byte Frames Received	Counts the number of good packets received that are exactly 64 bytes (from <Destination Address> through <FCS>, inclusively) in length
23	65–127 Byte Frames Received	Counts the number of good packets received that are 65–127 bytes (from <Destination Address> through <FCS>, inclusively) in length
24	128–255 Byte Frames Received	Counts the number of good packets received that are 128–255 bytes (from <Destination Address> through <FCS>, inclusively) in length
25	256–511 Byte Frames Received	Counts the number of good packets received that are 256–511 bytes (from <Destination Address> through <FCS>, inclusively) in length
26	512–1023 Byte Frames Received	Counts the number of good packets received that are 512–1023 bytes (from <Destination Address> through <FCS>, inclusively) in length
27	1024–1522 Byte Frames Received	Counts the number of good packets received that are 1024–1522 bytes (from <Destination Address> through <FCS>, inclusively) in length
28	1523–9022 Byte Frames Received	Counts the number of received frames that passed address filtering and were greater than 1523 bytes in length
29	64-Byte Frames Transmitted	Counts the number of good packets transmitted that are exactly 64 bytes (from <Destination Address> through <FCS>, inclusively) in length
30	65–127 Byte Frames Transmitted	Counts the number of good packets transmitted that are 65–127 bytes (from <Destination Address> through <FCS>, inclusively) in length

Counter Number	Name	Meaning
31	128–255 Byte Frames Transmitted	Counts the number of good packets transmitted that are 128–255 bytes (from <Destination Address> through <FCS>, inclusively) in length
32	256–511 Byte Frames Transmitted	Counts the number of good packets transmitted that are 256–511 bytes (from <Destination Address> through <FCS>, inclusively) in length
33	512–1023 Byte Frames Transmitted	Counts the number of good packets transmitted that are 512–1023 bytes (from <Destination Address> through <FCS>, inclusively) in length
34	1024–1522 Byte Frames Transmitted	Counts the number of good packets transmitted that are 1024–1522 bytes (from <Destination Address> through <FCS>, inclusively) in length
35	1523–9022 Byte Frames Transmitted	Counts the number of transmitted frames that passed address filtering and were greater than 1523 in length
36	Valid Bytes Received	Counts the bytes received in all packets that did not manifest any type of error
37	Error Runt Packets Received	Counts the number of invalid frames that were less than the minimum size (64 bytes from <Destination Address> through <FCS>, inclusively)
38	Error Jabber Packets Received	Counts Jabber packets, which are defined as packets that exceed the programmed MTU size <i>and</i> have a bad FCS value

2860 The Network Controller shall also indicate in the Counters Cleared from Last Read fields whether the
 2861 corresponding field has been cleared by means other than NC-SI (possibly by the host) since it was last
 2862 read by means of the NC-SI. Counting shall resume from 0 after a counter has been cleared. The format
 2863 of the Counters Cleared from Last Read field is shown in Table 101.

2864 Currently no command-specific reason code is identified for this response.

2865 **Table 101 – Counters Cleared from Last Read Fields format**

Field	Bits	Mapped to Counter Numbers
MS Bits	0..6	32..38
	7..31	Reserved
LS Bits	0..31	0..31

2866 Implementation Note: The Get Controller Packet Statistics response contains the following counters related to flow
 2867 control: Pause XON Frames Received, Pause XOFF Frames Received, Pause XON Frames
 2868 Transmitted, and Pause XOFF Frames Transmitted. An implementation can optionally include
 2869 Priority-Based Flow Control (PFC) packets in these counters.

2870 **8.4.51 Get NC-SI Statistics command (0x19)**

2871 In addition to the packet statistics accumulated on the LAN network interface, the channel separately
 2872 accumulates a variety of NC-SI specific packet statistics for the channel. The Get NC-SI Statistics
 2873 command may be used by the Management Controller to request that the channel send a copy of all

2874 current NC-SI packet statistic values for the channel. The implementation may or may not include
 2875 statistics for commands that are directed to the package.

2876 Table 102 illustrates the packet format of the Get NC-SI Statistics command.

2877 **Table 102 – Get NC-SI Statistics command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2878 **8.4.52 Get NC-SI Statistics response (0x99)**

2879 In the absence of any error, the channel shall process and respond to the Get NC-SI Statistics command
 2880 by sending the response packet and payload shown in Table 103.

2881 **Table 103 – Get NC-SI Statistics response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	NC-SI Commands Received			
24..27	NC-SI Control Packets Dropped			
28..31	NC-SI Command Type Errors			
32..35	NC-SI Command Checksum Errors			
36..39	NC-SI Receive Packets			
40..43	NC-SI Transmit Packets			
44..47	AENs Sent			
48..51	Checksum			

2882 The Get NC-SI Statistics Response frame contains a set of statistics counters that monitor the NC-SI
 2883 traffic in the Network Controller. Counters that are supported shall be reset to 0x0 when entering the
 2884 Initial State and after being read. Implementation of the counters shown in Table 104 is optional. The
 2885 Network Controller shall return any unsupported counter with a value of 0xFFFFFFFF. Counters may
 2886 wrap around or stop if they reach 0xFFFFFFFFE. It is vendor-specific how NC-SI commands that are sent
 2887 to the package ID are included in the NC-SI statistics.

2888 Currently no command-specific reason code is identified for this response.

2889 **Table 104 – Get NC-SI Statistics counters**

Counter Number	Name	Meaning
1	NC-SI Commands Received	For packets that are not dropped, this field returns the number of NC-SI Control Packets received and identified as NC-SI commands.

Counter Number	Name	Meaning
2	NC-SI Control Packets Dropped	Counts the number of NC-SI Control Packets that were received and dropped (i.e., Packets with correct FCS and EtherType that are dropped for one of the other reasons listed in clause 6.8.2.1). NC-SI Control Packets that were dropped because the channel ID was not valid may not be included in this statistics counter.
3	NC-SI Unsupported Commands Received	Counts the number of NC-SI command packets that were received but are not supported. (Network controller responded to the command with a Command Unsupported response code.)
4	NC-SI Command Checksum Errors	Counts the number of NC-SI Control Packets that were received but dropped because of an invalid checksum (if checksum is provided and checksum validation is supported by the channel).
5	NC-SI Receive Packets	Counts the total number of NC-SI Control Packets received. This count is the sum of NC-SI Commands Received and NC-SI Control Packets Dropped.
6	NC-SI Transmit Packets	Counts the total number of NC-SI Control Packets transmitted to the Management Controller. This count is the sum of NC-SI responses sent and AENs sent.
7	AENs Sent	Counts the total number of AEN packets transmitted to the Management Controller

2890 **8.4.53 Get NC-SI Pass-through Statistics command (0x1A)**

2891 The Get NC-SI Pass-through Statistics command may be used by the Management Controller to request
 2892 that the channel send a copy of all current NC-SI Pass-through packet statistic values.

2893 Table 105 illustrates the packet format of the Get NC-SI Pass-through Statistics command.

2894

Table 105 – Get NC-SI Pass-through Statistics command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2895

8.4.54 Get NC-SI Pass-through Statistics response (0x9A)

2896

In the absence of any error, the channel shall process and respond to the Get NC-SI Pass-through

2897

Statistics command by sending the response packet and payload shown in Table 106.

2898

Table 106 – Get NC-SI Pass-through Statistics response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..27	Pass-through TX Packets Received on NC-SI Interface (Management Controller to Network Controller)			
28..31	Pass-through TX Packets Dropped			
32..35	Pass-through TX Packet Channel State Errors			
36..39	Pass-through TX Packet Undersized Errors			
40..43	Pass-through TX Packet Oversized Errors			
44..47	Pass-through RX Packets Received on LAN Interface			
48..51	Total Pass-through RX Packets Dropped			
52..55	Pass-through RX Packet Channel State Errors			
56..59	Pass-through RX Packet Undersized Errors			
60..63	Pass-through RX Packet Oversized Errors			
64..67	Checksum			

2899

The Get NC-SI Statistics Response frame contains a set of statistics counters that monitor the NC-SI

2900

Pass-through traffic in the Network Controller. Supported counters shall be reset to 0x0 when entering

2901

the Initial State and after being read. Implementation of the counters shown in Table 107 is optional. The

2902

Network Controller shall return any unsupported counter with a value of 0xFFFFFFFF for 32-bit counters

2903

and 0xFFFFFFFFFFFFFFFF for 64-bit counters. Counters may wrap around or stop if they reach

2904

0xFFFFFFFFFE for 32-bit counters and 0xFFFFFFFFFFFFFFFFFE for 64-bit counters.

2905

Table 107 – Get NC-SI Pass-through Statistics counters

Counter Number	Name	Meaning
1	Total Pass-through TX Packets Received (Management Controller to Channel)	Counts the number of Pass-through packets forwarded by the channel to the LAN
2	Total Pass-through TX Packets Dropped (Management Controller to Channel)	Counts the number of Pass-through packets from the Management Controller that were dropped by the Network Controller
3	Pass-through TX Packet Channel State Errors (Management Controller to Channel)	Counts the number of egress management packets (Management Controller to Network Controller) that were dropped because the channel was in the disabled state when the packet was received
4	Pass-through TX Packet Undersized Errors (Management Controller to Channel)	Counts the number of Pass-through packets from the Management Controller that were undersized (under 64 bytes, including FCS)
5	Pass-through TX Packet Oversized Errors (Management Controller to Channel)	Counts the number of Pass-through packets from the Management Controller that were oversized (over 1522 bytes, including FCS)
6	Total Pass-through RX Packets Received on the LAN Interface (LAN to Channel)	Counts the number of Pass-through packets that were received on the LAN interface of the channel. This counter does not necessarily count the number of packets that were transmitted to the Management Controller, because some of the packets might have been dropped due to RX queue overflow.
7	Total Pass-through RX Packets Dropped (LAN to Channel)	Counts the number of Pass-through packets that were received on the LAN interface of the channel but were dropped and not transmitted to the Management Controller
8	Pass-through RX Packet Channel State Errors (LAN to Channel)	Counts the number of ingress management packets (channel to Management Controller) that were dropped because the channel was in the disabled state when the packet was received. The NC may also count packets that were dropped because the package was in the deselected state.
9	Pass-through RX Packet Undersized Errors (LAN to Channel)	Counts the number of Pass-through packets from the LAN that were undersized (under 64 bytes, including FCS)
10	Pass-through RX Packet Oversized Errors (LAN to Channel)	Counts the number of Pass-through packets from the LAN that were oversized (over 1522 bytes, including FCS)

2906 Currently no command-specific reason code is identified for this response.

2907 **8.4.55 Get Package Status command (0x1B)**

2908 The Get Package Status command provides a way for a Management Controller to explicitly query the
 2909 status of a package. The Get Package Status command is addressed to the package rather than to a
 2910 particular channel; in other words, the command is sent with a Channel ID where the Package ID subfield
 2911 matches the ID of the intended package, and the Internal Channel ID subfield is set to 0x1F.

2912 Table 108 illustrates the packet format of the Get Package Status command.

2913

Table 108 – Get Package Status packet format

Bits				
Bytes	31..24	23..16	15..08	07..00

2919

Table 110 – Package Status field bit definitions

Bit Position	Field Description	Value Description
0	Hardware Arbitration Status	0b = Hardware arbitration is non-operational (inactive) or unsupported. NOTE: This means that hardware arbitration tokens are not flowing through this NC. 1b = Hardware arbitration is supported, active, and implemented for the package on the given system.
1	Delayed Response Status	0b = Delayed Response handling is disabled. 1b = Delayed Response handling is enabled.
31..2	Reserved	Reserved

2920 **8.4.57 Get NC Capabilities and Settings command (0x25)**

2921 The Get NC Capabilities and Settings command is sent only as a package command. It is used to
 2922 discover the supported architectural and currently configured (active) parameters of the NC.

2923 Table 111 illustrates the packet format for the Get NC Capabilities and Settings command.

2924

Table 111 – Get NC Capabilities and Settings command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2925

8.4.58 Get NC Capabilities and Settings response (0xA5)

2926

In the absence of any errors, the package shall process and respond to the Get NC Capabilities and Settings Command and send the response packet shown in Table 112.

2927

2928

Currently no command-specific reason code is identified for this response.

2929

Table 112 – Get NC Capabilities and Settings response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code

32..35	Checksum			
36..45	Pad			

2930

8.4.58.1 Max Ports field

2931

The Max Ports field indicates the maximum number of network ports that can be supported by the implementation (uint8).

2932

2933

8.4.58.2 Enabled Ports field

2934

The Enabled Ports field indicates the current number of network ports that are currently configured (uint8).

2935

2936

8.4.58.3 Max PCIe Endpoints field

2937

The Max PCIe Endpoints field indicates the maximum number of PCIe Endpoints that can be supported by the implementation (uint8).

2938

2939

8.4.58.4 Enabled PCIe Endpoints field

2940

The Enabled PCIe Endpoints field indicates the current number of PCIe Endpoints that are currently configured (uint8).

2941

2942 **8.4.58.5 Max PFs field**

2943 The Max PFs field indicates the maximum number of PCIe Physical Functions that can be supported by
2944 the implementation (uint8).

2945 **8.4.58.6 Enabled PFs field**

2946 The Enabled PFs field indicates the current number of PCIe Physical Functions that are currently
2947 configured (uint8).

2948 **8.4.58.7 Max VFs field**

2949 The Max VFs field indicates the maximum number of PCIe Virtual Functions that can be supported by the
2950 implementation (uint8).

2951 **8.4.58.8 Fabrics field**

2952 The Fabrics field indicates the network fabrics that are supported by the implementation.

2953 **Table 113 – Fabrics field bit definitions**

Bit Position	Field Description	Value Description
0	Ethernet	0b = Ethernet Fabric is not supported. 1b = Ethernet Fabric is supported.
1	Fibre Channel	0b = Fibre Channel Fabric is not supported. 1b = Fibre Channel Fabric is supported.
2	InfiniBand	0b = InfiniBand Fabric is not supported. 1b = InfiniBand Fabric is supported.
3..7	Reserved	Reserved

2954 **8.4.58.9 Enabled Fabrics field**

2955 The Enabled Fabrics field indicates the currently configured fabrics.

2956 **Table 114 – Enabled Fabrics field bit definitions**

Bit Position	Field Description	Value Description
0	Ethernet	0b = Ethernet Fabric is not enabled. 1b = Ethernet Fabric is enabled.
1	Fibre Channel	0b = Fibre Channel Fabric is not enabled. 1b = Fibre Channel Fabric is enabled.
2	InfiniBand	0b = InfiniBand Fabric is not enabled. 1b = InfiniBand Fabric is enabled.
3..7	Reserved	Reserved

2957 **8.4.58.10 Other Capabilities field**

2958 The Other Capabilities field indicates which features of this specification the NC supports, as described in
2959 Table 115.

2960

Table 115 – Capabilities Flags bit definitions

Bit Position	Field Description	Value Description
0	VF allocation	0b = The Max VFs field is interpreted as per port. 1b = The Max VFs field is interpreted as per device.
1	Enabled Ports	0b = The number of Enabled Ports is fixed. 1b = The number of Enabled Ports is programmable.
2	Enabled PCIe Endpoints	0b = The number of Enabled PCIe Endpoints is fixed. 1b = The number of Enabled PCIe Endpoints is programmable.
3	Enabled PFs	0b = The number of Enabled PFs is fixed. 1b = The number of Enabled PFs is programmable.
4..8	Max Data Transfer Size Exp	This value advertises the maximum value of data transfer length for the chunked data transfer. This field represents the 2s exponent of the maximum data transfer size. 0x0 = Chunk Data Transfer is not supported. 0x1 = Reserved 0x2 = Max Data Transfer Length supported is 4 (2 ²) bytes. ... 0x8 = Max Data Transfer Length supported is 256 (2 ⁸) bytes. ... 0x17 = Max Data Transfer Length supported is 8M (2 ²³) bytes. ... 0x1F = Max Data Transfer Length supported is 2G (2 ³¹) bytes.
9..15	Reserved	Reserved

2961 **8.4.59 Set NC Configuration command (0x26)**

2962 The Set NC Configuration command allows the Management Controller to configure the number of active
2963 Physical functions and PCIe (host) and network interfaces, where allowed (generally if the reported
2964 maximum value of the respective entity is greater than one). The values (programmed or fixed) are used
2965 in the PF Assignment command, where the associations are made between the physical ports, partitions,
2966 and host buses. If the implementation or controller architecture does not allow any configuration of these
2967 parameters, this command shall not be implemented.

2968 The values configured by this command are held by the NC and take effect only at the next PCIe reset.

2969 The Set NC Configuration command is addressed to the package rather than to a channel; in other
2970 words, the command is sent with a Channel ID where the Package ID subfield matches the ID of the
2971 intended package and the Internal Channel ID subfield is set to 0x1F.

2972 Table 116 illustrates the packet format of the Set NC Configuration command.

2973 **Table 116 – Set NC Configuration command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Enable Ports	Enable PCIe Endpoints	Enable PFs	Reserved
20..23	Checksum			
24..45	Pad			

2974 **8.4.59.1 Enable Ports field**

2975 The Enable Ports field (uint8) indicates the number of network ports to be enabled at the next PCIe reset.

2976 **8.4.59.2 Enable PCIe Endpoints field**

2977 The Enable PCIe Endpoints field (uint8) indicates the number of PCIe Endpoints to be enabled at the next
 2978 PCIe reset. In some implementation architectures, this is not settable by NC-SI; in those cases, this field
 2979 becomes read-only and the value is ignored. PCIe Endpoint 0 shall be used if the Controller is configured
 2980 for single-bus operation.

2981 **8.4.59.3 Enable PFs field**

2982 The Enable PFs field (uint8) indicates the number of PCIe Physical Functions to be enabled at the next
 2983 PCIe reset.

2984 **8.4.60 Set NC Configuration response (0xA6)**

2985 The package shall, in the absence of a checksum error or identifier mismatch, always accept the Set NC
 2986 Configuration command and send a response (see Table 117).

2987 **Table 117 – Set NC Configuration response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

2988 **8.4.61 Get PF Assignment command (0x27)**

2989 The Get PF Assignment command is a Package command that allows the Management Controller to
 2990 receive the list of PCI Physical Functions (partitions) currently assigned to channels in the package, their
 2991 enablement state, and conditionally what PCIe Endpoint they are assigned to if the NC supports multiple
 2992 host interfaces.

2993 See the Set PF Assignment command description for additional information.

2994 Table 118 illustrates the packet format of the Get PF Assignment Command.

2995 **Table 118 – Get PF Assignment Command Packet Format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

2996 **8.4.62 Get PF Assignment Response (0xA7)**

2997 In the absence of any errors, the channel shall process and respond to the Get PF Assignment Command
2998 and send the response packet shown in Table 119.

2999 NOTE: Braces {} denote fields that depend on device capabilities.

3000 **Table 119 – Get PF Assignment Response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Channel 0 Function Assignment bitmap			
24..27	{Channel 1 Function Assignment bitmap}			
...	...			
	{Channel c – 1 Function Assignment bitmap}			
	Function - Port Association			
	Function Enablement bitmap			
	{PCIe Endpoint 0 Function Assignment bitmap}			
	{PCIe Endpoint 1 Function Assignment bitmap}			
	...			
	{PCIe Endpoint b – 1 Function Assignment bitmap}			
	Checksum			
	Pad			

3001 **8.4.62.1 Channel Function Assignment bitmap fields**

3002 The number of Channel Function Assignment bitmaps returned in the response is equal to 'c', the number
3003 returned in the Enabled Ports field of Get NC Capabilities and Settings Response. The Channel Function
3004 Assignment bitmaps are 32-bit fields in which each bit position corresponds to a PCIe physical function in
3005 the NC on the specified channel. If a physical function is assigned to a channel, even if the physical
3006 function is not currently enabled, the value of the corresponding bit in the channel's bitmap shall be set to
3007 1b; otherwise, the value shall be set to 0b.

3008

Table 120 – Channel Function Assignment bitmap field

Bit Position	Field Description	Value Description
0	F0 status	0b = F0 is not assigned to the channel. 1b = F0 is assigned to the channel.
1	F1 status	0b = F1 is not assigned to the channel. 1b = F1 is assigned to the channel.
...
31	F31 status	0b = F31 is not assigned to the channel. 1b = F31 is assigned to the channel.

3009 **8.4.62.2 Function Port Association bitmap field**

3010 The Function Port Association bitmap is a 32-bit field in which each bit position corresponds to a physical
3011 function in the device.

3012

Table 121 – Function Port Association bitmap field

Bit Position	Field Description	Value Description
0	F0 association	0b = F0 is fixed to the specified channel. 1b = F0 may be assigned to any channel.
1	F1 association	0b = F1 is fixed to the specified channel. 1b = F1 may be assigned to any channel.
...
31	F31 association	0b = F31 is fixed to the specified channel. 1b = F31 may be assigned to any channel.

3013 **8.4.62.3 Function Enablement bitmap field**

3014 The Function Assignment bitmap is a 32-bit field in which each bit position corresponds to a physical
3015 function in the NC. The number of functions shown as enabled in this field shall be equal to the value of
3016 the Enabled PFs field in the Get NC Capabilities and Settings command. A function may be assigned to a
3017 PCIe Endpoint and be enabled and not be assigned to a channel in some implementations (i.e., a non-
3018 networking function).

3019

Table 122 – Function Enablement bitmap field

Bit Position	Field Description	Value Description
0	F0 status	0b = F0 is not enabled 1b = F0 is enabled
1	F1 status	0b = F1 is not enabled. 1b = F1 is enabled.
...
31	F31 status	0b = F31 is not enabled. 1b = F31 is enabled

3020 **8.4.62.4 PCIe Endpoint Assignment bitmap field**

3021 The number of PCIe Endpoint Assignment bitmaps returned in the response is equal to 'b', the number
 3022 returned in the Enabled PCIe Endpoints field of Get NC Capabilities and Settings response. The PCIe
 3023 Endpoint b Assignment bitmaps are 32-bit fields in which each bit position corresponds to a physical
 3024 function in the NC on the specified host bus. If the physical function is assigned to an PCIe Endpoint,
 3025 even if the physical function is not currently enabled, the value of the corresponding bit shall be set to 1b;
 3026 otherwise the value shall be set to 0b.

3027

Table 123 – PCIe Endpoint Assignment bitmap field

Bit Position	Field Description	Value Description
0	F0 status	0b = F0 is not assigned on the specified PCIe Endpoint. 1b = F0 is assigned on the specified PCIe Endpoint.
1	F1 status	0b = F1 is not assigned on the specified PCIe Endpoint. 1b = F1 is assigned on the specified PCIe Endpoint.
...
31	F31 status	0b = F31 is not assigned on the specified PCIe Endpoint. 1b = F31 is assigned on the specified PCIe Endpoint

3028 **8.4.62.5 Calculation of Partition ID**

3029 When multiple functions are assigned to a channel, they are addressed by a value called the Partition ID.
 3030 The Partition ID is created by taking the set of Functions that are assigned to a channel and assigning
 3031 each an index value starting with the lowest-numbered Function. A Function assigned to a channel has a
 3032 Partition ID even if it is not enabled. Partition numbering starts at 0. For example, if F2 and F6 are
 3033 assigned to channel 3, but only F2 is enabled, then F2 has Partition ID = 0 and F6 has Partition ID = 1 on
 3034 that channel.

3035 **8.4.63 Set PF Assignment command (0x28)**

3036 The Set PF Assignment command is a Package command that allows the Management Controller to
 3037 enable, disable, and assign PCIe Physical Functions (partitions) in the controller to the channels and, if
 3038 applicable, to different PCI Endpoints in multi-home or multi-host configurations.

3039 The format of the command payload is dependent on the numbers of Physical Functions, Channels, and
 3040 PCIe Endpoints supported by the controller:

- 3041 1) The number of Function Assignments bitmap fields shall be determined by the value (c) of the
 3042 Enabled Ports field of Get NC Capabilities and Settings Response.

3043 2) The number of Physical Functions allowed to be configured in the Function Assignment and
 3044 Enablement bitmap fields shall be determined by the value of the Enabled PFs field in the Get
 3045 NC Capabilities and Settings command response. Assignment in all bitmaps starts at bit 0 and
 3046 continues sequentially for the number of Functions supported. To support various
 3047 implementation architectures, the definition of assignment/enablement rules is beyond the
 3048 scope of this specification.

3049 3) If the value (b) of the Enabled PCIe Endpoints field of the Get NC Capabilities and Settings
 3050 response is greater than 1, the Controller shall also include that number of PCIe Endpoint
 3051 Function Assignment bitmaps in the command. Controllers that do not support multiple PCIe
 3052 interfaces shall not implement PCIe Endpoint Host Function Assignment bitmap fields.

3053 The values configured by this command are held by the controller and only take effect at the next PCIe
 3054 reset. The configuration is persistent unless changed by another Set PF Assignment command or other
 3055 mechanism.

3056 Table 124 illustrates the packet format of the Set PF Assignment Command.

3057 NOTE: Braces {} denote fields that depend on device capabilities.

3058 **Table 124 – Set PF Assignment Command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Channel 0 Function Assignment bitmap			
...	{Channel 1 Function Assignment bitmap}			
	...			
	{Channel c - 1 Function Assignment bitmap}			
	Function Enablement bitmap			
	{PCIe Endpoint 0 Function Assignment bitmap}			
	{PCIe Endpoint 1 Function Assignment bitmap}			
	...			
	{PCIe Endpoint b - 1 Function Assignment bitmap}			
	Checksum			
	Pad			

3059 **8.4.63.1 Channel Function Assignment bitmap field**

3060 The Channel Function Assignment bitmap is a 32-bit field in which each bit position corresponds to a
 3061 physical function in the device. If the physical function is assigned to the channel, even if the physical
 3062 function is not currently enabled, the corresponding bit value shall be set to 1b. This allows for a partition
 3063 ID to be assigned and partition commands to be sent to the function even if it is not enabled.

3064

Table 125 – Channel Function Assignment bitmap field

Bit Position	Field Description	Value Description
0	F0 status	0b = F0 is not assigned on the channel. 1b = F0 is assigned on the channel.
1	F1 status	0b = F1 is not assigned on the channel. 1b = F1 is assigned on the channel.
...
31	F31 status	0b = F31 is not assigned on the channel. 1b = F31 is assigned on the channel.

3065 **8.4.63.2 Function Enablement bitmap field**

3066 The Function Assignment bitmap is a 32-bit field in which each bit position corresponds to a physical
3067 function in the device.

3068

Table 126 – Function Enablement bitmap field

Bit Position	Field Description	Value Description
0	F0 status	0b = F0 is not enabled on the specified channel. 1b = F0 is enabled on the specified channel.
1	F1 status	0b = F1 is not enabled on the specified channel. 1b = F1 is enabled on the specified channel.
...
31	F31 status	0b = F31 is not enabled on the specified channel. 1b = F31 is enabled on the specified channel.

3069 **8.4.63.3 PCIe Endpoint Assignment bitmap field**

3070 The PCIe Endpoint Assignment bitmap is a 32-bit field in which each bit position corresponds to a
3071 physical function in the device.

3072

Table 127 – PCIe Endpoint Assignment bitmap field

Bit Position	Field Description	Value Description
0	F0 status	0b = F0 is not assigned on the specified PCIe Endpoint. 1b = F0 is assigned on the specified PCIe Endpoint.
1	F1 status	0b = F1 is not assigned on the specified PCIe Endpoint. 1b = F1 is assigned on the specified PCIe Endpoint.
...
31	F31 status	0b = F31 is not assigned on the specified PCIe Endpoint. 1b = F31 is assigned on the specified PCIe Endpoint.

3073 **8.4.64 Set PF Assignment Response (0xA8)**

3074 In the absence of any errors, the channel shall process and respond to the Set PF Assignment Command
3075 and send the response packet shown in Table 128.

3076

Table 128 – Set PF Assignment Response packet format

Bits				
Bytes	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

3077 **8.4.65 Get Channel Configuration command (0x29)**

3078 The Get Channel Configuration command is used to discover the currently configured settings of the
 3079 channel, including the fabric type, the implemented media type, the number of enabled partitions (if any)
 3080 and their bandwidth allocation settings where applicable.

3081 Table 129 illustrates the packet format for the Get Channel Configuration command.

3082

Table 129 – Get Channel Configuration command packet format

Bits				
Bytes	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

3083 **8.4.66 Get Channel Configuration response (0xA9)**

3084 In the absence of any errors, the channel shall process and respond to the Get Channel Configuration
 3085 Command and send the response packet shown in Table 130.

3086 Currently no command-specific reason code is identified for this response.

3087

Table 130 – Get Channel Configuration response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Fabric Type	Media Type	Max MTU	
24..27	Reserved			Num Enabled Partitions
28..31	P1 Max TX BW	P1 Min TX BW	P2 Max TX BW	P2 Min TX BW
...	...			
	Checksum			
	Pad			

3088 **8.4.66.1 Fabric Type field**

3089 The Fabric Type field indicates which personality types are currently enabled on the channel, as
3090 described in Table 131.

3091

Table 131 – Fabric Type definitions

Value	Fabric Type	Value Description
1	Ethernet Mode	Ethernet operation is enabled.
2	Fibre Channel Mode	Fibre Channel operation is enabled.
3	InfiniBand Mode	InfiniBand operation is enabled.
All others	Reserved	Reserved

3092 **8.4.66.2 Media Type field**

3093 The Media Type field indicates the physical interface type used on the port implementation and if that port
3094 supports only one or more than one NC-SI channels (for example, some designs may support up to 4
3095 independent ports in a QSFP interface), as described in Table 132.

3096 NOTE: An implementation that implements a SFF cage interface into which a RJ-45 transceiver is plugged shall
3097 return 'SFF cage' as the media type.

3098

Table 132 – Media Type bit definitions

Bit Position	Field Description	Value Description
0	Backplane	0b = The media does not have a backplane interface. 1b = The media has a backplane interface.
1	Base-T (RJ-45 style)	0b = The media does not have a Base-T interface. 1b = The media has a Base-T (RJ-45 style) interface.
2	SFF cage	0b = The media does not have an SFF-style interface. 1b = The media has an SFF-style interface.
3..6	Reserved	Reserved
7	Shared Interface	0b = The media is dedicated to one NC-SI channel. 1b = The media is shared between multiple channels.

3099 8.4.66.3 Max MTU field

3100 The Max MTU field is used to report the maximum allowed MTU size (bytes) when the port is configured
3101 for Ethernet.

3102 8.4.66.4 Num Enabled Partitions

3103 The Num Enabled Partitions field indicates the number of Functions that have been assigned to the
3104 channel/port. This field is used only to provide the number of partitions present in the bandwidth fields. If
3105 the Num Enabled Partitions is an odd number, then the last two bytes before the Checksum field shall be
3106 reserved and set to 0.

3107 8.4.66.5 P(n) Max TX BW Fields

3108 These fields contain the Maximum TX bandwidth allocation of the nth enabled partition expressed in % of
3109 the physical port link speed.

3110 8.4.66.6 P(n) Min TX BW Fields

3111 These fields contain the Minimum TX bandwidth allocation of the nth enabled partition expressed in % of
3112 the physical port link speed.

3113 8.4.67 Set Channel Configuration command (0x2A)

3114 The Set Channel Configuration command allows the Management Controller to configure characteristics
3115 of the channel. The TX Bandwidth fields must be set for each enabled partition, but their values may be
3116 overridden during operation by other configuration methods (which are outside of the scope of this
3117 specification).

3118 Table 133 illustrates the packet format of the Set Channel Configuration command.

3119

Table 133 – Set Channel Configuration command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Fabric Type	Num Partitions	Max MTU	
20..23	P1 Max TX BW	P1 Min TX BW	P2 Max TX BW	P2 Min TX BW
...	...			
	Checksum			
	Pad			

3120 8.4.67.1 Fabric Type field

3121 The Fabric Type field indicates the personality type to be enabled on the channel, as described in Table
 3122 134. The contents of this field may be ignored if the channel supports only one fabric type. The Fabric
 3123 type is a channel property shared by all partitions assigned to the channel.

3124

Table 134 – Fabric Type definitions

Value	Fabric Type	Value Description
1	Ethernet Mode	Enable Ethernet operation
2	Fibre Channel Mode	Enable Fibre Channel operation
3	InfiniBand Mode	Enable InfiniBand operation
All others	Reserved	Reserved

3125 8.4.67.2 Max MTU field

3126 The Max MTU field is used to configure the maximum allowed MTU size (bytes) when the port is
 3127 configured for Ethernet or InfiniBand.

3128 8.4.67.3 Num Partitions

3129 The Num Partitions field indicates the number of Functions that have been assigned to the channel/port in
 3130 the Set PF Assignment command. This field is only used to provide the number of partitions present in
 3131 the bandwidth fields and does not have the ability to change the number of assigned partitions on the
 3132 channel. Each assigned partition must be allocated min and max TX bandwidth values when enabled.

3133 The initial value is generally expected to be one partition enabled per port and, if modified, the new value
 3134 should persist across system boot and power cycles.

3135 If the Num Partitions is an odd number, then the last two bytes before the Checksum field shall be
 3136 reserved and set to 0.

3137 8.4.67.4 P(n) Max TX BW fields

3138 These fields contain the Maximum TX bandwidth allocation of the nth enabled partition expressed in % of
 3139 the physical port link speed. Oversubscription of partition maximum bandwidth is allowed. The field value
 3140 is a decimal integer ranging from 0 to 100.

3141 The initial value is generally expected to be 100% per partition, allowing each enabled partition full use of
 3142 the channel bandwidth if no other partition has traffic. If modified, the new value should persist across
 3143 system boot and power cycles.

3144 **8.4.67.5 P(n) Min TX BW field**

3145 These fields contain the Minimum TX bandwidth allocation of the nth enabled partition expressed in % of
 3146 the physical port link speed. This is interpreted as committed bandwidth to the partition and as such the
 3147 Min TX BW fields of all enabled partitions on the port must sum to 100%. The field value is a decimal
 3148 integer ranging from 0 to 100.

3149 The initial value is generally expected to be equal weighting among all enabled partitions, allowing each
 3150 enabled partition equal use of the channel bandwidth. If modified, the new value should persist across
 3151 system boot and power cycles.

3152 **8.4.68 Set Channel Configuration response (0xAA)**

3153 The package shall, in the absence of a checksum error or identifier mismatch, always accept the Set
 3154 Channel Configuration command and send a response (see Table 135).

3155 **Table 135 – Set Channel Configuration response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

3156 **8.4.69 Get Partition Configuration command (0x2B)**

3157 The Get Partition Configuration command is used to discover additional optional functions supported by
 3158 the channel, such as the number of unicast/multicast addresses supported.

3159 Table 136 illustrates the packet format for the Get Partition Configuration command.

3160 **Table 136 – Get Partition Configuration command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Partition ID	Reserved		
20..23	Checksum			
24..45	Pad			

3161 **8.4.69.1 Partition ID field**

3162 The Partition ID field is the identifier for the function on the channel as defined in clause 8.4.62.5.

3163 **8.4.70 Get Partition Configuration response (0xAB)**

3164 In the absence of any errors, the channel shall process and respond to the Get Partition Configuration
 3165 Command and send the response packet shown in Table 137.

3166 Currently no command-specific reason code is identified for this response.

3167 **Table 137 – Get Partition Configuration response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Personality Configured	Personality Supported	Configuration Flags	
24..27	Max TX BW	Min TX BW	Reserved	
28..31	PCI DID		PCI VID	
32..35	PCI SSID		PCI SVID	
36..39	PCIe Endpoint #	PCIe Bus #	PCIe Device #	PCIe Function #
40..43	Reserved	Address Count	Address TLVs...	
...
	Checksum			

3168 **8.4.70.1 Personality Configured field**

3169 The Personality Configured field indicates which personality type(s) are currently enabled on the partition,
 3170 as described in Table 138.

3171 NOTE: Some implementations may support multiple personalities being simultaneously enabled.

3172

Table 138 – Personality Configured bit definitions

Bit Position	Field Description	Value Description
0	Ethernet Status	0b = Ethernet operation is not enabled. 1b = Ethernet operation is enabled.
1	Fibre Channel Status	0b = Fibre Channel operation is not enabled. 1b = Fibre Channel operation is enabled.
2	Fibre Channel over Ethernet Status	0b = Fibre Channel over Ethernet operation is not enabled. 1b = Fibre Channel over Ethernet operation is enabled.
3	InfiniBand Status	0b = InfiniBand operation is not enabled. 1b = InfiniBand operation is enabled.
4	iSCSI Offload Status	0b = SCSI Offload operation is not enabled. 1b = iSCSI Offload operation is enabled.
5	RDMA Status	0b = RDMA operation is not enabled. 1b = RDMA operation is enabled.
6	NVMe	0b = NVMe operation is not enabled. 1b = NVMe operation is enabled.
7	Reserved	Reserved

3173 **8.4.70.2 Personality Supported field**

3174 The Personality Supported field indicates which personality types the partition supports, as described in
3175 Table 139.

3176

Table 139 – Personality Supported bit definitions

Bit Position	Field Description	Value Description
0	Ethernet Support	0b = Ethernet operation is not supported. 1b = Ethernet operation is supported.
1	Fibre Channel Support	0b = Fibre Channel operation is not supported. 1b = Fibre Channel operation is supported.
2	Fibre Channel over Ethernet Support	0b = Fibre Channel over Ethernet operation isn't supported. 1b = Fibre Channel over Ethernet operation is supported.
3	InfiniBand Support	0b = InfiniBand operation is not supported. 1b = InfiniBand operation is supported.
4	iSCSI Offload Support	0b = SCSI Offload operation is not supported. 1b = iSCSI Offload operation is supported.
5	RDMA Support	0b = RDMA operation is not supported. 1b = RDMA operation is supported.
6	NVMe	0b = NVMe Offload operation is not supported. 1b = NVMe Offload operation is supported.
7	Reserved	Reserved

3177 **8.4.70.3 Configuration Flags field**

3178 The Configuration Flags field indicates which optional features of this specification the channel supports,
3179 as described in Table 140.

3180

Table 140 – Configuration Flags bit definitions

Bit Position	Field Description	Value Description
0	Host Driver Status	0b = When reporting is supported, a Host driver is not present on the partition. 1b = When reporting is supported, a Host driver is present on the partition.
1	Host Driver Status Reporting	0b = Host Driver status reporting is not supported. 1b = Host Driver status reporting (bit 0) is supported.
2..3	Partition Link Status	00b = When reporting is supported, Partition Link is down. 01b = When reporting is supported, Partition Link is forced up. 10b = When reporting is supported, Partition Link follows Channel Link. 11b = Reserved
4	Partition Link Status Reporting	0b = Partition Link Status reporting is not supported. 1b = Partition Link Status reporting (bit 2) is supported.
5	Boot Status	0b = The partition is not configured for boot. 1b = The partition is configured for boot.
6	Bootable	0b = The partition does not support boot. 1b = The partition supports boot and reporting.
7..31	Reserved	Reserved

3181

3182 8.4.70.4 Max TX BW field

3183 This field contains the Maximum TX bandwidth allocation of the partition expressed in % of the physical
3184 port link speed. The % value ranges from 0 to 100 and is represented as a decimal integer.

3185 8.4.70.5 Min TX BW field

3186 This field contains the Minimum TX bandwidth allocation of the partition expressed in % of the physical
3187 port link speed. This is interpreted as committed bandwidth to the partition and as such the Min TX BW
3188 fields of all enabled partitions on the port must sum to 100%. The % value ranges from 0 to 100 and is
3189 represented as a decimal integer.

3190 8.4.70.6 PCI DID

3191 The current PCI Device ID of the Partition.

3192 8.4.70.7 PCI VID

3193 The current PCI Vendor ID of the Partition.

3194 8.4.70.8 PCI SSID

3195 The current PCI Subsystem ID of the Partition.

3196 8.4.70.9 PCI SVID

3197 The current PCI Subvendor ID of the Partition.

3198 8.4.70.10 PCIe Endpoint #

3199 The identifier indicating which PCIe Endpoint on the NC the partition is associated with.

3200 8.4.70.11 PCIe Bus #

3201 The assigned primary PCIe Bus number assigned to the partition in the host system's bus enumeration
3202 process. If PCIe Device number is set to 0xFE, then the PCIe Bus number field shall be ignored.

3203 8.4.70.12 PCIe Device #

3204 The assigned PCIe Device number assigned to the partition, except in the cases of ARI mode operation
3205 when it shall contain the value of 0xFF. If the PCIe Device number is set to 0xFE, then the PCIe Bus #,
3206 PCIe Device #, and PCIe Function # fields shall be ignored and the partition shall be considered a
3207 partition with an unassigned routing ID (Bus, Device, Function number or Bus, Function number).

3208 8.4.70.13 PCIe Function #

3209 The assigned PCIe Function number assigned to the partition in the host system's bus enumeration
3210 process. If the PCIe Device number is set to any value between 0x00 and 0x1f, then the PCIe function
3211 number shall be a value between 0x00 and 0x07. If PCIe Device number is set to 0xFE, then the PCIe
3212 Function number field shall be ignored.

3213 8.4.70.14 Address Count field

3214 This field indicates the number of permanent and virtual addresses reported by the partition.

3215 8.4.70.15 Address TLVs

3216 These TLVs show the permanently programmed and current addresses being used by the partition.

3217

Table 141 – Address Type-Length-Value Field Bit Definitions

Bit Position	Field Description	Value Description
7..0	Address Type	<p>The following type encodings shall be used to indicate the address values that are permanently assigned to the partition. The response shall include all types whether or not that mode of operation is active or the partition is enabled:</p> <p>0x00 = Reserved 0x01 = Ethernet MAC 0x02 = iSCSI Offload (Ethernet MAC) 0x03 = Fibre Channel World Wide Node Name 0x04 = Fibre Channel World Wide Port Name 0x05 = FCoE-FIP MAC 0x06 = InfiniBand Node GUID 0x07 = InfiniBand Port GUID 0x08 = InfiniBand VPort/LID</p> <p>The following type encodings shall be used to indicate all address values that are currently in use by the partition based on configured mode of operation. These may be the permanently assigned address or a programmatically assigned address.</p> <p>:</p> <p>0xF1 = Ethernet MAC 0xF2 = iSCSI Offload (Ethernet MAC) 0xF3 = Fibre Channel World Wide Node Name 0xF4 = Fibre Channel World Wide Port Name 0xF5 = FCoE-FIP MAC 0xF6 = InfiniBand Node GUID 0xF7 = InfiniBand Port GUID 0xF8 = InfiniBand VPort/LID</p> <p>All others = Reserved</p>
15..8	Address Length	The length indicates the number of bytes used in the address
...	Address	Address Length number of bytes of the Address

3218 **8.4.71 Set Partition Configuration command (0x2C)**

3219 The Set Partition Configuration command allows the Management Controller to configure various settings
 3220 of the partition including virtual addresses, VF allocation, and other parameters.

3221 The Set Partition Configuration command is addressed to the channel with the Partition ID field set to the
 3222 index/ordinal of the target PF on the channel.

3223 The partition's personality configuration may be made persistent if written to the NVRAM via the Settings
 3224 Commit command. These settings take effect at the next PCIe Reset.

3225 Table 142 illustrates the packet format of the Set Partition Configuration command.

3226 **Table 142 – Set Partition Configuration command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Partition ID	Personality Configuration	Reserved	
20..23	Partition Link Control	Reserved	Address Count	Address TLV
24..27	Checksum			
28..45	Pad			

3227 **8.4.71.1 Personality Configuration field**

3228 The Personality Configuration field indicates which personality type(s) shall be enabled on the partition,
 3229 as described in Table 143. Any attempt to enable a personality not shown as supported in clause 8.4.70.2
 3230 shall cause the command to fail with Parameter Is Invalid reason code. In some implementations, it may
 3231 be appropriate to select more than one personality at a time, for instance Ethernet and RDMA.

3232 **Table 143 – Personality Configuration bit definitions**

Bit Position	Field Description	Value Description
0	Ethernet Status	0b = Disable Ethernet operation 1b = Enable Ethernet operation
1	Fibre Channel Status	0b = Disable Fibre Channel operation 1b = Enable Fibre Channel operation
2	Fibre Channel over Ethernet Status	0b = Disable Fibre Channel over Ethernet operation 1b = Enable Fibre Channel over Ethernet operation
3	InfiniBand Status	0b = Disable InfiniBand operation 1b = Enable InfiniBand operation
4	iSCSI Offload Status	0b = Disable iSCSI Offload operation 1b = Enable iSCSI Offload operation
5	RDMA Status	0b = Disable RDMA operation 1b = Enable RDMA operation
6	NVMe	0b = Disable NVMe operation 1b = Enable NVMe operation
7	Reserved	Reserved

3233

3234 **8.4.71.2 Partition Link Control**

3235 Table 144 describes the values for the Partition Link Control field.

3236 **Table 144 – Values for the Partition Link Control field (8-bit field)**

Value	Description
0x00	Partition Link is down.
0x01	Partition Link is forced up.
0x02	Partition Link follows Channel link state.
0x03– 0xFF	Reserved

3237 **8.4.71.3 Address Count field**

3238 The Address Count field contains the number of partition virtual addresses to be configured as specified
 3239 in the Address TLV field.

3240 **8.4.71.4 Address TLV**3241 **Table 145 – Address Type-Length field bit definitions**

Bit Position	Field Description	Value Description
7..0	Address Type	<p>The following specified addresses override the permanent or factory-programmed network address to be used by the partition based on configured mode of operation. To return to using the permanent address, supply either an address of 0 or the permanent address in this field or remove power from the NC.</p> <p>:</p> <p>0xF1 = Ethernet MAC 0xF2 = iSCSI Offload (Ethernet MAC) 0xF3 = Fibre Channel World Wide Node Name 0xF4 = Fibre Channel World Wide Port Name 0xF5 = FCoE-FIP MAC 0xF6 = InfiniBand Node GUID 0xF7 = InfiniBand Port GUID 0xF8 = InfiniBand VPort/LID</p> <p>All others = Reserved</p>
15..8	Address Length	The length indicates the number of bytes used in the address

3242 **8.4.72 Set Partition Configuration response (0xAC)**

3243 The package shall, in the absence of a checksum error or identifier mismatch, always accept the Set
 3244 Partition Configuration command and send a response (see Table 146).

3245 **Table 146 – Set Partition Configuration response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

3246 **8.4.73 Get Boot Config Command (0x2D)**

3247 The Get Boot Config Command allows the Management Controller to query for the Boot Initiator settings
 3248 of a given Boot Protocol type configured on the channel/PF/partition and stored in the NVRAM of the
 3249 controller.

3250 If the command is sent to a destination that exists but that does not support the specified Boot Protocol
 3251 type, the command execution shall fail with a reason code indicating a Parameter Is Invalid, Unsupported,
 3252 or Out-of-Range.

3253 Table 147 illustrates the packet format of the Get Boot Config command.

3254 **Table 147 – Get Boot Config command packet**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Partition ID	Reserved	Reserved	Protocol Type
20..23	Checksum			
24..45	Pad			

3255 **8.4.73.1 Protocol Type field**

3256 The Protocol Type field specifies the boot protocol for which configuration data is requested.

3257

Table 148 – Protocol Type field

Bit Position	Field Description	Value Description
7..0	Boot Protocol Type	0x00 = PXE 0x01 = iSCSI 0x02 = FCoE 0x03 = FC 0x04 = NVMeoFC 0x05-0xFF = Reserved

3258 **8.4.74 Get Boot Config Response (0xAD)**

3259 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Get Boot
 3260 Config command and send a response.

3261 The Get Boot Config Response frame contains the currently stored settings for the specified Boot
 3262 Protocol type contained in the controller's NVRAM that the channel/PF/partition will use in a boot
 3263 operation done locally by the adapter. Settings that the Controller supports but has no value for (e.g.,
 3264 settings that have no initial or current value) should be included in the Response and have a length of 0.

3265 All string values specified in this command shall be in the unterminated ASCII string format.

3266 Table 149 illustrates the packet format of the Get Boot Config Response.

3267

Table 149 – Get Boot Config Response packet

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Reserved		Protocol Type	Number of TLVs
24..	Type-Length Field #1		Value Field #1	
...	Type-Length Field #2		Value Field #2	
...	...			
...	Checksum			

3268 **8.4.74.1 Protocol Type field**

3269 The Protocol Type field specifies the boot protocol for which boot attributes are being returned.

3270

Table 150 – Protocol Type field

Bit Position	Field Description	Value Description
7..0	Boot Protocol Type	0x00 = PXE 0x01 = iSCSI 0x02 = FCoE 0x03 = FC 0x04 = NVMeoFC 0x05-0xFE = Reserved 0xFF = Unknown protocol type

3271 **8.4.74.2 Boot Protocol Type-Length-Value fields**

3272 The set of boot attributes (one of the following 4 tables) that correspond to the specified Protocol Type in
 3273 the Command are returned as TLVs in the Response.

3274

3282 8.4.75 Set Boot Config command (0x2E)

3283 The Set Boot Config command allows the Management Controller to send to the channel/PF/partition the
 3284 Boot settings to be used by the channel/PF/partition in conducting boot operations of the specified type.

- 3285 The Network Controller shall apply the attribute values in the order received in this command (e.g., TLV1
- 3286 before TLV2, etc.) so that any dependency relationships are maintained.
- 3287 See the Get Boot Config Command for the definition of the **command** fields.
- 3288 All string values specified in this command shall be in unterminated ASCII string format.
- 3289 A NC that does not support or is not in partitioning mode shall have the Partition ID field programmed as
- 3290 0x00.
- 3291 A TLV length value of 0 indicates the clearing of the current value of the attribute to null or no value.
- 3292 A maximum of 32 TLVs may be sent in any one instance of the Set Boot Config command.
- 3293 If the command is sent to a destination that exists but that does not support the specified Boot Protocol
- 3294 type, the command execution shall fail with a reason code of Parameter Is Invalid, Unsupported, or Out-
- 3295 of-Range.

3296 **Table 156 – Set Boot Config command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Partition ID	Reserved	Protocol Type	Number of TLVs
20..23	Type-Length Field #1		Value Field #1	
...	Type-Length Field #2		Value Field #2	
...	...			
...	Checksum			
...	Pad			

3297 **8.4.76 Set Boot Config Response (0xAE)**

- 3298 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Set Boot
- 3299 Config command and send a response.
- 3300 Only if all the TLVs are accepted without error, then the Command Completed/No Error response/reason
- 3301 code shall be returned with the TLV Error Reporting field set to all 0s (all zeros). If the command is sent to
- 3302 a destination that exists but that does not support the specified Boot Protocol type, the command
- 3303 response shall return the Parameter Is Invalid, Unsupported, or Out-of-Range reason code.
- 3304 If there are errors in any of the TLVs included in the Set command, the entire command is deemed to fail,
- 3305 and no configuration changes shall be made by the controller. The TLV Error Reporting field shall be
- 3306 used to provide individual status reporting on the TLVs received.

3307

Table 157 – Set Boot Config Response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	TLV Error Reporting			
24..27	Checksum			
28..45	Pad			

3308 8.4.76.1 TLV Error Reporting field

3309 The TLV Error Reporting field is a bitmap indicating which TLVs in the incoming Set command were
 3310 processed without error and which were not. The bit order corresponds to the order of TLVs in the
 3311 incoming Set command as shown. There is a 1:1 correspondence between incoming TLVs and the active
 3312 bits in this field. If fewer than 32 TLVs are transmitted, the bits corresponding to the unsent TLVs shall be
 3313 set to 0.

3314

Table 158 – TLV Error Reporting field

Bit Position	Field Description	Value Description
0	TLV #1 status	0b = No error detected in TLV #1 or TLV #1 is not present 1b = Error detected in TLV #1
...
31	TLV #32 status	0b = No error detected in TLV #32 or TLV #32 is not present 1b = Error detected in TLV #32

3315 8.4.77 Get Partition Statistics command (0x2F)

3316 The Get Partition Statistics command is used to retrieve network statistics relevant to the partition from
 3317 the NC. For example, the MC should only request Ethernet statistics from a partition configured for
 3318 Ethernet operation. The defined responses are customized for each personality type.

3319 Implementation of this command is conditional and is required only for NCs that support partitioning.
 3320 Implementation of each response type is conditional based on the NC supporting the specified type of
 3321 operation on the partition.

3322 The NC shall return in the response a value of 0xFFFFFFFF for unsupported 32-bit counters and
 3323 0xFFFFFFFFFFFFFFFF for unsupported 64-bit counters. For implementations that declare a particular
 3324 counter only occupies 32 bits in a defined 64-bit (upper/lower) field, the lower field shall be used to
 3325 provide the count and the upper field shall be set to 0xFFFFFFFF.

3326 As the intent of the command is to retrieve live statistics from enabled partitions, if the command is sent to
 3327 a Partition ID that doesn't exist in the current configuration or if the Stats type does not match the
 3328 configured personality of the partition, the command shall fail with the Parameter is Invalid reason code.

3329

Table 159 – Get Partition Statistics command packet format

Bits				
Bytes	31..24	23..16	15..08	07..00

52..55	Loss of Signal			
56..59	Invalid CRCs			
60..63	Checksum			

3404 **8.4.83.1 Counters Cleared from Last Read field**

3405 The FC Controller shall also indicate in the Counters Cleared from Last Read field whether the
 3406 corresponding fields have been cleared since they were last read via NC-SI. The Counters Cleared from
 3407 Last Read fields shall have the format shown in Table 177.

3408 **Table 177 – Counters Cleared from Last Read field format**

Bit Position	Field Description	Value Description
0	Total FC Frames Received	0b = Not Cleared 1b = Cleared
1	Total FC Frames Transmitted	0b = Not Cleared 1b = Cleared
2	Receive KB Count	0b = Not Cleared 1b = Cleared
3	Transmit KB Count	0b = Not Cleared 1b = Cleared
4	FC Sequences Received	0b = Not Cleared 1b = Cleared
5	FC Sequences Transmitted	0b = Not Cleared 1b = Cleared
6	Link Failures	0b = Not Cleared 1b = Cleared
7	Loss of Signal	0b = Not Cleared 1b = Cleared
8	Invalid CRCs	0b = Not Cleared 1b = Cleared
15..9	Reserved	Reserved

3409 **8.4.83.2 FC Statistics Counter definitions**

3410 **Table 178 – FC Statistics**

Name	Meaning
Total FC Frames Received	Counts the number of FC frames received by the port
Total FC Frames Transmitted	Counts the number of FC frames transmitted by the port
Receive KB Count	Counts the number of kilobytes transmitted by the port
Transmit KB Count	Counts the number of kilobytes transmitted by the port
FC Sequences Received	Counts the number of FC sequences received by the port
FC Sequences Transmitted	Counts the number of FC sequences transmitted by the port
Link Failures	Counts the number of times the link has failed
Loss of Signal	Counts the number of times the signal was lost
Invalid CRCs	Counts the number of CRC errors detected

3411 **8.4.84 Set Module Management Data command (0x30)**

3412 Set Module Management Data command is used to write management data to modules plugged into the
 3413 NC. Set Module Management Data is defined as a channel command (that is, the command is sent with a

3414 valid Package ID and a valid Internal Channel ID) addressed to a particular module plugged into the port
3415 corresponding to the channel.

3416 The writing of management data to the module is implementation dependent.

3417 A two-byte Type identifier is used to specify the bank and page index of the target data to be returned.
3418 The previous SFF-type specifications do not use the term 'bank'; instead they use upper and lower page
3419 terminology.

3420 For this command, the lower page is considered Bank 0 and the upper page Bank 1. Some devices
3421 support only one bank and therefore will only respond with data with the bank index set to 0x00.

3422 Table 179 illustrates the packet format for the Set Module Management Data command.

3423 **Table 179 – Set Module Management Data command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Requested Bank	Requested Page	Offset	Length
20..N-1	Management Data			
N..N+3	Checksum			
...	Pad (if $N \leq 38$)			

3424 **8.4.84.1 Requested Bank field**

3425 The Requested Bank field is the value of the bank where the management data is being requested to be
3426 written. For older-style SFF specifications that do not use "bank", this field shall be set to 0 when the
3427 lower page data is requested and shall be set to 1 when the upper page data is requested.

3428 **8.4.84.2 Requested Page field**

3429 The Requested Page field is the value of the page where the management data is being requested to be
3430 written.

3431 **8.4.84.3 Offset field**

3432 This field shall be set to the offset within the targeted bank of the targeted page where the management
3433 data is written.

3434 **8.4.84.4 Length field**

3435 This field shall be set to the length of the management data included in the payload. The Length shall be
3436 in bytes and a multiple of 4. The length shall be less than or equal to 128.

3437 **8.4.84.5 Management Data field**

3438 The management data that is requested to be written.

3439 **8.4.85 Set Module Management Data response (0xB0)**

3440 In the absence of any errors, the NC shall process and respond to the Set Module Management Data
3441 Command and send the response packet shown in Table 180.

- 3442 Currently no command-specific reason code is identified for this response.
- 3443 If there is no module installed or no module present, then the NC shall return response/reason codes
- 3444 Command Unavailable/Information not available.
- 3445 The NC shall fail this command and return response and reason codes as Command Unsupported and
- 3446 Unknown/Unsupported Command Type respectively for backplane and RJ-45 implementations.
- 3447 If the Requested Bank or Page number does not exist, then the NC should return the Command Failed
- 3448 response code and should return reason code Parameter Is Invalid, Unsupported, or Out-of-Range.
- 3449 If the module is resetting or powering up, then the NC shall return the Command Failed response code
- 3450 and should return reason code Information not available.
- 3451 If the module is powered down, then the NC shall return the Command Failed response code and should
- 3452 return reason code Secondary Device Not Powered.
- 3453 If the location at which the management data is being requested to be written is not writable, then the NC
- 3454 should return the Command Failed response code and should return reason code No Reason Code or
- 3455 Parameter Is Invalid, Unsupported, or Out-of-Range.
- 3456 If the module cannot write the management data in the allocated time, then the NC shall return
- 3457 response/reason code either Command Failed/Command Timeout or Delayed Response/Command
- 3458 Timeout.
- 3459 It is highly recommended that the MC that plans to use this command enables Delayed Response
- 3460 feature.

3461 **Table 180 – Set Module Management Data response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

3462 **8.4.86 Get FC Link Status command (0x31)**

- 3463 The Get FC Link Status command allows the Management Controller to query the channel for potential
- 3464 link status and error conditions (see Table 181).
- 3465 Implementation of this command is conditional and is required only for controllers supporting native Fibre
- 3466 Channel.
- 3467 Implementation Note:
- 3468 Some controllers may include a port trunking (bonding) capability in which one (or more) channels will
- 3469 map to multiple physical ports. FC trunking (bonding) is based on the following rules:
 - 3470 • FC controllers provide a maximum of 4 physical ports.
 - 3471 • All ports are configured to the same speed.
 - 3472 • If trunking is enabled, all ports become involved in a bond; no standalone ports remain.
 - 3473 • Ports may bond in pairs or all together.

- 3474 • Dual port controllers bond Ports 1&2 and present one channel to the MC.
- 3475 • Quad port controllers bond Ports (1&2) [trunk 1] and {3&4} [trunk2] or {1&2&3&4} and present
- 3476 two or one channel(s) respectively.

3477 **Table 181 – Get FC Link Status command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Reserved			
20..23	Checksum			
24..45	Pad			

3478 **8.4.87 Get FC Link Status Response (0xB1)**

3479 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Get FC
 3480 Link Status command and send a response (see Table 182).

3481 **Table 182 – Get FC Link Status Response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Num FC Ports	FC Trunk Status	FC Link Status	Trunk Speeds
24..27	Channel 1 Link Speed	Channel 2 Link Speed	Channel 3 Link Speed	Channel 4 Link Speed
28..31	Checksum			
32..45	Pad			

3482 **8.4.87.1 Num FC Ports field**

3483 This is an integer value that specifies the total number of physical ports on the Package.

3484 **8.4.87.2 FC Trunk Status field**

3485 This field indicates if the physical port is a member of a FC trunk.

3486

Table 183 – FC Trunk Status field bit definitions

Bit Position	Field Description	Value Description
0	Port 1 Trunk Flag	0b = Physical Port 1 is not a member of a trunk. 1b = Physical Port 1 is a member of a trunk.
1	Port 2 Trunk Flag	0b = Physical Port 2 is not a member of a trunk. 1b = Physical Port 2 is a member of a trunk.
2	Port 3 Trunk Flag	0b = Physical Port 3 is not a member of a trunk. 1b = Physical Port 3 is a member of a trunk.
3	Port 4 Trunk Flag	0b = Physical Port 4 is not a member of a trunk. 1b = Physical Port 4 is a member of a trunk.
7..4	Reserved	Reserved

3487 **8.4.87.3 FC Link Status field**

3488 Table 184 describes the FC Link Status field bit definitions.

3489 **Table 184 – FC Link Status field bit definitions**

Bit Position	Field Description	Value Description
0	Port 1 Link Flag	0b = Physical Port 1 Link is down. 1b = Physical Port 1 Link is up.
1	Port 2 Link Flag	0b = Physical Port 2 Link is down. 1b = Physical Port 2 Link is up.
2	Port 3 Link Flag	0b = Physical Port 3 Link is down. 1b = Physical Port 3 Link is up.
3	Port 4 Link Flag	0b = Physical Port 4 Link is down. 1b = Physical Port 4 Link is up.
7..5	Reserved	Reserved

3490 **8.4.87.4 Trunk Speeds field**

3491 The percentage of the configured trunk speed that is currently available, represented as an integer.

3492 Table 185 describes the Trunk Speeds field.

3493 **Table 185 – Trunk Speeds field**

Bit Position	Field Description	Value Description
3..0	Trunk 1 Percentage Speed	Percentage of the Trunk 1 configured link speed that is available, expressed as hex value. Not applicable if no Trunks are configured. 0x0 = 0% 0x1 = 25% 0x2 = 50% 0x3 = 75% 0x4 = 100% 0x5-0xF = Reserved

Bit Position	Field Description	Value Description
7..4	Trunk 2 Percentage Speed	Percentage of the Trunk 2 configured link speed that is available, expressed as hex value. Not applicable if two Trunks are not configured. 0x0 = 0% 0x1 = 25% 0x2 = 50% 0x3 = 75% 0x4 = 100% 0x5-0xF = Reserved

3494 8.4.87.5 Channel Link Speed field

3495 The Channel Link Speed field provides a link speed based on NC-SI Channel configuration. Up to 4
3496 Channel link speed fields are supported. If the number of FC ports is equal to the number of reported NC-
3497 SI channels, then trunking is not active and the reported speed is the speed of the channel on the port. In
3498 two- or four-port trunking modes, the number of FC ports will be twice or four times the number of
3499 reported NC-SI channels and the reported configured link speed is the sum of the individual link speeds in
3500 the trunk. If one or more of the member links goes down the reported link speed will not change, but the
3501 FC Link Status and Trunk Speed fields will provide the indication that the trunk is not operating at its
3502 stated speed.

3503 Table 186 describes the Channel Link Speed field bit definitions.

3504 **Table 186 – Channel Link Speed field**

Bit Position	Field Description	Value Description
3..0	Link Speed	0x0 = No link speed established 0x1 = FC2 0x2 = FC4 0x3 = FC8 0x4 = FC16 0x5 = FC32 0x6 = FC64 0x7 = FC128 0x8 = FC256 0x9-0xF = Reserved
7..4	Reserved	Reserved

3505 8.4.88 Get Module Management Data command (0x32)

3506 The Get Module Management Data command is used to retrieve 128-byte blocks of management and
3507 inventory data stored in the passive copper cable or optical transceiver module associated with the
3508 channel. Different standards and specifications exist (e.g., +SFF and [CMIS](#)) in the industry for this
3509 management data, but they share common data access methods allowing this command to successfully
3510 operate with the known variety of module interface specifications.

3511 A two-byte Type identifier is used to specify the bank and page index of the target data to be returned.
3512 The older SFF-type specifications do not use the term “bank”; instead they use upper and lower page
3513 terminology. For this command, the lower page is considered Bank 0 and the upper page Bank 1. Some
3514 devices support only 1 bank and therefore will only respond with data with the bank index set to 0x00.

3515 The lower 128 bytes of page 0x00 typically contains more important time-critical data. The upper 128
 3516 bytes of page 0x00 contains static inventory information. The implementation may read and cache the
 3517 upper 128 bytes once upon power on or module insertion to expedite processing of requests for page
 3518 0x00 data.

3519 For a given module, the NC shall support reading of all mandatory pages defined by the transceiver's
 3520 Management Data specification. The reading of optional and Vendor-defined pages and any writing of
 3521 pages is implementation dependent.

3522 Table 187 illustrates the packet format for the Get Module Management Data command.

3523 **Table 187 – Get Module Management Data command packet format**

		Bits			
Bytes		31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header				
16..19	Requested Bank	Requested Page	Reserved	Flags	
20..23	Checksum				
24..45	Pad				

3524 **8.4.88.1 Requested Bank field**

3525 The Requested Bank field is the value of the bank data being requested. For older-style SFF
 3526 specifications that do not use “bank”, this field shall be set to 0 when the lower page data is requested
 3527 and shall be set to 1 when the upper page data is requested.

3528 **8.4.88.2 Requested Page field**

3529 The Requested Page field is the value of the page data being requested.

3530 **8.4.88.3 Flags field**

3531 **Table 188 – Flags field bit definitions**

Bit Position	Field Description	Value Description
0	Page Upper Flag	0b = Requesting lower page data 1b = Requesting upper page data
7..1	Reserved	Reserved

3532 **8.4.89 Get Module Management Data response (0xB2)**

3533 In the absence of any errors, the NC shall process and respond to the Get Module Management Data
 3534 Command and send the response packet shown in Table 189.

3535 Currently no command-specific reason code is identified for this response.

3536 If there is no module installed or no module present, then the NC shall return response/reason codes
 3537 Command Unavailable/Information not available.

3538 If the Requested Bank or Page number does not exist, then the NC should return the Command Failed
 3539 response code with the reason code Parameter Out-of-Range.

3540 The NC shall return the Command Failed response code with the following reason codes for the
3541 conditions below:

- 3542 • If the module is resetting or powering up, then the NC shall return reason code Information not
3543 available.
- 3544 • If the module is powered down, then the NC shall return reason code Secondary Device Not
3545 Powered.

3546 If the module cannot respond with data in the allocated time, then the NC shall return either Command
3547 Timeout or Delayed Response as supported by the implementation.

3548 The NC shall fail this command and return response and reason codes as Command Failed and
3549 Information not available, respectively, for backplane and RJ-45 implementations.

3550 **Table 189 – Get Module Management Data response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Max Bank	Max Page	Bank Number	Page Number
24..27	Data 0	Data 1	...	
...	...			
...	Checksum			
...	Pad (if necessary)			

3551 **8.4.89.1 Max Bank field**

3552 The Max Bank field contains the value of the highest Bank number supported for the requested page of
3553 the module. If the module type does not support Banks, the field shall be set to 0x00. If the NC has not
3554 determined or cannot determine the highest Bank number, then the value 0xFF shall be returned.

3555 **8.4.89.2 Max Page field**

3556 The Max Page field contains the value of the highest Page number in the current Bank supported by the
3557 module. If the NC has not determined or cannot determine the highest Page number, then the value 0xFF
3558 shall be returned.

3559 **8.4.89.3 Bank Number field**

3560 The Bank Number field contains the value of the Bank number requested by the command.

3561 **8.4.89.4 Page Number field**

3562 The Page Number field contains the value of the Page number requested by the command.

3563 **8.4.89.5 Module Type Decode**

3564 [SFF-8024](#) provides a mapping of module types, their identifiers reported in codes, and the Management
3565 Interface Specification they comply with.

3566

Table 190 – Module Type definitions

Identifier	Form Factor	Management Interface Specification
0x02	Module soldered to PCB	SFF-8472
0x03	SFP / SFP+ / SFP28 and later	SFF-8472
0x0D	QSFP+	SFF-8436
0x11	QSFP+ / QSFP28 and later	SFF-8636 or CMIS
0x18	QSFP-DD / QSFP-DD800	CMIS
0x1E	QSFP+ or later	CMIS
0x19	OSFP	CMIS
0x1A	SFP-DD	SFP-DD Management Interface Specification
0x1B	DSFP	DSFP
0x17	MicroQSFP	SFF-8436
All other values	Reserved	Reserved

3567 8.4.90 Set Pass-through Mode Control Command (0x33)

3568 The Set Pass-through Mode Control command allows the Management Controller to enable and disable
 3569 specified data paths for Pass-through data on the channel when supported by the NC.

3570 Implementation of this command is conditional depending on the type of device and its feature set. For
 3571 non-Ethernet devices, this command would be implemented only if some type of Pass-through is
 3572 supported. For Ethernet NCs, support of either Host-BMC Pass-through or embedded CPU-BMC Pass-
 3573 through functionality mandates the implementation of this command. Network-BMC Pass-through is
 3574 traditional NC-SI Pass-through (required in NC-SI), whereas Host-BMC Pass-through is defined as a
 3575 network path between the Host and the BMC via the NC-SI interface. Embedded CPU-BMC Pass-
 3576 through is defined as a network path between the BMC and a compute engine or other entity on the
 3577 network adapter. Further definition of these interfaces is beyond the scope of this specification.

3578 The Host-BMC Pass-through, Network-BMC Pass-through, and embedded CPU-BMC Pass-through
 3579 controls specified in this command act as masks in conjunction with the existing Enable Channel and
 3580 Enable Channel TX commands. The existing Pass-through MAC address and filtering control methods
 3581 are simply extended to all defined data paths when configured. No additional filters or MACs are
 3582 provided.

3583 Table 191 illustrates the packet format for the Set Pass-through Mode Control Command.

3584

Table 191 – Set Pass-through Mode Control Command

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Reserved		Pass-through Type	Reserved
20..23	Checksum			
24..45	Pad			

3585 **8.4.90.1 Pass-through Type Field**

3586 The Pass-through Type field indicates which Pass-through data path is to be enabled or disabled as
3587 described in Table 192.

3588

Table 192 – Pass-through Type definitions

Bit	Field Description	Value Description
0	Network-BMC Pass-through traffic	0b = Disallowed 1b = Allowed (default)

3594 **8.4.92 Get Pass-through Mode Command (0x34)**

3595 The Get Pass-through Mode command allows the Management Controller to query the Network Controller
3596 for the current state of the Pass-through data paths supported by the channel. Implementation of this
3597 command is required if the Set Pass-through Mode Control command is implemented.

3598 Table 194 illustrates the packet format for the Get Pass-through Mode Control command.

3599

Table 194 – Get Pass-through Mode Command Packet

3629
3630

The Set VF Allocation command is a Package command that allows the Management Controller to configure the number of PCIe Virtual Functions to be advertised in PCIe Configuration Space by each of the Physical Functions in the NC. The total number of Virtual Functions the NC supports is returned in the Get NC Capabilities and Settings response, and the sum of the VFs configured by this command shall not exceed that total value.

3631
3632
3633

The values configured by this command are held by the controller and only take effect at the next PCIe reset. The configuration is persistent unless changed by another Set VF Allocation command or other mechanism.

3634

Table 201 illustrates the packet format of the Set VF Allocation Command.

3635

Table 201 – Set VF Allocation Command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00

...	...			
	Checksum			
	Pad			

3636 **8.4.96.1 Function Num VFs field**

3637 Field entries contain the number of VFs that each Physical Function is advertising in Configuration Space.

3638

Table 202 – Function Num VFs Fields

Field Name	Field Description
Function 0 Num VFs	Number of VFs to be advertised by Function 0
Function 1 Num VFs	Number of VFs to be advertised by Function 1
...	...
Function N Num VFs	Number of VFs to be advertised by Function N

3639 **8.4.97 Set VF Allocation Response (0xB6)**3640 In the absence of any errors, the channel shall process and respond to the Set VF Allocation Command
3641 and send the response packet shown in Table 203.

3642

Table 203 – Set VF Allocation Response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00

3643 **8.4.98 Get InfiniBand Link Status command (0x38)**3644 The Get InfiniBand Link Status command allows the Management Controller to query the channel for the
3645 IB link status. In addition to the generic Get Link Status command, this command provides IB-specific link
3646 status.

3647 Implementation of this command is conditional and is required only for controllers supporting InfiniBand.

3648 Table 204 illustrates the packet format of the InfiniBand Link Status command.

3649

Table 204 – Get InfiniBand Link Status command

3650 **8.4.99 Get InfiniBand Link Status Response (0xB8)**

3651 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Get
3652 InfiniBand Link Status command and send a response.

3653 The Get InfiniBand Link Status Response frame reports IB link width, logical and physical link states, and
3654 the supported and the configured link speed of the port.

3655 Table 205 illustrates the packet format of the Get InfiniBand Link Status Response.

3656

Table 205 – Get InfiniBand Link Status Response packet

3658

Table 206 – InfiniBand Link Status definitions

Name	Direction	Description
IB Link Active Width	TX	When Link Type is InfiniBand and physical link is up, this field reflects the active link width. Otherwise this field is 0b. Bit 0: 1b = 1X link width Bit 1: 1b = 2X link width Bit 2: 1b = 4X link width Bit 3: 1b = 8X link width Bits 7:4 = Reserved

Name	Direction	Description
IB Link Supported Width	RX	When Link Type is InfiniBand, this field reflects the supported link widths. When Link Type is Ethernet, this field is 0b. Bit 0: 1b = 1X link width is supported Bit 1: 1b = 2X link width is supported Bit 2: 1b = 4X link width is supported Bit 3: 1b = 8X link width is supported Bits 7:4 = Reserved
Link Type	TX	Reflects the configured link type. Bit 0: 0b = Ethernet 1b = InfiniBand Bits 7:1 = Reserved
Phys State	RX	The physical link state as specified in IB spec (PortInfoPortPhysicalState). 0x0 = Used when Link Type is Ethernet 0x1 = Sleep 0x2 = Polling 0x3 = Disabled 0x4 = PortConfigurationTraining 0x5 = LinkUp 0x6 = LinkErrorRecovery 0x7 = PhyTest
Logical Port State	TX	The logical port state of the physical port as specified in IB spec (PortInfo.PortState). 0x0: Used when Link Type is Ethernet 0x1: Down 0x2: Init 0x3: Arm 0x4: Active
IB Link Active Speed	TX	When Link Type is InfiniBand and the physical link is up, this field reflects the active link speed. Otherwise this field is 0x00. Bit 0: 1b = SDR Bit 1: 1b = DDR Bit 2: 1b = QDR Bit 3: 1b = FDR10 Bit 4: 1b = FDR Bit 5: 1b = EDR Bit 6: 1b = HDR Bit 7: 1b = NDR

Name	Direction	Description
IB Link Supported Speed	RX	When Link Type is InfiniBand, this field reflects the supported link speeds. When Link Type is Ethernet, this field is 0x00. Bit 0: 1b = SDR Bit 1: 1b = DDR Bit 2: 1b = QDR Bit 3: 1b = FDR10 Bit 4: 1b = FDR Bit 5: 1b = EDR Bit 6: 1b = HDR Bit 7: 1b = NDR

3659 **8.4.100 Get InfiniBand Statistics command (0x39)**

3660 The Get IB Statistics command allows the Management Controller to query the channel for the IB
 3661 Statistics.

3662 Implementation of this command is conditional and is required only for controllers supporting InfiniBand.

3663 Table 207 illustrates the packet format of the Get IB Statistics Command.

3664 **Table 207 – Get InfiniBand Statistics Command**

Bytes	Bits			
	31..24	23..16	15..08	07..00

3665 **8.4.101 Get InfiniBand Statistics Response (0xB9)**

3666 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Get IB
 3667 Statistics command and send a response.

3668 The Get IB Statistics Response frame reports a set of IB statistics from the channel. A value of
 3669 0xFFFFFFFF shall be used for any unsupported counter.

3670 All counters shall be reset on Controller resets or power cycles only.

3671 Table 208 illustrates the packet format of the Get IB Statistics Response.

3672

Table 208 – Get InfiniBand Statistics Response packet

80..83	Checksum			

3673

Table 209 – InfiniBand Statistics Counter definitions

Name	Direction	Description
PortXmitData	TX	Total number of data octets, divided by 4 (lanes), transmitted on all VLs.
PortRcvData	RX	Total number of data octets, divided by 4 (lanes), received on all VLs.
PortXmitPkts	TX	Total number of packets transmitted on all VLs from this port. This may include packets with errors.
PortRcvPkts	RX	Total number of packets (this may include packets containing Errors).
PortXmitWait	TX	Number of ticks during which the port had data to transmit but no data was sent during the entire tick (either because of insufficient credits or because of lack of arbitration).
PortXmitDiscard	TX	Total number of outbound packets discarded by the port because the port was down or congested.
SymbolErrorCounter	RX	Total number of minor link errors detected on one or more physical lanes.
LinkErrorRecoveryCounter	RX	Total number of times the Port Training state machine has successfully completed the link error recovery process.
LinkDownedCounter	RX	Total number of times the Port Training state machine has failed the link error recovery process and downed the link.
PortRcvErrors	RX	Total number of packets containing an error that were received on the port.
PortRcvRemotePhysicalErrors	RX	Total number of packets marked with the EBP delimiter that were received on the port.
PortRcvSwitchRelayErrors	RX	Total number of packets received on the port that were discarded because they could not be forwarded by the switch relay.
LocalLinkIntegrityErrors	RX	Number of times that the count of local physical errors exceeded the threshold specified by LocalPhyErrors.
ExcessiveBufferOverrun	RX	Number of times that OverrunErrors consecutive flow control update periods occurred, each having at least one overrun error.
VL15Dropped	RX	Number of incoming VL15 packets dropped due to resource limitations (e.g., lack of buffers) of the port.

3674 8.4.102 Settings Commit command (0x47)

3675 The Settings Commit command is a package command used by the Management Controller to indicate
 3676 that those previously programmed settings defined as persistent must now be written to non-volatile
 3677 storage. It also indicates that any previously programmed individual settings that have dependencies on
 3678 other settings (e.g., partition bandwidth) have been fully programmed and can be finalized and/or
 3679 validated. Only those settings in commands that returned successful response/reason codes will be
 3680 written to non-volatile storage.

3681 The MC can only be assured that the settings have been persisted when this commit command has a
 3682 successful completion. It is highly likely that execution of this command will result in a Delayed Response.
 3683 The MC should assume that all the settings that were sent but not committed are lost on losses of power,

3684 various types of resets as defined by the NC, return to initial states of any affected channel, etc. and must
 3685 be resent after the interruption. The MC is ultimately responsible for ensuring that its configuration
 3686 settings have been properly received by the NC, so it is recommended that the MC monitor settings as
 3687 appropriate.

3688 Table 210 illustrates the packet format of the Settings Commit command.

3689 **Table 210 – Settings Commit command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

3690 8.4.103 Settings Commit response (0xC7)

3691 The package shall, in the absence of an error, always accept the Settings Commit command and send
 3692 the response packet shown in Table 211.

3693 Currently no command-specific reason code is identified for this response.

3694 **Table 211 – Settings Commit response packet format**

20..23	Checksum			
24..45	Pad			

3695 8.4.104 Get ASIC Temperature (0x48)

3696 The Get ASIC Temperature command allows the Management Controller to query for temperature values
 3697 from the Controller's on-chip thermal sensor(s).

3698 The Get ASIC Temperature command is defined as a package command. This means the command shall
 3699 be addressed to the package; in other words, the command is sent with the Internal Channel ID set to
 3700 0x1F.

3701 The internal temperature of the controller is returned in the response of this command. If the controller
 3702 has multiple internal temperature sensors, the highest measured temperature with respect to its threshold
 3703 shall be returned.

3704 Table 212 illustrates the packet format of the Get ASIC Temperature Command.

3705

Table 212 – Get ASIC Temperature Command packet

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Reserved			
20..23	Checksum			
24..45	Pad			

3706 **8.4.105 Get ASIC Temperature Response (0xC8)**

3707 The package shall, in the absence of a checksum error or identifier mismatch, always accept the Get
3708 ASIC Temperature Command and send a response.

3709 Table 213 illustrates the packet format of the Get ASIC Temperature Response.

3710

Table 213 – Get ASIC Temperature Response packet

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Maximum temperature		Current temperature	
24..27	Checksum			
28..45	Pad			

3711 **8.4.105.1 Maximum Temperature Value**

3712 This value is the maximum T-Diode temperature limit in degrees Celsius at which the controller can
3713 operate at full load for its rated service lifetime. The value should be derated to take measurement
3714 tolerance into account. The value shall be reported as a signed 16-bit integer.

3715 **8.4.105.2 Current Temperature Value**

3716 This value is the highest current real-time temperature of the ASIC sensors in degrees Celsius. The value
3717 shall be reported as a signed 16-bit integer.

3718 **8.4.106 Get Ambient Temperature (0x49)**

3719 The Get Ambient Temperature command allows the Management Controller to query for temperature
3720 values from ambient temperature sensor(s) attached to the Controller.

3721 The Get Ambient Temperature command is defined as a package command.

3722 Table 214 illustrates the packet format of the Get Ambient Temperature command.

3723

Table 214 – Get Ambient Temperature command packet

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Reserved			
20..23	Checksum			
24..45	Pad			

3724 **8.4.107 Get Ambient Temperature Response (0xC9)**

3725 The Package shall, in the absence of a checksum error or identifier mismatch, always accept the Get
3726 Ambient Temperature Command and send a response.

3727 Table 215 illustrates the packet format of the Get Ambient Temperature Response.

3728

Table 215 – Get Ambient Temperature Response packet

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Temperature3 Value	Temperature2 Value	Temperature1 Value	Number of Sensors
24..27	Checksum			
28..45	Pad			

3729 **8.4.107.1 Temperature1, Temperature2, Temperature3 Values**

3730 Each temperature value (up to 3 values as specified by the Number of Sensors field) is the real-time
3731 ambient temperature reported in degrees Celsius. If Number of Sensors is set to 0, then all three
3732 temperature values are invalid and shall be ignored. If Number of Sensors is set to 1, then Temperature 2
3733 and Temperature 3 are invalid and shall be ignored. If Number of Sensors is set to 2, then Temperature 3
3734 is invalid and shall be ignored. If Number of Sensors is set to 3 or more, then Temperature 1,
3735 Temperature2, and Temperature3 are valid. Each valid temperature value shall be reported as a signed
3736 8-bit integer. It is possible that the ambient temperature value may exceed the bounds of the 8-bit signed
3737 integer. When the value exceeds either the upper or lower bound that can be represented by the signed
3738 8-bit integer, then the value reported shall be the that bound.

3739 **8.4.108 Get Transceiver Temperature (0x4A)**

3740 The Get Transceiver Temperature command allows the Management Controller to query for the real-time
3741 temperature value and thresholds of the (optical) transceiver attached to the channel.

3742 Table 216 illustrates the packet format of the Get Transceiver Temperature Command.

3743

Table 216 – Get Transceiver Temperature Command Packet

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Reserved			
20..23	Checksum			
24..45	Pad			

3744 **8.4.109 Get Transceiver Temperature Response (0xCA)**

3745 The channel shall, in the absence of a checksum error or identifier mismatch, always accept the Get
3746 Transceiver Temperature command and send a response.

3747 The Get Transceiver Temperature Response frame contains the current temperature of the attached
3748 module and the high side temperature thresholds.

3749 Definitions and interpretation of the data fields in the response are defined in the relevant SFF or MSA
3750 specification (e.g., [SFF-8472](#), [SFF-8436](#), [SFF-8636](#), [CMIS 4.0](#), 5.x, etc.) for the transceiver. 16-bit values
3751 are encoded as one contiguous entity with the most significant bit in bit 15 (or 31) and the least significant
3752 bit in bit 0 (or 16) in the response packet. The Controller is not expected to modify the data read from the
3753 transceiver.

3754 In cases where the transceiver supports more than one channel, each channel shall provide a response
3755 when queried.

3756 The reason code Information not available shall be used if the transceiver is not present, does not provide
3757 temperature data, or if the command is issued before the transceiver has not yet achieved power up
3758 state.

3759 Table 217 illustrates the packet format of the Get Transceiver Temperature Response.

3760

Table 217 – Get Transceiver Temperature Response packet

16..19	Response Code		Reason Code	
20..23	Temp High Alarm Threshold		Temp High Warning Threshold	
24..27	Temperature Value		Reserved	
28..31	Checksum			
32..45	Pad			

3761 **8.4.110 Thermal Shutdown Control Command (0x4B)**

3762 The Thermal Shutdown Control command allows the Management Controller to query for the state of (or
3763 alternatively set or reset the enablement state of) the NC's thermal self-shutdown feature. Thermal
3764 shutdown is used for damage avoidance when the NC temperature becomes too high. NCs shall indicate
3765 the implementation state of this feature in the Get Capabilities response (0x96) Capabilities Flag field bit
3766 7 and implement this command/response only when the feature is present.

3767 The Thermal Shutdown Control command is defined as a package command and is sent with the Internal
3768 Channel ID set to 0x1F.

3769 Table 218 illustrates the packet format of the Thermal Shutdown Control Command.

3770 **Table 218 – Thermal Shutdown Control Command packet**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Reserved			Operation
20..23	Checksum			
24..45	Pad			

3771 **8.4.110.1 Operation Field**

3772 The value specified in this field defines the operation required for the NC's shutdown feature. The NC
3773 shall support the query operation. The Enable/Disable operations are optional.

3774 **Table 219 – Operation field definitions**

Value	Description	Value Description
0	Disable	Thermal self-shutdown shall be disabled on the device.
1	Enable	Thermal self-shutdown shall be enabled on the device.
2	Query	The currently configured shutdown setting shall be returned.
All other values	Reserved	Reserved

3775 **8.4.111 Thermal Shutdown Control Response (0xCB)**

3776 The package shall, in the absence of a checksum error or identifier mismatch, always accept the Thermal
3777 Shutdown Control Command and send a response.

3778 The Operating State status provided in the response shall be confirming the state after the execution of
3779 the command. If the Config Control state is set to read-only, any command to enable or disable the
3780 feature shall fail with the Parameter Is Invalid reason code. The other fields shall be included in the
3781 response with their current setting.

3782 Table 220 illustrates the packet format of the Thermal Shutdown Control Response.

3783

Table 220 – Thermal Shutdown Control Response packet

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Reserved		Status	Shutdown Temperature
24..27	Checksum			
28..45	Pad			

3784 **8.4.111.1 Shutdown Temperature Value**

3785 This value is the unsigned integer temperature value in degrees Celsius at which the NC will shut itself
 3786 down when reached.

3787 **8.4.111.2 Status Field**

3788 The value returned in this field is the enablement status of the shutdown feature.

3789

Table 221 – Status definitions

Bit	Description	Value Description
0	Operating State	0b = Thermal self-shutdown is disabled on the device 1b = Thermal self-shutdown is enabled on the device
1	Enable/Disable Support	0b = Enable/Disable operations for thermal shutdown are not supported 1b = Enable/Disable operations for thermal shutdown are supported
All other values	Reserved	Reserved

3790 **8.4.112 Transmit Data to NC command (0x4C)**

3791 The Transmit Data to NC command is a package command that allows the MC to transfer an opaque
 3792 block of data to the NC. The transfer can be initiated by the MC itself or in response to the reception of
 3793 the Request Data Transfer AEN. In the latter case, the Total Length of Transfer and Data Handle fields (if
 3794 provided) should be populated from the AEN fields. If the requested Data Handle is not supported, then
 3795 the Abort opcode shall be used. Blocks of data that exceed the data space available in one NC-SI frame
 3796 will be broken down into multiple transfers that comply with NC-SI RBT frame size. When multiple
 3797 transfers are used:

- 3798 • Transmission ordering shall be maintained.
- 3799 • All chunks shall be an integer multiple of 32 bits (i.e., double-word aligned) except for the last
 3800 chunk which may include padding to make it double-word aligned.
- 3801 • If the NC detects a transfer error it may request a retransmission of the active chunk but no
 3802 other chunks.
- 3803 • Any processing of the block of data will start only after the successful receipt of all transmitted
 3804 chunks.

3805 The MC and the NC both have the ability to abort the transfer at any time during the transfer by use of the
 3806 proper opcode or reason code, respectively. If the NC loses transfer context due to being reset or another

3807 event, or if it detects an out-of-order chunk number being specified in the command, it shall abort the
 3808 transfer. Any data transfer that is aborted is deemed to have failed and cannot be resumed. The MC may
 3809 attempt to repeat the transfer as a new transfer sequence.

3810 One active transfer sequence (transmit or receive) shall be supported at a given time.

3811 Table 222 illustrates the packet format of the Transmit Data to NC command.

3812 **Table 222 – Transmit Data to NC command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Reserved			Opcode
20..23	Offset			
24..27	Data Handle/Chunk Number			
	Chunk or Part of Data			
	Checksum			
	Pad			

3813 8.4.112.1 Opcode field

3814 **Table 223 – Opcode field format**

Value	Description	Value Description
0x1	Initial Chunk	First block of data in the transfer
0x2	Middle Chunk	Intermediate block of data in the transfer
0x4	Final Chunk	Last block of data in the transfer
0x5	Initial and Final Chunk	First and last block of data in the transfer
0x8	Abort Transfer	Terminate the transfer
All other values	Reserved	Reserved

3815 8.4.112.2 Offset

3816 Offset of the current transfer within the larger data block.

3817 8.4.112.3 Data Handle/Chunk number

3818 For the first chunk being transferred (Initial Chunk Opcode), this is an identifier (Data Handle) of the block
 3819 of data being transferred. For subsequent chunk transfers it is a sequentially incrementing count for the
 3820 chunk being transferred (equal to 2 for the second chunk transfer, 3 for the third, etc.).

3821 8.4.113 Transmit Data to NC response (0xCC)

3822 The package shall, in the absence of a checksum error or identifier mismatch, always accept the Transmit
 3823 Data to NC command and send a response.

3824 Table 224 illustrates the packet format of the Transmit Data to NC command response.

3825 There are command-specific reason codes identified for this response (see Table 225).

3826 **Table 224 – Transmit Data to NC response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Checksum			
24..45	Pad			

3827 **Table 225 – Transmit Data to NC command-specific reason codes**

Value	Description	Comment
0x4C01	Abort Transfer	Returned when the NC is terminating the transfer for an unspecified reason
0x4C02	Invalid Data Handle	Specified Data Handle is invalid or not supported.
0x4C03	Sequence count error	The Chunk Number received is not consecutive with the previous number received. Also results in an aborted transfer.
0x4C04	Insufficient Storage	NC cannot process or store data.

3828 **8.4.114 Receive Data from NC command (0x4D)**

3829 The Receive Data from NC command is a package command that allows the MC to receive an opaque
 3830 block of data from the NC. Blocks of data that exceed the data space available in one NC-SI frame will be
 3831 broken down into multiple transfers that comply with the NC-SI RBT frame size. When multiple transfers
 3832 are used:

- 3833 • Reception ordering shall be maintained.
- 3834 • All chunks shall be an integer multiple of 32 bits, (i.e., double-word aligned), except for the last
 3835 chunk which may include padding to make it double-word aligned.
- 3836 • If the MC detects a transfer error, it may request a retransmission of the active chunk but no
 3837 other chunks.
- 3838 • Any processing of the block of data will start only after the successful receipt of all transmitted
 3839 chunks.

3840 The MC and the NC both have the ability to abort the transfer at any time during the transfer by use of the
 3841 proper opcode or reason code, respectively. If the NC loses transfer context due to being reset or another
 3842 event, or if it detects an out-of-order chunk number being specified in the command, it shall abort the
 3843 transfer. Any data transfer that is aborted is deemed to have failed and cannot be resumed. The MC may
 3844 attempt to repeat the transfer as a new transfer sequence.

3845 One active transfer sequence (transmit or receive) shall be supported at a given time.

3846 Table 226 illustrates the packet format of the Receive Data from NC command.

3847 **Table 226 – Receive Data from NC command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Reserved			Opcode
20..23	Offset			
24..27	Data Handle/Chunk Number			
28..31	Checksum			
32..45	Pad			

3848 **8.4.114.1 Opcode field**3849 **Table 227 – Opcode field format**

Value	Description	Value Description
0	Initial Chunk	Request for the first chunk of the transfer to be returned
1	Reserved	Reserved
2	Next Chunk	Request for the next chunk of the transfer to be returned
3	Abort Transfer	Termination of transfer by MC
All other values	Reserved	Reserved

3850 **8.4.114.2 Offset field**

3851 Offset of the current transfer within the larger data block. For a given data transfer, the value of this field
3852 shall be the same for all NC-SI commands of the data transfer.

3853 **8.4.114.3 Data Handle/Chunk number field**

3854 For the first chunk being requested (Initial Chunk Opcode), this is an identifier (Data Handle) of the block
3855 of data being requested. For subsequent chunk transfers it is a sequentially incrementing count for the
3856 chunk being transferred (equal to 2 for the second chunk transfer, 3 for the third, etc.).

3857 **Table 228 – Data Handle Values**

Value	Description	Comment
0x00000000-0xFFFFFFFF	Vendor Defined	Implementation specific
0xFFFF0000	Core dump	Data Handle used to retrieve core dump
0xFFFF0001	Crash dump	Data Handle used to retrieve crash dump
0xFFFF0002-0xFFFFFFFF	DMTF Reserved	Reserved for future use by DMTF

3858

3859 **8.4.115 Receive Data from NC response (0xCD)**

3860 The package shall, in the absence of a checksum error or identifier mismatch, always accept the Receive
3861 Data from NC command and send a response.

3862 Table 229 illustrates the packet format of the Receive Data from NC command response.

3863 **Table 229 – Receive Data from NC response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Reserved			Opcode
	Data			
	Checksum			
	Pad (if needed)			

3864 **8.4.115.1 Opcode field**

3865 **Table 230 – Opcode field format**

Value	Description	Value Description
0x1	Initial Chunk	First block of data in the transfer
0x2	Middle Chunk	Intermediate block of data in the transfer
0x4	Final Chunk	Last block of data in the transfer
0x5	Initial and Final Chunk	First and last block of data in the transfer
0x8	Abort Transfer	Terminate the transfer
All other values	Reserved	Reserved

3866

3867

Table 231 – Receive Data from NC command-specific reason codes

Value	Description	Comment
0x4D01	Abort Transfer	NC cannot proceed with transfer.
0x4D02	Invalid Handle Value	Data Handle is invalid or not supported.
0x4D03	Sequence count error	Chunk Number requested is not consecutive with the previous number transmitted.

3868 **8.4.116 Get Inventory Information command (0x4E)**

3869 The Get Inventory Information command may be used by the Management Controller to query the
3870 Network Controller for defined inventory information about the NC.

3871 This command is defined as a package command.

3872 Table 232 illustrates the packet format of the Inventory Information command.

3873

Table 232 – Get Inventory Information command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

3874 **8.4.117 Get Inventory Information response (0xCE)**

3875 The package shall, in the absence of an error, always accept the Get Inventory Information command and
3876 send the response packet shown in Table 233. The value fields are defined as unterminated ASCII
3877 strings except for the Manufacturing Timestamp, which is timestamp104 as defined in [DSP0240](#).

3878 Currently no command-specific reason code is identified for this response.

3879

Table 233 – Get Inventory Information response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..35	Number of TLVs	Type-Length Field #1		Value Field #1
	...			
	Checksum			
	Pad			

3880 **8.4.117.1 Inventory Information Type-Length-Value fields**

3881 The Type definitions for the inventory elements are defined in Table 234.

3882

Table 234 – Inventory Information Type-Length field

Bit Position	Field Description	Value Description
7..0	Attribute Name/Type	0x00 = Manufacturer 0x01 = Product / Model 0x02 = Version 0x03 = Part Number 0x04 = Serial Number 0x05 = Manufacturing timestamp104 0x06-0x7F = Reserved 0x80-0xAF = Reserved for Manufacturer Use 0xB0-0xFF = Reserved for OEM use
15..8	Length	Length in bytes of the field

3883 **8.4.118 OEM command (0x50)**

3884 The OEM command may be used by the Management Controller to request that the channel provide
 3885 vendor-specific information. The [Vendor Enterprise Number](#) is the unique MIB/SNMP Private Enterprise
 3886 number assigned by IANA per organization. Vendors are free to define their own internal data structures
 3887 in the vendor data fields.

3888 Table 235 illustrates the packet format of the OEM command.

3889 **Table 235 – OEM command packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Manufacturer ID (IANA)			
20..	Vendor Data			
	NOTE: The optional checksum is unspecified for the OEM command. OEMs supporting checksum validation for NC-SI commands may include the checksum in the OEM specific payload for the command and response.			

3890 8.4.119 OEM response (0xD0)

3891 The channel shall return the “Unknown Command Type” reason code for any unrecognized enterprise
3892 number, using the packet format shown in Table 236. If the command is valid, the response, if any, is
3893 allowed to be vendor specific. The 0x8000 range is recommended for vendor-specific code.

3894 Table 236 illustrates the packet format of the OEM command response.

3895 **Table 236 – OEM response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Manufacturer ID (IANA)			
24..	Return Data (Optional)			

3896 8.4.120 PLDM Request (0x51)

3897 The PLDM Request Packet may be used by the Management Controller to send PLDM commands over
3898 NC-SI/RBT. This command may be targeted at the entire package or a specific channel. It is expected
3899 that the MC will use PLDM Request command 0x51 to query the supported PLDM commands, before
3900 using Query Pending NC PLDM Request command.

3901 Table 237 illustrates the packet format of the PLDM Request Packet over NC-SI/RBT.

3902 **Table 237 – PLDM Request packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	PLDM Message Common Fields			
20..	PLDM Message Payload (zero or more bytes) + Payload Pad			
...	Checksum			
...	Pad			

3903 Refer to the PLDM Base specification ([DSP0240](#)) for details on the PLDM messaging control and
 3904 discovery commands.

3905 **8.4.121 PLDM Response (0xD1)**

3906 The PLDM Response Packet may be used by the Network Controller to send PLDM responses over NC-
 3907 SI/RBT. The package shall, in the absence of a checksum error or identifier mismatch, always accept the
 3908 PLDM Request Command and send a response.

3909 Table 238 illustrates the packet format of the PLDM command response.

3910 **Table 238 – PLDM Response packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	PLDM Message Common Fields			PLDM Completion Code
24..	PLDM Message Payload (zero or more bytes) + Payload Pad			
..	Checksum			
..	Ethernet Packet Pad			

3911 Refer to the PLDM Base specification ([DSP0240](#)) for details on the PLDM Response Messages.

3912 Note that the NC-SI PLDM Response (0xD1) response/reason codes are only used to report the support,
 3913 success, or failure of the PLDM Request command (0x51) at the NC-SI over RBT messaging layer. The
 3914 PLDM Completion Code is used for determining the success or failure of the encapsulated PLDM
 3915 Commands at the PLDM messaging layer.

3916 **8.4.122 Get Package UUID command (0x52)**

3917 The Get Package UUID command may be used by the Management Controller to query the Universally
 3918 Unique Identifier (UUID), also referred to as a globally unique ID (GUID), of the Network Controller over
 3919 NC-SI/RBT. This command is targeted at the package. This command can be used by the MC to
 3920 correlate endpoints used on different NC-SI transports (e.g., RBT, MCTP).

3921 Table 239 illustrates the packet format of the Get Package UUID Command over NC-SI/RBT.

3922

Table 239 – Get Package UUID command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

3923

8.4.123 Get Package UUID response (0xD2)

3924

The package shall, in the absence of an error, always accept the Get Package UUID command and send the response packet shown in Table 240. Currently no command-specific reason code is identified for this response.

3925

3926

3927

Table 240 – Get Package UUID response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..35	UUID bytes 1:16, respectively			
36..39	Checksum			
40..45	Pad			

3928

The individual fields within the UUID are stored most-significant byte (MSB) first per the convention described in [RFC4122](#). RFC4122 specifies four different versions of UUID formats and generation algorithms suitable for use as a UUID. These are version 1 (0001b) “time based”, and three “name-based” versions: version 3 (0011b) “MD5 hash”, version 4 (0100b) “Pseudo-random”, and version 5 “SHA1 hash”. The version 1 format is recommended, however the versions 3, 4, or 5 formats are also allowed to be used. See Table 241 for UUID format version 1.

3929

3930

3931

3932

3933

	12	
	13	
	14	
	15	
	16	

3935 **8.4.124 Query and Set OEM AEN command (0x53)**

3936 The command Query and Set OEM AEN is used by the Management Controller when sets of different
 3937 OEM AENs, identified by the OEM’s IANA value, are simultaneously supported by a NC. It allows the MC
 3938 to query the channel or package for the active OEM AEN set as well as the other OEM AEN sets that are
 3939 supported. The MC can then configure a particular IANA as the active one for subsequent issues of the
 3940 AEN Enable command.

3941 Implementation of this command is optional for those NCs that support only one set of OEM AENs.

3942 Implementation of this command is required when the NC has implemented multiple sets of OEM AENs
 3943 and allows the MC to select a set that is different than the default.

3944 The NC may allow AENs from multiple sets to be simultaneously enabled through successive uses of this
 3945 command and AEN Enable.

3946 The NC shall interpret a null IANA in the received command as a request for the list of OEM AEN sets
 3947 and shall not change the active set.

3948 The Query and Set OEM AEN command is defined as both a channel or a package command.

3949 Table 242 illustrates the packet format of Query and Set OEM AEN command.

3950 **Table 242 – Query and Set OEM AEN command packet**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	IANA Field			
20..23	Checksum			
24..45	Pad			

3951 **8.4.125 Query and Set OEM AEN Response (0xD3)**

3952 The Channel shall, in the absence of a checksum error or identifier mismatch, always accept the Query
 3953 and Set OEM AEN Command and send a response.

3954 For each supported OEM IANA, #1 through #n, three fields are required: the identifying IANA field, and
 3955 the 16-bit Enabled AENs and Supported AENs fields that correspond 1:1 to bits 31..16 in the AEN Control
 3956 Field of the AEN Enable command.

3957 Table 243 illustrates the packet format of the Query and Set OEM AEN Response.

3958

Table 243 – Query and Set OEM AEN Response packet

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Reserved			# of IANAs
24..27	Configured IANA			
28..31	IANA # 1			
32..35	IANA # 1 Enabled AENs		IANA # 1 Supported AENs	
	IANA # 2			
	...			
	Checksum			
	Pad			

3959 **8.4.125.1 # of IANAs field**

3960 An integer value representing the number of OEM AEN sets supported by the NC.

3961 **8.4.125.2 Configured IANA field**

3962 The IANA representing the currently enabled OEM AEN set for configuration by subsequent Enable OEM
 3963 AEN commands. If a valid IANA was sent in the command, the response shall confirm the change to that
 3964 IANA set. If the sent IANA was not valid, the previously configured IANA set shall remain active.

3965 **8.4.125.3 IANA #n field**3966 The identifier for the nth OEM AEN set supported by the NC.3967 **8.4.125.4 IANA #n Enabled AENs field**

3968 A bitmap showing the currently enabled AENs from the IANA #n's set of supported AENs.

3969 **8.4.125.5 IANA #n Supported AENs field**

3970 A bitmap showing the supported OEM AENs in the IANA #n's AEN set.

3971 **8.4.126 Transport-specific AEN Enable command (0x55)**

3972 Network Controller implementations shall support this command on the condition that the Network
 3973 Controller generates one or more RBT-specific AENs defined in this specification or other NC-SI bindings
 3974 such as [DSP0261](#). The AEN Enable command enables and disables the different transport-specific AENs
 3975 supported by the Network Controller. The Network Controller shall copy the AEN MC ID field from the
 3976 AEN Enable command into the MC ID field in every subsequent AEN sent to the Management Controller
 3977 as defined in AEN Enable command.

3978 This command is defined as a package command.

3979 Table 244 illustrates the packet format of the Enable Transport-specific AENs command.

3980

Table 244 – Transport-specific AEN Enable command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Reserved		Transport-specific AENs enable	
20..23	Checksum			
24..45	Pad			

3981

Table 245 – Transport-specific AEN enable field format

Bit Position	Field Name	Value Description
0	Medium Change AEN Control (0x70)	0b = Disable Medium Change AEN 1b = Enable Medium Change AEN Relevant only for NC-SI/MCTP
1	Pending PLDM Request AEN (0x71)	0b = Disable Pending PLDM Request AEN 1b = Enable Pending PLDM Request AEN Relevant only for PLDM over NC-SI control over RBT
2	Pending SPDM Request AEN (0x72)	0b = Disable Pending SPDM Request AEN 1b = Enable Pending SPDM Request AEN Relevant only for SPDM over NC-SI control over RBT
3..15	Reserved	Reserved

3982

8.4.127 Transport-specific AENs Enable Response (0xD5)

3983

In the absence of any error, the package shall process and respond to the Transport-specific AEN Enable command by sending the response packet and payload shown in Table 246.

3984

3985

Table 246 – Transport-specific AEN Enable Response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00

16..19	Checksum			
...	Pad			

3986

8.4.128 Query Pending NC PLDM Request (0x56)

3987

The Query Pending NC PLDM Request may be used by the Management Controller to read the status of pending PLDM commands which the NC needs to send to the MC. Only one PLDM request can be handled by a Pending PLDM Request instance. When multiple requests are pending in the NC, each will be handled independently and the order at which requests are provided to the MC is decided by the NC.

3988

3989

3990

3991

Implementations using PLDM over RBT, where the NC has to send PLDM commands to the MC, shall support this command. This command is defined as a package command.

3992

3993

Table 247 illustrates the packet format of the Query Pending NC PLDM Request command.

3994

Table 247 – Query Pending NC PLDM Request packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header

0	Pending Request	0b = No additional pending PLDM command from NC to MC. 1b = The NC has an additional pending PLDM command to the MC.
7..1	Reserved	Reserved

4016 **8.4.132 Get MC MAC Address command (0x58)**

4017 A network controller may provision MAC addresses for Out-Of-Band (OOB) management traffic. These
 4018 MAC addresses are not visible to the host(s). Get MC MAC Address is used to discover MAC addresses
 4019 provisioned on the network controller for the MC. Get MC MAC Address is a channel-specific command.
 4020 For multiport devices, it is expected that the MC queries provisioned MC MAC Addresses on each
 4021 channel individually.

4022 Table 253 illustrates the packet format of the Get MC Address Command.

4023

Table 253 – Get MC MAC Address command packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

4024 **8.4.133 Get MC MAC Address response (0xD8)**

4025 In the response of Get MC MAC Address command, the network controller provides information about the
 4026 provisioned MAC address(es) for the MC on that channel. The NC shall, in the absence of an error,
 4027 always accept the Get MC MAC Address command and send the response packet shown in Table 254.
 4028 Currently no command-specific reason code is identified for this response.

4029

Table 254 – Get MC MAC Address response packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Response Code		Reason Code	
20..23	Address Count	Reserved		
...	Addr 1 Byte 5	Addr 1 Byte 4	Addr 1 Byte 3	Addr 1 Byte 2
	Addr 1 Byte 1	Addr 1 Byte 0	Addr 2 Byte 5	Addr 2 Byte 4
	...			Pad (if needed)

4030 **8.4.133.1 Address Count**

4031 This field shall be set to the number of MC MAC addresses provisioned on the channel.

4032 **8.4.133.2 Reserved**

4033 This field shall be set to 0 by the network controller and shall be ignored by the management controller.

4034 **8.4.133.3 Addr i Byte j**

4035 This field shall be set to the value of the j^{th} byte ($1 \leq j \leq 6$) of the i^{th} provisioned MC MAC address.

4036 **8.4.133.4 Pad**

4037 If the number of MC MAC addresses is an odd number, then 2 bytes of the Pad field shall be present at
 4038 the end of the payload to align the payload on a 32-bit boundary. If the Pad field is present, each of its
 4039 bytes shall be set to 0×00 .

4040 If the number of MC MAC addresses is an even number, then no Pad shall be used.

4041 **8.4.134 SPDM command (0x60)**

4042 The SPDM command is used by the Management Controller in RBT implementations to encapsulate and
 4043 send an SPDM payload as defined in [DSP0274](#) to the NC or alternately receive an encapsulated SPDM
 4044 payload from the NC.

4045 The SPDM payload must be smaller than the maximum NC-SI payload allowed over RBT. Payloads that
 4046 exceed the RBT limits shall use SPDM's native multi-part transfer mechanism. Polling mode shall be used
 4047 to transfer each part of a multi-part transfer from the NC.

4048 The command response may be a long-running command due to the nature of some SPDM tasks.

4049 The SPDM command is defined as a package command.

4050 This command and response are not supported on NC-SI over MCTP.

4051 Table 255 illustrates the packet format of the SPDM command.

4052 **Table 255 – SPDM command packet**

Bytes	Bits			
	31..24	23..16	15..08	07..00

24..	SPDM Response Payload			
	Checksum			
	Pad			

4058 **8.4.136 Query Pending NC SPDM Request (0x61)**

4059 The Query Pending NC SPDM Request may be used by the Management Controller in RBT
 4060 implementations to read the status of pending SPDM requests that the NC needs to send to the MC. Only
 4061 one SPDM request can be handled by a Pending SPDM Request instance. When multiple requests are
 4062 pending in the NC, each will be handled independently, and the order at which requests are provided to
 4063 the MC is decided by the NC.

4064 The Query Pending NC SPDM command is defined as a package command.

4065 This command and response are not supported on NC-SI over MCTP.

4066 Table 257 illustrates the packet format of the Query Pending NC SPDM Request command.

4067

Table 257 – Query Pending NC SPDM Request packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	NC-SI Control Packet Header			
16..19	Checksum			
20..45	Pad			

4068 **8.4.137 Query Pending NC SPDM Request Response (0xE1)**

4069 In the event there are no pending requests, the command shall execute successfully and return with no
 4070 SPDM payload. Currently no command-specific reason code is identified for this response (see Table
 4071 248).

4072 Table 258 illustrates the packet format of the Query Pending NC SPDM Request Response.

4073

Table 258 – Query Pending NC SPDM Request Response Packet Format

4076 8.4.138 Send NC SPDM Reply (0x62)

4077 The Reply Pending SPDM command may be used by the Management Controller to provide the SPDM
 4078 command response to previously read SPDM commands from the NC. The response to this command
 4079 provides further indication to the MC regarding additional pending SPDM NC commands. This command
 4080 is defined as a package command.

4081 Table 260 illustrates the packet format of the Send NC SPDM Reply command.

4082

4089 8.5 AEN packet formats

4090 This clause defines the formats for the different types of AEN packets. For a list of the AEN types, see
4091 Table 18.

4092 8.5.1 Link Status Change AEN

4093 The Link Status Change AEN indicates to the Management Controller any changes in the channel's
4094 external Ethernet interface link status.

4095 This AEN should be sent if any change occurred in the link status (that is, the actual link mode was
4096 changed). The Link Status and OEM Link Status fields reproduce the bit definitions defined in the Get
4097 Link Status Response Packet (see Table 51).

4098 Table 263 illustrates the packet format of the Link Status Change AEN.

4099 **Table 263 – Link Status Change AEN packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	AEN Header			
16..19	Reserved			AEN Type = 0x00
20..23	Link Status			
24..27	OEM Link Status			
28..31	Checksum			

4100 **8.5.2 Configuration Required AEN**

4101 The Configuration Required AEN indicates to the Management Controller that the channel is transitioning
 4102 into the Initial State. (This AEN is not sent if the channel enters the Initial State because of a Reset
 4103 Channel command.)

4104 NOTE: This AEN may not be generated in some situations in which the channel goes into the Initial State. For
 4105 example, some types of hardware resets may not accommodate generating the AEN.

4106 Table 264 illustrates the packet format of the Configuration Required AEN.

4107 **Table 264 – Configuration Required AEN packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	AEN Header			
16..19	Reserved			AEN Type = 0x01
20..23	Checksum			

4108 **8.5.3 Host Network Controller Driver Status Change AEN**

4109 This AEN indicates a change of the Host Network Controller Driver Status. Table 265 illustrates the
 4110 packet format of the AEN.

4111 **Table 265 – Host Network Controller Driver Status Change AEN packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	AEN Header			
16..19	Reserved			AEN Type = 0x02
20..23	Host Network Controller Driver Status			
24..27	Checksum			

4112 The Host Network Controller Driver Status field has the format shown in Table 266.

4113 **Table 266 – Host Network Controller Driver Status format**

Bit Position	Name	Description
0	Host Network Controller Driver Status	0b = The Network Controller driver for the host external network interface associated with this channel is not operational (not running). 1b = The Network Controller driver for the host external network interface associated with this channel is being reported as operational (running).
1..31	Reserved	Reserved

4114 **8.5.4 Delayed Response Ready AEN**

4115 This AEN indicates that the response to a delayed command is ready. Table 267 illustrates the packet
4116 format of the AEN.

4117 NOTE: This AEN does not deliver the delayed command response; it must be retrieved separately.

4118 **Table 267 – Delayed Response Ready AEN packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	AEN Header			
16..19	Reserved			AEN Type = 0x03
20..23	Original Command Type	Original Command IID	Padding	
24..27	Checksum			

4119 The Original Command Type includes the Control Packet Type field of the completed command, and the
4120 Original Command IID includes the IID field of the original command.

4121 **8.5.5 InfiniBand Link Status Change AEN**

4122 The InfiniBand Link Status Change AEN indicates to the Management Controller any changes in the
4123 channel's external InfiniBand interface link status.

4124 This AEN should be sent if any change occurred in the IB link status (that is, the actual link mode was
4125 changed). The InfiniBand Link Status Change AEN specific fields reproduce the bit definitions defined in
4126 the Get IB Link Status Response Packet (see Table 206).

4127 Table 273 illustrates the packet format of the InfiniBand Link Status Change AEN.

4128 **Table 268 – InfiniBand Link Status Change AEN packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	AEN Header

24..27	Reserved	IB Link Active Speed	Reserved	IB Link Supported Speed
28..31	Checksum			

4129 **8.5.6 Fibre Channel Link Status Change AEN**

4130 The Fibre Channel Link Status Change AEN indicates to the Management Controller any changes in the
4131 channel's external Fibre Channel interface link status including when trunked.

4132 This AEN should be sent if any change occurred in the FC link status (that is, the actual link mode was
4133 changed). The Fibre Channel Link Status Change AEN specific fields reproduce the bit definitions defined
4134 in the Get FC Link Status Response Packet (see Table 182).

4135 Table 280 illustrates the packet format of the FC Link Status Change AEN.

4136 **Table 269 – Fibre Channel Link Status Change AEN packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	AEN Header			
16..19	Reserved			AEN Type = 0x05
20..23	Num FC Ports	FC Trunk Status	FC Link Status	Trunk Speeds
24..27	Channel 1 Link Speed	Channel 2 Link Speed	Channel 3 Link Speed	Channel 4 Link Speed
28..31	Checksum			

4137 **8.5.7 Transceiver Event AEN**

4138 This indicates to the Management Controller that a change in presence status or a thermal threshold in
4139 the SFF-compliant Transceiver attached to the channel has occurred.

4140 Since some SFF cages have multiple TX and RX lanes, it is possible that multiple NC-SI channels are
4141 handled by a single transceiver module or copper cable assembly. In this case, subscribing to
4142 Transceiver Event AEN on one channel enables reporting of AENs for all such channels that are enabled
4143 for AENs. The NC shall send the Transceiver Event AEN on all affected channels that are enabled for
4144 AENs if one or more alerts are triggered.

4145 In the case of FC port trunking (bonding), the 1:1 relationship of NC-SI channel to transceiver is lost and
4146 multiple transceivers will handle the aggregated traffic. When operating in the trunking mode, an
4147 enablement of this AEN on one channel will cover all transceivers that are members of the trunk. In this
4148 case, AENs can be generated individually for each member in the trunk by using the SFF Cage number
4149 field to identify the transceiver generating the AEN.

4150 Table 270 illustrates the packet format of the AEN.

4151

Table 270 – Transceiver Event AEN packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00
00..15	AEN Header			
16..19	Reserved	Transceiver Presence	SFF Cage Number	AEN Type = 0x06
20..23	Transceiver Event List			
24..27	Reserved			
28..31	Checksum			

4152 8.5.7.1 SFF Cage Number field

4153 SFF cage numbers are assigned to SFF cages in the implementation based on the NC-SI channel they
 4154 are associated with (when not trunked) offset by one. Thus, SFF cage #1 is associated with NC-SI
 4155 channel 0, SFF cage #2 is associated with channel 1, etc.

4156 8.5.7.2 Transceiver Event List field

4157 The Transceiver Event List field has the format shown in Table 271.

4158

Table 271 – Transceiver Event List format

Bit Position	Name	Description
0	Low Temp Warning	0b = No alert 1b = The Transceiver's low temperature warning threshold has been exceeded.
1	High Temp Warning	0b = No alert 1b = The Transceiver's high temperature warning threshold has been exceeded.
2	Low Temp Alarm	0b = No alert 1b = The Transceiver's low temperature alarm threshold has been exceeded.
3	High Temp Alarm	0b = No alert 1b = The Transceiver's high temperature alarm threshold has been exceeded.
4	Low Voltage Warning	0b = No alert 1b = The Transceiver's low voltage warning threshold has been exceeded.
5	High Voltage Warning	0b = No alert 1b = The Transceiver's high voltage warning threshold has been exceeded.
6	Low Voltage Alarm	0b = No alert 1b = The Transceiver's low voltage alarm threshold has been exceeded.
7	High Voltage Alarm	0b = No alert 1b = The Transceiver's high voltage alarm threshold has been exceeded.

Bit Position	Name	Description
15..8	8x RX Power Levels	0b = No alert 1b = The Transceiver's RX Power alarm threshold has been exceeded. LSB is lane 1 thru MSB is lane 8.
23..16	8x TX Power Levels	0b = No alert 1b = The Transceiver's TX Power alarm threshold has been exceeded. LSB is lane 1 thru MSB is lane 8.
31..24	8x TX Bias Levels	0b = No alert 1b = The Transceiver's TX Bias Current alarm threshold has been exceeded. LSB is lane 1 thru MSB is lane 8.

4159 **8.5.7.3 Transceiver Presence field**

4160 **Table 272 – Transceiver Presence format**

Bit Position	Name	Description
0	Transceiver Presence Change	0b = No change in presence detected. 1b = The Transceiver was either removed or inserted. The insertion event reporting shall occur only after the Transceiver has completed its initialization stage
7..1	Reserved	Reserved

4161 **8.5.8 Request Data Transfer AEN**

4162 This AEN indicates to the Management Controller that the NC is requesting the MC to initiate a transfer of
4163 an opaque data package from the NC to the MC. It is sent using an Internal Channel ID value of 0x1F to
4164 indicate a package-level operation.

4165 Table 273 illustrates the packet format of the AEN.

4166 **Table 273 – Request Data Transfer AEN packet format**

Bytes	Bits			
	31..24	23..16	15..08	07..00

20..23	Total Length of Transfer (bytes)			
24..27	Data Handle			
28..31	Checksum			

4167 **8.5.9 Partition Link Status Change AEN**

4168 The Partition Link Status Change AEN indicates to the Management Controller any change in the internal
4169 link status of any partition on the channel. This AEN is only valid when the NC supports partitioning and it
4170 is enabled.

4171 This AEN should be sent if any change occurred in the internal link status of any enabled partition on the
4172 channel.

4173 Table 274 illustrates the packet format of the Partition Link Status Change AEN.

4174 **Table 274 – Partition Link Status Change AEN packet format**

1	0b = Partition 2 on channel link state has not changed 1b = Partition 2 on channel link state has changed
...	...
7	0b = Partition 8 on channel link state has not changed 1b = Partition 8 on channel link state has changed

4177

Table 276 – Partition Link Status field

Bit	Description
0	0b = Partition 1 on channel link is down. 1b = Partition 1 on channel link is up.
1	0b = Partition 2 on channel link is down. 1b = Partition 2 on channel link is up.
...	...
7	0b = Partition 8 on channel link is down. 1b = Partition 8 on channel link is up.

4178 **8.5.10 Thermal Shutdown Event AEN**

4179 The Thermal Shutdown Event AEN indicates to the Management Controller that NC device shutdown is
4180 imminent due to the defined thermal threshold being reached. It is sent using an Internal Channel ID
4181 value of 0x1F to indicate a package-level operation.

4182 Table 277 illustrates the packet format of the Thermal Shutdown Event AEN.

4183

Table 277 – Thermal Shutdown Event AEN packet format

Bytes	Bits			
	31..24	23..16	15..08	07..00

16..19	Reserved		AEN Type = 0x09	
20..23	Checksum			

4184 **8.5.11 Pending PLDM Request AEN**

4185 The Pending PLDM Request AEN is an RBT-specific AEN used to alert the MC that there is a pending
 4186 PLDM request for the MC in the NC. This AEN allows for the MC to poll for pending PLDM requests on
 4187 the NC at a lower rate. It is sent using an Internal Channel ID value of 0x1F to indicate a package-level
 4188 operation.

4189 As a transport-specific AEN, this AEN is enabled using the transport-specific AEN enable command and
 4190 is controlled by bit 1 in Transport Specific AEN’s enable field.

4191 This AEN should be sent if there is a new pending PLDM request that is available in the NC designated to
 4192 the MC that was not reported to the MC through **Send NC PLDM Reply Response (0xD7)**. A Pending
 4193 PLDM Request AEN should not be sent from the time the NC recognizes an incoming **Query Pending**
 4194 **NC PLDM Request (0x56)** until the NC sends **Send NC PLDM Reply Response (0xD7)** for the PLDM
 4195 request.

4196

4197 **8.5.12 Pending SPDM Request AEN**

4198 The Pending SPDM Request AEN is an RBT-specific AEN used to alert the MC that there is a pending
 4199 SPDM command request for the MC in the NC. It is sent using an Internal Channel ID value of 0x1F to
 4200 indicate a package-level operation.

4201 As a transport-specific AEN, this AEN is enabled using the transport-specific AEN enable command and
 4202 is controlled by bit 2 in Transport Specific AEN’s enable field.

4203 This AEN should be sent if there is a new pending SPDM request that was generated in the NC
 4204 designated for the MC and that was not reported to the MC through **Send NC SPDM Reply Response**
 4205 **(0xE2)**. A Pending SPDM Request AEN should not be sent from the time the NC recognizes an incoming
 4206 **Query Pending NC SPDM Request (0x61)** until the NC sends **Send NC SPDM Reply Response (0xE2)**
 4207 for the SPDM request.

4209

4210 **9 Packet-based and opcode timing**

4211 Table 280 presents the timing specifications for a variety of packet-to-electrical-buffer interactions, inter-
 4212 packet timings, and opcode processing requirements. The following timing parameters shall apply to the
 4213 NC-SI over RBT binding defined in this specification.

4214 **Table 280 – NC-SI packet-based and opcode timing parameters**

Name	Symbol	Value	Description
Package Deselect to Hi-Z Interval	T1	200 μ s, max	Maximum time interval from when a Network Controller completes transmitting the response to a Deselect Package command to when the Network Controller outputs are in the high-impedance state Measured from the rising edge of the first clock that follows the last bit of the packet to when the output is in the high-impedance state as defined in clause 10
Package Output to Data	T2	2 clocks, min	Minimum time interval after powering up the output drivers before a Network Controller starts transmitting a packet through the NC-SI interface Measured from the rising edge of the first clock of the packet
Network Controller Power Up Ready Interval	T4	2 s, max	Time interval from when the NC-SI on a Network Controller is powered up to when the Network Controller is able to respond to commands over NC-SI Measured from when V_{ref} becomes available
Normal Execution Interval	T5	50 ms, max	Maximum time interval from when a controller receives a command to when it delivers a response to that command, unless otherwise specified Measured from the rising edge of the first clock following the last bit of the command packet to the rising edge of the clock for the first bit of the response packet
Asynchronous Reset Interval	T6	2 s, max	Interval during which a controller may not recognize or respond to commands or handle Pass-through traffic due to an Asynchronous Reset event. See clause 6.1.8. For a Management Controller, this means that a Network Controller could become unresponsive for up to T6 seconds if an Asynchronous Reset event occurs. This is not an error condition. The Management Controller retry behavior should be designed to accommodate this possibility.
Synchronous Reset Interval	T7	2 s, max	Interval during which a controller may not recognize or respond to commands or handle Pass-through traffic due to a Synchronous Reset event. See clause 6.1.8. Measured from the rising edge of the first clock following the last bit of the Reset Channel response packet
Token Timeout	T8	32,000 REF_CLK, min	Number of REF_CLKs before timing out while waiting for a TOKEN to be received

Name	Symbol	Value	Description
Opcode Processing	T9	32 REF_CLK, max	Number of REF_CLKs after receiving an opcode on ARB_IN to decode the opcode and generate the next opcode on ARB_OUT Measured from the falling edge of the last bit of the opcode received on ARB_IN to the rising edge of the next opcode on ARB_OUT
Opcode Bypass Delay	T10	32 REF_CLK, max	Number of REF_CLK delays between a bit received on ARB_IN and the corresponding bit passed on to ARB_OUT while in Bypass Mode Measured from the falling edge of the last bit of the opcode received on ARB_IN to the rising edge of the next opcode on ARB_OUT
TOKEN to RXD	T11	T2, min 32 REF_CLK, max	Number of REF_CLKs after receiving TOKEN to when packet data is driven onto the RXD lines Measured from the falling edge of the last bit of the opcode received on ARB_IN to the rising edge of the first clock of the next packet on RXD
Max XOFF Renewal Interval	T12	50,331,648 REF_CLK, max	Maximum time period (3 XOFF Frame timer cycles) during which a channel within a package is allowed to request and renew a single XOFF condition after requesting the initial XOFF
IPG to TOKEN Opcode Overlap	T13	6 REF_CLK, max	Maximum number of REF_CLKs that the beginning of TOKEN transmission can precede the end of the Inter Packet Gap. For more information, see clause 7.3.8.
Delayed Execution Interval	T14	4 s, max	Maximum time interval from when a controller receives a command to when it delivers a response to that command, including all responses with "Delayed Response" code Measured from the rising edge of the first clock following the last bit of the command packet to the rising edge of the clock for "Delayed Response Ready" AEN, if enabled, or to the moment the NC is internally ready with a response for a polling command
NOTE: If hardware arbitration is in effect, the hardware arbitration output buffer enable/disable timing specifications take precedence.			

4215

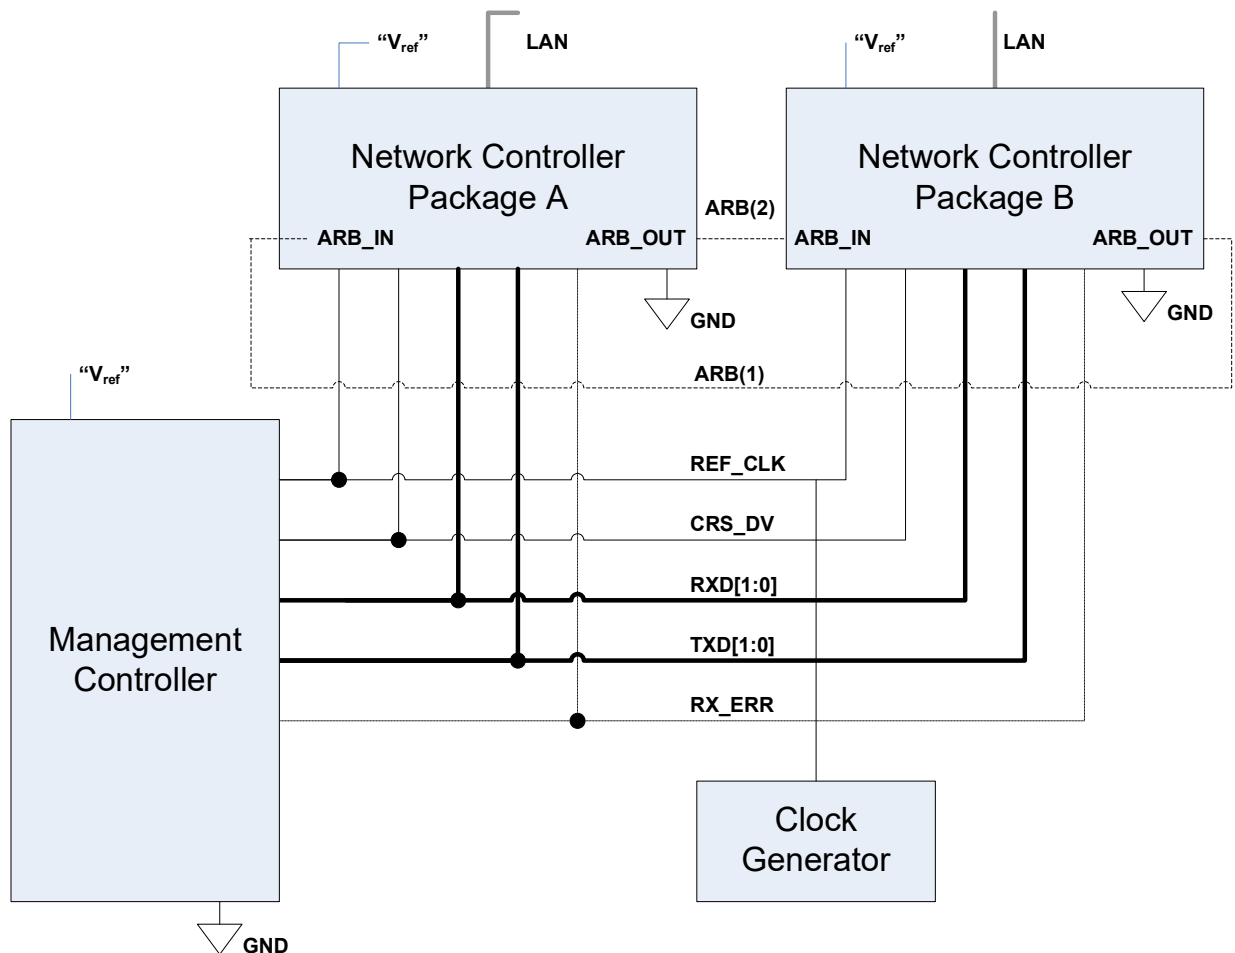

4216 **10 RBT Electrical specification**

4217 This clause provides background information about the NC-SI RBT specification, describes the RBT
 4218 topology, and defines the electrical, timing, signal behavior, and power-up characteristics for the RBT
 4219 physical interface.

4220 **10.1 Topologies**

4221 The electrical specification defines the RBT electrical characteristics for one management processor and
 4222 one to four Network Controller packages in a bussed “multi-drop” arrangement. The actual number of
 4223 devices that can be supported may differ based on the trace characteristics and routing used to
 4224 interconnect devices in an implementation.

4225 Figure 16 shows an example topology.

4226

4227 **Figure 16 – Example NC-SI RBT signal interconnect topology**

4228 10.2 Electrical and signal characteristics and requirements

4229 This clause defines the electrical, timing, signal behavior, and power-up characteristics for the NC-SI RBT
4230 physical interface.

4231 10.2.1 Companion specifications

4232 Implementations of the physical interface and signaling for RBT shall meet the specifications in [RMII](#) and
4233 [IEEE 802.3](#), except where those requirements differ or are extended with specifications provided in this
4234 document, in which case the specifications in this document shall take precedence.

4235 10.2.2 Full-duplex operation

4236 RBT is specified only for full-duplex operation. Half-duplex operation is not covered by this specification.

4237 10.2.3 Signals

4238 Table 281 lists the signals that make up the RBT physical interface.

4239 Unless otherwise specified, the high level of an RBT signal corresponds to its asserted state, and the low
4240 level represents the de-asserted state. For data bits, the high level represents a binary '1' and the low
4241 level a binary '0'.

4242

Table 281 – Physical RBT signals

Signal Name	Direction (with respect to the Network Controller)	Direction (with respect to the Management Controller MAC)	Use	Mandatory (M) or Optional (O)
REF_CLK ^[a]	Input	Input	Clock reference for receive, transmit, and control interface	M
CRS_DV ^[b]	Output	Input	Carrier Sense/Receive Data Valid	M
RXD[1:0]	Output	Input	Receive data	M
TX_EN	Input	Output	Transmit enable	M
TXD[1:0]	Input	Output	Transmit data	M
RX_ER	Output	Input	Receive error	O
ARB_IN	Input ^[c]	n/a	Network Controller hardware arbitration Input	O ^[c]
ARB_OUT	Output ^[c]	n/a	Network Controller hardware arbitration Output	O ^[c]

NOTES: ^[a] A device can provide an additional option to allow it to be configured as the source of REF_CLK, in which case the device is not required to provide a separate REF_CLK input line, but it can use the REF_CLK input pin as an output. The selected configuration shall be in effect at NC power up and remain in effect while the NC is powered up.

^[b] In the [RMII Specification](#), the MII Carrier Sense signal, CRS, was combined with RX_DV to form the CRS_DV signal. When RBT is using its specified full-duplex operation, the CRS aspect of the signal is not required; therefore, the signal shall provide only the functionality of RX_DV as defined in [IEEE 802.3](#). (This is equivalent to the CRS_DV signal states in [RMII Specification](#) when a carrier is constantly present.) The Carrier Sense aspect of the CRS_DV signal is not typically applicable to RBT because it does not typically detect an actual carrier (unlike an actual PHY). However, the Network Controller should emulate a carrier-present status on CRS_DV per [IEEE 802.3](#) in order to support Management Controller MACs that may require a carrier-present status for operation.

^[c] If hardware arbitration is implemented, the Network Controller package shall provide both ARB_IN and ARB_OUT connections. In some implementations, ARB_IN may be required to be tied to a logic high or low level if it is not used.

4243 **10.2.4 High-impedance control**

4244 Shared RBT operation requires Network Controller devices to be able to set their outputs (RXD[1:0],
 4245 CRS_DV, and, if implemented, RX_ER) into a high-impedance state either upon receipt of a command
 4246 being received, or, if hardware-based arbitration is enabled, as a result of hardware-based arbitration. A
 4247 pull-down resistor should be provided on high impedance signals to prevent them from floating when not
 4248 driven.

4249 Network Controllers shall leave their RBT outputs in the high-impedance state on interface power up and
 4250 shall not drive them until the package is selected. For additional information about Network Controller
 4251 packages, see 8.4.5.

4252 For RBT output signals in this specification, unless otherwise specified, the high-impedance state is
 4253 defined as the state in which the signal leakage meets the I_z specification provided in 10.2.5.

4254 **10.2.5 Hardware Implementations**

4255 A variety of shared RBT hardware implementations are possible. In such cases, the designer must take
 4256 care to ensure the HW arbitration loop is maintained when used, even if some RBT devices are not
 4257 present. Pull resistors are recommended to be placed on the system board side of any connector for add-
 4258 in RBT cards so that a proper resistance for the high impedance signals can be maintained.

4259 **10.2.6 DC characteristics**

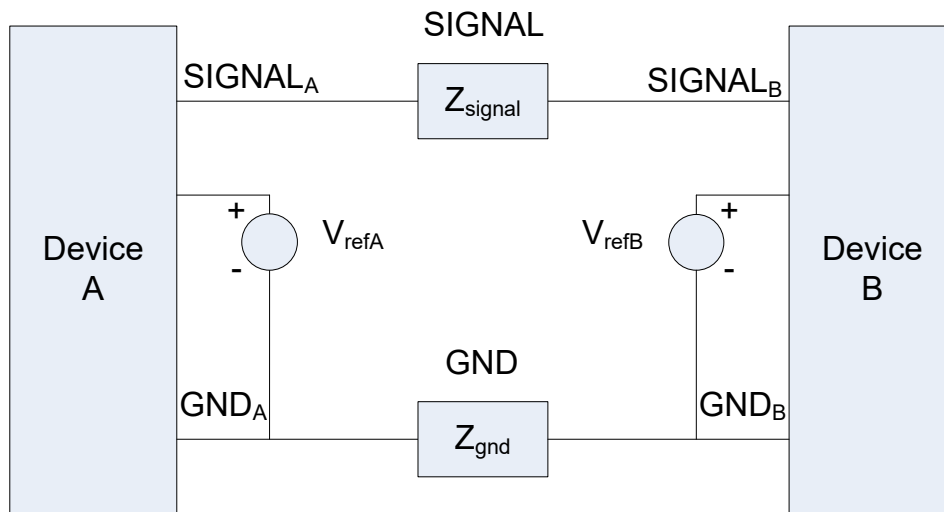

4260 This clause defines the DC characteristics of the RBT physical interface.

4261 **10.2.6.1 Signal levels**

4262 CMOS 3.3 V signal levels are used for this specification.

4263 The following characteristics apply to DC signals:

- 4264 • Unless otherwise specified, DC signal levels and V_{ref} are measured relative to Ground (GND) at
- 4265 the respective device providing the interface, as shown in Figure 17.
- 4266 • Input specifications refer to the signals that a device shall accept for its input signals, as
- 4267 measured at the device.
- 4268 • Output specifications refer to signal specifications that a device shall emit for its output signals,
- 4269 as measured at the device.

4270

4271

Figure 17 – DC measurements

4272 Table 282 provides DC specifications.

4273 **Table 282 – DC specifications**

Parameter	Symbol	Conditions	Minimum	Typical	Maximum	Unit
IO reference voltage	$V_{ref}^{[a]}$		3.0	3.3	3.6	V
Signal voltage range	V_{abs}		-0.300		3.765	V
Input low voltage	V_{il}				0.8	V
Input high voltage	V_{ih}		2.0			V
Input high current	I_{ih}	$V_{in} = V_{ref} = V_{ref,max}$	0		200	μA
Input low current	I_{il}	$V_{in} = 0 V$	-20		0	μA
Output low voltage	V_{ol}	$I_{ol} = 4 mA, V_{ref} = min$	0		400	mV
Output high voltage	V_{oh}	$I_{oh} = -4 mA, V_{ref} = min$	2.4		V_{ref}	V
Clock midpoint reference level	V_{ckm}				1.4	V
Leakage current for output signals in high-impedance state	I_z	$0 \leq V_{in} \leq V_{ref}$ at $V_{ref} = V_{ref,max}$	-20		20	μA

NOTES: ^[a] V_{ref} = Bus high reference level (typically the NC-SI logic supply voltage). This parameter replaces the term supply voltage because actual devices may have internal mechanisms that determine the operating reference for RBT that are different from the devices' overall power supply inputs.

^[b] V_{ref} is a reference point that is used for measuring parameters (such as overshoot and undershoot) and for determining limits on signal levels that are generated by a device. To facilitate system implementations, a device shall provide a mechanism (for example, a power supply pin, internal programmable reference, or reference level pin) to allow V_{ref} to be set to within 20 mV of any point in the specified V_{ref} range. This approach enables a system integrator to establish an interoperable V_{ref} level for devices on RBT.

4274 **10.2.7 AC characteristics**

4275 This clause defines the AC characteristics of the RBT physical interface.

4276 **10.2.7.1 Rise and fall time measurement**

4277 Rise and fall time are measured between points that cross 10% and 90% of V_{ref} (see Table 282). The
4278 middle points (50% of V_{ref}) are marked as V_{ckm} and V_m for clock and data, respectively.

4279 **10.2.7.2 REF_CLK measuring points**

4280 In Figure 18, REF_CLK duty cycle measurements are made from V_{ckm} to V_{ckm} . Clock skew T_{skew} is
4281 measured from V_{ckm} to V_{ckm} of two RBT devices and represents the maximum clock skew between any
4282 two devices in the system.

4283 **10.2.7.3 Data, control, and status signal measuring points**

4284 In Figure 18, all timing measurements are made between V_{ckm} and V_m . T_{co} is measured with a capacitive
4285 load between 10 pF and 50 pF. Propagation delay T_{prop} is measured from V_m on the transmitter to V_m on
4286 the receiver.

4290

Table 283 – AC specifications

Parameter	Symbol	Minimum	Typical	Maximum	Units
REF_CLK Frequency			50	50 + 100 ppm	MHz
REF_CLK Duty Cycle		35		65	%
Clock-to-out ^[a] (10 pF ≤ C _{load} ≤ 50 pF)	T _{co}	2.5		12.5	ns
Skew between clocks	T _{skew}			1.5	ns
TXD[1:0], TX_EN, RXD[1:0], CRS_DV, RX_ER, and ARB_IN data setup to REF_CLK rising edge	T _{su}	3			ns
TXD[1:0], TX_EN, RXD[1:0], CRS_DV, RX_ER, and ARB_OUT data hold from REF_CLK rising edge	T _{hd}	1			ns
Signal Rise / Fall Time	T _r / T _f	0.5		6	ns
REF_CLK Rise / Fall Time	T _{ckr} / T _{ckf}	0.5		3.5	ns
Interface Power-Up High-Impedance Interval	T _{pwrz}	2			µs
Power Up Transient Interval (recommendation)	T _{pwrt}			100	ns
Power Up Transient Level (recommendation)	V _{pwrt}	-200		200	mV
Interface Power-Up Output Enable Interval	T _{pwre}			10	ms
REF_CLK Startup Interval	T _{clkstrt}			100	ms
NOTES: ^[a] This timing relates to the output pins, while T _{su} and T _{hd} relate to timing at the input pins.					

4291 **10.2.7.4 Timing calculation (informative)**

4292 **10.2.7.4.1 Setup time calculation**

4293
$$T_{su} \leq T_{clk} - (T_{skew} + T_{co} + T_{prop})$$

4294 **10.2.7.4.2 Hold time calculation**

4295
$$T_{hd} \leq T_{co} - T_{skew} + T_{prop}$$

4296 **10.2.7.5 Overshoot specification**

4297 Devices shall accept signal overshoot within the ranges specified in Figure 19, measured at the device,
4298 without malfunctioning.

4299

4300

Figure 19 – Overshoot measurement

4301 The signal may overshoot up to the specified V_{max} for the first 3 ns following the transition above V_{ih} .
 4302 Following that interval is an exponential decay envelope equal to the following:

4303
$$V_{ref} + V_{os} * e^{[-K * ([t - 3 \text{ ns}] / T_d)]}$$

4304 Where, for $t = 3$ to 10 ns:

4305 $t = 0$ corresponds to the leading crossing of V_{ih} , going high.

4306 V_{ref} is the bus high reference voltage (see 10.2.5).

4307 $V_{abs,max}$ is the maximum allowed signal voltage level (see 10.2.5).

4308 $V_{os} = V_{max} - V_{ref}$

4309 $K = \ln(25 \text{ mV}/V_{os})$

4310 $T_d = 7 \text{ ns}$

4311 For $t > 10 \text{ ns}$, the $V_{ref} + 25 \text{ mV}$ limit holds flat until the conclusion of T_{high} .

4312 **10.2.7.6 Undershoot specification**

4313 Devices are required to accept signal undershoot within the ranges specified in Figure 20, measured at
 4314 the device, without malfunctioning.

4315

4316

Figure 20 – Undershoot measurement

4317 The signal is allowed to undershoot up to the specified $V_{abs,min}$ for the first 3 ns following the transition
 4318 above V_{il} . Following that interval is an exponential envelope equal to the following:

4319
$$GND + V_{abs,min} * e^{[-K * (t - 3 ns) / T_d]}$$

4320 Where, for $t = 3$ to 10 ns:

4321 $t = 0$ corresponds to the leading crossing of V_{il} , going low.

4322 $V_{abs,min}$ is the minimum allowed signal voltage level (see 10.2.5).

4323 $K = \ln(25 \text{ mV}/V_{os})$

4324 $T_d = 7 \text{ ns}$

4325 For $t > 7 \text{ ns}$, the $GND - 25 \text{ mV}$ limit holds flat until the conclusion of T_{low} .

4326 **10.2.8 Interface power-up**

4327 To prevent signals from back-powering unpowered devices, it is necessary to specify a time interval
 4328 during which signals are not to be driven until devices sharing the interface have had time to power up.
 4329 To facilitate system implementation, the start of this interval shall be synchronized by an external signal
 4330 across devices.

4331 **10.2.8.1 Power-up control mechanisms**

4332 The device that provides the interface shall provide one or more of the following mechanisms to enable
 4333 the system integrator to synchronize interface power-up among devices on the interface:

4334 • **Device power supply pin**

4335 The device has a power supply pin that the system integrator can use to control power-up of the
 4336 interface. The device shall hold its outputs in a high-impedance state (current $< I_z$) for at least
 4337 T_{pwrz} seconds after the power supply has initially reached its operating level (where the power
 4338 supply operating level is specified by the device manufacturer).

- 4339
- **Device reset pin or another similar signal**
- 4340 The device has a reset pin or other signal that the system integrator can use to control the
4341 power-up of the interface. This signal shall be able to be driven asserted during interface power-
4342 up and de-asserted afterward. The device shall hold its outputs in a high-impedance state
4343 (current $< I_z$) for at least T_{pwrz} seconds after the signal has been de-asserted, other than as
4344 described in clause 10.2.8.2. It is highly recommended that a single signal be used; however,
4345 an implementation is allowed to use a combination of signals if required. Logic levels for the
4346 signals are as specified by the device manufacturer.

- 4347
- **REF_CLK detection**
- 4348 The device can elect to detect the presence of an active REF_CLK and use that for determining
4349 whether NC-SI power up has occurred. It is recommended that the device should count at least
4350 100 clocks and continue to hold its outputs in a high-impedance state (current $< I_z$) for at least
4351 T_{pwrz} seconds more (Informational: 100 clocks at 50 MHz is 2 μ s).

4352 10.2.8.2 Power-up transients

4353 It is possible that a device may briefly drive its outputs while the interface or device is first receiving
4354 power, due to ramping of the power supply and design of its I/O buffers. It is recommended that devices
4355 be designed so that such transients, if present, are less than V_{pwrt} and last for no more than T_{pwrt} .

4356 10.2.9 REF_CLK startup

4357 REF_CLK shall start up, run, and meet all associated AC and DC specifications within $T_{clkstrt}$ seconds of
4358 interface power up.

4359 10.3 RBT Implementation guidance

4360 This specification does not define implementation requirements due to the wide variation in architectures,
4361 devices and materials used. Following good engineering practices are a key part of a successful NC-SI
4362 RBT implementation:

- 4363
- Care must be taken in placement and layout.
- 4364
- Do a complete signal integrity analysis including determining what, if any, termination is required.
- 4365
- Minimize stubs.
- 4366
- Have uniform clock trace lengths.
- 4367
- Minimize noise on high-impedance signals.

4368

ANNEX A (normative)

4369
4370
4371
4372

Extending the model

4373 This annex explains how the model can be extended to include vendor-specific content.

4374 **A.1 Commands extension**

4375 A Network Controller vendor can implement extensions and expose them using OEM commands, as
4376 described in clause 8.4.118.

4377 **A.2 Design considerations**

4378 This clause describes certain design considerations for vendors of Management Controllers.

4379 **A.2.1 PHY support**

4380 Although not a requirement of this specification, a Management Controller vendor can design the RBT
4381 interface in such a manner that it could also be configured for use with a conventional RMII PHY. This
4382 would enable the vendor's controller to also be used in applications where a direct, non-shared network
4383 connection is available or preferred for manageability.

4384 **A.2.2 Multiple Management Controllers support**

4385 Currently, there is no requirement for Management Controllers to be able to put their TXD output lines
4386 and other output lines into a high-impedance state, because the present definition assumes only one
4387 Management Controller on the bus. However, component vendors can provide such control capabilities in
4388 their devices to support possible future system topologies where more than one Management Controller
4389 share the bus to enable functions such as Management Controller fail-over or to enable topologies where
4390 more than one Management Controller can participate in NC-SI communications on the bus. If a vendor
4391 elects to make such provision, it is recommended that the TXD line and the remaining output lines be
4392 independently and dynamically switched between a high-impedance state and re-enabled under firmware
4393 control.

4394

ANNEX B (informative)

Relationship to RMI Specification

4395
4396
4397
4398

4399 **B.1 Differences from the *RMI Specification***

4400 The following list presents key differences and clarifications between the *NC-SI Specification* and
4401 sections in the [RMI Specification](#). (Section numbers refer to the [RMI Specification](#).)

- 4402 • General: Where specifications from [IEEE 802.3](#) apply, this specification uses the version
4403 specified in clause 2 (Normative references), rather than the earlier IEEE 802.3u version that is
4404 referenced by [RMI](#).
- 4405 • Section 1.0:
 - 4406 – The *NC-SI Specification* requires 100 Mbps support, but it does not specify a required
4407 minimum. (10 Mbps support is not required by NC-SI.)
 - 4408 – Item 4. (Signals may or may not be considered to be TTL. NC-SI is not 5 V tolerant.)
- 4409 • Section 2.0:
 - 4410 – Comment: NC-SI chip-to-chip includes considerations for multi-drop and allows for non-
4411 PCB implementations and connectors (that is, not strictly point-to-point).
- 4412 • Section 3.0:
 - 4413 – Note/Advisory: The NC-SI clock is provided externally. An implementation can have
4414 REF_CLK provided by one of the devices on the bus or by a separate device.
- 4415 • Section 5.0:
 - 4416 – For NC-SI, the term *PHY* is replaced by *Network Controller*.
- 4417 • Table 1:
 - 4418 – The information in Table 1 in the [RMI Specification](#) is superseded by tables in this
4419 specification.
- 4420 • Section 5.1, paragraph 2:
 - 4421 – The *NC-SI Specification* allows 100 ppm. This supersedes the [RMI Specification](#), which
4422 allows 50 ppm.
- 4423 • Section 5.1, paragraph 3:
 - 4424 – The NC-SI inherits the same requirements. The NC-SI MTU is only required to support
4425 Ethernet MTU with VLAN, as defined in the [IEEE 802.3](#) version listed in clause 2
 - 4426 – Section 5.1 paragraph 4:
 - 4427 – The [RMI Specification](#) states: “During a false carrier event, CRS_DV shall remain asserted
4428 for the duration of carrier activity.” This statement is not applicable to full-duplex operation
4429 of the NC-SI. CRS_DV from the Network Controller is used only as a data valid (DV)
4430 signal. Because the Carrier Sense aspect of CRS_DV is not used for full-duplex operation
4431 of the NC-SI, the Network Controller would not generate false carrier events for the NC-SI.
4432 However, it is recommended that the MAC in the Management Controller be able to
4433 correctly detect and handle these patterns if they occur, as this would be part of enabling
4434 the Management Controller MAC to also be able to work with an RMI PHY.

- 4435 • Section 5.2:
- 4436 – The NC-SI does not specify a 10 Mbps mode. The Carrier Sense aspect of CRS_DV is not
4437 used for full-duplex operation of NC-SI.
- 4438 • Section 5.3.1:
- 4439 – While the NC-SI does not specify Carrier Sense usage of CRS_DV, it is recommended that
4440 a Management Controller allow for CRS_DV toggling, in which CRS_DV toggles at 1/2
4441 clock frequency, and that Management Controller MACs tolerate this and realign bit
4442 boundaries correctly in order to be able to work with an RMII PHY also.
- 4443 • Section 5.3.2:
- 4444 – There is no 10 Mbps mode specified for the NC-SI RBT interface.
- 4445 • Section 5.3.3:
- 4446 – Generally, there is no expectation that the Network Controller will generate these error
4447 conditions for the NC-SI; however, the MAC in the Management Controller should be able
4448 to correctly detect and handle these patterns if they occur.
- 4449 • Section 5.3.3:
- 4450 – The NC-SI does not specify or require support for RMII Registers.
- 4451 • Section 5.5.2:
- 4452 – Ignore (n/a) text regarding 10 Mbps mode. RBT does not specify or require interface
4453 operation in 10 Mbps mode.
- 4454 • Section 5.6:
- 4455 – The Network Controller will not generate collision patterns for the specified full-duplex
4456 operation of the NC-SI; however, the MAC in the Management Controller should be able to
4457 detect and handle these patterns if they occur in order to be able to work with an RMII PHY
4458 also.
- 4459 • Section 5.7:
- 4460 – NC-SI RBT uses the [IEEE 802.3](#) version listed in clause 2 instead of 802.3u as a
4461 reference.
- 4462 • Section 5.8:
- 4463 – Loopback operation is not specified for the NC-SI RBT interface.
- 4464 • Section 7.0:
- 4465 – The NC-SI RBT electrical specifications (clause 10) take precedence. (For example,
4466 section 7.4.1 in the [RMII Specification](#) for capacitance is superseded by *NC-SI*
4467 *Specification* 25 pF and 50 pF target specifications.)
- 4468 • Section 8.0:
- 4469 – NC-SI RBT uses the [IEEE 802.3](#) version listed in clause 2 (Normative references) as a
4470 reference, instead of 802.3u.
