Foreword

” For many years the brewing and hop industries have been diligently working towards improving the sustainability aspects of our entire production chain. One important area of greatly improved sustainability for Hopsteiner is our hop breeding program. Our work in this area has been prescient, given the disappointing results of crop 2022 both in Europe and the United States. The poor crops serve as a stark reminder of the importance of breeding hop varieties with greater drought, heat and disease tolerance. Many traditional hop varieties experienced lower yields and quality damage compared to newer, more technically advanced varieties. This was the case in the main hop growing countries, as heat and drought impacted Germany and the Czech Republic while a late-arriving summer made for a similar yield reduction in USA. In extreme cases in Europe, yields and alphas were down by half.

While a poor harvest brings with it many challenges, it does provide a true opportunity to prove the success of a targeted hop breeding program. However, the success of a variety does not just rely on its agronomic prowess; brewer and grower acceptance are vital in its lifecycle. It is critical that this transition begins so that the cost basis and supply chain of hops can remain intact in the face of many other challenges, for example cost inflation and the reduction in the number of permitted plant protection materials.

We stand ready to collaborate with you to achieve some of these transitions.

Your Hopsteiner Team
November 2022

Hop Market Review and Outlook

Retrospective

In Europe crop 2021 was very good, with above-average yields and alpha values. The acreage was slightly less than in 2020 but produced approximately 2,800 more mt hops. The total crop size was 66,983 mt. The Czech Republic's crop was a record.

In USA the crop of 52,542 mt was solid. The larger crop, combined with a reduction of craft beer sold, meant an increase in the inventory of standard craft beer hop varieties, along with a few specialty varieties whose acreage and production exceeded demand.

The sold-ahead percentage of crop 2021 was very high, but the size of the crop exceeded even those levels, which led to the first meaningful European spot market in quite some time. The excellent quality of the overall crop was a big help in selling the excess volumes. Some volumes were used in advance for crop 2022, which was an important move given what we now know about the small 2022 crop.

The average alpha value of crop 2021 was 9.6%, an increase from the 9.4% of crop 2020. With an expected 2022 world beer production of 1.879 mhl and a calculated demand of 9,019 mt alpha, the crop produced an assumed surplus of approximately 3,550 mt alpha acids.

Look Ahead

Hop acreage was reduced in 2022 due to the generally well-supplied market. There were slight reductions in the UK, Poland, Czech, Slovenia and Germany. In USA the reduction was approximately 3.5%.

In Europe, Crop 2022 was adversely affected by both multiple hailstorms and hot, dry weather. In USA a wet and cold spring hampered plant development and also caused an unusually strong outbreak of downy mildew. The crop was not able to recover from these setbacks. Overall the estimated volume of 46,250 MT represents a decline of 12% from 2021. The corresponding yield of 1.87 tons/hectare is a drop from 2.05 the prior year.

The crop in Germany of 34,000 mt is extremely disappointing. In addition to a loss of approximately 2,000 mt to hailstorms, high temperatures and scant precipitation during the prime growing months severely curtailed the crop's development. Some varieties, for example Perle, had their yields drop 45%. It goes without saying the challenge that result presents for the market. Further to the yield problems are alpha levels that put several German aroma varieties into the alpha clause price/volume adjustment zone. All customers are informed of this and we are working to arrive at solutions for each.

Most other European growing countries experienced similar problems with their crops, whether from hot dry weather, storms or disease infestation. This also means that aroma hops from these areas will also be affected by the alpha clause. The only exception was Poland, where better rainfall allowed for a decent crop to develop. The total European crop of approximately 47,527 mt represents a drop of 29% from 2021.

Hop growing areas in Argentina, Australia, Japan, New Zealand, South Africa and China had average to good harvests in 2022. The worldwide crop of 104,733 mt is therefore approximately 20% less than in 2021. The average alpha level is 9.0% compared with 9.6% in 2021.

According to current 2022 and estimated 2023 volumes, beer production is growing slightly. Nevertheless, the craft beer segment has not regained its pre-pandemic growth trajectory. A review of various analyses shows a drop of approximately 2%. We are basing our 2023 hop supply-demand calculation on a worldwide alpha dosage of 4.8 grams of alpha per hectoliter. If we project 2023's world beer production to be 1,902 mhl, the global demand for hops is approximately 9,130 mt alpha. This results in a slight surplus of 258 mt based on 2022's estimated alpha production of 9,388 mt. Clearly each variety has its own market, but with the crop being so much below normal, this general analysis does apply across many of the individual varieties, several of which will not meet contracts. Discussions with customers are well underway.

Crop 2022 illustrates the great value of holding reasonable inventory of hops. This will remain critical into the future, as non-weather factors such as longer transit times, changing plant protection rules and cost inflation take on greater negative roles for the hop supply chain. Breweries also need to institute best practices for approving newer and alternative varieties to mitigate supply risks. Hop varieties bred with greater sustainability should be actively considered and approved for use. Improved yields and greater disease resistance mean stabilized costs, fewer acres, less water consumption and greater production efficiency. We have a fine range of sustainable varieties and continue to work on breeding challenges. We look forward to working with breweries towards these goals.
